| 202-11765-02            | May 2018 | We made the following major changes:  
  • Added Safety Instructions and Warnings on page 29  
  • Added the DHCPv6 option to Configure the IPv6 Network Interface on page 37  
  • Added Configure Layer 2 Loop Protection on page 155  
  • Added Configure DiffServ IPv6 Class Settings on page 175  
  • Revised Configure 802.1X Settings for a Port on page 214  
  • Added View the Client Summary on page 220  
  • Revised Use the ACL Wizard to create an ACL on page 232  
  • Added Configure an IPv6 ACL on page 258  
  • Added Configure IPv6 Rules on page 260  
  In addition we made multiple minor changes. |
| 202-11765-01            | June 2017   | First publication |

Get Started

This manual describes how you can configure and operate the NETGEAR 24-Port Gigabit Smart Managed Pro Switch with PoE+ and 2 SFP Ports, Model GS724TPv2 by using the local browser–based management interface (referred to as the local browser interface). The manual describes the software configuration procedures and explains the options that are available within those procedures.

This chapter provides an overview of how you can start your switch and access the local browser interface. The chapter contains the following sections:

- Switch Local Browser Interface Overview
- Change the Default IP Address of the Switch
- Discover a Switch in a Network With a DHCP Server
- Discover a Switch in a Network Without a DHCP Server
- Configure the Network Settings on Your Computer
- Access the Local Browser Interface
- About the User Interfaces
- Use a Web Browser to Access the Switch and Log In
- Local Browser Interface Device View
- Interface Naming Conventions
- Configure Interface Settings
- Context-Sensitive Help and Access to the Support WebSite
- Register Your Product
- Safety Instructions and Warnings

For more information about the topics covered in this manual, visit the support website at netgear.com/support.

Firmware updates with new features and bug fixes are made available from time to time at downloadcenter.netgear.com. You can check for and download new firmware manually. If the
features or behavior of your product does not match what is described in this guide, you might need to update your firmware.
Switch Local Browser Interface Overview

The switch provides administrative management options that let you configure, monitor, and control the network. Using the local browser interface, you can configure the switch and the network, including the ports, the management VLAN, VLANs for traffic control, link aggregation for increased bandwidth, quality of service (QoS) for prioritizing traffic, and network security.

Initial discovery of the switch on the network requires the Smart Control Center (SCC) program, which runs on a Windows-based computer. You can also download the SCC program from downloadcenter.netgear.com. If you do not use a Windows-based computer, get the IP address of the switch from the DHCP server in the network or use an IP scanner utility.

After discovery, you can configure the switch using the local browser interface for advanced setup and configuration of features, or the SCC program for very basic setup. For more information, see the SCC user manual, which you can download from downloadcenter.netgear.com.

Change the Default IP Address of the Switch

To enable remote management of the switch through a web browser or SNMP, connect the switch to the network and specify an IP address, subnet mask, and default gateway. The switch default IP address is 192.168.0.239 and the default subnet mask is 255.255.255.0.

To change the default IP address of the switch, use one of the following methods:

• **Dynamic assignment through DHCP.** DHCP is enabled on the switch by default. If you connect the switch to a network with a DHCP server, the switch obtains its network information automatically. You can use the Smart Control Center to discover the automatically assigned network information. For more information, see Discover a Switch in a Network With a DHCP Server on page 12.

• **Static assignment through the Smart Control Center.** If you connect the switch to a network that does not include a DHCP server, you can use the Smart Control Center to assign a static IP address, subnet mask, and default gateway. For more information, see Discover a Switch in a Network Without a DHCP Server on page 13.

• **Static assignment by connecting from a local host.** If you do not want to use the Smart Control Center to assign a static address, you can connect to the switch from a host (administrative system) in the 192.168.0.0/24 network and change the settings by using the local browser interface on the switch. For information about how to set the IP address on the administrative system so that it is in the same subnet as the default IP address of the switch, see Configure the Network Settings on Your Computer on page 14.
Discover a Switch in a Network With a DHCP Server

This section describes how to set up your switch in a network that includes a DHCP server. The DHCP client on the switch is enabled by default. When you connect the switch to your network, the DHCP server automatically assigns an IP address to the switch. Use the Smart Control Center to discover the IP address automatically assigned to the switch.

To install the switch in a network with a DHCP server:

1. Connect the switch to a network with a DHCP server.
2. Power on the switch by connecting its power cord.
3. Install the Smart Control Center on your computer.
4. Start the Smart Control Center.
5. Click the Discover button for the Smart Control Center to find your switch.

6. Make a note of the displayed IP address assigned by the DHCP server.

You need this address later to access the switch directly from a web browser (without using the Smart Control Center).
7. Select your switch by clicking the line that displays the switch.

8. Click the **Web Browser Access** button.

   The Smart Control Center launches a browser that displays the login page of the selected device.

   Use your web browser to manage your switch. The default password is **password**. For more information about the page layout and options, see Use a Web Browser to Access the Switch and Log In on page 18.

---

### Discover a Switch in a Network Without a DHCP Server

This section describes how to use the Smart Control Center to set up your switch in a network without a DHCP server. If your network does not include a DHCP service, you must assign a static IP address to your switch.

If you prefer, you can assign the switch a static IP address even if your network does include a DHCP server.

**To assign a static IP address:**

1. Connect the switch to your existing network.
2. Power on the switch by connecting its power cord.
3. Install the Smart Control Center on your computer.
4. Start the Smart Control Center.
5. Click the **Discover** button for the Smart Control Center to find your switch.
   
   The utility broadcasts Layer 2 discovery packets within the broadcast domain to discover the switch.

6. Select the switch, and then click the **Configure Device** button.
   
   The page expands to display additional fields at the bottom.

7. Select the **Disabled** radio button.
   
   DHCP is disabled.

8. Enter the static switch IP address, gateway IP address, and subnet mask for the switch.
9. Type your password to continue with the configuration change.

   **Tip:** You must enter the current password each time that you use the Smart Control Center to update the switch settings. The default password is **password**.

10. Click the **Apply** button.

   Your settings are saved.

### Configure the Network Settings on Your Computer

If you do not want to use the Smart Control Center to configure the network information on the switch, you can connect directly to the switch from an administrative system, such as a computer. The IP address of the computer must be in the same subnet as the default IP address on the switch. For most networks, this means that you must change the IP address of the computer to be on the same subnet as the default IP address of the switch (192.168.0.239).
The method to change the IP address on a computer varies depending on the operating system version. You need Windows administrator privileges to change these settings. The following procedures show how to change the static IP address on a computer running a Microsoft Windows 7.

**To modify the network settings on your computer:**

1. Open the Control Panel and click the **Network and Sharing Center** option.

2. Click the **Local Area Connection** link.
   The Local Area Connection Status pop-window opens.

3. Click the **Properties** button.

4. Select **Internet Protocol Version 4 (TCP/IPv4)**.

5. Click the **Properties** button.
6. Select the **Use the following IP address** radio button and change the IP address of the computer to an address in the 192.168.0.0 network, such as 192.168.0.200. The IP address must be different from that of the switch but within the same subnet.

**WARNING:**
When you change the IP address of your administrative system, you lose your connection to the rest of the network. Be sure to write down your current network address settings before you change them.

7. Click the **OK** button.
8. Close all other pop-up windows.

To configure a static address on the switch:
1. Use a straight-through cable to connect the Ethernet port on the administrative system directly to any port on the switch.
2. Open a web browser on your computer and connect to the local browser interface.
   For more information, see **Access the Local Browser Interface** on page 17.
3. Change the network settings on the switch to match those of your network.
   For more information, see **Configure the Switch IP Settings** on page 35.

After you change the network settings on the switch, return the network configuration on your administrative system to the original settings.
Access the Local Browser Interface

You must be able to ping the IP address of the switch from your administrative system for web access to be available. If you used the Smart Control Center to set up the IP address and subnet mask, either with or without a DHCP server, use that IP address in the address field of your web browser. If you did not change the IP address of the switch from the default value, enter 192.168.0.239 in the address field.

To access the switch local browser interface, use one of the following methods:

- From the Smart Control Center, select the switch and click the **Web Browser Access** button.
- Open a web browser and enter the IP address of the switch in the address field.

Clicking the **Web Browser Access** button on the Smart Control Center or accessing the switch directly from your web browser displays the Login page.

---

**Note:** For more information about the Smart Control Center (SCC) program, you can download the SCC program from downloadcenter.netgear.com.

---

About the User Interfaces

The switch software includes a set of comprehensive management functions for configuring and monitoring the system by using one of the following methods:

- Local browser interface
- Simple Network Management Protocol (SNMP)

Each of the standards-based management methods allows you to configure and monitor the components of the switch software. The method you use to manage the system depends on your network size and requirements, and on your preference.

This manual describes how to use the local browser interface to manage and monitor the system.

Software Requirements to Use the Web Interface

To access the switch by using a web browser, the browser must meet the following software requirements:

- HTML version 4.0, or later
- HTTP version 1.1, or later
Supported Web Browsers

The following browsers were tested and support the local browser interface. Later browser versions might function fine but were not tested. The supported web browsers include the following:

- Microsoft Internet Explorer (IE) versions 10–12
- Mozilla Firefox versions 18–52
- Chrome versions 28–58
- Opera Versions 26–44
- Safari on Windows OS 5.1.7
- Safari on MAC OS: 10.1

Use a Web Browser to Access the Switch and Log In

You can use a web browser to access the switch and log in. You must be able to ping the IP address of the switch local browser interface from your administrative system for web access to be available.

To use browser–based access to log in to the switch:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.

4. Enter the switch’s password in the Password field.
   - The default password is password.

   The Switch Information page displays.
   - The following figure shows the layout of the web interface.
Navigation Tabs, Configuration Menus, and Page Menu

The navigation tabs along the top of the web interface give you quick access to the various switch functions. The tabs are always available and remain constant, regardless of which feature you configure.

When you select a tab, the features for that tab appear as menus directly under the tabs. The configuration menus in the blue bar change according to the navigation tab that is selected.

The configuration pages for each feature are available as submenu links in the page menu on the left side of the page. Some items in the menu expand to reveal multiple submenu links, as the following figure shows.
Configuration and Status Options

The area directly under the configuration menus and to the right of the links displays the configuration information or status for the page you select. On pages that contain configuration options, you might be able to enter information into fields, select options from menus, select check boxes, and select radio buttons.

Each page contains access to the HTML-based help that explains the fields and configuration options for the page.

Web Interface Buttons

Each page also contains command buttons. The following table shows the command buttons that are used throughout the pages in the web interface:

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Clicking the Add button adds the new item configured in the heading row of a table.</td>
</tr>
<tr>
<td>Apply</td>
<td>Clicking the Apply button sends the updated configuration to the switch. Your settings are saved and configuration changes take effect immediately.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Clicking the Cancel button cancels the configuration on the page and resets the data on the page to the previous values of the switch.</td>
</tr>
<tr>
<td>Delete</td>
<td>Clicking the Delete button removes the selected item.</td>
</tr>
<tr>
<td>Update</td>
<td>Clicking the Update button refreshes the page with the latest information from the device.</td>
</tr>
<tr>
<td>Logout</td>
<td>Clicking the Logout button ends the session.</td>
</tr>
</tbody>
</table>

User-Defined Fields

User-defined fields can contain 1 to 159 characters, unless otherwise noted on the configuration web page. All characters can be used except for the ones stated in the following table (unless specifically noted in a procedure for a feature).

<table>
<thead>
<tr>
<th>Invalid Characters for user-defined fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>\  &lt;</td>
</tr>
<tr>
<td>/  &gt;</td>
</tr>
<tr>
<td>*</td>
</tr>
<tr>
<td>?</td>
</tr>
</tbody>
</table>
Local Browser Interface Device View

The Device View displays the ports on the switch. This graphic tool provides an alternate way to navigate to configuration and monitoring options. The graphic tool also provides information about device ports, configuration and status, tables, and feature components.

To use Device View:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The Switch Information page displays.

5. Select System > Device View.

   Depending upon the status of the port, the port color in Device View is either red, green, or black.

   • Green indicates that the port is linking up.
   • Red indicates that an error occurred on the port or that the port is administratively disabled.
   • Black indicates that no link is present.

   Each port also provides two LEDs in Device View to indicate the link status of the port.

   • The green LED indicates that the port is linking at a speed of 1 Gbps.
   • The yellow LED indicates that the port is linking at a speed of 100 Mbps or 10 Mbps.
6. Click a port to open a menu that displays statistics and configuration options. You can select a menu option to access the page that contains the configuration or monitoring options.

If you right-click the graphic, but do not right-click a specific port, the main menu displays. This menu contains the same options as the navigation tabs at the top of the page.

Right-click the specific port that you want to view or configure to see a menu that displays statistics and configuration options. Select the menu option to access the page that contains the configuration or monitoring options.

The system LEDs are located on the left side of the front panel.

Power LED

The Power LED is a bicolor LED that serves as an indicator of power and diagnostic status:

- **Solid green**. The power is supplied to the switch and operating normally.
- **Solid yellow**. The system is in the boot-up stage.
- **Off**. No power is supplied to the switch.

Fan LED

The Fan LED indicates the following status:

- **Solid yellow**. The fan is faulty.
- **Off**. The fan is operating normally.

PoE Max LED

The PoE Max LED indicates the following status:

- **Solid amber**. Less than 7W of PoE power is available.
- **Blinking amber**. At least once during the previous two minutes, less than 7W of PoE power was available.
- **Off**. Sufficient (more than 7W of) PoE power is available.
Interface Naming Conventions

The switch supports physical and logical interfaces. Interfaces are identified by their type and the interface number. The physical ports are Gigabit interfaces and are numbered on the front panel. You configure the logical interfaces by using the software.

The following table describes the naming convention for all interfaces available on the switch.

**Table 3. Naming conventions for interfaces**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical</td>
<td>The physical ports are 1 Gigabit Ethernet interfaces and are numbered sequentially starting from 1.</td>
<td>g1, g2, g12</td>
</tr>
<tr>
<td>Link aggregation group (LAG)</td>
<td>LAG interfaces are logical interfaces that are used only for bridging functions.</td>
<td>l1, l2, l3</td>
</tr>
<tr>
<td>CPU management interface</td>
<td>This is the internal switch interface responsible for the switch base MAC address. This interface is not configurable and is always listed in the MAC Address Table.</td>
<td>c1</td>
</tr>
</tbody>
</table>

Configure Interface Settings

For some features that allow you to configure interface settings, you can apply the same settings simultaneously to any of the following:

- A single port
- Multiple ports
- All ports
- A single LAG
- Multiple LAGs
- All LAGs
- Multiple ports and LAGs
- All ports and LAGs

Many of the pages that allow you to configure or view interface settings include links to display all ports, all LAGs, or all ports and LAGs on the page.
Use these links as follows:

- To display all ports, click the 1 link.
- To display all LAGs, click the LAG link.
- To display all ports and LAGs, click the All link.

The procedures in this section describe how to select the ports and LAGs to configure. The procedures assume that you are already logged in to the switch. If you do not know how to log in to the switch, see Use a Web Browser to Access the Switch and Log In on page 18.

**To configure a single port by using the Go To Interface field:**

1. Ensure that the page is displaying all ports, and not only the LAGs.
2. In the Go To Interface field, type the port number, for example g3.
   
   For more information, see Interface Naming Conventions on page 23.
3. Click the Go button.

   The check box associated with the interface is selected, the row for the selected interface is highlighted, and the interface number appears in the heading row.

4. Configure the desired settings.
5. Click the Apply button.

   Your settings are saved.

**To configure a single LAG by using the Go To Interface field:**

1. Click the LAG link or the All link to display the LAGs.
2. In the Go To Interface field, type the LAG number, for example l3.

   For information, see Interface Naming Conventions on page 23.
3. Click the Go button.

   The check box associated with the interface is selected, the row for the selected interface is highlighted, and the interface number appears in the heading row.

4. Configure the desired settings.
5. Click the **Apply** button.
   Your settings are saved.

**To configure a single port:**

1. Ensure that the page is displaying all ports, and not only the LAGs.
2. Select the check box next to the port number.
   The row for the selected interface is highlighted, and the interface number appears in the heading row.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.

**To configure a single LAG:**

1. Click the **LAG** link or the **All** link to display the LAGs.
2. Select the check box next to the LAG number.
   The row for the selected interface is highlighted, and the interface number appears in the heading row.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.

**To configure multiple ports:**

1. Ensure that the page is displaying all ports, and not only the LAGs.
2. Select the check box next to each port to configure.
   The row for each selected interface is highlighted.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.
To configure multiple LAGs:
1. Click the LAG link or the All link to display the LAGs.
2. Select the check box next to each LAG to configure.
   The check box associated with each interface is selected, and the row for each selected interface is highlighted.
3. Configure the desired settings.
4. Click the Apply button.
   Your settings are saved.

To configure all ports:
1. Ensure that the page is displaying only ports, and not LAGs.
2. Select the check box in the heading row.
   The check box associated with every port is selected, and the rows for all ports are highlighted.
3. Configure the desired settings.
4. Click the Apply button.
   Your settings are saved.

To configure all LAGs:
1. Click the LAG link to display only the LAG interfaces.
2. Select the check box in the heading row.
   The check box associated with every LAG is selected, and the rows for all LAGs are highlighted.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.

**To configure multiple ports and LAGs:**
1. Click the **All** link to display all ports and LAGs.
2. Select the check box associated with each port and LAG to configure.
   The rows for the selected ports and LAGs are highlighted.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.

**To configure all ports and LAGs:**
1. Click the **All** link to display all ports and LAGs.
2. Select the check box in the heading row.
   The check box associated with every port and LAG is selected, and the rows for all ports and LAGs are highlighted.
3. Configure the desired settings.
4. Click the **Apply** button.
   Your settings are saved.

---

### Context-Sensitive Help and Access to the Support WebSite

When you log in to the switch, every page contains a link to the online help (🔗) that contains information to assist in configuring and managing the switch. The online help pages are context sensitive. For example, if the IP Addressing page is open, the help topic for that page displays if you click the link to the online help.

From the local browser interface, you can access the NETGEAR support website at [netgear.com/support](http://netgear.com/support).

**To access the support website from the local browser interface:**
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The Switch Information page displays.

5. Select Help > Support.
   The Support page displays.

6. To access the NETGEAR support site for the switch, click the Apply button.

User Guide

The user manual (the guide you are now reading) is available at the NETGEAR download center at downloadcenter.netgear.com.

To access the user manual online from the local browser interface:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The Switch Information page displays.

5. Select Help > Online Help > User Guide.
   The User Guide page displays.

6. To access the NETGEAR download center, click the Apply button.

7. Enter the model number of the switch.

8. Locate the user manual on the product support web page.
Register Your Product

To qualify for product updates and product warranty, we encourage you to register your product. The first time you log in to the switch, you are given the option of registering with NETGEAR. Registration confirms that your email alerts work, lowers technical support resolution time, and ensures that your shipping address accuracy. We would also like to incorporate your feedback into future product development. We never sell or rent your email address and you can opt out of communications at any time.

To register with NETGEAR when you are prompted, click the REGISTER NOW button. Or at any time you can visit the NETGEAR website for registration at https://my.netgear.com/registration/login.aspx.

Safety Instructions and Warnings

Use the following safety guidelines to ensure your own personal safety and to help protect your system from potential damage.

To reduce the risk of bodily injury, electrical shock, fire, and damage to the equipment, observe the following precautions:

- This product is designed for indoor use only in a temperature-controlled (0–50°C or 32–122°F) and humidity-controlled (90 percent maximum relative humidity, noncondensing) environment.

  Any device that is located outdoors and connected to this product must be properly grounded and surge protected.

  To the extent permissible by applicable law, failure to follow these guidelines can result in damage to your NETGEAR product, which might not be covered by NETGEAR’s warranty.

- Observe and follow service markings:
  - Do not service any product except as explained in your system documentation.
  - Opening or removing covers that are marked with the triangular symbol with a lightning bolt can expose you to electrical shock. We recommend that only a trained technician services components inside these compartments.

- If any of the following conditions occur, unplug the product from the electrical outlet and replace the part or contact your trained service provider:
  - The power cable, extension cable, or plug is damaged.
  - An object fell into the product.
  - The product was exposed to water.
  - The product was dropped or damaged.
  - The product does not operate correctly when you follow the operating instructions.
• Keep your system away from radiators and heat sources. Also, do not block cooling vents.
• Do not spill food or liquids on your system components, and never operate the product in a wet environment. If the system gets wet, see the appropriate section in your troubleshooting guide, or contact your trained service provider.
• Do not push any objects into the openings of your system. Doing so can cause fire or electric shock by shorting out interior components.
• Use the product only with approved equipment.
• Allow the product to cool before removing covers or touching internal components.
• Operate the product only from the type of external power source indicated on the electrical ratings label. If you are not sure of the type of power source required, consult your service provider or local power company.
• To avoid damaging your system, be sure that the voltage selection switch (if provided) on the power supply is set to match the power at your location:
  - 115V, 60 Hz in most of North and South America and some Far Eastern countries such as South Korea and Taiwan
  - 100V, 50 Hz in eastern Japan and 100V, 60 Hz in western Japan
  - 230V, 50 Hz in most of Europe, the Middle East, and the Far East
• Be sure that attached devices are electrically rated to operate with the power available in your location.
• Use only approved power cables. If you were not provided with a power cable for your system or for any AC-powered option intended for your system, purchase a power cable approved for your country.

  The power cable must be rated for the product and for the voltage and current marked on the product electrical ratings label. The voltage and current rating of the cable must be greater than the ratings marked on the product.
• To help prevent electric shock, plug the system and peripheral power cables into properly grounded electrical outlets.
• The peripheral power cables are equipped with three-prong plugs to help ensure proper grounding. Do not use adapter plugs or remove the grounding prong from a cable. If you must use an extension cable, use a three-wire cable with properly grounded plugs.
• Observe extension cable and power strip ratings. Make sure that the total ampere rating of all products plugged into the extension cable or power strip does not exceed 80 percent of the ampere ratings limit for the extension cable or power strip.
• To help protect your system from sudden, transient increases and decreases in electrical power, use a surge suppressor, line conditioner, or uninterruptible power supply (UPS).
• Position system cables and power cables carefully. Route cables so that they cannot be stepped on or tripped over. Be sure that nothing rests on any cables.
• Do not modify power cables or plugs. Consult a licensed electrician or your power company for site modifications.
• Always follow your local and national wiring rules.
This chapter contains the following sections:

- View and Configure the Switch Management Settings
- Use the Device View
- Configure PoE
- Configure SNMP
- Configure LLDP
- Configure DHCP Snooping
- Set Up PoE Timer Schedules
View and Configure the Switch Management Settings

This section describes how you can display the switch status and specify some basic switch information, such as the IP address of the local browser interface, the system clock settings, and the DNS information.

This section contains the following subsections:

- View or Define System Information and View Software Information on page 33
- Configure the Switch IP Settings on page 35
- Configure the IPv6 Network Interface on page 37
- View the IPv6 Network Neighbor on page 38
- Configure the Time Settings on page 39
- Configure Denial of Service Settings on page 54
- Configure DNS Settings on page 56
- Configure Green Ethernet Settings on page 60

View or Define System Information and View Software Information

When you log in, the System Information page displays. You can view and configure general device information, including software information.

To view or define system information and view software information:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch's password in the Password field.
   The default password is password.
   The Switch Information page displays.
5. **Define the following fields:**
   - **System Name.** Enter the name to identify this switch. You can use up to 255 alphanumeric characters. The default is blank.
   - **System Location.** Enter the location of this switch. You can use up to 255 alphanumeric characters. The default is blank.
   - **System Contact.** Enter the contact person for this switch. You can use up to 255 alphanumeric characters. The default is blank.

6. **Click the Apply button.**
   
   Your settings are saved.

The following table describes the status information that the System Information page displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Name</td>
<td>The product name of this switch.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number of the switch.</td>
</tr>
<tr>
<td>System Object OID</td>
<td>The base object ID for the switch's enterprise MIB.</td>
</tr>
<tr>
<td>Date &amp; Time</td>
<td>The current date and time.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>The time in days, hours, and minutes since the last switch reboot.</td>
</tr>
<tr>
<td>Base Mac Address</td>
<td>Universally assigned hardware address of the switch.</td>
</tr>
</tbody>
</table>

7. **Scroll down to the Versions section.**
To refresh the page, click the **Update** button.

The following table describes the nonconfigurable information displayed in the Versions section of the System Information page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model Name</td>
<td>The model name of the switch.</td>
</tr>
<tr>
<td>Boot Version</td>
<td>The version of the bootloader software of the switch.</td>
</tr>
<tr>
<td>Software Version</td>
<td>The version number of the code currently running on the switch.</td>
</tr>
</tbody>
</table>

Configure the Switch IP Settings

You can configure network information for the local browser interface, which is the logical interface used for in-band connectivity with the switch through any of the switch’s front-panel ports. The configuration parameters associated with the switch’s network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

**To configure the network information for the local browser interface:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. **Select System > Management > IP Configuration.**
   
   The IP Configuration page displays.

6. Select the appropriate radio button to specify how to configure the network information for the switch local browser interface:
   
   • **Dynamic IP Address (DHCP).** Specifies that the switch must obtain the IP address through a DHCP server.
• **Dynamic IP Address (BOOTP)**. Specifies that the switch must obtain the IP address through a BootP server.

• **Static IP Address**. Specifies that the IP address, subnet mask, and default gateway must be manually configured. Enter this information in the fields below this radio button.

7. If you selected the **Static IP Address** radio button, configure the following network information:

   • **IP Address**. The IP address of the network interface. The default is 192.168.0.239. Each part of the IP address must start with a number other than zero. For example, IP addresses 001.100.192.6 and 192.001.10.3 are not valid.

   • **Subnet Mask**. The IP subnet mask for the interface. The default is 255.255.255.0.

   • **Default Gateway**. The default gateway for the IP interface. The default is 192.168.0.254.

8. Specify the VLAN ID for the management VLAN.

   The management VLAN is used to establish an IP connection to the switch from a workstation that is connected to a port in the same VLAN. If not specified, the active management VLAN ID is 1 (default), which allows an IP connection to be established through any port.

   When the management VLAN is set to a different value, an IP connection can be made only through a port that is part of the management VLAN. Also, the port VLAN ID (PVID) of the port to be connected in that management VLAN must be the same as the management VLAN ID.

   **Note:** Make sure that the VLAN that must be the management VLAN exists. Also make sure that the PVID of at least one port in the VLAN is the same as the management VLAN ID. For information about creating VLANs and configuring the PVID for a port, see Configure VLANs on page 103.

   The following requirements apply to the management VLAN:

   • Only one management VLAN can be active at a time.

   • When a new management VLAN is configured, connectivity through the existing management VLAN is lost.

   • The management station must be reconnected to the port in the new management VLAN.

9. Click the **Apply** button.

   Your settings are saved.
Configure the IPv6 Network Interface

To access the switch over an IPv6 network, you must initially configure the switch with IPv6 information (IPv6 prefix, prefix length, and default gateway). IPv6 can be configured using any of the following options:

You can configure the IPv6 network interface, which is the logical interface used for in-band connectivity with the switch through all of the switch’s front-panel ports. The configuration parameters associated with the switch’s network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

To access the switch over an IPv6 network, you must initially configure the switch with IPv6 information (IPv6 prefix, prefix length, and default gateway). You can configure IPv6 using any of the following options:

- IPv6 auto-configuration
- DHCPv6

When in-band connectivity is established, IPv6 information can be changed using SNMP-based management or web-based management.

To configure the network information for an IPv6 network:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Management > IPv6 Network Configuration.
   The IPv6 Network Global Configuration page displays.

6. Next to Admin Mode, ensure that the Enable radio button is selected.

7. Determine how the switch acquires an IPv6 address:
   - IPv6 Address Auto Configuration Mode. Select the Enable radio button to enable the network interface to acquire an IPv6 address through IPv6 Neighbor Discovery Protocol (NDP) and through the use of router advertisement messages. If you select the Disable radio button (which is the default selection), the network interface does not use the native IPv6 address auto-configuration features to acquire an IPv6.
address. Auto-configuration functions only if DHCPv6 is not enabled on the management interface.

- **DHCPv6.** Next to Current Network Configuration Protocol, select the DHCPv6 radio button to enable the DHCPv6 client on the management interface. The switch attempts to acquire network information from a DHCPv6 server. If you select the None radio button (which is the default selection), the DHCPv6 client on the network interface is disabled. If DHCPv6 is enabled, the DHCPv6 Client DUID field displays the client identifier used by the DHCPv6 client (if enabled) when sending messages to the DHCPv6 server.

8. In the **IPv6 Gateway** field, specify the default gateway for the IPv6 network interface.

   The gateway address is in IPv6 global or link-local address format.

9. To configure one or more static IPv6 addresses for the local browser interface, do the following:

   a. In the **IPv6 Address/Prefix Length** field, specify the static IPv6 prefix and prefix to the IPv6 network interface.

      The address is in the global address format.

   b. In the **EUI64** menu, select **True** to enable the Extended Universal Identifier (EUI) flag for IPv6 address, or select **False** to omit the EUI flag.

   c. Click the **Add** button.

10. Click the **Apply** button.

    Your settings are saved.

### View the IPv6 Network Neighbor

You can view information about the IPv6 neighbors that the switch discovered through the network interface by using the Neighbor Discovery Protocol (NDP).

**To view the IPv6 Network Neighbor Table:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.
5. Select **System > Management > IPv6 Network Neighbor**.

![IPv6 Network Interface Neighbor Table](image)

The following table describes the information the IPv6 Network Neighbor page displays about each IPv6 neighbor that the switch discovered.

**Table 4. IPv6 network interface neighbor table information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 address</td>
<td>The IPv6 address of a neighbor switch visible to the network interface.</td>
</tr>
<tr>
<td>MAC address</td>
<td>The MAC address of a neighbor switch.</td>
</tr>
<tr>
<td>IsRtr</td>
<td>• <strong>true</strong> (1). The neighbor machine is a router.</td>
</tr>
<tr>
<td></td>
<td>• <strong>false</strong> (2). The neighbor machine is not a router.</td>
</tr>
<tr>
<td>Neighbor State</td>
<td>The state of the neighboring switch:</td>
</tr>
<tr>
<td></td>
<td>• <strong>reachable</strong> (1). The neighbor is reachable by this switch.</td>
</tr>
<tr>
<td></td>
<td>• <strong>stale</strong> (2). Information about the neighbor is scheduled for deletion.</td>
</tr>
<tr>
<td></td>
<td>• <strong>delay</strong> (3). No information was received from the neighbor during the delay period.</td>
</tr>
<tr>
<td></td>
<td>• <strong>probe</strong> (4). The switch is attempting to probe for this neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>unknown</strong> (5). Unknown status.</td>
</tr>
<tr>
<td>Last Updated</td>
<td>The last sysUpTime that this neighbor was updated.</td>
</tr>
</tbody>
</table>

**Configure the Time Settings**

The switch supports the Simple Network Time Protocol (SNTP). As its name suggests, it is a less complicated version of Network Time Protocol, which is a system for synchronizing the clocks of networked computer systems, primarily when data transfer is handled through the Internet. You can also set the system time manually.

**Configure the Time Setting Manually**

You can view and adjust the date and time settings.

**To manually configure the time setting:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Management > Time > Time Configuration.

![Time Configuration](Image)

6. Select the Clock Source Local radio button.

7. In the Date field, specify the current date in months, days, and years (MM/DD/YYYY).

8. In the Time field, specify the current time in hours, minutes, and seconds (HH:MM:SS).

   **Note:** If you select the Clock Source Local radio button and enter information in the Date and Time fields, over a period of time, the date and time might become inaccurate. However, if you use SNTP, the date and time remain accurate (see Configure the Time Settings With SNTP on page 40 and Configure the Global SNTP Settings on page 42).

   **Note:** If you do not enter a date and time, the switch calculates the date and time using the CPU’s clock cycle.

9. Click the Apply button.
   Your settings are saved.

Configure the Time Settings With SNTP

**To configure the time by using SNTP:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **System > Management > Time > Time Configuration**.
   The Time Configuration page displays.

6. Next to **Clock Source**, select the **SNTP** radio button.
   The page refreshes and displays the SNTP Global Configuration section and the SNTP Global Status section.
   The default is SNTP. The local clock can be set to SNTP only if the following two conditions are met:
   - The SNTP server is configured.
   - The SNTP last attempt status is successful.

7. Next to **Client Mode**, select the mode of operation of the SNTP client:
   - **Disable**. SNTP is not operational. No SNTP requests are sent from the client nor are any incoming SNTP messages processed.
   - **Unicast**. SNTP operates in a point-to-point fashion. A unicast client sends a request to a designated server at its unicast address and expects a reply from which it can determine the time and, optionally, the round-trip delay and local clock offset relative to the server.
   - **Broadcast**. SNTP operates in the same manner as multicast mode but uses a local broadcast address instead of a multicast address. The broadcast address provides a single-subnet scope while a multicast address provides an Internet-wide scope.
   The default is Disable.

8. If the SNTP client mode is **Unicast**, you can add the IP address or DNS name of one or more SNTP servers for the switch to poll.
   For more information, see [Configure an SNTP Server](#) on page 46.

9. In the **Port** field, specify the local UDP port that the SNTP client receives server packets on.
   The allowed range is 1025 to 65535 and 123. The default is 123. When the default is configured, the actual client port value used in SNTP packets is assigned by the OS.

10. In the **Unicast Poll Interval** field, specify the number of seconds between unicast poll requests expressed as a power of 2.
    The allowed range is 6 to 10. The default is 6.

11. In the **Broadcast Poll Interval** field, specify the number of seconds between broadcast poll requests expressed as a power of 2.
    Broadcasts received prior to the expiry of this interval are discarded. The allowed range is 6 to 10. The default is 6.

12. In the **Unicast Poll Timeout** field, specify the number of seconds to wait for an SNTP response to a unicast poll request.
    The allowed range is 1 to 30. The default is 5.
13. In the **Unicast Poll Retry** field, specify the number of times to retry a unicast poll request to an SNTP server after the first time-out before the switch attempts to use the next configured server.

   The allowed range is 0 to 10. The default is 1.

14. In the **Time Zone Name** field, specify a time zone.

   You can also specify the number of hours and number of minutes that the time zone is different from the Coordinated Universal Time (UTC). The time zone can affect the display of the current system time. The default is UTC.

   **Note:** When using SNTP/NTP time servers to update the switch’s clock, the time data received from the server is based on the UTC, which is the same as Greenwich Mean Time (GMT). This might not be the time zone in which the switch is located.

15. In the **Offset Hours** field, specify the number of hours that the time zone is different from UTC.

   The allowed range is –12 to 13. The default is 0.

16. In the **Offset Minutes** field, specify the number of minutes that the time zone is different from UTC.

   The allowed range is 0 to 59. The default is 0.

17. Click the **Apply** button.

   Your settings are saved.

**Configure the Global SNTP Settings**

**To configure the global SNTP settings:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **System > Management > Time > Time Configuration > SNTP Global Configuration**.
When you select the **SNTP** option as the clock source, the SNTP Global Configuration section is displayed below the Time Configuration section of the page.

6. Select a **Client mode** radio button to specify the mode of operation of the SNTP client:
   - **Disable**. SNTP is not operational. No SNTP requests are sent from the client and no received SNTP messages are processed.
   - **Unicast**. SNTP operates in a point-to-point fashion. A unicast client sends a request to a designated server at its unicast address and expects a reply from which it can determine the time and, optionally, the round-trip delay and local clock offset relative to the server.
   - **Broadcast**. SNTP operates in the same manner as multicast mode but uses a local broadcast address instead of a multicast address. The broadcast address provides a single-subnet scope while a multicast address provides an Internet-wide scope.

   The default is Unicast.

7. In the **Port** field, specify the local UDP port that the SNTP client receives server packets on.

   The allowed range is 1025 to 65535 and the value 123. The default is 123. When the default is configured, the actual client port value used in SNTP packets is assigned by the operating system.

8. In the **Unicast Poll Interval** field, specify the number of seconds between unicast poll requests expressed as a power of 2.

   The allowed range is 6 to 10. The default is 6.

9. In the **Broadcast Poll Interval** field, specify the number of seconds between broadcast poll requests expressed as a power of 2.

   Broadcasts received prior to the expiry of this interval are discarded. The allowed range is 6 to 10. The default is 6.
10. In the **Unicast Poll Timeout** field, specify the number of seconds to wait for an SNTP response to a unicast poll request.
   The allowed range is 1 to 30. The default is 5.

11. In the **Unicast Poll Retry** field, specify the number of times to retry a unicast poll request to an SNTP server after the first time-out before the switch attempts to use the next configured server.
   The allowed range is 0 to 10. The default is 1.

12. In the **Time Zone Name** field, specify a time zone.
   You can also specify the number of hours and number of minutes that the time zone is different from the Coordinated Universal Time (UTC). The time zone can affect the display of the current system time. The default is UTC.

   **Note:** When using SNTP/NTP time servers to update the switch’s clock, the time data received from the server is based on the UTC, which is the same as Greenwich Mean Time (GMT). This might not be the time zone in which the switch is located.

13. In the **Offset Hours** field, specify the number of hours that the time zone is different from UTC.
   The allowed range is –12 to 13. The default is 0.

14. In the **Offset Minutes** field, specify the number of minutes that the time zone is different from UTC.
   The allowed range is 0 to 59. The default is 0.

15. Click the **Apply** button.
   Your settings are saved.

16. To refresh the page, click the **Update** button.

**View SNTP Global Status**

When you select the **SNTP** option as the clock source, the SNTP global status is displayed below the SNTP Global Configuration section of the page. The SNTP Global Status table displays information about the system’s SNTP client.

**To view SNTP global status:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).
The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.

   The System Information page displays.

5. **Select System > Management > Time > Time Configuration > SNTP Global Status.**
   When you select the SNTP option as the clock source, the SNTP Global Status is displayed below the SNTP Global Configuration section.

6. Click the **Update** button to update the page with the latest information about the switch.

   The following table displays the nonconfigurable information on the page.

   **Table 5. SNTP Global Status information**

<table>
<thead>
<tr>

</table>

Configure an SNTP Server

SNTP assures accurate network device clock time synchronization up to the millisecond. Time synchronization is performed by a network SNTP server. The switch operates only as an SNTP client and cannot provide time services to other systems.

Time sources are established by strata. Strata define the accuracy of the reference clock. The higher the stratum (where zero is the highest), the more accurate the clock. The device receives time from Stratum 1 and above since it is itself a Stratum 2 device.
The following is an example of strata:

- **Stratum 0.** A real-time clock is used as the time source, for example, a GPS system.
- **Stratum 1.** A server that is directly linked to a Stratum 0 time source is used. Stratum 1 time servers provide primary network time standards.
- **Stratum 2.** The time source is distanced from the Stratum 1 server over a network path. For example, a Stratum 2 server receives the time over a network link, through NTP, from a Stratum 1 server.

Information received from SNTP servers is evaluated based on the time level and server type.

SNTP time definitions are assessed and determined by the following time levels:

- **T1.** Time that the original request was sent by the client.
- **T2.** Time that the original request was received by the server.
- **T3.** Time that the server sent a reply.
- **T4.** Time that the client received the server's reply.

The device can poll unicast server types for the server time.

Polling for unicast information is used for polling a server for which the IP address is known. SNTP servers that were configured on the device are the only ones that are polled for synchronization information. T1 through T4 are used to determine server time. This is the preferred method for synchronizing device time because it is the most secure method. If this method is selected, SNTP information is accepted only from SNTP servers defined on the device using the SNTP Server Configuration page.

The device retrieves synchronization information, either by actively requesting information or at every poll interval.

You can view and modify information for adding and modifying Simple Network Time Protocol SNTP servers.

Add an SNTP Server

**To add an SNTP server:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
The System Information page displays.

5. Select **System > Management > Time > SNTP Server Configuration**.

![SNTP Server Configuration](image)

6. From the **Server Type** menu, select the type of SNTP address to enter in the address field. The address can be either an IP address (IPv4 or IPv6) or a host name (DNS). The default is IPv4.

7. In the **Address** field, specify the IP address or the host name of the SNTP server.

   This is a text string of up to 64 characters, containing the encoded unicast IP address or host name of an SNTP server. Unicast SNTP requests are sent to this address. If this address is a DNS host name, then that host name is resolved into an IP address each time an SNTP request is sent to it.

8. If the UDP port on the SNTP server to which SNTP requests are sent is not the standard port (123), specify the port number in the **Port** field.

   The valid range is 1 to 65535. The default is 123.

9. In the **Priority** field, specify the priority order which to query the servers.

   The SNTP client on the device continues sending SNTP requests to different servers until a successful response is received, or all servers are exhausted. The priority indicates the order in which to query the servers. The request is sent to an SNTP server with a priority value of 1 first, then to a server with a priority value of 2, and so on. If any servers are assigned the same priority, the SNTP client contacts the servers in the order that they appear in the table. The valid range is 1 to 3. The default is 1.

10. In the **Version** field, specify the NTP version running on the server.

    The range is 1 to 4. The default is 4.

11. Click the **Add** button.

    The SNTP server entry is added.

12. Repeat the previous steps to add additional SNTP servers.

    You can configure up to three SNTP servers.
The SNTP Server Status table displays status information about the SNTP servers configured on your switch. The following table describes the fields in the SNTP Server Status table.

Table 6. SNTP Server Status information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>All the existing server addresses. If no server configuration exists, a message stating that no SNTP server exists displays on the page.</td>
</tr>
<tr>
<td>Last Update Time</td>
<td>The local date and time (UTC) that the response from this server was used to update the system clock.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>The local date and time (UTC) that this SNTP server was last queried.</td>
</tr>
</tbody>
</table>
| Last Attempt Status | The status of the last SNTP request or unsolicited message for both unicast and broadcast modes. If no message was received from a server, a status of Other is displayed. These values are appropriate for all operational modes:  
  - **Other**: The status of the last request is unknown, or no SNTP responses were received.  
  - **Success**: The SNTP operation was successful and the system time was updated.  
  - **Request Timed Out**: After an SNTP request was sent to an SNTP server, the response timer expired before a response from the server was received.  
  - **Bad Date Encoded**: The time provided by the SNTP server is not valid.  
  - **Version Not Supported**: The SNTP version supported by the server is not compatible with the version supported by the client.  
  - **Server Unsynchronized**: The SNTP server is not synchronized with its peers. This is indicated by the leap indicator field on the SNTP message.  
  - **Server Kiss Of Death**: The SNTP server indicated that no further queries were to be sent to this server. This is indicated by a stratum field equal to 0 in a message received from a server. |
| Requests          | The number of SNTP requests made to this server since last agent reboot.    |
| Failed Requests   | The number of failed SNTP requests made to this server since the last reboot.|

Change the Settings for an Existing SNTP Server

**To change the settings for an existing SNTP server:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
The default password is `password`.
The System Information page displays.

5. Select **System > Management > Time > SNTP Server Configuration**.
The SNTP Server Configuration page displays.

6. Select the check box next to the configured server.
7. Specify new values in the available fields.
8. Click the **Apply** button.
   Your settings are saved.

Remove an SNTP Server

**To remove an SNTP server:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see *Change the Default IP Address of the Switch* on page 11.
   The login window opens.

4. Enter the switch's password in the **Password** field.
   The default password is `password`.
   The System Information page displays.

5. Select **System > Management > Time > SNTP Server Configuration**.
The SNTP Server Configuration page displays.

6. Select the check box next to the configured server to remove.
7. Click the **Delete** button.
   The entry is removed, and the device is updated.

Configure Daylight Saving Time Settings

You can configure settings for summer time, which is also known as daylight saving time. Used in some countries around the world, summer time is the practice of temporarily advancing clocks during the summer months. Typically clocks are adjusted forward one or more hours near the start of spring and are adjusted backward in autumn.

**To configure the daylight saving time settings:**

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > Management > Time > Daylight Saving Configuration.

6. Select a Daylight Saving (DST) radio button:
   • **Disable.** Disable daylight saving time.
   • **Recurring.** Daylight saving time occurs at the same time every year. The start and end times and dates for the time shift must be manually configured.
   • **Recurring EU.** The system clock uses the standard recurring summer time settings used in countries in the European Union. When this option is selected, the rest of the applicable fields on the page are automatically populated and cannot be edited.
   • **Recurring USA.** The system clock uses the standard recurring daylight saving time settings used in the United States. When this option is selected, the rest of the applicable fields on the page are automatically populated and cannot be edited.
   • **Non Recurring.** Daylight saving time settings are in effect only between the start date and end date of the specified year. When this option is selected, the summer time settings do not repeat on an annual basis.
7. Click the Apply button.
   Your settings are saved.
The fields that are described in the following table are visible on the page only if the DayLight Saving (DST) Recurring, Recurring EU, or Recurring USA radio button is selected.

Table 7. Daylight saving setting is Recurring, Recurring EU, or Recurring USA

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begins At</td>
<td>These fields are used to configure the start values of the date and time.</td>

|           | • **Day**. Configure the end day.                                           |
|           | • **Month**. Configure the end month.                                       |
|           | • **Hours**. Configure the end hours.                                       |
|           | • **Minutes**. Configure the end minutes.                                   |

| Offset    | Specify the number of minutes to shift the summer time from the standard time. The valid range is 1–1440 minutes. |

| Zone      | Specify the acronym associated with the time zone when summer time is in effect. This field is not validated against an official list of time zone acronyms. |
View the DayLight Saving Time Status

The Daylight Saving (DST) Status section shows information about the summer time settings and whether the time shift for summer time is currently in effect.

**To view the daylight saving time status:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select System > Management > Time > DayLight Saving Configuration.

6. To refresh the page, click the **Update** button.
The following table displays the nonconfigurable information on the page.

### Configure Denial of Service Settings

You can configure Denial of Service (DoS), allowing the switch to classify and block specific types of DoS attacks.

### Configure Auto-DoS

The Auto-DoS Configuration page lets you automatically enable all the DoS features available on the switch, except for the L4 Port attack. For information about the types of DoS attacks the switch can monitor and block, see Configure Denial of Service on page 55.

### To enable the Auto-DoS feature:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch’s password in the **Password** field.
The default password is **password**.

The System Information page displays.

5. Select **System > Management > Denial of Service > Auto-DoS Configuration**.

The Auto-DoS Configuration page displays.

6. Next to Auto-DoS Mode, select the **Enable** radio button.

When an attack is detected, a warning message is logged to the buffered log and is sent to the syslog server. At the same time, the port is shut down and can be enabled only manually by the admin user.

7. Click the **Apply** button.

Your settings are saved.

Configure Denial of Service

You can select which types of DoS attacks the switch monitors and blocks.

**To configure individual DoS settings:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see *Change the Default IP Address of the Switch* on page 11.

   The login window opens.

4. Enter the switch's password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **System > Management > Denial of Service > Denial of Service Configuration**.

6. Select the types of DoS attacks for the switch to monitor and block and configure any associated values:
Configure DNS Settings

You can configure information about DNS servers that the network uses and how the switch operates as a DNS client.

Configure Global DNS Settings

You can configure global DNS settings and DNS server information.

To configure the global DNS settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Management > DNS > DNS Configuration.
6. Select the **Disable** or **Enable** radio button to specify whether to disable or enable the administrative status of the DNS client.
   - **Enable**: Allow the switch to send DNS queries to a DNS server to resolve a DNS domain name. The DNS is enabled by default.
   - **Disable**: Prevent the switch from sending DNS queries.

7. In the **DNS Default Name** field, enter the default DNS domain name to include in DNS queries.
   When the system is performing a lookup on an unqualified host name, this field provides the domain name (for example, if default domain name is netgear.com and the user enters test, then test is changed to test.netgear.com to resolve the name). The name must not be longer than 255 characters.

8. In the **DNS Server** field, specify the IPv4 address to which the switch sends DNS queries.

9. Click the **Add** button.
   The server is added to the list. You can specify up to eight DNS servers. The Preference field displays the server preference order. The preference is set in the order in which preferences were entered.

10. To remove a DNS server from the list, select its check box and click the **Delete** button.
    If you click the **Delete** button without selecting a DNS server, all the DNS servers are deleted.

11. Click the **Apply** button.
    Your settings are saved.

12. To refresh the page, click the **Update** button.
The following table describes the fields that are shown in the DNS Server Configuration table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>The identification of the DNS Server.</td>
</tr>

</tbody>
</table>

Configure and View Host Name-to-IP Address Information
You can manually map host names to IP addresses and view dynamic host mappings.

Add a Static Entry to the Dynamic Host Mapping Table

To add a static entry to the local dynamic host mapping table:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Management > DNS > Host Configuration.

6. In the Host Name (1 to 255 characters) field, specify the static host name to add.
   Its length cannot exceed 255 characters and it is a required field.

7. In the IPv4/IPv6 Address field, enter the IP address to associate with the host name.

8. Click the Add button.
Remove an Entry From the Dynamic Host Mapping Table

To remove an entry from the dynamic host mapping table:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Management > DNS > Host Configuration.
   The DNS Host Configuration page displays.

6. Select the check box next to the entry to remove.

7. Click the Delete button.

Change the Host Name or IP Address in an Entry of the Dynamic Host Mapping Table and View All Entries

To change the host name or IP address in an entry of the dynamic host mapping table and view all entries:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > Management > DNS > Host Configuration.  
The DNS Host Configuration page display.

6. Select the check box next to the entry to update.

7. Enter the new information in the appropriate field.

8. Click the Apply button.
   Your settings are saved.

9. To clear all the dynamic host name entries from the list, click the Clear button.

The Dynamic Host Mapping table shows host name-to-IP address entries that the switch learned. The following table describes the dynamic host fields.

Table 11. Dynamic Host Mapping information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>Lists the host name that you assign to the specified IP address.</td>
</tr>
<tr>
<td>Total</td>
<td>Time since the dynamic entry was first added to the table.</td>
</tr>
<tr>
<td>Elapsed</td>
<td>Time since the dynamic entry was last updated.</td>
</tr>
<tr>

</tbody>
</table>

Configure Green Ethernet Settings

Using the Green Ethernet feature allows for power consumption savings.

Configure Green Ethernet Global Settings

You can configure Green Ethernet features.

To configure the Green Ethernet settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
The System Information page displays.

5. Select **System > Management > Green Ethernet > Green Ethernet Configuration.**

6. Select the EEE Mode **Disable** or **Enable** radio button.

   Energy Efficient Ethernet (EEE) combines the MAC with a family of physical layers that support operation in a low-power mode. It is defined by IEEE 802.3az Energy Efficient Task Force. Lower power mode enables both the send and receive sides of the link to disable some functionality for power savings when lightly loaded. Transition to low-power mode does not change the link status. Frames in transit are not dropped or corrupted in transition to and from low-power mode. Transition time is transparent to upper layer protocols and applications.

7. Click the **Apply** button.

   Your settings are saved.

Configure Green Ethernet Interface Settings

You can configure per-port Green Ethernet settings.

**To configure the Green Ethernet interface settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **System > Management > Green Ethernet > Green Ethernet Interface Configuration.**
6. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the port, or type the port number (for example, g1) in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.

7. From the EEE mode menu, select Enable or Disable.
   The default is Disable.

8. Click the Apply button.
   Your settings are saved.

Use the Device View

For device view information, see Local Browser Interface Device View on page 21.

Configure PoE

The switch can supply up to 30W PoE+ (IEEE 802.3at) to each port, with a maximum PoE power budget of 190W across all active PoE+ ports.

By default, supplied power is prioritized according to the port order, up to the total power budget of the device. Port 1 receives the highest PoE priority, while port 24 is relegated to the lowest PoE priority.

If the power requirements for attached devices exceed the total power budget of the switch, the PoE power to the device on the highest-numbered active PoE port is disabled to make
sure that the devices connected to the higher-priority, lower-numbered PoE ports are supported first.

Although a device is listed as an 802.3at PoE+-powered or 802.3af PoE-powered device, it might not require the maximum power limit that is specified by its IEEE standard. Many devices require less power, allowing all 24 PoE ports to be active simultaneously when the devices correctly report their PoE class to the switch.

Configure PoE Trap Settings and View PoE Information

You can configure the PoE trap settings and view PoE information such as nominal power, threshold power, and consumed power.

To configure the PoE trap settings and view PoE information:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select System > PoE > Basic > PoE Configuration.

6. From the Traps menu, select Enable or Disable.
   
   The default is Enable. Selecting Disable deactivates the PoE traps.

7. Click the Apply button.
   
   Your settings are saved.
The following table describes the nonconfigurable fields on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware Version</td>
<td>The firmware version of the PoE firmware component.</td>
</tr>
<tr>
<td>Power Status</td>
<td>The power status.</td>
</tr>
<tr>
<td>Nominal Power</td>
<td>The maximum amount of power in watts that the switch can deliver to all ports.</td>
</tr>
<tr>
<td>Threshold Power Watts</td>
<td>If the consumed power is below the threshold power, the switch can power up another port. The consumed power can be between the nominal and threshold power. The threshold power is displayed in watts.</td>
</tr>
<tr>
<td>Consumed Power Watts</td>
<td>The total amount of power in watts that is being delivered to all ports.</td>
</tr>
</tbody>
</table>

Configure the PoE Port Settings

You can configure PoE settings for individual PoE ports.

**To configure the PoE port settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select System > PoE > Advanced > PoE Port Configuration.

6. Select one or more ports by taking one of the following actions:
• To configure a single port, select the check box associated with the port, or type the port number (for example, g1) in the **Go To Interface** field and click the **Go** button.
• To configure multiple ports with the same settings, select the check box associated with each interface.
• To configure all ports with the same settings, select the check box in the heading row.

7. From the **Admin Mode** menu, select the administrative PoE mode of the port:
   • **Enable**. The port’s capacity to deliver power is enabled. This is the default setting.
   • **Disable**. The port’s capacity to deliver power is disabled.

8. From the **Port Priority** menu, select the priority for the port in relation to other ports if the total power that the switch is capable of delivering exceeds the total power budget:
   • **Low**. Low priority. This is the default setting.
   • **Medium**. Medium priority.
   • **High**. High priority.
   • **Critical**. Critical priority.

The port priority determines which ports can still deliver power after the total power delivered by the switch exceeds the total power budget. (In such a situation, the switch might not be able to deliver power to all connected devices.) If the same priority applies to two ports, the lower-numbered port receives higher priority.

9. From the **High Power Mode** menu, select the PoE mode that the port must function in:
   • **802.3af**. The port is powered in and limited to the IEEE 802.3af mode. A PD that requires IEEE 802.3at does not receive power if the port functions in IEEE 802.3af mode.
   • **Legacy**. The port is powered using high-inrush current, which is used by legacy PDs that require more than 15W to power up.
   • **Pre-802.3at**. The port is initially powered in the IEEE 802.3af mode and, before 75 msec pass, is switched to the high-power IEEE 802.3at mode. Select this mode if the PD does not perform Layer 2 classification or if the switch performs 2-event Layer 1 classification.
   • **802.3at**. The port is powered in the IEEE 802.3at mode and is backward compatible with IEEE 802.3af. The 802.3at mode is the default mode. In this mode, if the switch detects that the attached PD requests more power than IEEE 802.3af but is not an IEEE 802.3at Class 4 device, the PD does not receive power from the switch.

10. From the **Detection Type** menu, select how the port detects the attached PD:
    • **pre-ieee**. The port performs legacy detection.
    • **ieee auto**. The port performs a 4-point resistive detection. This is the default setting.
    • **auto**. The port performs a 4-point resistive detection, and if required, continues with legacy detection.

11. From the **Timer Schedule** menu, select a timer schedule or select **None**, which is the default selection.

    For information about setting up and configuring PoE timer schedules, see **Set Up PoE Timer Schedules** on page 90.
12. Click the **Apply** button.

Your settings are saved.

The following table describes the nonconfigurable fields on the page.

**Table 13. PoE Port Configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Power</td>
<td>All ports supports high-power mode.</td>
</tr>
<tr>
<td>Max Power</td>
<td>The maximum power in milliwatts that can be provided by the port.</td>
</tr>
<tr>
<td>Class</td>
<td>The class defines the range of power that a powered device (PD) is drawing from the switch. The class definitions are as follows:</td>
</tr>
<tr>
<td></td>
<td>• 0: 0.44–12.95W</td>
</tr>
<tr>
<td></td>
<td>• 1: 0.44–3.83W</td>
</tr>

<td></td>
<td>• 2: 0.44–6.48W</td>
</tr>
<tr>
<td></td>
<td>• 3: 0.44–12.95W</td>
</tr>
<tr>
<td></td>
<td>• 4: 0.44–25.5W</td>
</tr>
<tr>
<td>Output Voltage</td>
<td>The voltage that is delivered to the PD in volts.</td>
</tr>
<tr>
<td>Output Current</td>
<td>The current that is delivered to the PD in mA.</td>
</tr>
<tr>
<td>Output Power</td>
<td>The power that is delivered to the PD in watts.</td>
</tr>
<tr>
<td>Status</td>
<td>The operational status of the port. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disabled</strong>. No power is delivered.</td>
</tr>
<tr>
<td></td>
<td>• <strong>DeliveringPower</strong>. Power is being drawn by the PD.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fault</strong>. A problem occurred with the power.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Test</strong>. The port is in test mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>otherFault</strong>. The port is idle because of an error condition.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Searching</strong>. The port is not in one of the other states in this list.</td>
</tr>
<tr>
<td>Fault Status</td>
<td>The error description when the PoE port is in a fault state. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• <strong>No Error</strong>. The port is not in any error state and can provide power.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MPS Absent</strong>. The port detected the absence of the main power supply, preventing the port from providing power.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Short</strong>. The port detected a short circuit condition, preventing the port from providing power.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Overload</strong>. The PD that is connected to the port attempts to draw more power than allowed by the port's settings, preventing the port from providing power at all.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Power Denied</strong>. The port was denied power because of a shortage of power or because of an administrative condition. In this condition, the port cannot provide power.</td>
</tr>
</tbody>
</table>
Configure SNMP

You can configure SNMP settings for SNMPv1/v2 and SNMPv3. The switch supports the configuration of SNMP groups and users that can manage traps that the SNMP agent generates.

The switch uses both standard public MIBs for standard functionality and private MIBs that support additional switch functionality. The main object for interface configuration is in the NetgearSmartSwitch-MIB, which is a private MIB. Some interface configurations also involve objects in the public MIB, IF-MIB.

Configure the SNMPv1/v2 Community

Only the communities that you define can access to the switch using the SNMP V1 and SNMP V2 protocols. Only those communities with read/write level access can be used to change the configuration using SNMP.

Add an SNMP Community:

**To add an SNMP community:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **System > SNMP > SNMP V1/V2 > Community Configuration**.

   ![Community Configuration](image)

6. In the **Management Station IP** field, specify the IP address of the management station.
7. In the **Management Station IP Mask** field, specify the subnet mask to associate with the management station IP address.
Together, the management station IP and the management station IP mask denote a range of IP addresses from which SNMP clients can use that community to access this device. If either the management station IP or management station IP mask value is 0.0.0.0, access is allowed from any IP address. Otherwise, every client’s address is ANDed with the mask, as is the management station IP address. If the values are equal, access is allowed. For example, if the management station IP address and management station IP mask parameters are 192.168.1.0/255.255.255.0, any client with an IP address from one 192.168.1.0 through 192.168.1.255 (inclusive) is allowed access. To allow access from only one station, use a management station IP mask value of 255.255.255.255, and use that machine’s IP address for client address.

8. In the **Community String** field, specify a community name.

9. From the **Access Mode** menu, select the access level for this community, which is either **Read/Write** or **Read Only**.

10. From the **Status** menu, select to enable or disable the community.

    If you select **Enable**, the community name must be unique among all valid community names or the set requests are rejected. If you select **Disable**, the community name becomes invalid.

11. Click the **Add** button.

    The selected community is added.

**Modify an Existing SNMP Community**

**To modify an existing SNMP community:**

1. Connect your computer to the same network as the switch.

    You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

    If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch on page 11**.

    The login window opens.

4. Enter the switch’s password in the **Password** field.

    The default password is **password**.

    The System Information page displays.

5. Select **System > SNMP > SNMP V1/V2 > Community Configuration**.

    The Community Configuration page displays.

6. Select the check box next to the community.

7. Update the desired fields.

8. Click the **Apply** button.
Delete an SNMP Community

To delete an SNMP community:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > SNMP > SNMP V1/V2 > Community Configuration.
   The Community Configuration page displays.

6. Select the check box next to the community to remove.

7. Click the Delete button.
   The community is removed.

Configure SNMPv1/v2 Trap Settings

You can configure settings for each SNMPv1 or SNMPv2 management host that must receive notifications about traps generated by the device. The SNMP management host is also known as the SNMP trap receiver.

Add an SNMP Trap Receiver

To add an SNMP trap receiver:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
The login window opens.

4. Enter the switch’s password in the Password field.

The default password is password.

The System Information page displays.

5. Select System > SNMP > SNMP V1/V2 > Trap Configuration.

6. In the Recipients IP field, enter the IPv4 address in the x.x.x.x format to receive SNMP traps from this device.

7. From the Version menu, select the trap version to be used by the SNMP trap receiver.
   • SNMP V1. The switch uses SNMPv1 to send traps to the receiver. The default setting is SNMP V1.
   • SNMP V2. The switch uses SNMPv2 to send traps to the receiver.

8. In the Community String field, specify the name of the SNMP community that includes the SNMP management host and the SNMP agent on the device.

   This name can be up to 16 characters and is case-sensitive.

9. From the Status menu, select Enable to send traps to the receiver or select Disable to prevent the switch from sending traps to the receiver.

10. Click the Add button.

    The receiver configuration is added.

Modify Information About an Existing SNMP Recipient

To modify information about an existing SNMP recipient:

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.
5. Select System > SNMP > SNMP V1/V2 > Trap Configuration. The Trap Configuration page displays.

6. Select the check box next to the recipient.

7. Update the desired fields.

8. Click the Apply button. Your settings are saved.

Delete an SNMP Recipient

To delete an SNMP trap recipient:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field. The default password is password.

   The System Information page displays.

5. Select System > SNMP > SNMP V1/V2 > Trap Configuration. The Trap Configuration page displays.

6. Select the check box next to the recipient to remove.

7. Click the Delete button. The trap recipient is removed.

Configure SNMPv1/v2 Trap Flags

You can enable or disable traps that the switch can send to an SNMP manager. When the condition identified by an active trap is encountered by the switch, a trap message is sent to any enabled SNMP trap receivers, and a message is written to the trap log.

To configure the trap flags:

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > SNMP > SNMP V1/V2 > Trap Flags.

![Diagram of SNMP V1/V2 > Trap Flags]

6. Enable or disable the following system traps:
   • **Authentication.** When enabled, SNMP traps are sent when events involving authentication occur, such as when a user attempts to access the switch local browser interface and fails to provide a valid user name and password. The default is Enable.
   • **Link Up/Down.** When enabled, SNMP traps are sent when the administrative or operational state of a physical or logical link changes. The default is Enable.
   • **Spanning Tree.** When enabled, SNMP traps are sent when various spanning tree events occur. The default is Enable.
7. Click the Apply button.
   Your settings are saved.

View the Supported MIBs

You can view a list of all MIBs that are supported by the switch.

To view the supported MIBs:
1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > SNMP > SNMP V1/V2 > Supported MIBs.

The following table describes the nonconfigurable information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The RFC number if applicable and the name of the MIB.</td>
</tr>
<tr>
<td>Description</td>
<td>The RFC title or MIB description.</td>
</tr>
</tbody>
</table>

### Configure SNMP V3 Users

Any user can connect to the switch using the SNMPv3 protocol, but for authentication and encryption, the switch supports only one user (admin). Therefore, you can create or modify only one profile.

To configure authentication and encryption settings for the SNMPv3 admin profile by using the web interface:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.

   The System Information page displays.

5. Select System > SNMP > SNMPv3 > User Configuration.

   The User Configuration page displays.

   The SNMPv3 Access Mode field is a read-only field that shows the access privileges for the user account. Access for the admin account is always Read/Write. Access for all other accounts is Read Only.

6. To enable authentication, select an Authentication Protocol radio button.

   You can select the MD5 radio button or the SHA radio button. With either of these options, the user login password is used as SNMPv3 authentication password. For information about how to configure the login password, see Change the Password on page 190.

7. To enable encryption:

   a. Next to Encryption Protocol, select the DES radio button to encrypt SNMPv3 packets using the DES encryption protocol.

   b. In the Encryption Key field, enter an encryption code of eight or more alphanumeric characters.

8. Click the Apply button.

   Your settings are saved.

Configure LLDP

The IEEE 802.1AB-defined standard, Link Layer Discovery Protocol (LLDP), allows stations on an 802 LAN to advertise major capabilities and physical descriptions. This information is viewed by a network manager to identify system topology and detect bad configurations on the LAN.

This section contains the following subsections:

- Configure LLDP Global Settings on page 75
- Configure LLDP Port Settings on page 76
- View LLDP-MED Network Policy Information on page 78
- Configure LLDP-MED Port Settings on page 79
- View Local LLDP Information on page 80
LLDP is a one-way protocol without any request/response sequences. Information is advertised by stations implementing the transmit function, and is received and processed by stations implementing the receive function. The transmit and receive functions can be enabled or disabled separately per port. By default, both transmit and receive are enabled on all ports. The application is responsible for starting each transmit and receive state machine appropriately, based on the configured status and operational state of the port.

The Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) is an enhancement to LLDP with the following features:

- Autodiscovery of LAN policies (such as VLAN, Layer 2 priority, and DiffServ settings), enabling plug and play networking.
- Device location discovery for creation of location databases.
- Extended and automated power management of Power over Ethernet endpoints.
- Inventory management, enabling network administrators to track their network devices and determine their characteristics (manufacturer, software and hardware versions, serial/asset number).

Configure LLDP Global Settings

You can specify the global LLDP and LLDP-MED parameters that are applied to the switch.

**To configure global LLDP settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **System > LLDP > Basic > LLDP Configuration.**
6. To configure nondefault values for the following LLDP properties, specify the following options:
   - **TLV Advertised Interval.** The number of seconds between transmissions of LLDP advertisements.
   - **Hold Multiplier.** The transmit interval multiplier value, where transmit hold multiplier × transmit interval = the time to live (TTL) value that the device advertises to neighbors.
   - **Re-initializing Delay.** The number of seconds to wait before attempting to re-initialize LLDP on a port after the LLDP operating mode on the port changes.
   - **Transmit Delay.** The minimum number of seconds to wait between transmissions of remote data change notifications to one or more SNMP trap receivers configured on the switch.

7. To configure a nondefault value for LLDP-MED, enter a value in the **Fast Start Duration** field.

   This value sets the number of LLDP packets sent when the LLDP-MED fast start mechanism is initialized, which occurs when a new endpoint device links with the LLDP-MED network connectivity device.

8. Click the **Apply** button.

   Your settings are saved.

Configure LLDP Port Settings

You can specify per-interface LLDP settings.

To configure the LLDP interface:

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).
The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **System > LLDP > Advanced > LLDP Port Settings**.

6. Select one or more interfaces by taking one of the following actions:
   - To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
   - To configure all interfaces with the same settings, select the check box in the heading row.

7. Use the following menus to configure the LLDP settings for the selected ports:
   - **Admin Status**. Select the status for transmitting and receiving LLDP packets:
     - **Tx Only**. Enable only transmitting LLDP PDUs on the selected ports.
     - **Rx Only**. Enable only receiving LLDP PDUs on the selected ports.
     - **Tx and Rx**. Enable both transmitting and receiving LLDP PDUs on the selected ports.
     - **Disabled**. Do not transmit or receive LLDP PDUs on the selected ports.

   The default is **Tx and Rx**.

   - **Management IP Address**. Choose whether to advertise the management IP address from the interface. The possible field values are as follows:
     - **Stop Advertise**. Do not advertise the management IP address from the interface.
     - **Auto Advertise**. Advertise the current IP address of the device as the management IP address.

   The default is **Auto Advertise**.

   - **Notification**. When notifications are enabled, LLDP interacts with the trap manager to notify subscribers of remote data change statistics. The default is **Disable**.
• **Optional TLV(s).** Enable or disable the transmission of optional type-length value (TLV) information from the interface. The default is Enable. The TLV information includes the system name, system description, system capabilities, and port description.

  For information about how to configure the system name, see View and Configure the Switch Management Settings on page 33. For information about how to configure the port description, see Configure Port Settings on page 96.

8. Click the **Apply** button.
   
   Your settings are saved.

**View LLDP-MED Network Policy Information**

You can display information about the LLPD-MED network policy TLVs transmitted in the LLDP frames on the selected local interface.

**To view LLDP-MED network policy information for an interface:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **System > LLDP > Advanced > LLDP-MED Network Policy**.
   
   The LLDP-MED Network Policy page displays.

6. From the **Interface** menu, select the interface for which you want to view the information.

   **Note:** The menu includes only the interfaces on which LLDP is enabled. If no interfaces are enabled for LLDP, the **Interface** menu does not display.

   The page refreshes and displays the data transmitted in the network policy TLVs for the interface.
The following table describes nonconfigurable information on the page.

**Table 15. LLDP-MED network policy information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</table>

**Configure LLDP-MED Port Settings**

You can enable LLDP-MED mode on an interface and configure its properties.

**To configure LLDP-MED settings for a port:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.
5. Select **System > LLDP > Advanced > LLDP-MED Port Settings**.

The LLDP-MED Port Settings page displays.

6. From the **Port** menu, select the port to configure.

7. Use the following menus to enable or disable the following LLDP-MED settings for the selected port:
   - **LLDP-MED Status**. The administrative status of LLDP-MED on the interface. When LLDP-MED is enabled, the transmit and receive function of LLDP is effectively enabled on the interface.
   - **Notification**. When Notification is enabled, the port sends a topology change notification if a device is connected or removed.
   - **Transmit Optional TLVs**. When Transmit Optional TLVs is enabled, the port transmits the following optional type length values (TLVs) in the LLDP PDU frames:
     - MED Capabilities
     - Network Policy
     - Location Identification
     - Extended Power via MDI: PSE
     - Extended Power via MDI: PD
     - Inventory

8. Click the **Apply** button.

Your settings are saved.

**View Local LLDP Information**

You can view the data that each port advertises through LLDP.

**To view local LLDP information:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch** on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.
5. Select **System > LLDP > Advanced > Local Information.**

The page includes only the interfaces on which LLDP is enabled.

The following table describes the LLDP device information and port summary information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis ID Subtype</td>
<td>The type of information used to identify the switch in the Chassis ID field.</td>
</tr>
<tr>

<tr>
<td>DSCP</td>
<td>The DSCP associated with a particular policy type.</td>
</tr>
</tbody>
</table>
View LLDP Neighbors Information

You can view the data that a specific interface receives from other LLDP-enabled systems.

**To view LLDP information received from a neighbor device:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch's password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **System > LLDP > Advanced > Neighbor Information**.

![LLDP Neighbors Information](image)

If no information was received from a neighbor device, or if the link partner is not LLDP-enabled, no information displays.

The following table describes the information that displays for all LLDP neighbors that were discovered.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSAP Entry</td>
<td>The Media Service Access Point (MSAP) entry number for the remote device.</td>
</tr>
<tr>
<td>Local Port</td>
<td>The interface on the local system that received LLDP information from a remote system.</td>
</tr>
<tr>
<td>Chassis ID Subtype</td>
<td>The type of data displayed in the Chassis ID field on the remote system.</td>
</tr>
</tbody>
</table>
6. To view additional information about the remote device, click the link in the MSAP Entry column.

A pop-up window displays information for the selected port.

The following table describes the information transmitted by the neighbor.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis ID</td>
<td>The remote 802 LAN device’s chassis.</td>
</tr>
<tr>
<td>Port ID Subtype</td>
<td>The type of data displayed in the remote system’s Port ID field.</td>
</tr>
<tr>
<td>Port ID</td>
<td>The physical address of the port on the remote system from which the data was sent.</td>
</tr>
<tr>
<td>System Name</td>
<td>The system name associated with the remote device. If the field is blank, the name might not be configured on the remote system.</td>

<tr>
<td>Software Revision</td>
<td>The software version advertised by the remote device.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number advertised by the remote device.</td>
</tr>
<tr>
<td>Model Name</td>
<td>The model name advertised by the remote device.</td>
</tr>
<tr>
<td>Asset ID</td>
<td>The asset ID advertised by the remote device.</td>
</tr>
</tbody>
</table>

### Location Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Civic</td>
<td>The physical location, such as the street address, that the remote device advertised in the location TLV, for example, 123 45th St. E. The field value length range is 6–160 characters.</td>
</tr>
<tr>
<td>Coordinates</td>
<td>The location map coordinates that the remote device advertised in the location TLV, including latitude, longitude, and altitude.</td>
</tr>
<tr>
<td>ECS ELIN</td>
<td>The Emergency Call Service (ECS) Emergency Location Identification Number (ELIN) that the remote device advertised in the location TLV. The field range is 10–25.</td>
</tr>
<tr>
<td>Unknown</td>
<td>Displays unknown location information for the remote device.</td>
</tr>
</tbody>
</table>
Configure DHCP Snooping

DHCP snooping is a useful feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall and that can cause traffic attacks within your network. The DHCP snooping binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and interface information that corresponds to the local untrusted interfaces of a switch. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall. A trusted interface is an interface that is configured to receive only messages from within the network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also provides way to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

Configure the Global DHCP Snooping Settings
You can view and configure the global settings for DHCP snooping.

To configure the global DHCP snooping settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

The System Information page displays.

5. Select System > Services > DHCP Snooping > Global Configuration.

6. Next to DHCP Snooping Mode, select the Enable radio button.

7. To enable the verification of the sender’s MAC address for DHCP snooping, next to MAC Address Validation, select the Enable radio button.
   When MAC address validation is enabled, the device checks packets that are received on an untrusted interface to verify that the MAC address and the DHCP client hardware address match. If the addresses do not match, the device drops the packet.

8. Click the Apply button.
   Your settings are saved.

Enable DHCP for All Interfaces in a VLAN

To enable DHCP snooping for all interfaces that are members of a VLAN:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
The System Information page displays.

5. Select **System > Services > DHCP Snooping > Global Configuration**.
   The DHCP Snooping Global Configuration page displays.

6. In the **VLAN ID** field, specify the VLAN on which DHCP snooping is enabled.

7. From the **DHCP Snooping Mode** menu, select **Enable**.

8. Click the **Apply** button.
   Your settings are saved.

### Interface Configuration

You can view and configure each port as a trusted or untrusted port. Any DHCP responses received on a trusted port are forwarded. If a port is configured as untrusted, any DHCP (or BootP) responses received on that port are discarded.

**To configure DHCP snooping interface settings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see *Change the Default IP Address of the Switch* on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **System > Services > DHCP Snooping > Interface Configuration**.

6. Select one or more interfaces by taking one of the following actions:
• To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.

• To configure multiple interfaces with the same settings, select the check box associated with each interface.

• To configure all interfaces with the same settings, select the check box in the heading row.

7. From the Trust Mode menu, select the desired trust mode:
   • Disabled. The interface is considered to be untrusted and could potentially be used to launch a network attack. DHCP server messages are checked against the bindings database. On untrusted ports, DHCP snooping enforces the following security rules:
     - DHCP packets from a DHCP server (DHCPOFFER, DHCPACK, DHCPNAK, DHCPRELEASEQUERY) are dropped.
     - DHCPRELEASE and DHCPDECLINE messages are dropped if the MAC address is in the snooping database but the binding’s interface is other than the interface where the message was received.
     - DHCP packets are dropped when the source MAC address does not match the client hardware address if MAC address validation is globally enabled.
   • Enabled. The interface is considered to be trusted and forwards DHCP server messages without validation.

8. Click the Apply button.
   Your settings are saved.

Binding Configuration

You can view, add, and remove static bindings in the DHCP snooping bindings database and view or clear the dynamic bindings in the bindings table.

To configure static DHCP bindings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Services > DHCP Snooping > Binding Configuration.
6. From the **Interface** menu, select the interface on which the DHCP client is authorized.

7. In the **MAC Address** field, specify the MAC address for the binding to be added.
   
   This is the key to the binding database.

8. From the **VLAN ID** menu, select the ID of the VLAN the client is authorized to use.

9. In the **IP Address** field, specify the IP address of the client.

10. Click the **Add** button.

   The DHCP snooping binding entry is added to the database.

The Dynamic Binding Configuration table shows information about the DHCP bindings that were learned on each interface on which DHCP snooping is enabled. The following table describes the dynamic bindings information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface on which the DHCP client message was received.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address associated with the DHCP client that sent the message. This is the key to the binding database.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID of the client interface.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address assigned to the client by the DHCP server.</td>
</tr>
<tr>
<td>Lease Time</td>
<td>The remaining IP address lease time for the client.</td>
</tr>
</tbody>
</table>

**Set Up PoE Timer Schedules**

The switch lets you define multiple timer schedules that you can use for PoE power delivery to attached PDs.

After you create a timer schedule, you can associate it with one or more PoE ports (see **Configure the PoE Port Settings on page 64**). You can use a separate timer schedule for each PoE port.
After you associate a timer schedule with a PoE port, the start date and time force the PoE port to stop delivering power and the stop date and time enable the PoE port to start delivering power.

Create a PoE Timer Schedule

The maximum number of timer schedules that you can add is 25.

**To create a PoE timer schedule:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select System > Timer Schedule > Basic > Timer Global Configuration.

6. Select the Admin Mode Enable radio button.
   By default, the Disable button is selected and PoE timer schedules are disabled.

7. In the Timer Schedule Name field, specify the name for a timer schedule.

8. Click the Add button.
   The timer schedule is added to the Timer Schedule Name table and is assigned an ID.
Specify the Settings for a PoE Timer Schedule

The PoE timer schedule functions as a recurring schedule, which lets you to set up a single schedule that starts at a particular date and that recurs either with a specific end date or indefinitely.

You can specify a daily, weekly, monthly, or yearly recurring schedule.

To specify the settings for a PoE timer schedule:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > Timer Schedule > Advanced > Timer Schedule Configuration.

   ![Timer Schedule Configuration]

6. From the Timer Schedule Name menu, select the name of the timer schedule that you want to configure.
   You can select only names of schedules that you created (see Create a PoE Timer Schedule on page 91).
7. In the Shutdown Time Start field, enter the time of day in the HH:MM format to specify when the timer schedule must start.
8. In the Shutdown Time End field, enter the time of day in the HH:MM format to specify when the timer schedule must stop.
9. Next to the Date Start field, click the calendar icon and use the menus in the pop-up window to enter the date in the DD-Mon-YYYY format to specify when the timer schedule must start.

10. Either select the No End Date radio button or select the End Date radio button, and next to the End Date field, click the calendar icon and use the menus in the pop-up window to enter the date in the DD-Mon-YYYY format to specify when the timer schedule must stop.

11. From the Recurrence Pattern menu, select the pattern:
   - **Daily.** The timer schedule works with daily recurrence. The fields adjust. Select one of the following radio buttons:
     - Every WeekDay. The schedule operates from Monday through Friday.
     - Every Day(s). Enter a number from 0 to 65534 in the field. The schedule is triggered every specified number of days. If the number of days is not specified, or if you enter 0, then the schedule is triggered only once.
   - **Weekly.** The timer schedule works with weekly recurrence. The fields adjust. Specify the following field and select one or more of the following check boxes:
     - Every Week(s). In the field, enter a number from 0 to 65534 to specify that the schedule must be triggered every specified number of weeks. If the number of weeks is not specified, or if you enter 0, then the schedule is triggered only once.
     - Select a single Week Day check box, multiple check boxes, or all check boxes to specify the day or days of the week that the schedule must operate.
   - **Monthly.** The timer schedule works with monthly recurrence. The fields adjust. Select one of the following radio buttons:
     - Upper Day radio button and field. In the Day field, enter a number from 1 to 31 to specify the day of the month when the schedule must be triggered. In the Every Month(s) field, enter a number from 0 to 65534 to specify that the schedule must be triggered every specified number of months. If the number of months is not specified, or if you enter 0, then the schedule is triggered only once.
     - Lower Day radio button and field. Select an option from both the left menu and right menu. In the Every Month(s) field, enter a number from 0 to 65534 to specify that the schedule must be triggered every specified number of months. If the number of months is not specified, or if you enter 0, then the schedule is triggered only once.
   - **Yearly.** The timer schedule works with yearly recurrence. The fields adjust. Select one of the following radio buttons:
     - Day(s). In the Day(s) field, enter a number from 1 to 31 to specify the day of the month when the schedule must be triggered. From the Month menu, select the month in which the schedule must be triggered. The schedule is triggered yearly but only in the selected month.
     - Day(s). Select an option from both the left menu and right menu. From the Month menu, select the month in which the schedule must be triggered. The schedule is triggered yearly but only in the selected month.

12. Click the Apply button.
Delete a PoE Timer Schedule

You can delete a PoE timer schedule that you no longer need. The associated timer schedule configuration is also deleted.

To delete a PoE timer schedule:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select System > Timer Schedule > Advanced > Timer Global Configuration.
   The Timer Schedule Configuration page displays.
6. Select the check box for the timer schedule that you want to delete.
   You can simultaneously delete multiple or all timer schedules.
7. Click the Delete button.
   The timer schedule is deleted.
3

Configure Switching

This chapter contains the following sections:

- Configure Port Settings
- Configure Link Aggregation Groups
- Configure VLANs
- Configure a Voice VLAN
- Configure Auto-VoIP
- Configure Spanning Tree Protocol
- Configure Multicast
- View and Configure the MAC Address Table
- Configure Layer 2 Loop Protection
Configure Port Settings

You can view, configure, and monitor the physical port information for the ports (that is, the physical interfaces) on the switch.

To configure port settings:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.

   The System Information page displays.

5. Select Switching > Ports > Port Configuration.

   The following figure that does no display all columns of the table.

   ![Port Configuration Table]

6. Select the check box to the left of the Port column to specify the interface for which data is to be displayed or configured.

   To select an interface, you can also enter the interface number in the Go To Interface field and click the Go button.

7. In the Description field, enter the description string to be attached to a port.

   The string can be up to 64 characters in length.

8. From the Admin Mode menu, select Enable or Disable.

   This sets the port control administrative mode. You must select Enable in order for the port to participate in the network. The default is Enable.

9. From the Auto-negotiation menu, select Enable or Disable.
This specifies the autonegotiation mode for this port. The default is Enable.

**Note:** After you change the autonegotiation mode, the switch might be inaccessible for a number of seconds while the new settings take effect.

10. In the **Speed** field, specify the speed value for the selected port.

   Possible field values are as follows:
   - **Auto.** All supported speeds. This is the default setting.
   - **10Mbps.** 10 Mbits/second.
   - **100Mbps.** 100 Mbits/second.
   - **1000Mbps.** 1000 Mbits/second.

   The delimiter characters for setting different speed values are a comma (,), a period (.) and a space ( ). For you to set the auto-negotiation speed, the autonegotiation mode must be set to **Enable.** The default is Auto.

   **Note:** After you change the speed value, the switch might be inaccessible for a number of seconds while the new settings take effect.

11. From the **Duplex Mode** menu, select the duplex mode for the selected port.

   Possible values are as follows:
   - **Auto.** Indicates that speed is set by the auto-negotiation process.
   - **Full.** Indicates that the interface supports transmission between the devices in both directions simultaneously.
   - **Half.** Indicates that the interface supports transmission between the devices in only one direction at a time.

   The default is Auto.

   **Note:** After you change the duplex mode, the switch might be inaccessible for a number of seconds while the new settings take effect.

12. From the **Auto Power Down Mode** menu, select whether the auto power down mode of the Green Ethernet feature is enabled or disabled.

   The default is disabled.

13. Use the **Link Trap** menu to select whether to send a trap when link status changes.

   The default is enabled for normal interfaces and disabled for LAG interfaces.

14. Use the **Frame Size** field to specify the maximum Ethernet frame size the interface supports or is configured to use, including Ethernet header, CRC, and payload.

   The range is 1518 to 9216. The default maximum frame size is 1518.

15. From the **Flow Control** menu, select to enable or disable IEEE 802.3 flow control.
The default is disabled. The switch does not send pause frames if the port buffers become full. Flow control helps to prevent data loss when the port cannot keep up with the number of frames being switched. When flow control is enabled, the switch can send a pause frame to stop traffic on a port if the amount of memory used by the packets on the port exceeds a preconfigured threshold and responds to pause requests from partner devices. The paused port does not forward packets for the period of time specified in the pause frame. When the pause frame time elapses, or the utilization returns to a specified low threshold, the switch enables the port to again transmit frames. For LAG interfaces, flow control mode is displayed as a blank field because flow control is not applicable.

16. Click the **Apply** button.
   Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 17. Port Configuration information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Type</td>
<td>For normal ports this field is blank. Otherwise, the possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Mirrored. The port is a mirrored port on which all the traffic is copied to the probe port.</td>
</tr>
<tr>
<td></td>
<td>• Probe. Use this port to monitor a mirrored port.</td>
</tr>
<tr>
<td></td>
<td>• Trunk Member. The port is a member of a link aggregation trunk. Look at the LAG pages for more information.</td>
</tr>
<tr>
<td>Physical Status</td>
<td>Indicates the port speed and duplex mode.</td>
</tr>
<tr>
<td>Link Status</td>
<td>Indicates whether the link is up or down.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the physical address of the specified interface.</td>
</tr>
<tr>
<td>PortList Bit Offset</td>
<td>Displays the bit offset value that corresponds to the port when the MIB object type PortList is used to manage in SNMP.</td>
</tr>
<tr>
<td>ifIndex</td>
<td>The ifIndex of the interface table entry associated with this port.</td>
</tr>
</tbody>
</table>

**Configure Link Aggregation Groups**

Link aggregation groups (LAGs), which are also known as port channels, allow you to combine multiple full-duplex Ethernet links into a single logical link. Network devices treat the aggregation as if it were a single link, which increases fault tolerance and provides load sharing. You assign the LAG VLAN membership after you create a LAG. The LAG by default becomes a member of the default management VLAN (that is, VLAN 1).

A LAG interface can be either static or dynamic, but not both. All members of a LAG must participate in the same protocols. A static port channel interface does not require a partner system to be able to aggregate its member ports.
Static LAGs are supported. When a port is added to a LAG as a static member, it neither transmits nor receives LACPDUs. The switch supports eight LAGs.

Configure LAG Settings

You can group one or more full-duplex Ethernet links to be aggregated together to form a link aggregation group, which is also known as a port channel. The switch treats the LAG as if it were a single link.

To configure LAG settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > LAG > Basic > LAG Configuration.

6. In the LAG Name field, enter the name to be assigned to the LAG.
   You can enter any string of up to 15 alphanumeric characters. A valid name must be specified for you to create the LAG.

7. In the Description field, enter the description string to be attached to a LAG.
   The description can be up to 64 characters in length.

8. From the Admin Mode menu, select Enable or Disable.
When the LAG is disabled, no traffic flows and LACPDUs are dropped, but the links that form the LAG are not released. The default is Enable.

9. From the **STP Mode** menu, select the Spanning Tree Protocol (STP) administrative mode associated with the LAG. The possible values are as follows:
   - **Disable**. Spanning tree is disabled for this LAG.
   - **Enable**. Spanning tree is enabled for this LAG. Enable is the default.

10. From the **Link Trap** menu, select **Enable** or **Disable** to specify whether to send a trap when the link status changes.
    The default is Enable, which causes the trap to be sent.

11. From the **LAG Type** menu, select **Static** or **LACP**:
    - **Static**. Disables Link Aggregation Control Protocol (LACP) on the selected LAG. The LAG is configured manually. The default is Static.
    - **LACP**. Disables LACP on the selected LAG. The LAG is configured automatically.

12. Click the **Apply** button.
    Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 18. LAG Configuration information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAG ID</td>
<td>Identification of the LAG.</td>
</tr>
<tr>
<td>Active Ports</td>
<td>Indicates the ports that are actively participating in the port channel.</td>
</tr>
<tr>
<td>LAG State</td>
<td>Indicates whether the link is up or down.</td>
</tr>
</tbody>
</table>

**Configure LAG Membership**

You can select two or more full-duplex Ethernet links to be aggregated together to form a link aggregation group (LAG), which is also known as a port channel. The switch can treat the port channel as a single link.

**To configure LAG membership:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch's password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > LAG > Basic > LAG Membership**.

   ![LAG Membership](image)

6. From the **LAG ID** menu, select the LAG ID.
7. In the **LAG Name** field, enter the name to be assigned to the LAG.
   You can enter any string of up to 15 alphanumeric characters. A valid name must be specified for you to create the LAG.
8. In the Ports table, click each port that you want to include as a member of the selected LAG.
   A selected port is displayed by a check mark.
9. Click the **Apply** button.
   Your settings are saved.

**Set the LACP System Priority**

The LACP configuration page is used to set the LACP system priority.

**To configure LACP:**
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
5. Select **Switching > LAG > Advanced > LACP Configuration**.

![LACP Configuration]

6. In the **LACP System Priority** field, specify the device’s link aggregation priority relative to the devices at the other ends of the links on which link aggregation is enabled.

   A higher value indicates a lower priority. You can change the value of the parameter globally by specifying a priority from 1 to 65535. The default is 32768.

7. Click the **Apply** button.

   Your settings are saved.

### Set the LACP Port Priority Settings

The LACP port configuration page is used to configure the LACP priority value for the selected port and the administrative LACP time-out value.

**To configure LACP port priority settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Switching > LAG > Advanced > LACP Port Configuration**.
6. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the interface, or type the interface number in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.

7. In the LACP Priority field, specify the LACP priority value for the selected interfaces.
   This value specifies the device’s link aggregation priority relative to the devices at the other ends of the links on which link aggregation is enabled. A higher value indicates a lower priority. The range is 0 to 255. The default is 128.

8. In the Timeout field, configure the administrative LACP time-out value:
   • Long. Specifies a long time-out value.
   • Short. Specifies a short time-out value.

9. Click the Apply button.
   Your settings are saved.

Configure VLANs

Adding virtual LAN (VLAN) support to a Layer 2 switch offers some of the benefits of both bridging and routing. Like a bridge, a VLAN switch forwards traffic based on the Layer 2 header, which is fast, and like a router, it partitions the network into logical segments, which provides better administration, security, and management of multicast traffic.

By default, all ports on the switch are in the same broadcast domain. VLANs electronically separate ports on the same switch into separate broadcast domains so that broadcast packets are not sent to all the ports on a single switch. When you use a VLAN, users can be grouped by logical function instead of physical location.
Each VLAN in a network is assigned an associated VLAN ID, which appears in the IEEE 802.1Q tag in the Layer 2 header of packets transmitted on a VLAN. An end station can omit the tag, or the VLAN portion of the tag, in which case the first switch port to receive the packet can either reject it or insert a tag using its default VLAN ID. A given port can handle traffic for more than one VLAN, but it can support only one default VLAN ID.

You can define VLAN groups stored in the VLAN membership table. The switch supports up to 64 VLANs. VLAN 1 is created by default and is the default VLAN of which all ports are members.

Configure VLAN Settings

The internal VLAN is reserved by a port-based routing interface and invisible to the end user. Once these internal VLANs are allocated by the port-based routing interface, they cannot be assigned to a routing VLAN interface.

Add a Internal VLAN

To add an internal VLAN:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > VLAN > Basic > VLAN Configuration.

6. In the VLAN ID field, specify the VLAN identifier for the new VLAN.
The range of the VLAN ID can be from 1 to 4093.

7. In the **VLAN Name** field, specify a name for the VLAN.
   The VLAN name can be up to 32 alphanumeric characters long, including blanks. The default is blank. VLAN ID 1 always uses the name Default.

8. The **VLAN Type** field displays the type of the VLAN that you are configuring.
   You cannot change the type of the default VLAN (VLAN ID = 1): it is always type Default. When you create a VLAN using this page, its type is always Static.

9. Click the **Add** button.
   The VLAN is added to the switch.

10. Click the **Apply** button.
    Your settings are saved.

Delete a VLAN

**To delete a VLAN from the switch:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > VLAN > Basic > VLAN Configuration**.
   The VLAN Configuration page displays.

6. In the **VLAN ID** field, specify the VLAN identifier.
   The range of the VLAN ID can be from 1 to 4093.

   **Note:** You cannot delete VLAN 1, which is created by default.

7. Click the **Delete** button.
   The VLAN is removed.
Reset a VLAN to Its Default Settings

To reset a VLAN to its default settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > VLAN > Basic > VLAN Configuration.
   The VLAN Configuration page displays.

6. Select the Reset Configuration check box.

7. Click the Apply button.
   Your settings are saved.

The default values are as follows:
• All ports are assigned to the default VLAN of 1.
• All ports are configured with a PVID of 1.
• All ports are configured to an Acceptable Frame Types value of Admit All Frames.
• All ports are configured with ingress filtering disabled.
• All ports are configured to transmit only untagged frames.

All VLANs, except for the default VLAN, are deleted.

Configure VLAN Membership

To configure VLAN membership:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

   The System Information page displays.

5. Select Switching > VLAN > Advanced > VLAN Membership.

6. In the VLAN ID menu, select the VLAN ID.

7. In the Group Operation menu, select one of the following options, which applies to all ports in the VLAN:
   • Untag All. For all ports that are members of the VLAN, tags are removed from all egress packets.
   • Tag All. For all ports that are members of the VLAN, all egress packets are tagged.
   • Remove All. All ports that were dynamically registered through GVRP are removed from the VLAN.

8. In the Ports table, click each port once, twice, or three times to configure one of the following modes or reset the port to the default settings:
   • T (Tagged). Select the ports on which all frames transmitted for this VLAN are tagged. The ports that are selected are included in the VLAN.
   • U (Untagged). Select the ports on which all frames transmitted for this VLAN are untagged. The ports that are selected are included in the VLAN.

9. In the LAG table, click each LAG once, twice, or three times to configure one of the following modes or reset the LAG to the default settings:
   • T (Tagged). Select the LAGs on which all frames transmitted for this VLAN are tagged. The LAGs that are selected are included in the VLAN.
- **U (Untagged).** Select the LAGs on which all frames transmitted for this VLAN are untagged. The LAGs that are selected are included in the VLAN.

10. Click the **Apply** button.

   Your settings are saved.

The following table describes the nonconfigurable information on the page.

### Table 19. Advanced VLAN membership

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Name</td>
<td>The name for the VLAN that you selected. It can be up to 32 alphanumeric characters long, including blanks. VLAN ID 1 always uses the name Default.</td>
</tr>

<tr>
<td></td>
<td>• <strong>Default</strong> (VLAN ID = 1). Always present.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Static.</strong> A VLAN that you configured.</td>
</tr>
</tbody>
</table>

**View VLAN Status**

You can view the status of all currently configured VLANs.

**To view the VLAN status:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **Switching > VLAN > Advanced > VLAN Status**.
The following table describes the nonconfigurable information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN identifier (VID) of the VLAN. The range of the VLAN ID is 1 to 4093.</td>

<tr>
<td></td>
<td>• Static. A VLAN that you configured.</td>
</tr>
<tr>
<td>Member Ports</td>
<td>The ports that are included in the VLAN.</td>
</tr>
</tbody>
</table>

**Configure Port PVID Settings**

You can assign a port VLAN ID (PVID) to an interface. The following requirements apply to a PVID:

- You must define a PVID for all ports.
- If no other value is specified, the default VLAN PVID is used.
- To change the port’s default PVID, you must first create a VLAN that includes the port as a member.

**To configure PVID settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > VLAN > Advanced > Port PVID Configuration**.

6. To display information for all physical ports and LAGs, click the **ALL** link.

7. Select interfaces by selecting the **Interface** check boxes next to the interfaces.
   You can select multiple interfaces. To select all the interfaces, select the **Interface** check box in the heading row.

8. In the **PVID** field, specify the VLAN ID to assign to untagged or priority-tagged frames received on this port.
   The default is 1.

9. In the **VLAN Member** field, specify the VLAN ID or list of VLANs of a member port.
   VLAN IDs range from 1 to 4093. The default is 1. Use a hyphen (-) to specify a range or a comma (,) to separate VLAN IDs in a list. Spaces and zeros are not permitted.

10. In the **VLAN Tag** field, specify the VLAN ID or list of VLANs of a tagged port.
    VLAN IDs range from 1 to 4093. Use a hyphen (-) to specify a range or a comma (,) to separate VLAN IDs in a list. Spaces and zeros are not permitted. To reset the VLAN tag configuration to the defaults, use the **None** keyword. Port tagging for the VLAN can be set only if the port is a member of this VLAN.

11. From the **Acceptable Frame** menu, specify the types of frames that can be received on this port.
    The options are **VLAN only** and **Admit All**:
    - **VLAN only**. Untagged frames or priority-tagged frames received on this port are discarded.
    - **Admit All**. Untagged frames or priority-tagged frames received on this port are accepted and assigned the value of the port VLAN ID for this port. With either option, VLAN-tagged frames are forwarded in accordance to the 802.1Q VLAN specification.

12. From the **Ingress Filtering** menu, select one of the following options:
    - **Enable**. The frame is discarded if this port is not a member of the VLAN with which this frame is associated. In a tagged frame, the VLAN is identified by the VLAN ID in
the tag. In an untagged frame, the VLAN is the port VLAN ID specified for the port that received this frame.

- **Disable**. All frames are forwarded in accordance with the 802.1Q VLAN bridge specification. The default is Disable.

13. In the **Port Priority** field, specify the default 802.1p priority assigned to untagged packets arriving at the port.

You can enter a number from 0 to 7.

14. Click the **Apply** button.

Your settings are saved.

The following table describes the nonconfigurable fields on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Ingress Filtering</td>
<td>Displays whether ingress filtering is enabled for the interface.</td>
</tr>
<tr>
<td>Untagged VLANs</td>
<td>The number of untagged VLANs for the interface.</td>
</tr>
<tr>
<td>Tagged VLANs</td>
<td>The number of tagged VLANs for the interface.</td>
</tr>
</tbody>
</table>

### Configure a Voice VLAN

You can configure the parameters for a voice VLAN configuration.

**To configure a voice VLAN:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
   - The System Information page displays.

5. Select **Switching > VLAN > Advanced > Voice VLAN Configuration**.
6. Select the Admin Mode **Disable** or **Enable** radio button.
   
   This specifies the administrative mode for the voice VLAN for the switch. The default is **Disable**.

7. Select the interface by taking one of the following actions:
   
   - To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
   - To configure all interfaces with the same settings, select the check box in the heading row.

8. From the **Interface Mode** menu, select the voice VLAN mode for selected interfaces:
   
   - **Disable**. This is the default.
   - **None**. Allow the IP phone to use its own configuration to send untagged voice traffic.
   - **VLAN ID**. Configure the phone to send tagged voice traffic.
   - **Dot1p**. Configure voice VLAN 802.1p priority tagging for voice traffic. When this is selected, enter the dot1p value in the **Value** field.
   - **Untagged**. Configure the phone to send untagged voice traffic.

9. In the **Value** field, enter the VLAN ID or dot1p value.
   
   This field is enabled only when VLAN ID or dot1p is selected as the interface mode.

10. In the **CoS Override Mode** field, select **Disable** or **Enable**.
    
    The default is **Disable**.

11. In the **Authentication Mode** field, select **Enable** or **Disable**.
    
    The default is **Enable**. When the authentication mode is enabled, voice traffic is allowed on an unauthorized voice VLAN port. When the authentication mode is disabled, devices are authorized through dot1x.

    **Note:** Authentication through dot1x is possible only if dot1x is enabled.
12. In the **DSCP Value** field, configure the Voice VLAN DSCP value for the port.
   The valid range is 0 to 63. The default is 0.
   The Operational State field displays the operational status of the voice VLAN on the given interface.

13. Click the **Apply** button.
   Your settings are saved.

Configure Auto-VoIP

Voice over Internet Protocol (VoIP) enables telephone calls over a data network. Because voice traffic is typically more time-sensitive than data traffic, the Auto-VoIP feature helps provide a classification mechanism for voice packets so that they can be prioritized above data packets in order to provide better Quality of Service (QoS). With the Auto-VoIP feature, voice prioritization is provided based on call-control protocols (SIP, SCCP, H.323) or OUI bits.

Configure Protocol-Based Port Settings

To prioritize time-sensitive voice traffic over data traffic, protocol-based Auto-VoIP checks for packets carrying the following VoIP protocols:

- Session Initiation Protocol (SIP)
- H.323
- Signalling Connection Control Part (SCCP)

VoIP frames that are received on ports that for which the Auto-VoIP feature is enabled are marked with the specified CoS traffic class value.

**To configure protocol-based port settings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.
5. Select **Switching > Auto-VoIP > Protocol-based > Port Settings**.

6. From the **Prioritization Type** menu, select **Traffic Class** or **Remark**.
   This specifies the type of prioritization.

7. From the **Class Value** menu, specify the CoS tag value to be reassigned for packets received on the voice VLAN when Remark CoS is enabled.

8. Click the **Apply** button.
   Your settings are saved.

**Configure Auto-VoIP OUI-Based Properties**

With Organizationally Unique Identifier (OUI)–based Auto-VoIP, voice prioritization is provided based on OUI bits.

**To configure Auto-VoIP OUI-based properties:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch** on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.
5. Select **Switching > Auto-VoIP > OUI-based > Properties.**

6. In the **Auto-VoIP VLAN ID** field, enter the VoIP VLAN ID of the switch.
   No default VLAN exists for Auto-VoIP, you must create a VLAN for Auto-VoIP.

7. From the **OUI-based priority** menu, select the OUI-based priority of the switch.
   The default is 7.

8. Click the **Apply** button.
   Your settings are saved.

**Configure OUI-Based Port Settings**

The port settings page allows you to configure the OUI port settings.

**To configure OUI-based port settings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch** on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > Auto-VoIP > OUI-based > Port Settings.**
6. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.

7. From the **Auto VoIP Mode** menu, select **Disable** or **Enable**.
   
   Auto-VoIP is disabled by default.
   
   The **Operational Status** field displays the current operational status of each interface.

8. Click the **Apply** button.
   
   Your settings are saved.

Manage the OUI Table

Device hardware manufacturers can include an OUI in a network adapter to help identify a hardware device. The OUI is a unique 24-bit number assigned by the IEEE registration authority. The switch comes preconfigured with the following OUIs that identify the IP phone manufacturer:

- 00:01:E3: SIEMENS
- 00:03:6B: CISCO1
- 00:12:43: CISCO2
- 00:0F:E2: H3C
- 00:60:B9: NITSUKO
- 00:D0:1E: PINTEL
You can select an existing OUI or add a new OUI and description to identify the IP phones on the network.

**Configure the OUI Table**

**To configure the OUI Table:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Auto-VoIP > OUI-based > OUI Table**.

6. In the **Telephony OUI(s)** field, specify the VoIP OUI prefix to be added in the format AA:BB:CC.

   Up to 52 OUIs can be configured.
7. In the **Description** field, enter the description for the OUI.

   The maximum length of description is 32 characters. The following OUIs are present in
   the configuration by default:

   - 00:01:E3 - SIEMENS
   - 00:03:6B - CISCO1
   - 00:12:43 - CISCO2
   - 00:0F:E2 - H3C
   - 00:60:B9 - NITSUKO
   - 00:D0:1E - PINTEL
   - 00:E0:75 - VERILINK
   - 00:E0:BB - 3COM
   - 00:04:0D - AVAYA1
   - 00:1B:4F - AVAYA2

8. Click the **Add** button.

   The telephony OUI entry is added.

---

**Delete One or More OUI Prefixes From the OUI Table**

**To delete one or more OUI prefixes from the OUI table:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or
   connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see *Change the Default IP Address of
   the Switch* on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Auto-VoIP > OUI-based > OUI Table**.

   The OUI Table page displays.

6. Select the check box next to each OUI prefix to be removed.

7. Click the **Delete** button.

   The telephony OUI entries are removed.
Display the Auto-VoIP Status

You can display the Auto-VoIP status.

**To view the Auto-VoIP status:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > Auto-VoIP > Auto-VoIP Status**.

![Auto-VoIP Status](image)

6. To refresh the page with the latest information about the switch, click the **Update** button.

The following table describes the nonconfigurable Auto-VoIP status information on the page.

**Table 22. Auto-VoIP status information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-VoIP VLAN ID</td>
<td>The Auto-VoIP VLAN ID.</td>
</tr>
<tr>
<td>Maximum Number of Voice Channels Supported</td>
<td>The maximum number of voice channels supported.</td>
</tr>
<tr>
<td>Number of Voice Channels Detected</td>
<td>The number of VoIP channels prioritized successfully.</td>
</tr>
</tbody>
</table>
Configure Spanning Tree Protocol

The Spanning Tree Protocol (STP) provides a tree topology for any arrangement of bridges. STP also provides one path between end stations on a network, eliminating loops. Spanning tree versions supported include Common STP, Multiple STP, and Rapid STP.

Classic STP provides a single path between end stations, avoiding and eliminating loops. For information on configuring Common STP, see Configure CST Port Settings on page 123.

Multiple Spanning Tree Protocol (MSTP) supports multiple instances of spanning tree to efficiently channel VLAN traffic over different interfaces. Each instance of the spanning tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree (RSTP), with slight modifications in the working but not the end effect (chief among the effects is the rapid transitioning of the port to the forwarding state). The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full-duplex connectivity and ports that are connected to end stations, resulting in rapid transitioning of the port to the forwarding state and the suppression of Topology Change Notification. These features are represented by the parameters pointtopoint and edgeport. MSTP is compatible with both RSTP and STP. It behaves in a way that is appropriate for STP and RSTP bridges. An MSTP bridge can be configured to behave entirely as an RSTP bridge or an STP bridge.

Note: For two bridges to be in the same region, the force version must be 802.1s and their configuration names, digest keys, and revision levels must match. For additional information about regions and their effect on network topology, refer to the IEEE 802.1Q standard.

Configure STP Settings

The STP Configuration page contains fields for enabling STP on the switch.

To configure STP settings:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
The default password is **password**.
The System Information page displays.

5. Select **Switching > STP > Basic > STP Configuration**.
The following figure does not show the STP Status section on the page.

![STP Configuration Page Screenshot](image)

6. Configure the following options:
   - **Spanning Tree State**. Enable or disable the spanning tree operation on the switch.
   - **STP Operation Mode**. Specify the STP version for the switch. The options are **STP**, **RSTP**, and **MSTP**.
   - **Configuration Name**. Specify an identifier used to identify the configuration currently being used. It can be up to 32 alphanumeric characters.
   - **Configuration Revision Level**. Specify an identifier used to identify the configuration currently being used. The values allowed are between 0 and 65535. The default is 0.
   - **BPDU Flooding**. Enable or disable the BPDU flood. This specifies whether spanning tree BPDUs are forwarded or not while spanning tree is disabled on the switch.

   The Configuration Digest Key field shows the identifier for the configuration that is in use.

7. Click the **Apply** button.
Your settings are saved.

The following table describes the nonconfigurable STP Status fields displayed on the page.

**Table 23. STP configuration status**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bridge Identifier</td>
<td>The bridge identifier for the CST. It is made up using the bridge priority and the base MAC address of the bridge.</td>
</tr>
<tr>
<td>Time Since Topology Change</td>
<td>The time in day-hour-minute-second format since the topology of the CST last changed.</td>
</tr>
<tr>
<td>Topology Change Count</td>
<td>The number of times that the topology changed for the CST.</td>
</tr>
<tr>
<td>Topology Change</td>
<td>The value of the topology change parameter for the switch indicating whether a topology change is in progress on any port assigned to the CST. Possible values are True and False.</td>
</tr>
</tbody>
</table>
### Configure CST Settings

You can configure Common Spanning Tree (CST) and Internal Spanning Tree on the switch.

#### To configure CST settings:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch’s password in the Password field.
   - The default password is password.
   - The System Information page displays.
5. Select Switching > STP > Advanced > CST Configuration.
6. Specify the CST options:

- **Bridge Priority.** When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. Specify the bridge priority value for the Common and Internal Spanning Tree (CST). The valid range is 0–61440. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if you set the priority to any value between 0 and 4095, the switch automatically sets the value to 0. The default is 32768.

- **Bridge Max Age (secs).** The bridge maximum age time for the Common and Internal Spanning Tree (CST), which indicates the time in seconds a bridge must wait before implementing a topological change. The valid range is 6–40, and the value must be less than or equal to \((2 \times \text{Bridge Forward Delay}) – 1\) and greater than or equal to \(2 \times (\text{Bridge Hello Time} + 1)\). The default is 20.

- **Bridge Hello Time (secs).** The bridge hello time for the Common and Internal Spanning Tree (CST), which indicates the time in seconds a root bridge must wait between configuration messages. The value is fixed at 2 seconds. The value must be less than or equal to \((\text{Bridge Max Age} / 2) – 1\). The default hello time value is 2.

- **Bridge Forward Delay (secs).** The bridge forward delay time, which indicates the time in seconds a bridge must remain in a listening and learning state before forwarding packets. The time range is from 4 seconds to 30 seconds. The default is 15 seconds.

7. Click the **Apply** button.

   Your settings are saved.

**Configure CST Port Settings**

You can configure Common Spanning Tree (CST) and Internal Spanning Tree on a specific port on the switch.

A port can become diagnostically disabled (D-Disable) when DOT1S experiences a severe error condition. The most common cause is when the DOT1S software experiences BPDU
flooding. The flooding criteria are such that DOT1S receives more than 15 BPDUs in a 3-second interval. The other causes for DOT1S D-Disable are extremely rare.

To configure CST port settings:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Switching > STP > Advanced > CST Port Configuration.

6. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.
7. From the STP Status menu, select the option to enable or disable the spanning tree administrative mode that is associated with the port or port channel.
   The possible values are Enable and Disable. The default is Enable.
8. From the Fast Link menu, select whether the specified port is an edge port within the CST.
The possible values are **Enable**, **Disable**, and **Auto**. The default value is Auto, which specifies that the switch waits three seconds (with no BPDUs received on the interface) before placing the interface into the PortFast mode.

**9.** From the **BPDU Forwarding** menu, configure BPDU forwarding.

The possible values are **Enable** and **Disable**. The default value is Disable. When BPDU forwarding is enabled, the switch forwards the BPDU traffic arriving on this port when STP is disabled on this port.

**10.** In the **Path Cost** field, set the path cost to a new value for the specified port in the common and internal spanning tree.

Specify a value in the range of 0 to 200000000. The default is 0. When the path cost is set to 0, the value is updated with the external path cost from a received STP packet.

**11.** In the **Priority** field, specify the priority for a particular port within the CST.

The port priority is set in multiples of 16. For example if you attempt to set the priority to any value between 0 and 15, it is set to 0. If you try to set it to any value between 16 and (2*16 – 1), it is set to 16, and so on. The range is 0 to 240. The default is 128.

**12.** Click the **Apply** button.

Your settings are saved.

**13.** To refresh the page with the latest information about the switch, click the **Update** button.

The following table describes the nonconfigurable information on the page.

### Table 24. CST port configuration

<table>
<thead>
<tr>

</tbody>
</table>
View CST Port Status

You can display Common Spanning Tree (CST) and Internal Spanning Tree on a specific port on the switch.

To view the CST port status:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Switching > STP > Advanced > CST Port Status.

6. To refresh the page with the latest information about the switch, click the Update button.

The following table describes the CST port status information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Identify the physical or port channel interfaces associated with VLANs associated with the CST.</td>

<td>Each MST bridge port that is enabled is assigned a port role for each spanning tree. The port role is one of the following values: Root Port, Designated Port, Alternate Port, Backup Port, Master Port, or Disabled Port.</td>
</tr>
<tr>
<td>Designated Root</td>
<td>Root bridge for the CST. It is made up using the bridge priority and the base MAC address of the bridge.</td>
</tr>
</tbody>
</table>
View Rapid STP Information

You can view information about the status of the Rapid Spanning Tree (RSTP) port.

To view information about RSTP:

1. Connect your computer to the same network as the switch.  
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.  
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.  
   The default password is password.
   The System Information page displays.

5. Select Switching > STP > Advanced > RSTP.  
   The Rapid STP page displays.

**Manage MST Settings**

You can configure Multiple Spanning Tree (MST) on the switch.

**Configure an MST Instance**

**To configure an MST instance:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
   - The System Information page displays.
5. Select **Switching > STP > Advanced > MST Configuration**.

6. Configure the MST values:
• **MST ID.** Specify the ID of the MST to create. The valid values for this are 1 to 64. This is visible only when the select option of the MST ID select box is selected. The switch supports up to four instances.

• **Priority.** The bridge priority value for the MST. When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if you set the priority to any value between 0 and 4095, the switch automatically sets the value to 0. The default is 32768. The valid range is 0–61440.

• **VLAN Id.** The menu includes all VLANs that are configured on the switch. You can select VLANs that must be associated with the MST instance or clear VLANs that are already associated with the MST instance.

7. Click the Add button.

The MST is added.

The following table describes the nonconfigurable information on the page.

**Table 27. MST configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bridge Identifier</td>
<td>The bridge identifier for the selected MST instance. It is made up using the bridge priority and the base MAC address of the bridge.</td>
</tr>
<tr>
<td>Last TCN</td>
<td>The time in day:hour:minute:second format since the topology of the selected MST instance last changed.</td>
</tr>
<tr>
<td>Topology Change Count</td>
<td>Number of times that the topology changed for the selected MST instance.</td>
</tr>
<tr>
<td>Topology Change</td>
<td>The value of the topology change parameter for the switch indicating if a topology change is in progress on any port assigned to the selected MST instance. It is either True or False.</td>
</tr>
<tr>
<td>Designated Root</td>
<td>The bridge identifier of the root bridge. It is made up from the bridge priority and the base MAC address of the bridge</td>
</tr>
<tr>
<td>Root Path Cost</td>
<td>Path cost to the designated root for this MST instance.</td>
</tr>
<tr>
<td>Root Port</td>
<td>Port to access the designated root for this MST instance.</td>
</tr>
</tbody>
</table>

**Modify an MST Instance**

**To modify an MST instance:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > STP > Advanced > MST Configuration.
   The MST Configuration page displays.

6. Select the check box next to the instance.

7. Update the values.

8. Click the Apply button.
   Your settings are saved.

Delete an MST Instance

To delete an MST instance:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > STP > Advanced > MST Configuration.
   The MST Configuration page displays.

6. Select the check box for the instance.

7. Click the Delete button.
   The MST instance is removed.
Configure the MST Port Settings

You can configure and display Multiple Spanning Tree (MST) settings on a specific port on the switch.

A port can become diagnostically disabled (D-Disable) when DOT1S experiences a severe error condition. The most common cause is when the DOT1S software experiences BPDU flooding. The flooding criteria is such that DOT1S receives more than 15 BPDUs in a 3-second interval. The other causes for DOT1S D-Disable are extremely rare.

To configure MST port settings:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.

   The System Information page displays.

5. Select Switching > STP > Advanced > MST Port Configuration.
   
   The Status page displays.

   **Note:** If no MST instances were configured on the switch, the page displays a “No MSTs Available” message.

6. Select one or more interfaces by taking one of the following actions:
   
   • To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.
   
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   
   • To configure all interfaces with the same settings, select the check box in the heading row.

7. Configure the MST values for the selected interfaces:
   
   • **Port Priority.** The priority for a particular port within the selected MST instance. The port priority is set in multiples of 16. If you specify a value that is not a multiple of 16, the priority is set to the priority is automatically set to the next lowest priority that is a multiple of 16. For example, if you set a value between 0 and 15, the priority is set to...
0. If you specify a number between 16 and 31, the priority is set to 16. Specify a value in the range of 0–240.

- **Port Path Cost.** Set the path cost to a new value for the specified port in the selected MST instance. Specify a value in the range of 0–200000000.

8. Click the **Apply** button.

Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 28. MST port status information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-calculated Port Path Cost</td>
<td>Displays whether the path cost is automatically calculated (Enabled) or not (Disabled). Path cost is calculated based on the link speed of the port if the configured value for Port Path Cost is zero.</td>
</tr>
<tr>
<td>Port ID</td>
<td>The port identifier for the specified port within the selected MST instance. It is made up from the port priority and the interface number of the port.</td>
</tr>
<tr>
<td>Port Up Time Since Counters Last Cleared</td>
<td>Time since the counters were last cleared, displayed in days, hours, minutes, and seconds.</td>
</tr>
<tr>
<td>Port Mode</td>
<td>Spanning Tree Protocol administrative mode associated with the port or port channel. Possible values are Enable or Disable.</td>
</tr>
<tr>
<td>Port Forwarding State</td>
<td>Indicates the current STP state of a port. If enabled, the port state determines what forwarding action is taken on traffic. Possible port states are as follows:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disabled.</strong> STP is currently disabled on the port. The port forwards traffic while learning MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Blocking.</strong> The port is currently blocked and cannot be used to forward traffic or learn MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Listening.</strong> The port is currently in the listening mode. The port cannot forward traffic nor can it learn MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learning.</strong> The port is currently in the learning mode. The port cannot forward traffic. However, it can learn new MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Forwarding.</strong> The port is currently in the forwarding mode. The port can forward traffic and learn new MAC addresses.</td>
</tr>
<tr>
<td>Port Role</td>
<td>Each MST bridge port that is enabled is assigned a port role for each spanning tree. The port role is one of the following: Root Port, Designated Port, Alternate Port, Backup Port, Master Port, or Disabled Port.</td>
</tr>
<tr>
<td>Designated Root</td>
<td>Root bridge for the selected MST instance. It is made up using the bridge priority and the base MAC address of the bridge.</td>
</tr>
<tr>
<td>Designated Cost</td>
<td>Displays cost of the port participating in the STP topology. Ports with a lower cost are less likely to be blocked if STP detects loops.</td>
</tr>
<tr>
<td>Designated Bridge</td>
<td>Bridge identifier of the bridge with the designated port. It is made up using the bridge priority and the base MAC address of the bridge.</td>
</tr>
<tr>
<td>Designated Port</td>
<td>Port identifier on the designated bridge that offers the lowest cost to the LAN. It is made up from the port priority and the interface number of the port.</td>
</tr>
</tbody>
</table>
View STP Statistics

You can view information about the number and type of bridge protocol data units (BPDUs) transmitted and received on each port.

**To view Spanning Tree statistics:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Switching > STP > Advanced > STP Statistics**.

6. To refresh the page with the latest information about the switch, click the **Update** button.

The following table describes the nonconfigurable information on the page.

**Table 29. STP Statistics**

Configure Multicast

Multicast IP traffic is traffic that is destined to a host group. Host groups for IPv4 multicast are identified by class D addresses, which range from 224.0.0.0 to 239.255.255.255. Host groups for IPv6 multicast are identified by the prefix ff00::/8.

View the MFDB Table

The Multicast Forwarding Database holds the port membership information for all active multicast address entries. The key for an entry consists of a VLAN ID and MAC address pair. Entries can contain data for more than one protocol.

To view the MFDB Table:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > Multicast > MFDB > MFDB Table.

6. In the Search by MAC Address field, enter a MAC address.
Enter six two-digit hexadecimal numbers separated by colons, for example 01:00:5e:45:67:89.

7. Click the Go button.
   If the address exists, the entry is displayed. An exact match is required.

The following describes the nonconfigurable information on the page.

Table 30. MFDB table information

**IGMP Snooping Overview**

Internet Group Management Protocol (IGMP) snooping is a feature that allows a switch to forward multicast traffic intelligently on the switch. Multicast IP traffic is traffic that is destined to a host group. Host groups are identified by class D IP addresses, which range from 224.0.0.0 to 239.255.255.255. Based on the IGMP query and report messages, the switch forwards traffic only to the ports that request the multicast traffic. This prevents the switch from broadcasting the traffic to all ports and possibly affecting network performance.

A traditional Ethernet network can be separated into different network segments to prevent placing too many devices onto the same shared media. Bridges and switches connect these segments. When a packet with a broadcast or multicast destination address is received, the switch forwards a copy to each of the remaining network segments in accordance with the IEEE MAC Bridge standard. Eventually, the packet is made accessible to all nodes connected to the network.

This approach works well for broadcast packets that are intended to be seen or processed by all connected nodes. In the case of multicast packets, however, this approach could lead to less efficient use of network bandwidth, particularly when the packet is intended for only a small number of nodes. Packets are flooded into network segments where no node is receptive to the packet. While nodes rarely incur any processing overhead to filter packets addressed to unrequested group addresses, they cannot transmit new packets onto the shared media for the period of time that the multicast packet is flooded. The problem of wasting bandwidth is even worse when the LAN segment is not shared, for example in full-duplex links.
Allowing switches to snoop IGMP packets is a creative effort to solve this problem. The switch uses the information in the IGMP packets as they are being forwarded throughout the network to determine which segments receive packets directed to the group address.

**Configure IGMP Snooping**

You can configure the parameters for IGMP snooping, which is used to build forwarding lists for multicast traffic.

**To configure IGMP snooping:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping Configuration**.

   The following figure does not display all information on the page.

   ![IGMP Snooping Configuration](image)

   **IGMP Snooping Configuration**

   - **IGMP Snooping Status**: Enable or Disable
   - **Validate IGMP IP header**: Enable
   - **Block Unknown Multicast Address**: Enable

   **IGMP Statistics**

   - **Multicast Control Frame Count**: 0
   - **Interfaces Enabled for IGMP Snooping**
   - **VLAN Ids Enabled for IGMP Snooping**
   - **VLAN Ids Enabled for IGMP Snooping Querier**

6. Select the IGMP Snooping Status **Enable** or **Disable** radio button.
This specifies the administrative mode for IGMP snooping for the switch. The default is Disable.

7. Select the Validate IGMP IP header Enable or Disable radio button.
   If IGMP IP header validation is enabled, any IGMP IP header must include the Router Alert, ToS, and TTL information. Otherwise, the IGMP packet is discarded. The default is Disable.

8. Select the Block Unknown Multicast Address Enable or Disable radio button.
   If the blocking of unknown multicast address is enabled, packets with unknown multicast MAC addresses in the destination field are dropped. If disabled, packets with unknown destination multicast MAC addresses are flooded to all interfaces in the VLAN. This is the default setting. The default is Disable.

9. Click the Apply button.
   Your settings are saved.

10. To refresh the page with the latest information about the switch, click the Update button.

The following table describes the nonconfigurable information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Control Frame Count</td>
<td>The number of multicast control frames that are processed by the CPU.</td>
</tr>
<tr>
<td>Interfaces Enabled for IGMP Snooping</td>
<td>A list of all the interfaces currently enabled for IGMP snooping.</td>
</tr>
<tr>
<td>VLAN IDs Enabled For IGMP Snooping</td>
<td>Displays VLAN IDs enabled for IGMP snooping.</td>
</tr>
<tr>
<td>VLAN IDs Enabled For IGMP Snooping Querier</td>
<td>Displays VLAN IDs enabled for IGMP snooping querier.</td>
</tr>
</tbody>
</table>

Configure IGMP Snooping for Interfaces

To configure IGMP snooping for interfaces:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch's password in the **Password** field.
   
The default password is **password**.
   
The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping Interface Configuration**.

![IGMP Snooping Interface Configuration](image)

6. Select one or more interfaces by taking one of the following actions:
   
   - To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
   
   - To configure all interfaces with the same settings, select the check box in the heading row.

7. From the **Admin Mode** menu, select **Disable** or **Enable**.
   
   This specifies the interface mode for the selected interface for IGMP snooping for the switch. The default is Disable.

8. In the **Host Timeout** field, specify the time that the switch must wait for a report for a particular group on a particular interface before it deletes that interface from the group.

   Enter a value between 2 and 3600 seconds. The default is 260 seconds.

9. In the **Max Response Time** field, specify the time that the switch must wait after sending a query on an interface because it did not receive a report for a particular group on that interface.

   Enter a value between 1 and 25 seconds. The default is 10 seconds. The configured value must be less than the value in the **Host Timeout** field.

10. In the **MRouter Timeout** field, specify the time that the switch must wait to receive a query on an interface before removing it from the list of interfaces with multicast routers attached.

    Enter a value between 0 and 3600 seconds. The default is 0 seconds. A value of zero indicates an infinite time-out, that is, no expiration.

11. From the **Fast Leave Mode** menu, select whether fast leave mode is enabled.
The option are **Enable** and **Disable**. The default is Disable.

12. Click the **Apply** button.
   
   Your settings are saved.

**View the IGMP Snooping Table**

You can view all of the entries in the Multicast Forwarding Database that were created for IGMP snooping.

**To view the entries in the IGMP snooping table:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping Table**.
   
   The IGMP Snooping Table page displays.

6. In the **Search By MAC Address** field, specify the MAC address for which you want to view the entry in the MFDB table.
   
   Enter six two-digit hexadecimal numbers separated by colons, for example 01:00:5e:45:67:89.

7. Click the **Go** button.
   
   If the address exists, the entry is displayed. An exact match is required.

The following table describes the nonconfigurable information on the page.

**Table 33. IGMP Snooping Table information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>A multicast MAC address for which the switch holds forwarding and/or filtering information. The format is six two-digit hexadecimal numbers that are separated by colons, for example, 01:00:5e:45:67:89.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>A VLAN ID for which the switch holds forwarding and filtering information.</td>
</tr>
</tbody>
</table>
Configure IGMP Snooping for VLANs

To configure IGMP snooping settings for VLANs:

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.

   The System Information page displays.

5. Select Switching > Multicast > IGMP Snooping > IGMP Snooping VLAN Configuration.

When you create a VLAN, the VLAN is automatically added to the IGMP Snooping VLAN Configuration page.

6. Configure the IGMP snooping values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>This displays the type of the entry. Static entries are those that are configured by the end user. Dynamic entries are added to the table as a result of a learning process or protocol.</td>
</tr>
<tr>
<td>Description</td>
<td>The text description of this multicast table entry. Possible values are Management Configured, Network Configured, and Network Assisted.</td>
</tr>
<tr>
<td>Interface</td>
<td>The list of interfaces that are designated for forwarding (Fwd) and filtering (Flt) for the associated address.</td>
</tr>
</tbody>
</table>
- **Admin Mode.** Enable or disable IGMP snooping for the specified VLAN ID. The default is Disable.

- **Fast Leave Mode.** Enable or disable the IGMP snooping fast leave mode for the specified VLAN ID. The default is Disable.

- **Host Timeout.** Specify the time that the switch must wait for a report for a particular group for the specified VLAN ID. The valid range is the value in the Maximum Response Time plus 1 to 3600 seconds. The default is 260 seconds.

- **Maximum Response Time.** Specify the time that the switch must wait after sending a query for the specified VLAN ID if the switch does not receive a report for a particular group for that VLAN ID. Enter a value between 1 and 25 seconds. The default is 10 seconds. The configured value must be less than the value in the Host Timeout field.

- **MRouter Timeout.** Set the value for multicast router expiry time of IGMP snooping for the specified VLAN ID. The valid range is 0 to 3600 seconds. The default is 0 seconds.

- **Querier Mode.** Enable or disable the IGMP Querier Mode for the specified VLAN ID. The default is Disable.

- **Query Interval.** Set the IGMP query interval for the specified VLAN ID. The valid range is 1 to 1800 seconds. The default is 60 seconds.

7. Click the **Apply** button.

   Your settings are saved.

**Modify IGMP Snooping Settings for a VLAN**

**To modify IGMP snooping settings for a VLAN:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping VLAN Configuration**.

   The IGMP Snooping VLAN Configuration page displays.

6. Select the check box next to the VLAN ID.
7. Update the values.
8. Click the **Apply** button.
   Your settings are saved.

### IGMP Snooping Querier Overview

IGMP snooping requires that one central switch or router periodically query all end-devices on the network to announce their multicast memberships. This central device is the IGMP querier. The IGMP query responses, known as IGMP reports, keep the switch updated with the current multicast group membership on a port-by-port basis. If the switch does not receive updated membership information in a timely fashion, it stops forwarding multicasts to the port where the end device is located.

You can configure and display information about IGMP snooping queriers on the network and, separately, on VLANs.

### Configure IGMP Snooping Querier

You can configure the parameters for IGMP snooping querier. Only a user with read/write access privileges can change the data on this page.

**To configure IGMP snooping querier settings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping Querier > Querier Configuration**.
6. Configure the following settings:
   • **Querier Admin Mode.** Enable or disable IGMP snooping for the switch. The default is Disable.
   • **Snooping Querier IP Address.** Enter the snooping querier IP address to be used as the source address in periodic IGMP queries. This address is used when no address is configured on the VLAN on which a query is being sent.
   • **IGMP Version.** Specify the IGMP protocol version used in periodic IGMP queries. The range is 1 to 2. The default is 2.
   • **Query Interval(secs).** Specify the time interval in seconds between periodic queries sent by the snooping querier. The query interval must be a value in the range of 1 and 1800. The default is 60.
   • **Querier Expiry Interval(secs).** Specify the time interval in seconds after which the last querier information is removed. The querier expiry Interval must be a value in the range of 60 and 300. The default is 125.

7. Click the **Apply** button.
   Your settings are saved.

### Configure IGMP Snooping Querier for VLANs

You can configure IGMP queriers for use with VLANs on the network.

**To create a new VLAN ID for IGMP snooping:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
The default password is **password**.

The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping Querier > Querier VLAN Configuration**.

![Querier VLAN Configuration](image)

6. From the **VLAN ID** menu, select **New Entry**.

7. Configure the following settings:
   - **VLAN ID**: The VLAN ID for which the IGMP snooping querier is to be enabled.
   - **Querier Election Participate Mode**: Enable or disable querier this mode:
     - **Disable**: Upon seeing another querier of the same version in the VLAN, the snooping querier moves to the non-querier state.
     - **Enable**: The snooping querier participates in querier election, in which the lowest IP address operates as the querier in that VLAN. The other querier moves to non-querier state.
   - **Snooping Querier VLAN Address**: Specify the snooping querier IP address to be used as the source address in periodic IGMP queries sent on the specified VLAN.

8. Click the **Apply** button.

Your settings are saved.

**Display IGMP Snooping Querier for VLAN Status**

To display querier VLAN status:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
The System Information page displays.

5. Select **Switching > Multicast > IGMP Snooping Querier > Querier VLAN Status**.

<table>
<thead>
<tr>
<th>VLAN ID</th>
<th>Operational State</th>
<th>Operational Version</th>
<th>Last Querier Address</th>
<th>Last Querier Version</th>
<th>Operational Max Response Time (sec)</th>
</tr>
</thead>
</table>

The following table describes the nonconfigurable information on the page.

**Table 34. Querier VLAN Status information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID on which IGMP snooping querier is administratively enabled and the VLAN exists in the VLAN database.</td>
</tr>
<tr>
<td>Operational State</td>
<td>The operational state of the IGMP snooping querier on a VLAN. It can be in any of the following states:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Querier</strong>. The snooping switch is the querier in the VLAN. The snooping switch sends out periodic queries with a time interval equal to the configured querier query interval. If the snooping switch finds a better querier in the VLAN, it moves to non-querier mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Non-Querier</strong>. The snooping switch is in non-querier mode in the VLAN. If the querier expiry interval timer expires, the snooping switch moves into querier mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disabled</strong>. The snooping querier is not operational on the VLAN. The snooping querier moves to disabled mode when IGMP snooping is not operational on the VLAN or when the querier address is not configured or the network management address is also not configured.</td>
</tr>
<tr>
<td>Operational Version</td>
<td>The operational IGMP protocol version of the querier.</td>
</tr>
<tr>
<td>Last Querier Address</td>
<td>The IP address of the last querier from which a query was snooped on the VLAN.</td>
</tr>
<tr>
<td>Last Querier Version</td>
<td>The IGMP protocol version of the last querier from which a query was snooped on the VLAN.</td>
</tr>
<tr>
<td>Operational Max Response Time</td>
<td>Displays maximum response time to be used in the queries that are sent by the snooping querier.</td>
</tr>
</tbody>
</table>

**Configure a Static Multicast Group**

You can configure up to 32 static multicast groups. You create a static multicast group by adding a multicast MAC address to a VLAN. The multicast MAC address becomes the group identifier.

**To configure a static multicast group:**

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select Switching > Multicast > Static Multicast Address > Multicast Group Configuration.

![Multicast Group Configuration](image)

6. From the VLAN ID menu, select the VLAN ID.

7. In the Multicast Address field, enter the multicast MAC address that must become the group identifier.

8. Click the Add button.
   
   The multicast group is added.

The following table describes the nonconfigurable information on the page.

**Table 35. Multicast Group Configuration information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Name</td>
<td>The VLAN name, if any, that is associated with the VLAN ID.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of multicast group, which is determined by the way in which members are added to the group:</td>
</tr>
<tr>
<td></td>
<td>• Dynamic. Members are added dynamically to the multicast group. By default, all groups are dynamic groups.</td>
</tr>
<tr>
<td></td>
<td>• Static. If you add static members to the multicast group (see Configure Multicast Group Membership on page 148), the group becomes a static group.</td>
</tr>
</tbody>
</table>
Remove a Static Multicast Group

You can remove a static multicast group that you no longer need. Because the multicast MAC address is the multicast group identifier. You remove a static multicast group by removing the static multicast address from the VLAN to which it is assigned.

To remove one or more static multicast groups:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select Switching > Multicast > Static Multicast Address > Multicast Group Configuration.
   
   The Multicast Group Configuration page displays.

6. Select the check boxes for the statically added multicast addresses that you want to remove.

7. Click the Delete button.
   
   The multicast groups are removed.

Configure Multicast Group Membership

By default, an interface is excluded from multicast groups but could be dynamically added to any multicast group. You can manually add interfaces to a group (which changes the type of the group from dynamic to static) and you can lock interfaces so that they cannot be added dynamically to a group.

To configure multicast group membership:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

   The System Information page displays.

5. Select Switching > Multicast > Static Multicast Address > Multicast Group Membership.

6. From the VLAN ID menu, select the VLAN ID for the VLAN in which the multicast group is located.
   If a name is associated with the VLAN, the name displays in the VLAN Name field.

7. From the Multicast Address menu, select the MAC address that identifies the multicast group.

8. Select which type of interfaces display onscreen:
   • To display physical ports only, click the 1 link.
   • To display LAGs only, click the LAG link.
   • To display both physical ports and LAGs, click the All link.

9. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the interface, or type the interface number in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.

10. From the Interface Status menu, select one of the following options:
    • Static. The interface becomes a static member of the multicast group on the selected VLAN.
• **Forbidden.** The interface is forbidden from joining the multicast group on the selected VLAN.

• **Excluded.** The interface is not a static member of the multicast group but could become a dynamic member of a multicast group on the selected VLAN. This is the default state.

**Note:** If an interface was added dynamically to the multicast group as a result of IGMP or MLD snooping, the status of the interface is Dynamic. You cannot select this status manually.

11. Click the **Apply** button.
Your settings are saved.

**Configure the Multicast Forward All Option**

After IGMP snooping is enabled, multicast packets are forwarded only to the members of multicast groups. However, you can enable the Multicast Forward All option for an interface so that the interface receives and forwards all multicast traffic on the VLAN.

**To enable the Multicast Forward All option for an interface:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Switching > Multicast > Static Multicast Address > Multicast Forward All.**
6. From the **VLAN ID** menu, select the VLAN ID for the VLAN in which the multicast group is located.

If a name is associated with the VLAN, the name displays in the VLAN Name field.

7. Select which type of interfaces display onscreen:
   - To display physical ports only, click the **1** link.
   - To display LAGs only, click the **LAG** link.
   - To display both physical ports and LAGs, click the **All** link.

8. Select one or more interfaces by taking one of the following actions:
   - To configure a single interface, select the check box associated with the interface, or type the interface number in the **Go To Interface** field and click the **Go** button.
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
   - To configure all interfaces with the same settings, select the check box in the heading row.

9. From the **Interface Status** menu, select one of the following options:
   - **Static**. The interface receives all multicast traffic on the VLAN and forwards the traffic.
   - **Forbidden**. The interface cannot receive any multicast traffic on the VLAN, even if the IGMP or MLD snooping process designated the interface as a member of a multicast group.
   - **Excluded**. The Multicast Forward All option is not enabled on the interface, that is, the interface does not forward all multicast traffic on the VLAN. This is the default state.

10. Click the **Apply** button.

    Your settings are saved.
View and Configure the MAC Address Table

You can view or configure the MAC Address Table. This table contains information about unicast entries for which the switch holds forwarding or filtering information. This information is used by the transparent bridging function in determining how to propagate a received frame.

Configure the MAC Address Table

To configure the MAC Address Table:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.

   The System Information page displays.

5. Select Switching > Address Table > Basic > Address Table.

6. Use the Search menu and field to search for a MAC address, VLAN ID, or interface number:
• **Search by MAC Address.** From the Search menu, select **MAC Address**, and enter the 6-byte hexadecimal MAC address in two-digit groups separated by colons, for example, 01:23:45:67:89:AB. Then click the **Go** button.

If the address exists, that entry is displayed as the first entry followed by the remaining (higher) MAC addresses. An exact match is required.

• **Search VLAN ID.** From the Search menu, select **VLAN ID**, and enter the VLAN ID, for example, 100. Then click the **Go** button.

• **Search Interface.** From the Search menu, select **Interface**, and enter the interface ID using the respective interface naming convention (for example, g1 or l1). Then click the **Go** button.

The following table describes the nonconfigurable information on the page.

**Table 36. MAC Address Table information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total MAC Address</td>
<td>The number of total MAC addresses learned or configured.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>A unicast MAC address for which the switch holds forwarding and/or filtering information. The format is a 6-byte MAC address that is separated by colons, for example 01:23:45:67:89:AB.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID associated with the MAC address.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface upon which this address was learned.</td>

<tr>
<td></td>
<td>• <strong>Static.</strong> The value of the corresponding instance was added by the system or a user and cannot be relearned.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Learned.</strong> The value of the corresponding instance was learned, and is being used.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Management.</strong> The value of the corresponding instance is also the value of an existing instance of dot1dStaticAddress.</td>
</tr>
</tbody>
</table>

**Set the Dynamic Address Aging Interval**

You can set the address aging interval for the specified forwarding database.

**To set the address aging interval:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch on page 11.**
The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

   The System Information page displays.

5. Select Switching > Address Table > Advanced > Dynamic Addresses.

   In the Address Aging Timeout (seconds) field, specify the time-out period in seconds for aging out dynamically learned forwarding information.

   802.1D-1990 recommends a default of 300 seconds. The value can be any number between 10 and 1000000 seconds. The default is 300.

6. Click the Apply button.
   Your settings are saved.

Configure a Static MAC Address

To configure a static MAC address:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

   The System Information page displays.

5. Select Switching > Address Table > Advanced > Static MAC Address.
6. From the **Interface** menu, select the interface.

7. In the **Static MAC Address** field, enter the MAC address.

8. From the **VLAN ID** menu, select the VLAN ID that must be associated with the MAC address.

9. Click the **Add** button.

The static MAC address is added to the switch.

---

**Configure Layer 2 Loop Protection**

Loops inside a network are costly because they consume resources and reduce the performance of the network. Detecting loops manually can be cumbersome.

The switch can automatically identify loops in the network. You can enable loop protection per port or globally.

If loop protection is enabled, the switch sends predefined PDU packets with the MAC address of the switch as the destination MAC address to all ports for which the feature is enabled. You can selectively disable PDU packet transmission for loop protection on specific ports even while port loop protection is enabled. If the switch receives a PDU packet with the MAC address of the switch as the destination MAC address, the switch can perform one of the following actions, depending on how you configure the action:

- Shut down the port.
- Generate a log message. (If a syslog server is configured, the log message can be sent to the syslog server.)
- Shut down the port and generate a log message.

If loop protection is disabled, the PDU packet is silently dropped.

Loop protection is not intended for ports that serve as uplinks between spanning tree–aware switches. It is intended for unmanaged switches that drop spanning tree BPDUs. Loop protection detects physical and logical loops between Ethernet ports on a device. You must enable loop protection globally before you can enable and configure it at the interface level. Loop protection is supported on physical interfaces and static LAG interfaces, but not on dynamic LAG interfaces.
Configure Global Layer 2 Loop Protection

To configure L2 loop protection globally:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > L2 Loop Protection > L2 Loop Protection Configuration.

6. To enable or disable loop protection feature, select the Admin Mode Enable or Disable radio button.
   By default, the Disable radio button is selected.

7. From the Transmit Interval menu, select the time in seconds between transmission of loop packets.
   The default transmit interval is 5 seconds.

8. From the Max PDU Receive menu, select the maximum number of packets to be received before an action is taken.
   The default is 1.

9. In the Disable Timer field, enter the time in seconds after which a port is disabled when a loop is detected.
   The range is from 0 to 604800 seconds. The default is 0 seconds.

10. Click the Apply button.
    Your settings are saved.
Configure Layer 2 Loop Protection on a Port

To configure L2 loop protection on a port:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Switching > L2 Loop Protection > L2 Loop Protection Configuration.

6. To display information for all physical ports and LAGs, click the ALL link.

7. Select interfaces by selecting the Interface check boxes next to the interfaces.
   You can select multiple interfaces. To select all the interfaces, select the Interface check box in the heading row.

8. From the Keep Alive menu, select Enable or Disable to specify whether keep-alives are enabled on an interface.
   The default is Disable.

9. From the RX Action menu, select the action that occurs when the switch detects a loop on an interface:
   - Log. The switch logs a message.
   - Disable. The switch disables the interface. This is the default action.
• Both. The switch both logs a message and disables the interface.

10. Click the **Apply** button.

    Your settings are saved.

11. Click the **Clear** button to clear all the statistics in the table.

12. Click the **Update** button to update the page to show the latest information.

The following table describes the nonconfigurable information displayed on the page.

**Table 37. L2 Loop Protection Interface Information**

<table>
<thead>

<td>The time that elapsed since the loop was detected.</td>
</tr>
<tr>
<td>Port Status</td>
<td>The status of the interface (Enabled, Disabled, or D-Disabled, which stands for diagnostically disabled).</td>
</tr>
</tbody>
</table>
In a switch, each physical port consists of one or more queues for transmitting packets on the attached network. Multiple queues per port are often provided to give preference to certain packets over others based on user-defined criteria. When a packet is queued for transmission in a port, the rate at which it is serviced depends on how the queue is configured and possibly the amount of traffic present in the other queues of the port. If a delay is necessary, packets get held in the queue until the scheduler authorizes the queue for transmission. As queues become full, packets can no longer be held for transmission and are dropped by the switch.

QoS is a means of providing consistent, predictable data delivery by distinguishing packets with strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given special treatment in a QoS-capable network. With this in mind, all elements of the network must be QoS capable. The presence of at least one node that is not QoS capable creates a deficiency in the network path, and the performance of the entire packet flow is compromised.

This chapter contains the following sections:

- Manage Class of Service
- Manage Differentiated Services
Manage Class of Service

The Class of Service (CoS) queueing feature lets you directly configure certain aspects of switch queueing. This provides the desired QoS behavior for different types of network traffic when the complexities of DiffServ are not required. The priority of a packet arriving at an interface can be used to steer the packet to the appropriate outbound CoS queue through a mapping table. CoS queue characteristics that affect queue mapping, such as minimum guaranteed bandwidth or transmission rate shaping, are user configurable at the queue (or port) level.

Eight queues per port are supported.

CoS Configuration Overview

You can set the Class of Service trust mode for an interface. Each port in the switch can be configured to trust one of the packet fields (802.1p or IP DSCP), or to not trust any packet’s priority designation (untrusted mode). If the port is set to a trusted mode, it uses a mapping table appropriate for the trusted field being used. This mapping table indicates the CoS queue to which the packet must be forwarded on the appropriate egress port. Of course, the trusted field must exist in the packet for the mapping table to be of any use. If this is not the case, default actions are performed. These actions involve directing the packet to a specific CoS level configured for the ingress port as a whole, based on the existing port default priority as mapped to a traffic class by the current 802.1p mapping table.

Alternatively, when a port is configured as untrusted, it does not trust any incoming packet priority designation and uses the port default priority value instead. All packets arriving at the ingress of an untrusted port are directed to a specific CoS queue on the appropriate egress ports, in accordance with the configured default priority of the ingress port. This process is also used for cases where a trusted port mapping cannot be honored, such as when a non-IP packet arrives at a port configured to trust the IP DSCP value.

Configure Global CoS Settings

To configure CoS trust mode settings on all interfaces:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **QoS > CoS > Basic > CoS Configuration**.

![CoS Configuration](image)

6. Either configure the same CoS trust mode settings for all CoS-configurable interfaces or configure CoS settings per interface:
   - To configure the same CoS trust mode settings for all CoS configurable interfaces, do the following:
     a. Select the **Global** radio button.
     b. From the **Global Trust Mode** menu, select one of the following trust mode options for ingress traffic on the switch:
        - **Untrusted**. Do not trust any CoS packet marking at ingress.
        - **802.1p**. The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues. The default mode is 802.1p.
        - **DSCP**. The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.
   - To configure CoS settings per interface, do the following:
     a. Select the **Interface** radio button.
     b. From the **Interface Trust Mode** menu, select one of the following trust mode options:
        - **Untrusted**. Do not trust any CoS packet marking at ingress.
        - **802.1p**. The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues. The default mode is 802.1p.
        - **DSCP**. The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.

7. Click the **Apply** button.
   Your settings are saved.
Configure CoS Interface Settings for an Interface

You can configure the trust mode for one or more interfaces and apply an interface shaping rate to all interfaces or to a specific interface.

**To configure CoS settings for an interface:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **QoS > CoS > Advanced > CoS Interface Configuration**.

   ![CoS Interface Configuration](image)

6. Click the **LAG** link to display all LAG interfaces or click the **All** link to display both all physical and all LAG interfaces.

7. Select one or more interfaces by taking one of the following actions:
   
   - To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
To configure all interfaces with the same settings, select the check box in the heading row.

8. From the **Interface Trust Mode** menu, select one of the following trust mode options for ingress traffic on the selected interfaces:
   - **Untrusted**. Do not trust any CoS packet marking at ingress.
   - **802.1p**. The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues. The default is 802.1p.
   - **DSCP**. The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.

9. In the **Interface Shaping Rate** field, specify the maximum bandwidth allowed.
   This is typically used to shape the outbound transmission rate in increments of 64 kbps in the range 16 to 16384 kbps. This value is controlled independently of any per-queue maximum bandwidth configuration. It is effectively a second-level shaping mechanism. The default is 0. The value 0 means that the maximum is unlimited.

   The expected shaping at egress interface is calculated as follows:
   \[
   \text{frameSize} \times \frac{\text{shaping}}{\text{frameSize} + \text{IFG}}, \quad \text{where } \text{IFG} (\text{Inter frame gap}) \text{ is } 20 \text{ bytes},
   \]
   \[
   \text{frameSize} \text{ is configured frame size, and shaping is configured traffic shaping.}
   \]

   For example, when 64 bytes frame size and 64 kbps shaping are configured, expected shaping is approximately 48 kbps.

10. Click the **Apply** button.
   Your settings are saved.

## Configure CoS Queue Settings for an Interface

You can define what a particular queue does by configuring switch egress queues. User-configurable parameters control the amount of bandwidth used by the queue, the queue depth during times of congestion, and the scheduling of packet transmission from the set of all queues on a port. Each port contains its own CoS queue-related configuration.

The configuration process is simplified by allowing each CoS queue parameter to be configured globally or per port. A global configuration change is automatically applied to all ports in the system.

**To configure CoS queue settings for an interface:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.

   The System Information page displays.

5. Select QoS > CoS > Advanced > Interface Queue Configuration.

6. Click the LAG link to display all LAG interfaces or click the All link to display both all physical and all LAG interfaces.

7. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.

8. From the Queue ID menu, select the queue to be configured.

9. In the Minimum Bandwidth field, specify the minimum guaranteed bandwidth allotted to the queue.

   Setting this value higher than its corresponding maximum bandwidth automatically increases the maximum to the same value. The default is 0. The valid range is 0 to 100 in increments of 1. The value 0 means no guaranteed minimum. The sum of the individual minimum bandwidth values for all queues for the interface cannot exceed the defined maximum (100).

10. From the Scheduler Type menu, select one of the following options:
   • Strict. Services traffic with the highest priority on a queue first.
• **Weighted.** Weighted round robin associates a weight to each queue. This is the default setting.

The Queue Management Type field displays the queue depth management technique that is used for queues on the interface. By default, this method is Taildrop, irrespective of your selection from the **Scheduler Type** menu.

11. Click the **Apply** button.
Your settings are saved.

### 802.1p to Queue Mapping

You can view and change which internal traffic classes are mapped to the 802.1p priority class values in Ethernet frames that the device receives. The priority-to-traffic class mappings can be applied globally or per interface. The mapping allows the switch to group various traffic types (for example, data or voice) based on their latency requirements and give preference to time-sensitive traffic.

**To map 802.1p priorities to queues:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.

   The System Information page displays.

5. Select **QoS > CoS > Advanced > 802.1p to Queue Mapping.**

![802.1p to Queue Mapping](image_url)
6. In the 802.1p to Queue Mapping table, map each of the eight 802.1p priorities to a queue (internal traffic class).

   The 802.1p Priority row contains traffic class selectors for each of the eight 802.1p priorities to be mapped. The priority goes from low (0) to high (7). For example, traffic with a priority of 0 is for most data traffic and is sent using best effort. Traffic with a higher priority, such as 7, might be time-sensitive traffic, such as voice or video.

   The values in the menu under each priority represent the traffic class. The traffic class is the hardware queue for a port. Higher traffic class values indicate a higher queue position. Before traffic in a lower queue is sent, it must wait for traffic in higher queues to be sent.

7. Click the **Apply** button.

   Your settings are saved.

**DSCP to Queue Mapping**

You can map an internal traffic class to a DSCP value.

**To map DSCP values to queues:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **QoS > CoS > Advanced > DSCP to Queue Mapping**.
6. For each DSCP value, select from the corresponding **Queue** menu which internal traffic class must be mapped to the DSCP value.

The traffic class is the hardware queue for a port. Higher traffic class values indicate a higher queue position. Before traffic in a lower queue is sent, it must wait for traffic in higher queues to be sent.

The allowed Per Hop Behavior (PHBs) values, apart from other DSCP experimental values, are as follows:

- **Class Selector (CS) PHB.** These values are based on IP precedence.
- **Assured Forwarding (AF) PHB.** These values define four main levels to sort and manipulate some flows within the network.
- ** Expedited Forwarding (EF) PHB.** These values are used to prioritize traffic for real-time applications. In many situations, if the network exceeded traffic and you need some bandwidth guaranteed for an application, the EF traffic must receive this rate independently of the intensity of any other traffic attempting to transit the node.

7. Click the **Apply** button.

Your settings are saved.

**Manage Differentiated Services**

The QoS feature contains Differentiated Services (DiffServ) support that allows traffic to be classified into streams and given certain QoS treatment in accordance with defined per-hop behaviors.

Standard IP-based networks are designed to provide best effort data delivery service. Best effort service implies that the network delivers the data in a timely fashion, although there is no guarantee. During times of congestion, packets might be delayed, sent sporadically, or dropped. For typical Internet applications, such as email and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. Conversely, any degradation of service can negatively affect applications with strict timing requirements, such as voice or multimedia.
DiffServ Configuration Overview

To use DiffServ for QoS, you must enable DiffServ (see Enable the DiffServ Mode and View the DiffServ Status on page 168) and define the following categories and their criteria:

1. **Class.** Create classes and define class criteria (see Configure a DiffServ Class on page 170).
2. **Policy.** Create policies, associate classes with policies, and define policy statements (see Configure a DiffServ Policy on page 180).
3. **Service.** Add a policy to an inbound interface (see Configure the DiffServ Service Interface on page 185).

Packets are classified and processed based on defined criteria. The classification criteria are defined by a class. The processing is defined by a policy’s attributes. Policy attributes can be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs. A policy can contain multiples classes. When the policy is active, the actions taken depend on which class matches the packet.

Packet processing begins by testing the class match criteria for a packet. A policy is applied to a packet when a class match within that policy is found.

Configure DiffServ Settings

Packets are filtered and processed based on defined criteria. The filtering criteria is defined by a class. The processing is defined by a policy’s attributes. Policy attributes can be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs.

The configuration process begins with defining one or more match criteria for a class. Then one or more classes are added to a policy. Policies are then added to interfaces.

Packet processing begins by testing the match criteria for a packet. The **All** class type option specifies that each match criteria within a class must evaluate to true for a packet to match that class. The **Any** class type option specifies that at least one match criteria must evaluate to true for a packet to match that class. Classes are tested in the order in which they were added to the policy. A policy is applied to a packet when a class match within that policy is found.

Enable the DiffServ Mode and View the DiffServ Status

You can enable the DiffServ mode and view the DiffServ general status group information, which includes the current administrative mode setting as well as the current and maximum number of rows in each of the main DiffServ private MIB tables.

**To enable the DiffServ mode and view the DiffServ status**

1. Connect your computer to the same network as the switch.

You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select QoS > DiffServ > Basic > DiffServ Configuration.
6. Select the administrative mode for DiffServ:
   • **Enable.** Differentiated services are active.
   • **Disable.** The DiffServ configuration is retained and can be changed but is not active.
7. Click the Apply button.
   Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 38. DiffServ Status information**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</thead>
<tbody>
<tr>
<td>Class table</td>
<td>The number of configured DiffServ classes out of the total allowed on the switch.</td>
</tr>
<tr>
<td>Class Rule table</td>
<td>The number of configured class rules out of the total allowed on the switch.</td>
</tr>
<tr>
<td>Policy table</td>
<td>The number of configured policies out of the total allowed on the switch.</td>
</tr>
<tr>
<td>Policy Instance table</td>
<td>The number of configured policy class instances out of the total allowed on the switch.</td>
</tr>
</tbody>
</table>
Configure a DiffServ Class

You can add a new DiffServ class name or rename or delete an existing class. You can also define the criteria to associate with a DiffServ class. As packets are received, these DiffServ classes are used to prioritize packets. You can set up multiple match criteria in a class. The logic is a Boolean logical AND for this criteria. After creating a class, click the class link to the Class page.

Create and Configure a DiffServ Class

To create and configure a DiffServ class:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch's password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select QoS > DiffServ > Advanced > Class Configuration.
6. In the **Class Name** field, enter a class name.
   The **Class Name** field also lists all the existing DiffServ class names, from which one can be selected for modification or deletion.

7. From the **Class Type** menu, select the class type.
   The switch supports only the class type value **All**, which means that all the various match criteria defined for the class are satisfied for a packet match. **All** signifies the logical AND statement of all the match criteria. You can select the class type only when you are creating a new class. After the class is created, the **Class Type** field becomes nonconfigurable.

8. Click the **Add** button.
   The new class is added.

9. After creating the class, click the class name.
   The class name is a hyperlink to the page on which you can define the class configuration.

10. Define the criteria that must be associated the DiffServ class:
    - **Match Every**. Select this radio button to add a match condition that considers all packets to belong to the class. The only selection from the **Match Every** menu is **Any**.
    - **Reference Class**. Select this radio button to reference another class for criteria. The match criteria defined in the reference class function as match criteria in addition to the match criteria that you define for the selected class. After you select the radio button, the classes that can be referenced are displayed. Select the class to reference. A class can reference at most one other class of the same type.
- **Class of Service.** Select this radio button to require the Class of Service (CoS) value in an Ethernet frame header to match the specified CoS value. This option lists all the values for the Class of Service match criterion in the range 0 to 7 from which one can be selected.

- **VLAN.** Select this radio button to require a packet’s VLAN ID to match a VLAN ID or a VLAN ID within a continuous range. If you configure a range, a match occurs if a packet's VLAN ID is the same as any VLAN ID within the range. The VLAN value is in the range of 1–4093.

- **Ethernet Type.** Select this radio button to require the EtherType value in the Ethernet frame header to match the specified EtherType value. After you select the radio button, specify the EtherType keyword from the list of common protocols that are mapped to their Ethertype value.

- **Source MAC.** Select this radio button to require a packet’s source MAC address to match the specified MAC address. After you select this radio button, use the following fields to configure the source MAC address match criteria:
  - **Address.** The source MAC address to match.
  - **Mask.** The MAC mask, which specifies the bits in the source MAC address to compare against the Ethernet frame. Use Fs and zeros to configure the MAC mask. An F means that the bit is checked, and a zero in a bit position means that the data is not significant. For example, if the MAC address is aa:bb:cc:dd:ee:ff, and the mask is ff:ff:00:00:00:00, all MAC addresses with aa:bb:xx:xx:xx:xx result in a match (where x is any hexadecimal number). Note that this is not a wildcard mask, which ACLs use.

- **Destination MAC.** Select this radio button to require a packet’s destination MAC address to match the specified MAC address. After you select the radio button, use the following fields to configure the destination MAC address match criteria:
  - **Address.** The destination MAC address to match.
  - **Mask.** The MAC mask, which specifies the bits in the destination MAC address to compare against an Ethernet frame. Use Fs and zeros to configure the MAC mask. An F means that the bit is checked, and a zero in a bit position means that the data is not significant. For example, if the MAC address is aa:bb:cc:dd:ee:ff, and the mask is ff:ff:00:00:00:00, all MAC addresses with aa:bb:xx:xx:xx:xx result in a match (where x is any hexadecimal number). Note that this is not a wildcard mask, which ACLs use.

- **Protocol Type.** Select this radio button to require a packet’s Layer 4 protocol to match the specified protocol, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter a protocol number from 0 to 255.

- **Source IP.** Select this radio button to require a packet’s source IP address to match the specified IP address. After you select the radio button, use the following fields to configure the source IP address match criteria:
  - **Address.** The source IP address format to match in dotted-decimal.
  - **Mask.** The bit mask in IP dotted-decimal format indicating which parts of the source IP address to use for matching against packet content.
• **Source L4 Port.** Select this radio button to require a packet’s TCP/UDP source port to match the specified protocol, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter a source port number.

• **Destination IP.** Select this radio button to require a packet’s destination IP address to match the specified IP address. After you select the radio button, use the following fields to configure the destination IP address match criteria:
  - **Address.** The destination IP address format to match in dotted-decimal.
  - **Mask.** The bit mask in IP dotted-decimal format indicating which parts of the destination IP address to use for matching against packet content.

• **Destination L4 Port.** Select this radio button to require a packet’s TCP/UDP destination port to match the specified protocol, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter a destination port number.

• **IP DSCP.** Select this radio button to require the packet’s IP DiffServ Code Point (DSCP) value to match the specified IP DSCP keyword code, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter an IP DSCP value from 0 to 63. The DSCP value is defined as the high-order 6 bits of the Service Type octet in the IP header.

• **Precedence Value.** Select this radio button to require the packet’s IP precedence value to match the specified number from 0 to 7, which you must select from the menu. The IP Precedence field in a packet is defined as the high-order 3 bits of the Service Type octet in the IP header.

• **IP ToS.** Select this radio button to require the packet’s Type of Service (ToS) bits in the IP header to match the specified value. The IP ToS field in a packet is defined as all 8 bits of the service type octet in the IP header. After you select the radio button, use the following fields to configure the ToS match criteria:
  - **Bits Value.** Enter a two-digit hexadecimal number octet value in the range from 00 to ff to match the bits in a packet’s ToS field.
  - **Bit Mask.** Specify the bit positions that are used for comparison against the IP ToS field in a packet.

11. Click the **Apply** button.
   
   Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 39. DiffServ Class Configuration, Class Summary information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Match Criteria</td>
<td>The configured match criteria for the specified class.</td>
</tr>
<tr>
<td>Values</td>
<td>The values of the configured match criteria.</td>
</tr>
</tbody>
</table>
Rename an Existing DiffServ Class

**To rename an existing DiffServ class:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Class Configuration**.

   The Class Name page displays.

6. Select the check box next to the class name.

7. In the **Class Name** field, specify the new name.

8. Click the **Apply** button.

   Your settings are saved.

Change the Criteria for an Existing DiffServ Class

**To change the criteria for an existing DiffServ class:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Class Configuration**.
The Class Name page displays.

6. Click the class name, which is a hyperlink.
   The page on which you can change the class configuration displays.

7. Change the class configuration as needed.
8. Click the **Apply** button.
   Your settings are saved.

Delete a DiffServ Class

**To delete a DiffServ class:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Class Configuration**.
   The Class Name page displays.

6. Select the check box next to the class name.
7. Click the **Delete** button.
   The class is removed.

Configure DiffServ IPv6 Class Settings

The IPv6 class configuration feature extends the existing QoS ACL and DiffServ functionality by providing support for IPv6 packet classification. An Ethernet IPv6 packet is distinguished from an IPv4 packet by its unique Ethertype value, so all IPv6 classifiers include the Ethertype field. An IPv6 access list serves the same purpose as its IPv4 counterpart.

Before the introduction of the IPv6 class feature, any DiffServ class definition was assumed to apply to an IPv4 packet. That is, any match item in a class rule was interpreted in the context of an IPv4 header. An example is a class rule that specifies an L4 port match value. With the introduction of the IPv6 match capability, you must specify if this class rule is for IPv4
or for IPv6 packets. To facilitate this distinction, a class configuration parameter is added to specify whether a class applies to IPv4 or IPv6 packet streams.

The destination and source IPv6 addresses use a prefix length value instead of an individual mask to qualify them as a subnet addresses or a host addresses. The flow label is a 20-bit number that is unique to an IPv6 packet, used by end stations to signify some form of Quality of Service (QoS) handling in routers.

Packets that match an IPv6 classifier are allowed to be marked using only the 802.1p (CoS) field or the IP DSCP field in the traffic Class octet. IP precedence is not defined for IPv6. This is not an appropriate type of packet marking.

IPv6 ACL/DiffServ assignment is appropriate for LAG interfaces. The procedures described by an ACL or DiffServ policy are equally applicable on a LAG interface.

Create and Configure an IPv6 DiffServ Class

**To create and configure an IPv6 DiffServ class:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > IPv6 Class Configuration**.

   ![IPv6 Class Configuration](image)

6. Enter a class name in the **Class Name** field.
   
   The **Class Name** field also lists all the existing IPv6 class names, from which one can be selected for modification or deletion.

7. From the **Class Type** menu, select the class type.
   
   The switch supports only the class type value **All**, which means that all the various match criteria defined for the class are satisfied for a packet match. **All** signifies the logical AND
statement of all the match criteria. You can select the class type only when you are creating a new class. After the class is created, the **Class Type** field becomes nonconfigurable.

8. Click the **Add** button.

The new class is added.

9. After creating the class, click the class name.

The class name is a hyperlink to the page on which you can define the class configuration.

10. Define the criteria that must be associated the IPv6 DiffServ class:

    • **Match Every**. Select this radio button to add a match condition that considers all packets to belong to the class. The only selection from the **Match Every** menu is **Any**.

    • **Reference Class**. Select this radio button to reference another class for criteria. The match criteria defined in the reference class function as match criteria in addition to the match criteria that you define for the selected class. After selecting this option, the classes that can be referenced are displayed. Select the class to reference. A class can reference at most one other class of the same type.

    • **Protocol Type**. Select this radio button to require a packet's Layer 4 protocol to match the specified protocol, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter a protocol number from 0 to 255.

    • **Source IP**. Select this radio button to require a packet’s source prefix and prefix length to match the source IPv6 prefix and prefix length that you must specify in the **Prefix** and **Length** fields. (The prefix must always be specified with the prefix length.) The prefix can be in the hexadecimal range from 0 to FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF and the prefix length can be in the range from 0 to 128.

    • **Source L4 Port**. Select this radio button to require a packet’s TCP/UDP source port to match the specified protocol, which you must select from the menu. The range is 0 to 65535. The menu includes **Other** as an option for unnamed ports.
- **Destination IP.** Select this radio button to require a packet’s destination prefix and prefix length to match the source IPv6 prefix and prefix length that you must specify in the Prefix and Length fields. (The prefix must always be specified with the prefix length.) The prefix can be in the hexadecimal range from 0 to 0FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF and the prefix length can be in the range from 0 to 128.

- **Destination L4 Port.** Select this radio button to require a packet’s TCP/UDP destination port to match the specified protocol, which you must select from the menu. The range is 0 to 65535. The menu includes Other as an option for unnamed ports.

- **IP DSCP.** Select this radio button to require the packet’s IP DiffServ Code Point (DSCP) value to match the specified IP DSCP keyword code, which you must select from the menu. The menu includes Other as a selection, which lets you enter an IP DSCP value from 0 to 63. The DSCP value is defined as the high-order 6 bits of the Service Type octet in the IP header.

11. Click the **Apply** button.

Your settings are saved.

**Rename an Existing IPv6 DiffServ Class**

**To rename an existing IPv6 DiffServ class:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select QoS > DiffServ > Advanced > IPv6 Class Configuration.

   The Class Name page displays.

6. Select the check box next to the class name.

7. In the **Class Name** field, specify the new name.

8. Click the **Apply** button.

   Your settings are saved.
Change the Criteria for an Existing IPv6 DiffServ Class

**To change the criteria for an existing IPv6 DiffServ class:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch on page 11**.
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.

5. Select **QoS > DiffServ > Advanced > IPv6 Class Configuration**.
   - The Class Name page displays.

6. Click the class name, which is a hyperlink.
   - The page on which you can change the class configuration displays.

7. Change the class configuration as needed.

8. Click the **Apply** button.
   - Your settings are saved.

Delete an IPv6 DiffServ Class

**To delete an IPv6 DiffServ class:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see **Change the Default IP Address of the Switch on page 11**.
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.

   The System Information page displays.
5. Select **QoS > DiffServ > Advanced > IPv6 Class Configuration**.
   The Class Name page displays.

6. Select the check box next to the class name.
7. Click the **Delete** button.
   The class is removed.

**Configure a DiffServ Policy**

You can associate a class with a policy.

**Create and Configure a DiffServ Policy**

**To create and configure a DiffServ policy:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Policy Configuration**.

6. Enter a policy name in the **Policy Name** field.
   You cannot specify the policy type. By default, the policy type is **In**, indicating that the policy applies to ingress packets.
7. From the **Member Class** menu, optionally select an existing class that you want to associate with the new policy.

8. Click the **Add** button.

   The new policy is added.

9. After creating the policy, click the policy name.

   The policy name is a hyperlink to the page on which you can define the policy attributes.

10. From the **Assign Queue** menu, select the queue to which packets of this policy class must be assigned.

    This is an integer value in the range 0 to 7.

11. Configure the policy attributes:

    - **Drop**. Select this radio button to require each inbound packet to be dropped.

    - **Mark VLAN CoS**. Select this radio button to specify the VLAN priority, which you must select from the menu. The VLAN priority is expressed as an integer value in the range from 0 to 7.

    - **Mark IP Precedence**. Select this radio button to require packets to be marked with an IP precedence value before being forwarded. You must select an IP precedence value from 0 to 7 from the menu.
• **Mark IP DSCP.** Select this radio button to require packet to be marked with an IP DSCP keyword code, which you must select from the menu. The menu includes **Other** as a selection, which lets you enter an IP DSCP value from 0 to 63. The DSCP value is defined as the high-order 6 bits of the Service Type octet in the IP header.

• **Simple Policy.** Select this radio button to define the traffic policing style for the class. A simple policy uses a single data rate and burst size, resulting in one of two outcomes: conform or violate. You must define the policy as described in the next step.

12. If you select the **Simple Policy** radio button, you can specify the traffic policing style for the class:

   • **Color Mode.** From the menu, select one of the following options:
     - **Color Blind.** This is the default selection. Color classes do not apply.

   **Note:** A valid color class contains a single, non-excluded match criterion for the CoS, IP DSCP, or IP Precedence option. The configured option must not conflict with the classifier of the policy instance itself.

   • **Committed Rate.** Enter the committed rate that is applied to conforming packets by specifying a value in the range from 1 to 65535.<br>

     The switch multiplies the value that you enter by 16 to get the value in kb/s.

13. Select the conforming actions.

The Conform Action section lists the actions to be taken on conforming packets according to the policing metrics. By default, conforming packets are sent.

In the Conform Action section, select one of the following actions:

   • **Send.** Packets are forwarded unmodified. This is the default confirming action and the default violating action.

   • **Drop.** Packets are dropped.

   • **Mark CoS.** Packets are marked by DiffServ with the specified CoS value before being forwarded. This selection requires that the Mark CoS field is set. You must select a CoS value from 0 to 7 from the menu.

   • **Mark IP Precedence.** These packets are marked by DiffServ with the specified IP Precedence value before being forwarded. This selection requires that the Mark IP Precedence field is set. You must select an IP precedence value from 0 to 7 from the menu.

   • **Mark IP DSCP.** Packets are marked by DiffServ with the specified DSCP value before being forwarded. This selection requires that the DSCP field is set. You must select a DSCP code from the menu. The menu includes **Other** as a selection, which lets you enter an IP DSCP value from 0 to 63. The DSCP value is defined as the high-order six bits of the Service Type octet in the IP header.

   **Note:** In the Violate Action section, by default the **Drop** radio button is selected. No other selection is available because the switch always drops packets that violate the policy.
14. Click the **Apply** button.
   
   Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 40. DiffServ policy configuration policy attributes**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Name</td>
<td>Displays the name of the DiffServ policy.</td>
</tr>
<tr>
<td>Policy Type</td>
<td>Displays type of the policy as In.</td>
</tr>
<tr>
<td>Member Class Name</td>
<td>Displays the name of the class instance within the policy.</td>
</tr>
</tbody>
</table>

**Rename an Existing DiffServ Policy**

**To rename an existing DiffServ policy:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Policy Configuration**.
   
   The Policy Configuration page displays.

6. Select the check box next to the policy name.

7. In the **Policy Name** field, specify the new name.

8. Click the **Apply** button.
   
   Your settings are saved.

**Change the Policy Attributes for an Existing DiffServ Policy**

**To change the policy attributes for an existing DiffServ policy:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.
4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.
5. Select QoS > DiffServ > Advanced > Policy Configuration.
   
   The Policy Configuration page displays.
6. Click the policy name, which is a hyperlink.
   
   The page on which you can change the policy attributes displays.
7. Change the policy attributes as needed.
8. Click the Apply button.
   
   Your settings are saved.

Delete a DiffServ Policy

To delete a DiffServ policy:
1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.
4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.
5. Select QoS > DiffServ > Advanced > Policy Configuration.
   
   The Policy Configuration page displays.
6. Select the check box next to the policy name.
7. Click the Delete button.
   
   The policy is removed.
Configure the DiffServ Service Interface

You can activate a policy on an interface.

Attach a DiffServ Policy to an Interface

To attach a DiffServ policy to an interface:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select QoS > DiffServ > Advanced > Service Configuration.

6. Select one or more interfaces by taking one of the following actions:
   • To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   • To configure all interfaces with the same settings, select the check box in the heading row.
7. From the **Policy Name** menu, select a policy name.

8. Click the **Apply** button.

Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 41. Service Interface Configuration information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Shows that the traffic direction of this service interface is In.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>Shows the operational status of this service interface, either Up or Down.</td>
</tr>
</tbody>
</table>

**Remove a DiffServ Policy From an Interface**

**To remove a DiffServ policy from an interface:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [*Change the Default IP Address of the Switch*](#) on page 11.
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
   - The System Information page displays.

5. Select **QoS > DiffServ > Advanced > Service Configuration**.
   - The Service Interface Configuration page displays.

6. Select the check boxes that are associated with the interfaces from which you want to remove the policy.

7. From the **Policy In Name** menu, select **None**.

8. Click the **Apply** button.

   Your settings are saved.
View DiffServ Service Statistics

You can display service-level statistical information about all interfaces to which DiffServ policies are attached.

To view the DiffServ service statistics:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select QoS > DiffServ > Advanced > Service Statistics.

6. Click the Update button to refresh the page with the latest information about the switch.

The following table describes the nonconfigurable information on the page.

Table 42. DiffServ Service Statistics information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>List of all valid slot number and port number combinations on the switch with a DiffServ policy currently attached in the inbound direction.</td>
</tr>
<tr>
<td>Direction</td>
<td>List of the traffic direction of interface as In. Shows only the directions for which a DiffServ policy is currently attached.</td>
</tr>
<tr>
<td>Policy Name</td>
<td>Name of the policy currently attached to the specified interface and direction.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>Operational status of the policy currently attached to the specified interface and direction. The value is either Up or Down.</td>
</tr>
<tr>

<tr>
<td>Discarded Packets</td>
<td>A count of the total number of packets discarded for all class instances in this service policy for any reason due to DiffServ treatment. This is the overall count per interface, per direction. The discarded packets are supported in the inbound direction but not in the outbound direction.</td>
</tr>
<tr>
<td>Member Classes</td>
<td>List of all DiffServ classes currently defined as members of the selected policy name. Select a member class name to display its statistics. If no class is associated with the selected policy, then nothing is populated in the list.</td>
</tr>
</tbody>
</table>

Table 42. DiffServ Service Statistics information (continued)
This chapter contains the following sections:

- **Configure the Management Security Settings**
- **Configure Management Access**
- **Configure Port Authentication**
- **Configure Traffic Control**
- **Configure Access Control Lists**
Configure the Management Security Settings

You can configure the login password, Remote Authorization Dial-In User Service (RADIUS) settings, Terminal Access Controller Access Control System (TACACS) settings, and authentication lists.

Change the Password

You can change the login password.

To change the login password for the local browser interface:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch's password in the Password field.
   - The default password is password.
   - The System Information page displays.

6. In the Old Password field, specify the current password for the account created by the user.
   - The entered password is displayed in dots. Passwords are up to 20 alphanumeric characters in length, and are case sensitive.
7. In the New Password field, specify the optional new or changed password for the account.
The entered password is displayed in dots. Passwords are up to 20 alphanumeric characters in length, and are case sensitive.

8. In the **Confirm Password** field, enter the password again to confirm that you entered it correctly.

The entered password is displayed in dots.

9. Click the **Apply** button.

Your settings are saved.

---

**Note:** If you forget the password and are unable to log in to the switch local browser interface, press the **Factory Defaults** button on the front panel of the switch for more than five seconds. The device reboots, and all switch settings, including the password, are reset to the factory default values.

---

**Configure RADIUS Servers**

RADIUS servers provide additional security for networks. The RADIUS server maintains a user database, which contains per-user authentication information. The switch passes information to the configured RADIUS server, which can authenticate a user name and password before authorizing use of the network. RADIUS servers provide a centralized authentication method for the following:

- Web access
- Access control port (802.1X)

**Configure the Global RADIUS Server Settings**

You can add information about one or more RADIUS servers on the network.

Consider the maximum delay time when you are configuring RADIUS maximum retransmit and RADIUS time-out values. If multiple RADIUS servers are configured, the maximum retransmit period on each server runs out before the next server is attempted. A retransmit does not occur until the configured time-out period on that server passes without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the retransmit time x time-out period for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces are blocked until the RADIUS application returns a response.

**To configure the global RADIUS server settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   ![RADIUS Configuration Screen]

   The Current Server IP Address field is blank if no servers are configured (see Configure a RADIUS Authentication Server on the Switch on page 193). The switch supports up to three RADIUS servers. If more than one RADIUS server is configured, the current server is the server configured as the primary server. If no servers are configured as the primary server, the current server is the most recently added RADIUS server.

6. In the Max Number of Retransmits field, specify the maximum number of times a request packet is retransmitted to the RADIUS server.
   The valid range is from 1 to 15. The default is 4.

   Consider the maximum delay time when you are configuring RADIUS maximum retransmit and RADIUS time-out values. If multiple RADIUS servers are configured, the maximum retransmit period on each server runs out before the next server is attempted. A retransmit does not occur until the configured time-out period on that server passes without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the retransmit time x time-out period for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces are blocked until the RADIUS application returns a response.

7. In the Timeout Duration field, specify the time-out value, in seconds, for request retransmissions.
   The valid range is from 1 to 30. The default is 5.

   Consider the maximum delay time when you are configuring RADIUS maximum retransmit and RADIUS time-out values. If multiple RADIUS servers are configured, the maximum retransmit period on each server runs out before the next server is attempted. A retransmit does not occur until the configured time-out period on that server passes without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the retransmit time x time-out period for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces are blocked until the RADIUS application returns a response.
without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the retransmit time x time-out period for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces are blocked until the RADIUS application returns a response.

8. From the **Accounting Mode** menu, select to disable or enable RADIUS accounting on the server.

   The default is Disabled.

9. Click the **Apply** button.

   Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 43. RADIUS Configuration information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Server Address</td>
<td>The address of the current server. This field is blank if no servers are configured.</td>
</tr>
<tr>
<td>Number of Configured</td>
<td>The number of configured authentication RADIUS servers. The value can range from 0 to 32.</td>
</tr>
<tr>
<td>Authentication Servers</td>
<td></td>
</tr>
</tbody>
</table>

Configure a RADIUS Authentication Server on the Switch

You can view and configure various settings for a RADIUS server configured on the switch.

Add a Primary RADIUS Authentication Server to the Switch

**To add a primary RADIUS authentication server to the switch and view the RADIUS authentication server statistics:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > Management Security > RADIUS > Server Configuration**.
6. In the **Server Address** field, specify the IP address of the RADIUS server.

7. In the **Authentication Port** field, specify the UDP port number the server uses to verify the RADIUS server authentication.

   The valid range is from 1 to 65535. The default is 1812.

8. From the **Secret Configured** menu, select **Yes**.

   You must select **Yes** before you can configure the RADIUS secret. After you add the RADIUS server, this field indicates whether the shared secret for this server was configured.

9. In the **Secret** field, type the shared secret text string used for authenticating and encrypting all RADIUS communications between the switch and the RADIUS server.

   This secret must match the RADIUS encryption.

10. From the **Active** menu, select **Primary**.

11. From the **Message Authenticator** menu, select **Enable** or **Disable** to specify whether the message authenticator attribute for the selected server is enabled.

   The message authenticator adds protection to RADIUS messages by using an MD5 hash to encrypt each message. The shared secret is used as the key, and if the message fails to be verified by the RADIUS server, it is discarded.

12. Click the **Add** button.

    The server is added to the switch.

13. Click the **Apply** button.

    Your settings are saved.

The following table describes the nonconfigurable information in the Statistics table on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Address</td>
<td>The address of the RADIUS server or the name of the RADIUS server for which the statistics are displayed.</td>
</tr>
<tr>
<td>Round Trip Time</td>
<td>The time interval, in hundredths of a second, between the most recent access-reply/access-challenge and the access-request that matched it from this RADIUS authentication server.</td>
</tr>
</tbody>
</table>
14. To reset the authentication server and RADIUS statistics to their default values, click the **Clear Counters** button.

**Modify the Settings for a RADIUS Authentication Server on the Switch**

**To modify the settings for a RADIUS authentication server on the switch:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Requests</td>
<td>The number of RADIUS access-request packets sent to this server. This number does not include retransmissions.</td>
</tr>
<tr>
<td>Access Retransmissions</td>
<td>The number of RADIUS access-request packets retransmitted to this server.</td>
</tr>
<tr>
<td>Access Accepts</td>
<td>The number of RADIUS access-accept packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>
<td>Access Rejects</td>
<td>The number of RADIUS access-reject packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>
<td>Access Challenges</td>
<td>The number of RADIUS access-challenge packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>

<td>The number of malformed RADIUS access-response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators or signature attributes or unknown types are not included in malformed access-responses.</td>
</tr>
<tr>
<td>Bad Authenticators</td>
<td>The number of RADIUS access-response packets containing invalid authenticators or signature attributes received from this server.</td>
</tr>
<tr>
<td>Pending Requests</td>
<td>The number of RADIUS access-request packets destined for this server that did not yet time out or receive a response.</td>
</tr>
<tr>
<td>Timeouts</td>
<td>The number of authentication time-outs to this server.</td>
</tr>
<tr>
<td>Unknown Types</td>
<td>The number of RADIUS packets of unknown type that were received from this server on the authentication port.</td>
</tr>
<tr>
<td>Packets Dropped</td>
<td>The number of RADIUS packets received from this server on the authentication port and dropped for some other reason.</td>
</tr>
</tbody>
</table>
The default password is `password`.
The System Information page displays.

5. Select **Security > Management Security > RADIUS > Server Configuration**.
   
The Server Configuration page displays.

6. Select the check box next to the server IP address.

7. Modify the configuration for the selected server.

8. Click the **Apply** button.
   
   Your settings are saved.

Remove a RADIUS Authentication Server From the Switch

**To remove a RADIUS authentication server from the switch:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is `password`.

   The System Information page displays.

5. Select **Security > Management Security > RADIUS > Server Configuration**.
   
   The Server Configuration page displays.

6. Select the check box next to the IP address of the server to remove.

7. Click the **Delete** button.
   
   The RADIUS server is removed.

8. Click the **Apply** button.
   
   Your settings are saved.
Configure a RADIUS Accounting Server
You can view and configure various settings for a RADIUS accounting server on the network.

Add a RADIUS Accounting Server to the Switch
To add a RADIUS accounting server to the switch and view the RADIUS accounting server statistics:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   The following figure does not show the Accounting Server Statistics section.

6. In the Accounting Server Address field, specify the IP address of the RADIUS accounting server to add.

7. In the Port field, specify the UDP port number the server uses to verify the RADIUS accounting server authentication. The default UDP port number is 1813.

8. From the Secret Configured menu, select Yes to add a RADIUS secret in the next field.
   You must select Yes before you can configure the RADIUS secret. After you add the RADIUS accounting server, this field indicates whether the shared secret for this server was configured.

9. In the Secret field, type the shared secret to use with the specified accounting server.

10. From the Accounting Mode menu, select Enable to enable the RADIUS accounting mode.
11. Click the **Add** button.
   The server is added to the switch.

12. Click the **Apply** button.
   Your settings are saved.

13. The following table describes the nonconfigurable information in the Accounting Server Statistics table on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting Server Address</td>
<td>The accounting server associated with the statistics.</td>
</tr>
<tr>
<td>Round Trip Time (secs)</td>
<td>The time interval, in hundredths of a second, between the most recent</td>

</tbody>
</table>

14. To reset the accounting server and RADIUS statistics to their default values, click the **Clear Counters** button.

Modify the Settings for a RADIUS Accounting Server on the Switch

**To modify the settings for a RADIUS accounting server on the switch:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
   The Accounting Server Configuration page displays.
6. Select the check box next to the server IP address.
7. Modify the configuration for the selected accounting server.
8. Click the Apply button.
   Your settings are saved.

Remove a RADIUS Accounting Server From the Switch

**To a remove a RADIUS accounting server from the switch:**
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
   The Accounting Server Configuration page displays.
6. Click the Delete button.
   The RADIUS accounting server is removed.
7. Click the Apply button.
   Your settings are saved.
Configure TACACS+

TACACS+ provides a centralized user management system, while still retaining consistency with RADIUS and other authentication processes. TACACS+ provides the following services:

- **Authentication.** Provides authentication during login and through user names and user-defined passwords.
- **Authorization.** Performed at login. When the authentication session is completed, an authorization session starts using the authenticated user name. The TACACS+ server checks the user privileges.

The TACACS+ protocol ensures network security through encrypted protocol exchanges between the device and TACACS+ server.

Configure the Global TACACS+ Settings

The TACACS+ Configuration page contains the TACACS+ settings for communication between the switch and the TACACS+ server that you configure.

**To configure the global TACACS+ settings:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#).
   - The login window opens.

4. Enter the switch’s password in the **Password** field.
   - The default password is `password`.
   - The System Information page displays.

5. Select **Security > Management Security > TACACS+ > TACACS+ Configuration**.

6. In the **Key String** field, specify the authentication and encryption key for TACACS+ communications between the switch and the TACACS+ server.
   - The valid range is 0–128. The key must match the key configured on the TACACS+ server.

7. In the **Connection Timeout** field, specify the maximum number of seconds allowed to establish a TCP connection between the switch and the TACACS+ server.
8. Click the **Apply** button.
Your settings are saved.

Configure a TACACS+ Server on the Switch
You can configure up to five TACACS+ servers with which the switch can communicate.

**To configure a TACACS+ server on the switch:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Security > Management Security > TACACS+ > TACACS+ Server Configuration**.

6. In the **TACACS+ Server** field, enter the TACACS+ server IP address.

7. In the **Priority** field, specify the priority for the TACACS+ server.
   The priority determines the order in which the TACACS+ servers are contacted when attempting to authenticate a user. A value of 0 is the highest priority. The valid range is 0–65535.

8. In the **Port** field, specify the authentication port value for TACAS+ server sessions. It must be within the range 0–65535. If you do not specify a value, the switch uses the standard TCP port 49 for sessions with the server.

9. In the **Key String** field, specify the authentication and encryption key for TACACS+ communications between the device and the TACACS+ server.
   The valid range is 0–128. The key must match the key used on the TACACS+ server.

10. In the **Connection Timeout** field, specify the time that passes before the connection between the device and the TACACS+ server times out.
    The range is 1–30. If you do not specify a value, the switch uses a default of 5.
11. Click the **Add** button.  
   The server is added to the switch.

12. Click the **Apply** button.  
   Your settings are saved.

**Configure Authentication Lists**

You can configure the default login list. A login list specifies one or more authentication methods to validate switch or port access for the admin user.

**Configure an HTTP Authentication List**

You can configure the default HTTP login list.

**To change the HTTP authentication method for the default list:**

1. Connect your computer to the same network as the switch.  
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.  
   The default password is **password**.
   The System Information page displays.

5. Select **Security > Management Security > Authentication List > HTTP Authentication List**.

6. Select the check box next to the **httpList** name.
7. From the menu in the 1 column, select the authentication method that must be used first in the selected authentication login list.

If you select a method that does not time out as the first method, such as Local, no other method is tried, even if you specified more than one method. User authentication occurs in the order the methods are selected. Possible methods are as follows:

- **Local.** The user’s locally stored ID and password are used for authentication. Since the Local method does not time out, if you select this option as the first method, no other method is tried, even if you specified more than one method.
- **RADIUS.** The user’s ID and password are authenticated using the RADIUS server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch uses Method 2 to authenticate the user.
- **TACACS+.** The user’s ID and password are authenticated using the TACACS+ server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch attempts user authentication Method 2.
- **None.** The authentication method is unspecified. This option is available only for Method 2 and Method 3.

8. From the menu in the 2 column, select the authentication method, if any, that must be used second in the selected authentication login list.

This is the method that is used if the first method times out. If you select a method that does not time out as the second method, the third method is not tried.

9. From the menu in the 3 column, select the authentication method, if any, that must be used third in the selected authentication login list.

10. From the menu in the 4 column, select the method, if any, that must be used fourth in the selected authentication login list.

This is the method that is used if all previous methods time out.

11. Click the **Apply** button.

Your settings are saved.

**Configure an HTTPS Authentication List**

You can configure the default login list for secure HTTP (HTTPS).

**To configure an HTTPS authentication list:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Security > Management Security > Authentication List > HTTPS Authentication List**.

   ![Management Security HTTPS Authentication List](image)

6. Select the check box next to the **httpsList** name.

7. From the menu in the 1 column, select the authentication method that must be used first in the selected authentication login list.
   If you select a method that does not time out as the first method, such as **Local**, no other method is tried, even if you specified more than one method. This setting does not display when you first create a new login list. User authentication occurs in the order the methods are selected. Possible methods are as follows:
   - **Local**. The user’s locally stored ID and password are used for authentication. Since the Local method does not time out, if you select this option as the first method, no other method is tried, even if you specified more than one method.
   - **RADIUS**. The user’s ID and password are authenticated using the RADIUS server. If you select **RADIUS** or **TACACS+** as the first method and an error occurs during the authentication, the switch uses Method 2 to authenticate the user.
   - **TACACS+**. The user’s ID and password are authenticated using the TACACS+ server. If you select **RADIUS** or **TACACS+** as the first method and an error occurs during the authentication, the switch attempts user authentication Method 2.
   - **None**. The authentication method is unspecified. This option is only available for Method 2 and Method 3.

8. From the menu in the 2 column, select the authentication method, if any, that must be used second in the selected authentication login list.
   This is the method that is used if the first method times out. If you select a method that does not time out as the second method, the third method is not tried.

9. From the menu in the 3 column, select the authentication method, if any, that must be used third in the selected authentication login list.

10. From the menu in the 4 column, select the method, if any, that must be used fourth in the selected authentication login list.
This is the method that is used if all previous methods time out.

11. Click the **Apply** button.
    
    Your settings are saved.

## Configure Management Access

You can configure HTTP and secure HTTP access to the switch local browser interface. You can also configure access control profiles and access rules.

### Configure HTTP Settings

You can configure the HTTP settings on the switch.

**To configure the HTTP server settings:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Security > Access > HTTP > HTTP Configuration**.

   ![HTTP Configuration](image)

6. In the **HTTP Session Soft Timeout** field, specify the number of minutes an HTTP session can be idle before a time-out occurs.

   The value must be in the range of 0–60 minutes. The default is 5 minutes. The currently configured value is shown when the web page is displayed.
After the session is inactive for the configured time, you are automatically logged out and must reenter the password to access the local browser interface. A value of zero means that the session does not time out.

7. In the **HTTP Session Hard Timeout** field, specify the hard time-out for HTTP sessions.
   
   This time-out is unaffected by the activity level of the session. The value must be in the range of 0–168 hours. A value of zero means that the session does not time out. The default is 24 hours.

8. In the **Maximum Number of HTTP Sessions** field, specify the maximum number of HTTP sessions that can exist at the same time.

9. Click the **Apply** button.
   
   Your settings are saved.

### Configure HTTPS Settings

Secure HTTP enables the transmission of HTTP over an encrypted Secure Sockets Layer (SSL) or Transport Layer Security (TLS) connection. When you manage the switch by using a web interface, Secure HTTP can help ensure that communication between the management system and the switch is protected from eavesdroppers and man-in-the-middle attacks.

You can configure the settings for HTTPS communication between the management station and the switch.

**To configure HTTPS settings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > Access > HTTPS > HTTPS Configuration**.
6. Select the HTTPS Admin Mode **Enable** or **Disable** radio button.

   This enables or disables the administrative mode of secure HTTP (HTTPS). The configured value is displayed. The default is Disable. You can download SSL certificates only when the HTTPS admin mode is disabled. HTTPS admin mode can be enabled only if a certificate is present on the device.

7. Select the TLS Version 1.2 **Enable** or **Disable** radio button.

   This enables or disables Transport Layer Security version 1.0. The configured value is displayed. The default is Enable.

8. In the **HTTPS Port** field, type the HTTPS port number.

   The value must be in the range of 1025 to 65535. Port 443 is the default port. The configured value is displayed.

9. In the **HTTPS Session Soft Timeout (Minutes)** field, enter the inactivity time-out for HTTPS sessions.

   The value must be in the range of 1 to 60 minutes. The default is 5 minutes. The configured value is displayed.

10. In the **HTTPS Session Hard Timeout (Hours)** field, set the hard time-out for HTTPS sessions.

    This time-out is unaffected by the activity level of the session. The value must be in the range of 1 to 168 hours. The default is 24 hours.

11. In the **Maximum Number of HTTPS Sessions** field, enter the maximum allowable number of HTTPS sessions.

    The value must be in the range of 0 to 4. The default is 4.

12. Click the **Apply** button.

    Your settings are saved.

Manage Certificates

You can manage certificates.
Generate an SSL Certificate

To generate an SSL certificate:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   ![Certificate Management](image)

   The Certificate Present field displays whether a certificate is present on the switch.

6. In the Certificate Management area, select Generate Certificates.

7. Click the Apply button.
   The switch generates an SSL certificate.
   The Certificate Generation Status field shows information about the progress.

Delete an SSL Certificate

To delete an SSL certificate:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.  
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.  
   The login window opens.  

4. Enter the switch’s password in the Password field.  
   The default password is password.  
   The System Information page displays.  

   The Certificate Present field displays Yes.  

7. In the Certificate Management area, select Delete Certificates.  
8. Click the Apply button.  
   The certificate is removed.  

Download Certificates  
You can transfer a certificate file to the switch.  
For the web server on the switch to accept HTTPS connections from a management station, the web server needs a public key certificate. You can generate a certificate externally (for example, offline) and download it to the switch.  
Before you download a file to the switch, the following conditions must be true:  
• The file to download from the TFTP server is on the server in the appropriate directory.  
• The file is in the correct format.  
• The switch contains a path to the TFTP server.  

To configure the certificate download settings for HTTPS sessions:  
1. Connect your computer to the same network as the switch.  
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.  

2. Launch a web browser.  
3. In the address field of your web browser, enter the IP address of the switch.  
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.  
   The login window opens.  

4. Enter the switch’s password in the Password field.  
   The default password is password.
The System Information page displays.

5. Select **Security > Access > HTTPS > Certificate Download**.

![Certificate Download](image)

**Note:** By default, the selection from the **File Type** menu is **SSL Server Certificate PEM File**. No other selection are available.

6. In the **TFTP Server IP** field, specify the address of the TFTP server.

   The address can be an IP address in standard x.x.x.x format or a host name. The host name must start with a letter of the alphabet. Make sure that the software image or other file to be downloaded is available on the TFTP server.

7. In the **Remote File Name** field, enter the name of the file on the TFTP server to download.

   You can enter up to 32 characters. The default is blank.

8. Select the **Start File Transfer** check box.

9. Click the **Apply** button.

   The file transfer starts. A status message displays during the transfer and upon successful completion of the transfer.

**Configure Access Control**

Access control allows you to configure a profile and set access rules.

Configure an Access Control Profile

You can set-up a security access profile.

**To configure an access profile:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).
The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Security > Access > Access Control > Access Profile Configuration**.

![Access Profile Configuration](image)

6. In the **Access Profile Name** field, enter the name of the access profile to be added.
   The maximum length is 32 characters.

7. Select one of the following check boxes:
   - **Activate Profile**. Activate an access profile.
   - **Deactivate Profile**. Deactivate an access profile.
   - **Remove Profile**. Remove an access profile. The access profile must be deactivated before you remove the access profile.

8. Click the **Apply** button.
   Your settings are saved.

9. To refresh the page with the latest information about the switch, click the **Update** button.

   The following table describes the nonconfigurable information on the page.

   **Table 44. Access profile configuration profile summary**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>The action performed when the rules are matched.</td>
</tr>
<tr>
<td>Service Type</td>
<td>The service type chosen. The policy is restricted by the service type chosen.</td>
</tr>
<tr>
<td>Source IP Address</td>
<td>Source IP address of the client originating the management traffic.</td>
</tr>
<tr>
<td>Mask</td>
<td>The subnet mask of the IP Address.</td>
</tr>
<tr>
<td>Priority</td>
<td>The priority of the rule.</td>
</tr>
</tbody>
</table>
Configure Access Rule Settings

You can add security access rules. You can apply changes to an access rule only when the access profile is in a deactivated state.

**Note:** You must create an access profile before you can add rules.

To configure the access rule settings:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **Security > Access > Access Control > Access Rule Configuration**.

6. From the **Rule Type** menu, select **Permit** or **Deny** to permit or deny access when the selected rules are matched.
   
   A Permit rule allows access by traffic that matches the rule criteria. A Deny rule blocks traffic that matches the rule criteria.

7. From the **Service Type** menu, select the access method to which the rule is applied.
   
   The policy is restricted by the selected access method. Possible access methods are **HTTP**, **Secure HTTP (SSL)**, and **SNMP**.

8. In the **Source IP Address** field, enter the source IP address of the client originating the management traffic.

9. In the **Mask** field, specify the subnet mask of the client that originates the management traffic.
10. In the **Priority** field, assign a priority to the rule.  
   The rules are validated against the incoming management request in ascending order of their priorities. If a rule matches, the action is performed and subsequent rules below that are ignored. For example, if a source IP 10.10.10.10 is configured with priority 1 to permit, and source IP 10.10.10.10 is configured with priority 2 to deny, then access is permitted if the profile is active, and the second rule is ignored.

11. Click the **Add** button.  
   The access rule is added.

### Configure Port Authentication

With port-based authentication, when 802.1X is enabled globally and on the port, successful authentication of any one supplicant attached to the port results in all users being able to use the port without restrictions. At any given time, only one supplicant is allowed to attempt authentication on a port in this mode. Ports in this mode are under bidirectional control. This is the default authentication mode.

An 802.1X network includes three components:

- **Authenticators.** The port that is authenticated before system access is permitted.
- **Supplicants.** The host connected to the authenticated port requesting access to the system services.
- **Authentication Server.** The external server, for example, the RADIUS server that performs the authentication on behalf of the authenticator, and indicates whether the user is authorized to access system services.

### Configure Global 802.1X Settings

You can configure global port access control settings on the switch.

**To globally enable all 802.1X features:**

1. Connect your computer to the same network as the switch.  
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.  
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).  
   The login window opens.

4. Enter the switch’s password in the **Password** field.
The default password is **password**.
The System Information page displays.

5. Select **Security > Port Authentication > Basic > 802.1X Configuration**.

![Port Authentication configuration interface](image)

6. Next to Port Based Authentication State, select the **Enable** radio button.
This enables or disables 802.1X administrative mode on the switch.

**Note:** If 802.1X is enabled, authentication is performed by a RADIUS server. This means that the primary authentication method must be RADIUS. To set the method, select **Security > Management Security > Authentication List** and select **RADIUS** as method 1 for defaultList. For more information, see **Configure Authentication Lists** on page 202.

When port-based authentication is globally disabled, the switch does not check for 802.1X authentication before allowing traffic on any ports, even if the ports are configured to allow only authenticated users.

7. Next to EAPOL Flood Mode, select the **Enable** radio button.
The default is Disable. Extensible Authentication Protocol (EAP) over LAN (EAPoL) flood support is enabled on the switch.

8. Click the **Apply** button.
Your settings are saved.

**Manage Port Authentication**

You can enable and configure port access control on one or more ports.

**Configure 802.1X Settings for a Port**

**To configure 802.1X settings for a port:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the **Password** field.

The default password is **password**.

The System Information page displays.

5. Select **Security > Port Authentication > Advanced > Port Authentication**.

The following figure does not show all columns on the page.

![Port Authentication Configuration](image)

6. Select the check box next to the port.

You can also select multiple check boxes to apply the same settings to the selected ports, or select the check box in the heading row to apply the same settings to all ports.

7. Specify the following settings:

   - **Port Control**. Defines the port authorization state. The control mode is set only if the link status of the port is link up. Select one of the following options:
     - **Auto**. The switch automatically detects the mode of the interface.
     - **Authorized**. The switch places the interface into an authorized state without being authenticated. The interface sends and receives normal traffic without client port-based authentication.
     - **Unauthorized**. The switch denies the selected interface system access by moving the interface into unauthorized state. The switch cannot provide authentication services to the client through the interface.
     - **MAC based**. The switch allows multiple supplicants that are connected to the same port to each be authenticated individually. That is, each client that is connected to the port must be authenticated separately in order to gain access to the network. The clients are distinguished by their MAC addresses.
     - **MAC Auth Bypass**. The switch uses MAC-based authentication, in which multiple supplicants that are connected to the same port each must be authenticated individually, but allows MAC-based Authentication Bypass (MAB) on the port for clients that do not support 802.1x.

   - **Guest VLAN ID**. Specify the VLAN ID for the guest VLAN. The valid range is 0–4093. The default is 0. Enter 0 to reset the guest VLAN ID on the interface. The guest VLAN
allows the port to provide a distinguished service to unauthenticated users, after three authentication failures. This feature provides a mechanism to allow users access to hosts on the guest VLAN.

- **Guest VLAN Period.** Specify the number of seconds that the selected port remains in the quiet state following a failed authentication exchange. The guest VLAN time-out must be a value in the range of 1–300. The default is 90.

- **Periodic Reauthentication.** Select Enable to allow periodic reauthentication of the supplicant for the specified port.

- **Reauthentication Period.** Specify the time, in seconds, after which reauthentication of the supplicant occurs. The reauthentication period must be a value in the range of 1–65535. The default is 3600. If this field is disabled, connected clients are not forced to reauthenticate periodically.

- **Quiet Period.** Specify the number of seconds that the port remains in the quiet state following a failed authentication exchange. While in the quiet state, the port does not attempt to acquire a supplicant.

- **Resending EAP.** Specify the EAP retransmit period for the selected port. The transmit period is the value, in seconds, after which an EAPoL EAP Request/Identify frame is resent to the supplicant.

- **Max EAP Requests.** Specify the maximum number of EAP requests for the selected port. The value is the maximum number of times an EAPoL EAP Request/Identity message is retransmitted before the supplicant times out.

- **Supplicant Timeout.** Specify the supplicant time-out for the selected port. The supplicant time-out is the value, in seconds, after which the supplicant times out.

- **Server Timeout.** Specify the time that elapses before the switch resends a request to the authentication server.

8. Click the **Apply** button.

Your settings are saved.

The following table describes the nonconfigurable information on the page.

**Table 45. Port authentication status information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Direction</td>
<td>The control direction for the specified port, which is always Both. The control direction dictates the degree to which protocol exchanges take place between supplicant and authenticator. The unauthorized controlled port exerts control over communication in both directions (disabling both incoming and outgoing frames).</td>
</tr>
<tr>
<td>Protocol Version</td>
<td>The protocol version associated with the selected port. The only possible value is 1, corresponding to the first version of the 802.1X specification.</td>
</tr>
<tr>
<td>PAE Capabilities</td>
<td>The port access entity (PAE) functionality of the selected port. Possible values are Authenticator or Supplicant.</td>
</tr>
</tbody>
</table>
Initialize 802.1X on a Port

To initialize 802.1X on a port:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   The Port Authentication page displays.

6. Select the check box associated with the port to initialize.

7. Click the Initialize button.
802.1X on the selected interface is reset to the initialization state. Traffic sent to and from the port is blocked during the authentication process. This button is available only if the control mode is auto. When you click this button, the action is immediate. You do not need to click the **Apply** button for the action to occur.

**Restart the 802.1X Authentication Process on a Port**

*To restart the 802.1X authentication process on a port:*

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch's password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > Port Authentication > Advanced > Port Authentication**.

   The Port Authentication page displays.

6. Select the check box associated with the port to reauthenticate.

7. Click the **Reauthenticate** button.

   The selected port is forced to restart the authentication process. This button is available only if the control mode is auto. If the button is not selectable, it is grayed out. When you click this button, the action is immediate. You do not need to click the **Apply** button for the action to occur.

**View the Port Summary**

You can view summary information about the port-based authentication settings for each port.

*To view the port summary:*

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Security > Port Authentication > Advanced > Port Summary**.

The following table describes the nonconfigurable information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>The port for which the settings are displayed in the table row.</td>
</tr>
<tr>
<td>Control Mode</td>
<td>This field indicates the configured control mode for the port. Possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Force Unauthorized</strong>. The authenticator port access entity (PAE) unconditionally sets the controlled port to unauthorized.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Force Authorized</strong>. The authenticator PAE unconditionally sets the controlled port to authorized.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Auto</strong>. The authenticator PAE sets the controlled port mode to reflect the outcome of the authentication exchanges between a supplicant, authenticator, and the authentication server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC Based</strong>. The authenticator PAE sets the controlled port mode to reflect the outcome of authentication exchanges between a supplicant, authenticator, and the authentication server on a per-supplicant basis.</td>
</tr>
<tr>
<td></td>
<td>• <strong>MAC Auth Bypass</strong>. The authenticator PAE sets the controlled port mode to reflect the outcome of authentication exchanges between a supplicant, authenticator, and the authentication server on a per-supplicant basis, but allowing MAC-based Authentication Bypass (MAB) on the port for clients that do not support 802.1x.</td>
</tr>
</tbody>
</table>
View the Client Summary

You can view information about supplicant devices that are connected to the local authenticator ports. If no active 802.1X sessions exist, the table is empty.

To view the client summary:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

The following table describes the fields on the Client Summary page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>The port to be displayed.</td>
</tr>
<tr>
<td>User Name</td>
<td>The user name representing the identity of the supplicant device.</td>
</tr>
<tr>
<td>Supplicant MAC Address</td>
<td>The supplicant's device MAC address.</td>
</tr>
<tr>
<td>Session Time</td>
<td>The time since the supplicant logged in seconds.</td>
</tr>
<tr>
<td>Filter ID</td>
<td>The policy filter ID assigned by the authenticator to the supplicant device.</td>
</tr>
<tr>
<td>Session Timeout</td>
<td>The session time-out imposed by the RADIUS server on the supplicant device.</td>
</tr>
<tr>
<td>Termination Action</td>
<td>The termination action imposed by the RADIUS server on the supplicant device.</td>
</tr>
</tbody>
</table>

Configure Traffic Control

You can configure MAC filters, storm control, port security, protected port, and private VLAN settings.

Manage MAC Filtering

You can create MAC filters that limit the traffic that is allowed into specified ports on the switch.

Create a MAC Filter

To create a MAC filter:

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
6. From the MAC Filter menu, select Create Filter.
   If you did not configure any filters, this is the only option available.
7. From the VLAN ID menu, select the VLAN that must be used with the MAC address.
8. In the MAC Address field, specify the MAC address of the filter in the format XX:XX:XX:XX:XX:XX.
   You cannot define filters for the following MAC addresses:
   • 00:00:00:00:00:00
   • 01:80:C2:00:00:00 to 01:80:C2:00:00:0F
   • 01:80:C2:00:00:20 to 01:80:C2:00:00:21
   • FF:FF:FF:FF:FF:FF
9. In the Port and LAG tables in the Source Port Members section, select the ports and LAGs that must be included in the inbound filter.

If a packet with the MAC address and VLAN ID that you specify is received on a port that is not part of the inbound filter, the packet is dropped.

10. Click the **Apply** button.

Your settings are saved.

Delete a MAC Filter

**To delete a MAC filter:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Security > Traffic Control > MAC Filter > MAC Filter Configuration**.

   The MAC Filter Configuration page displays.

6. From the **MAC Filter** menu, select the filter.

7. Click the **Delete** button.

   The filter is removed.

MAC Filter Summary

You can view the MAC filters that are configured on the switch.

**To view the MAC filter summary:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

The System Information page displays.

   The following table describes the nonconfigurable information on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>The MAC address of the filter in the format XX:XX:XX:XX:XX:XX.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID used with the MAC address to fully identify packets you want filtered.</td>
</tr>
<tr>
<td>Source Port Members</td>
<td>A list of ports to be used for filtering inbound packets.</td>
</tr>
</tbody>
</table>

**Configure Storm Control**

A broadcast storm is the result of an excessive number of broadcast messages simultaneously transmitted across a network by a single port. Forwarded message responses can overload network resources, cause the network to time out, or do both.

The switch measures the incoming packet rate per port for broadcast, multicast, unknown, and unicast packets and discards packets if the rate exceeds the defined value. You enable storm control per interface, by defining the packet type and the rate at which the packets are transmitted.

**To configure storm control settings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.
4. Enter the switch’s password in the **Password** field. The default password is **password**.

   The System Information page displays.

5. **Select Security > Traffic Control > Storm Control.**

6. **In the Port Settings section, select one or more interfaces by taking one of the following actions:**
   
   - To configure a single interface, select the check box associated with the port, or type the port number in the **Go To Interface** field and click the **Go** button.
   
   - To configure multiple interfaces with the same settings, select the check box associated with each interface.
   
   - To configure all interfaces with the same settings, select the check box in the heading row.

7. In the Storm Control section, from the **Ingress Control Mode** menu, select the mode of broadcast affected by storm control:
   
   - **Disabled.** Storm control is disabled. This is the default setting.
   
   - **Unknown Unicast.** If the rate of incoming unknown Layer 2 unicast traffic (that is, traffic for which a destination lookup failure occurs) increases beyond the configured threshold on an interface, the traffic is dropped.
   
   - **Multicast.** If the rate of incoming Layer 2 multicast traffic increases beyond the configured threshold on an interface, the traffic is dropped.
   
   - **Broadcast.** If the rate of incoming Layer 2 broadcast traffic increases beyond the configured threshold on an interface, the traffic is dropped.

8. **If the selection from the Ingress Control Mode menu is not** **Disabled**, specify whether the ingress control mode is enabled by selecting **Enable** or **Disable** from the **Status** menu.

9. **In the Threshold field,** specify the maximum rate at which unknown packets are forwarded.
The range is a percent of the total threshold between 0–100%. The default is 5%.

10. From the Control Action mode menu, select one of the following options:
   - **Drop**. If the threshold of the configured broadcast storm is exceeded, the packet is dropped. This is the default action.
   - **Shutdown**. If the threshold of the configured broadcast storm is exceeded, the port is shut down.

11. Click the **Apply** button.
    Your settings are saved.

### Configure Port Security

Port security lets you lock one or more ports on the switch. When a port is locked, only packets with an allowable source MAC addresses can be forwarded. All other packets are discarded.

#### Configure the Global Port Security Mode

**To configure the global port security mode:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
   - The System Information page displays.
5. Select **Security > Traffic Control > Port Security > Port Security Configuration**.
6. To enable port security on the switch, select the Port Security Mode **Enable** radio button. The default is **Disable**.

7. Click the **Apply** button. Your settings are saved.

8. Click the **Update** button to refresh the page with the latest information about the switch.

The Port Security Violations table shows information about violations that occurred on ports that are enabled for port security. The fields are described in the following table.

**Table 49. Port Security Violations information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>The physical interface.</td>
</tr>
<tr>
<td>Last Violation MAC</td>
<td>The source MAC address of the last packet that was discarded at a locked port.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID corresponding to the last MAC address violation.</td>
</tr>
</tbody>
</table>

Configure a Port Security Interface

A MAC address can be defined as allowable by one of two methods: dynamically or statically. Both methods are used concurrently when a port is locked.

Dynamic locking implements a first arrival mechanism for port security. You specify how many addresses can be learned on the locked port. If the limit was not reached, then a packet with an unknown source MAC address is learned and forwarded normally. When the limit is reached, no more addresses are learned on the port. Any packets with source MAC addresses that were not already learned are discarded. You can effectively disable dynamic locking by setting the number of allowable dynamic entries to zero.

Static locking allows you to specify a list of MAC addresses that are allowed on a port. The behavior of packets is the same as for dynamic locking: only packets with an allowable source MAC address can be forwarded.

**To configure port security settings:**

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

6. Select one or more interfaces by taking one of the following actions:
   
   • To configure a single interface, select the check box associated with the port, or type the port number in the Go To Interface field and click the Go button.
   
   • To configure multiple interfaces with the same settings, select the check box associated with each interface.
   
   • To configure all interfaces with the same settings, select the check box in the heading row.

7. Specify the following settings:
   
   • **Port Security.** Enable or disable the port security feature for the selected interfaces. The default is Disable.
   
   • **Max Learned MAC Address.** Specify the maximum number of dynamically learned MAC addresses on the selected interfaces.
   
   • **Max Static MAC Address.** Specify the maximum number of statically locked MAC addresses on the selected interfaces.
• **Enable Violation Traps.** Enable or disable the sending of new violation traps if a packet with a disallowed MAC address is received. The default is No, which means that the option is disabled.

8. Click the **Apply** button.
   Your settings are saved.

View Learned MAC Addresses and Convert Them to Static MAC Addresses
You can convert a dynamically learned MAC address to a statically locked address.

**To view learned MAC addresses for an individual interface or LAG and convert these MAC addresses to static MAC addresses:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [*Change the Default IP Address of the Switch*](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Security > Traffic Control > Port Security > Port Security Configuration**.
   The Port Security Configuration page displays.

6. Make sure that port security is globally enabled.
   For more information, see [*Configure the Global Port Security Mode*](#) on page 226.

7. Select **Security > Traffic Control > Port Security > Interface Configuration**.
   The Interface Configuration page displays.

8. Make sure that port security is enabled for the individual interface for which you want to view the dynamically learned MAC addresses.
   For more information, see [*Configure a Port Security Interface*](#) on page 227.

10. From the Port List menu, select the individual interface.

The Dynamic MAC Address Table displays the MAC addresses and their associated VLANs that were learned on the selected port. The fields are described in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID corresponding to the MAC address.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC addresses learned on a specific port.</td>
</tr>
</tbody>
</table>

11. To convert the dynamically learned MAC address to a statically locked addresses, select the Convert Dynamic Address to Static check box.

12. Click the Apply button.

The dynamic MAC address entries are converted to static MAC address entries in a numerically ascending order until the static limit is reached.

The Number of Dynamic MAC Addresses Learned field displays the number of dynamically learned MAC addresses on a specific port.

13. To refresh the page with the latest information about the switch, click the Update button.

Configure Protected Ports

You can configure the ports as protected or unprotected. If a port is configured as protected, it does not forward traffic to any other protected port on the switch, but it does forward traffic to unprotected ports.

To configure protected ports:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.

The default password is password.

The System Information page displays.

5. Select Security > Traffic Control > Protected Port.

6. In the Ports table, click each port that you want to configure as a protected port.

Protected ports are marked with a check mark. No traffic forwarding is possible between two protected ports.

7. Click the Apply button.

Your settings are saved.

Configure Access Control Lists

Access control lists (ACLs) ensure that only authorized users can access specific resources while blocking off any unwarranted attempts to reach network resources. ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and above all provide security for the network. The switch supports IPv4, IPv6, and MAC ACLs.

You can use the ACL Wizard to configure a simple ACL and apply it to selected ports (see Use the ACL Wizard to Create a Simple ACL on page 232) or you can configure an ACL manually, which allows you to set up a more complex ACL.

To manually configure an ACL:

1. Create a MAC-based, IPv4-based, or IPv6-based ACL ID (see Configure a MAC ACL on page 237 or Configure an IP ACL on page 246).

2. Create a rule, assign it to a unique ACL ID, and define the rule. (see Configure MAC ACL Rules on page 240, Configure Rules for a Basic IP ACL on page 248, or Configure Rules for an Extended IP ACL on page 253).
A rule can identify protocols, source, and destination IP and MAC addresses, and other packet-matching criteria.

3. Use the ID number to assign the ACL to a port or to a LAG (see Configure MAC Bindings on page 243 or Configure IP ACL Interface Bindings on page 264).

To view ACL configuration examples, see Access Control Lists (ACLs) on page 314.

Use the ACL Wizard to Create a Simple ACL

The ACL Wizard helps you create a simple ACL and apply it to selected ports easily and quickly. First, select an ACL type to use when you create an ACL. Then add an ACL rule to this ACL and apply this ACL on the selected ports. The ACL Wizard allows you to create the ACL, but does not allow you to modify it. To modify the ACL, go to the ACL Configuration page. See Configure an IP ACL on page 246.

---

**Note:** The steps in the following procedure describe how you can create an ACL based on the destination MAC address. If you select a different type of ACL (for example, an ACL based on a source IPv4), the page displays different information.

---

Use the ACL Wizard to create an ACL

To use the ACL Wizard to create an ACL:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.

   The System Information page displays.

5. Select Security > ACL > ACL Wizard.
6. From the **ACL Type** menu, select the type of ACL.

You can select from the following ACL types:

- **ACL Based on Destination MAC**. Creates an ACL based on the destination MAC address, destination MAC mask, and VLAN.
- **ACL Based on Source MAC**. Creates an ACL based on the source MAC address, source MAC mask, and VLAN.
- **ACL Based on Destination IPv4**. Creates an ACL based on the destination IPv4 address and IPv4 address mask.
- **ACL Based on Destination IPv6**. Creates an ACL based on the destination IPv6 prefix and IPv6 prefix length.
- **ACL Based on Source IPv4**. Creates an ACL based on the source IPv4 address and IPv4 address mask.
- **ACL Based on Source IPv6**. Creates an ACL based on the source IPv6 prefix and IPv6 prefix length.
- **ACL Based on Destination IPv4 L4 Port**. Creates an ACL based on the destination IPv4 Layer 4 port number.
- **ACL Based on Destination IPv6 L4 Port**. Creates an ACL based on the destination IPv6 Layer 4 port number.
- **ACL Based on Source IPv4 L4 Port**. Creates an ACL based on the source IPv4 Layer 4 port number.
- **ACL Based on Source IPv6 L4 Port**. Creates an ACL based on the source IPv6 Layer 4 port number.

**Note:** For L4 port options, two rules are created (one for TCP and one for UDP).
7. In the **Sequence Number** field, enter a whole number in the range of 1 to 2147483647 that is used to identify the rule.

8. From the **Action** menu, select **Permit** or **Deny** to specify the action that must be taken if a packet matches the rule’s criteria.

9. From the **Match Every** menu, select one of the following options:
   - **False**. Signifies that packets do not need to match the selected ACL and rule. With this selection, you can add a destination MAC address, destination MAC mask, and VLAN.
   - **True**. Signifies that all packets must match the selected ACL and rule and are either permitted or denied. In this case, since all packets match the rule, the option of configuring other match criteria is not offered.

10. Specify the additional match criteria for the selected ACL type.

   The rest of the rule match criteria fields available for configuration depend on the selected ACL type. For information about the possible match criteria fields, see the following table.

<table>
<thead>
<tr>
<th>ACL Based On</th>
<th>Fields</th>

  • **Destination IP Mask**. Specify the destination IP address mask. |
| **Destination IPv6**| • **Destination Prefix**. Specify the destination prefix.  
  • **Destination Prefix Length**.Specify the destination prefix length. |
| **Source IPv4**     | • **Source IP Address**. Specify the source IP address.  
  • **Source IP Mask**. Specify the source IP address mask. |
| **Source IPv6**     | • **Source Prefix**. Specify the source destination prefix.  
  • **Source Prefix Length**. Specify the source prefix length. |
| **Destination IPv4 L4 Port**| • **Destination L4 port (protocol)**. Specify the destination IPv4 L4 port protocol.  
  • **Destination L4 port (value)**. Specify the destination IPv4 L4 port value. |
11. For this procedure (in which an ACL based on the destination MAC address is created), configure the following settings:

   a. In the **Destination MAC** field, specify the destination MAC address that must be compared against the information in an Ethernet frame.

   b. In the **Destination MAC Mask** field, specify the destination MAC address mask that must be compared against the information in an Ethernet frame.

      The valid format is xx:xx:xx:xx:xx:xx. The BPDU keyword can be specified using a destination MAC mask of 00:00:00:ff:ff:ff.

   c. In the **VLAN ID** field, specify which VLAN must be compared against the information in an Ethernet frame.

      Valid range of values is 1 to 4093. Either a VLAN range or VLAN can be configured.

   d. In the Binding Configuration section, from the **Direction** menu, select the packet filtering direction for the ACL.

      Only the inbound direction is valid.

   e. In the Ports and LAG tables in the Binding Configuration section, select the ports and LAGs to which the ACL must be applied.

   f. Click the **Add** button.

      The rule is added to the ACL and is based on the destination MAC.

12. Click the **Apply** button.

    Your settings are saved.

**Modify an ACL Rule**

**To modify an ACL rule:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of
   the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Security > ACL > ACL Wizard.
   The ACL Wizard page displays.

6. Select check box that is associated with the rule.

7. Update the match criteria as needed.

8. Click the Apply button.
   Your settings are saved.

Delete an ACL Rule

To delete an ACL rule:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or
   connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of
   the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Security > ACL > ACL Wizard.
   The ACL Wizard page displays.

6. Select check box that is associated with the rule.

7. Click the Delete button.
   The rule is removed.
ACL Wizard Example
In the following figure, the ACL rule is configured to check for packet matches on ports 8, 10, 11, and 13 and on LAG 1. Only the Inbound option is valid. Packets that include a source address in the 192.168.3.0/16 network are forwarded by the interfaces. All other packets are dropped because every ACL includes an implicit deny all rule as the last rule.

For information about the ACL Wizard, see Use the ACL Wizard to Create a Simple ACL on page 232.

Configure a MAC ACL
A MAC ACL consists of a set of rules that are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit or Deny) is taken, and the additional rules are not checked for a match.

The following steps are involved in defining a MAC ACL and applying it to the switch:

1. Create a MAC ACL ID (see Configure a MAC ACL on page 237).
2. Create a MAC rule (see Configure MAC ACL Rules on page 240).
3. Associate the MAC ACL with one or more interfaces (see Configure MAC Bindings on page 243).

You can view or delete MAC ACL configurations in the MAC Binding table (see View or Delete MAC ACL Bindings in the MAC Binding Table on page 245).

Add a MAC ACL
To add a MAC ACL:

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Security > ACL > Basic > MAC ACL.

The MAC ACL Table displays the number of ACLs currently configured in the switch and the maximum number of ACLs that can be configured. The current size is equal to the number of configured IPv4 and IPv6 ACLs plus the number of configured MAC ACLs.

6. In the Name field, specify a name for the MAC ACL.
   The name string can include alphabetic, numeric, hyphen, underscore, or space characters only. The name must start with an alphabetic character.
7. Click the Add button.
   The MAC ACL is added.

Each configured ACL displays the following information:
- **Rules.** The number of rules currently configured for the MAC ACL.
- **Direction.** The direction of packet traffic affected by the MAC ACL, which can be Inbound or blank.

Change the Name of a MAC ACL

**To change the name of a MAC ACL:**
1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Security > ACL > Basic > MAC ACL.
   The MAC ACL page displays.
6. Select check box that is associated with the rule.
7. In the Name field, specify the new name.
8. Click the Apply button.
   Your settings are saved.

Delete a MAC ACL

To delete a MAC ACL:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Security > ACL > Basic > MAC ACL.
   The MAC ACL page displays.
6. Select check box that is associated with the rule.
7. Click the Delete button.
The rule is removed.

Configure MAC ACL Rules

You can define rules for MAC-based ACLs. The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. A default *deny all* rule is the last rule of every list.

Add a Rule to a MAC ACL

**To add a rule to a MAC ACL:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#).

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > ACL > Basic > MAC Rules**.
   
   The following figure does not show all columns.

6. From the **ACL Name** menu, select the MAC ACL.

7. In the **Sequence Number** field, enter a whole number in the range of 1 to 10 to identify the rule.

8. From the **Action** menu, select the action that must be taken if a packet matches the rule’s criteria:
   - **Permit.** Forwards packets that meet the ACL criteria.
• **Deny.** Drops packets that meet the ACL criteria.

9. In the **Assign Queue** field, specify the hardware egress queue identifier that must be used to handle all packets matching this ACL rule.

   The valid range of queue IDs is 0 to 7.

10. From the **Redirect Interface** menu, select the egress interface to which the matching traffic stream must be redirected, bypassing any forwarding decision normally performed by the switch.

   This field cannot be set if a mirror interface is already configured for the ACL rule.

11. From the **Match Every** menu, select whether each Layer 2 MAC packet must be matched against the rule:

   • **True.** Each packet must match the selected ACL rule.
   • **False.** Not all packets need to match the selected ACL rule.

12. In the **CoS** field, specify the 802.1p user priority that must be compared against the information in an Ethernet frame.

   The valid range of values is 0 to 7.

13. In the **Destination MAC** field, specify the destination MAC address that must be compared against the information in an Ethernet frame.

14. In the **Destination MAC Mask** field, specify the destination MAC address mask that must be compared against the information in an Ethernet frame.

   The valid format is xx:xx:xx:xx:xx:xx. The BPDU keyword can be specified using a destination MAC mask of 00:00:00:ff:ff:ff.

15. From the **EtherType Key** menu, select the EtherType value that must be compared against the information in an Ethernet frame.

   The valid values are as follows:

   • Appletalk
   • ARP
   • IBM SNA
   • IPv4
   • IPv6
   • IPX
   • MPLS multicast
   • MPLS unicast
   • NetBIOS
   • Novell
   • PPPoE
   • Reverse ARP
• User Value

16. In the EtherType User Value field, specify the customized EtherType value that must be used when you select User Value from the EtherType Key menu.

   This value must be compared against the information in an Ethernet frame. The valid range of values is 0x0600 to 0xFFFF.

17. In the Source MAC field, specify the source MAC address that must be compared against the information in an Ethernet frame.

18. In the Source MAC Mask field, specify the source MAC address mask that must be compared against the information in an Ethernet frame.

19. In the VLAN field, specify the VLAN ID that must be compared against the information in an Ethernet frame.

   The valid range of values is 1 to 4093. Either VLAN range or VLAN can be configured.

20. From the Logging menu, select whether to enable or disable logging.

   When set to Enable, logging is enabled for this ACL rule (subject to resource availability on the switch). If the access list trap flag is also enabled, periodic traps are generated, indicating the number of times the rule was evoked during the report interval. A fixed five-minute report interval is used for the switch. A trap is not issued if the ACL rule hit count is zero for the interval. This field is only supported for a deny action.

21. Click the Add button.

   The rule is added.

Change the Match Criteria for a MAC Rule

To change the match criteria for a MAC rule:

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.

   The System Information page displays.
5. Select **Security > ACL > Basic > MAC Rules**.
   The MAC Rules page displays.

6. Select the check box that is associated with the rule.

7. Modify the fields as needed.

8. Click the **Apply** button.
   Your settings are saved.

**Delete a Rule for a MAC ACL**

**To delete a rule for a MAC:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Security > ACL > Basic > MAC Rules**.
   The MAC Rules page displays.

6. Select the check box that is associated with the rule.

7. Click the **Delete** button.
   The rule is removed.

**Configure MAC Bindings**

You can assign MAC ACL lists to ACL priorities and interfaces. When an ACL is bound to an interface, all the rules that are defined are applied to the selected interface.

**To configure MAC bindings:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of
   the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.

   The System Information page displays.

6. From the ACL ID menu, select an ACL.
   The fixed selection from the Direction menu is Inbound, which means that MAC ACL
   rules are applied to traffic entering the interface.

7. In the Sequence Number field, optionally specify a number to indicate the order of the
   access list relative to other access lists already assigned to the interface and direction.
   A low number indicates high precedence order. If a sequence number is already in use
   for the interface and direction, the specified access list replaces the currently attached
   access list using that sequence number. If you do not specify the sequence number, a
   sequence number that is one number greater than the highest sequence number
   currently in use for this interface and direction is used. The valid range is 1–4294967295.

8. To add the selected ACL to a port or LAG, in the Ports table or LAG table, click the port or
   LAG so that a check mark displays.
   You can add the ACL to several ports and LAGs.

   The Ports and LAG tables display the available and valid interfaces for ACL binding. All
   nonrouting physical interfaces, VLAN interfaces, and interfaces participating in LAGs are
   listed.
9. Click the **Apply** button.

Your settings are saved.

The following table describes the columns in the Interface Binding Status table on the page.

**Table 50. Interface Binding Status table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface of the ACL assigned.</td>
</tr>
<tr>
<td>Direction</td>
<td>The selected packet filtering direction for the ACL.</td>
</tr>
<tr>
<td>ACL Type</td>
<td>The type of ACL assigned to the selected interface and direction.</td>
</tr>
<tr>
<td>ACL ID</td>
<td>The ACL number (for an IP ACL) or ACL name (for a MAC ACL) identifying the ACL assigned to the selected interface and direction.</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>The sequence number signifying the order of the specified ACL relative to other ACLs assigned to the selected interface and direction.</td>
</tr>
</tbody>
</table>

**View or Delete MAC ACL Bindings in the MAC Binding Table**

You can view or delete the MAC ACL bindings in the MAC Binding Table.

**To view or delete MAC ACL bindings:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > ACL > Basic > MAC Binding Table**.
The previous figure shows examples.

6. To delete a MAC ACL-to-interface binding, do the following:
   a. Select the check box next to the interface.
   b. Click the **Delete** button.

   The binding is removed.

The following table describes the nonconfigurable information on the page.

**Table 51. MAC Binding Table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface of the ACL assigned.</td>
</tr>
<tr>
<td>Direction</td>
<td>The selected packet filtering direction for the ACL.</td>
</tr>
<tr>
<td>ACL Type</td>
<td>The type of ACL assigned to the selected interface and direction.</td>
</tr>
<tr>
<td>ACL ID</td>
<td>The ACL name identifying the ACL assigned to the selected interface and direction.</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>The sequence number signifying the order of the specified ACL relative to other ACLs assigned to the selected interface and direction.</td>
</tr>
</tbody>
</table>

**Configure an IP ACL**

An IP or IPv6 ACL consists of a set of rules that are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit or Deny) is taken, and the additional rules are not checked for a match. You must specify the interfaces to which an IP ACL applies, as well as whether it applies to inbound or outbound traffic.

The following steps are involved in defining an IP ACL and applying it to the switch:

1. Create an IP ACL ID (see **Configure an IP ACL** on page 246).
2. Create an IP rule (see **Configure Rules for a Basic IP ACL** on page 248 or **Configure Rules for an Extended IP ACL** on page 253).
3. Associate the IP ACL with one or more interfaces (see **Configure IP ACL Interface Bindings** on page 264).

**Add an IP ACL**

**To add an IP ACL:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.

The default password is password.

The System Information page displays.

5. Select Security > ACL > Advanced > IP ACL.

The previous figure shows an example.

The IP ACL page shows the current size of the ACL table compared to the maximum size of the ACL table. The current size is equal to the number of configured IPv4 and IPv6 ACLs plus the number of configured MAC ACLs. The maximum size is 100.

The Current Number of ACL field displays the current number of all ACLs configured on the switch.

The Maximum ACL field displays the maximum number of IP ACLs that can be configured on the switch.

6. In the IP ACL ID field, specify the ACL ID or IP ACL name, which depends on the IP ACL type. The IP ACL ID is an integer in the following range:

- **1–99.** Creates a basic IP ACL, which allows you to permit or deny traffic from a source IP address.
- **100–199.** Creates an extended IP ACL, which allows you to permit or deny specific types of Layer 3 or Layer 4 traffic from a source IP address to a destination IP address. This type of ACL provides more granularity and filtering capabilities than the standard IP ACL.
- **IP ACL Name.** Creates an IPv4 or IPv6 ACL name string that is up to 31 alphanumeric characters in length. The name must start with an alphabetic character.

Each configured ACL displays the following information:

- **Rules.** The number of rules currently configured for the IP ACL.
• **Type.** Identifies the ACL as a basic IP ACL (with ID from 1 to 99), extended IP ACL (with ID from 100 to 199), or a named IPv4 or IPv6 ACL.

7. Click the **Add** button.
   
The IP ACL is added.

**Delete an IP ACL**

**To delete an IP ACL:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see *Change the Default IP Address of the Switch* on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **Security > ACL > Advanced > IP ACL**.
   
   The IP ACL Configuration page displays.

6. Select the check box that is associated with the IP ACL.

7. Click the **Delete** button.
   
   The IP ACL is removed.

**Configure Rules for a Basic IP ACL**

You can define rules for IP-based standard ACLs (basic ACLs). The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded.

---

**Note:** An implicit *deny all* rule is included at the end of an ACL list. This means that if an ACL is applied to a packet, and if none of the explicit rules match, then the final implicit *deny all* rule applies and the packet is dropped.
Add a Rule for a Basic IP ACL

To add a rule for a basic IP ACL:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

The previous figure shows an example.

If no rules exist, the Basic ACL Rule Table shows the message No rules have been configured for this ACL. If one or more rules exist for the ACL, the rules display in the Basic ACL Rule Table.

6. From the ACL ID menu, select the IP ACL for which you want to add a rule.
   For basic IP ACLs, this must be an ID in the range from 1 to 99.

7. Click the Add button.
8. Specify the following match criteria for the rule:
   - **Sequence Number.** Enter an ACL sequence number in the range of 1 to 10 that is used to identify the rule. An IP ACL can contain up to 10 rules.
   - **Action.** Select the ACL forwarding action, which is one of the following:
     - **Permit.** Forward packets that meet the ACL criteria.
     - **Deny.** Drop packets that meet the ACL criteria.
   - **Egress Queue.** If the selection form the Action menu is Permit, you can specify the hardware egress queue identifier that is used to handle all packets matching this IP ACL rule. The range of queue IDs is 0 to 7.
   - **Logging.** If the selection form the Action menu is Deny, you can enable logging for the ACL by selecting the Enable radio button. (Logging is subject to resource availability in the device.) If the access list trap flag is also enabled, periodic traps are generated, indicating the number of times this rule was evoked during the report interval. A fixed five-minute report interval is used for the switch. A trap is not issued if the ACL rule hit count is zero for the current interval.
   - **Match Every.** From the Match Every menu, select whether all packets must match the selected IP ACL rule:
     - **Enable.** All packets must match the selected IP ACL rule and are either permitted or denied.
     - **Disable.** Not all packets need to match the selected IP ACL rule.
     This field cannot be set if a mirror interface is already configured for the IP ACL rule.
   - **Src IP Address.** Enter an IP address using dotted-decimal notation to be compared to a packet's source IP address as a match criterion for the selected IP ACL rule.
   - **Src IP Mask.** Specify the IP mask in dotted-decimal notation to be used with the source IP address value.

9. Click the **Apply** button.
   Your settings are saved.
Modify the Match Criteria for a Basic IP ACL Rule

To modify the match criteria for a basic IP ACL rule:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   The IP Rules page displays.

6. From the ACL ID menu, select the ACL that includes the rule that you want to modify.

7. In the Basic ACL Rule Table, click the rule.
   The rule is a hyperlink. The Standard ACL Rule Configuration page displays.

8. Modify the basic IP ACL rule criteria.

9. Click the Apply button.
   Your settings are saved.

Delete a Basic IP ACL Rule

To delete a basic IP ACL rule:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
The System Information page displays.

5. Select **Security > ACL > Advanced > IP Rules**.

The IP Rules page displays.

6. From the **ACL ID** menu, select the ACL that includes the rule that you want to modify.

7. In the Basic ACL Rule Table, select the check box that is associated with the rule.

8. Click the **Delete** button.

The rule is removed.
Configure Rules for an Extended IP ACL

You can define rules for extended IP-based ACLs. The access list definition includes rules that specify whether traffic that is matching the criteria is forwarded normally or discarded.

**Note:** An implicit *deny all* rule is included at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit *deny all* rule applies and the packet is dropped.

Add a Rule for an Extended IP ACL

**To add a rule for an extended IP ACL:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch's password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

If no rules exist, the Extended ACL Rule Table shows the message *No rules have been configured for this ACL*. If one or more rules exist for the ACL, the rules display in the Extended ACL Rule Table.

6. From the ACL ID/Name menu, select the IP ACL for which you want to add a rule.
   
   For extended IP ACLs, this must be an ID in the range from 100 to 199 or a name.

7. Click the Add button.
8. Configure the following match criteria for the rule:

- **Sequence Number.** Enter a whole number in the range of 1 to 10 that is used to identify the rule. An extended IP ACL can contain up to 10 rules.

- **Action.** Select the ACL forwarding action, which is one of the following:
  - **Permit.** Forward packets that meet the ACL criteria.
  - **Deny.** Drop packets that meet the ACL criteria.

- **Egress Queue.** If the selection from the **Action** menu is **Permit**, select the hardware egress queue identifier that is used to handle all packets matching this IP ACL rule. The range of queue IDs is 0 to 7.

- **Logging.** If the selection from the **Action** menu is **Deny**, you can enable logging for the ACL by selecting the **Enable** radio button. (Logging is subject to resource availability in the device.)

  If the access list trap flag is also enabled, periodic traps are generated, indicating the number of times this rule was evoked during the report interval. A fixed five-minute report interval is used for the switch. A trap is not issued if the ACL rule hit count is zero for the current interval.

- **Match Every.** From the **Match Every** menu, select whether all packets must match the selected IP ACL rule:
  - **False.** Not all packets need to match the selected IP ACL rule. You can configure other match criteria on the page.
  - **True.** All packets must match the selected IP ACL rule and are either permitted or denied. In this case, you cannot configure other match criteria on the page.

- **Protocol Type.** From the menu, select a protocol that a packet’s IP protocol must be matched against: **IP, ICMP, IGMP, TCP, UDP, EIGRP, GRE, IPINIP, OSPF, PIM, or Other.** If you select **Other**, specify enter a protocol number from 0 to 255.

- **Src.** In the **Src** field, enter a source IP address, using dotted-decimal notation, to be compared to a packet’s source IP address as a match criterion for the selected IP ACL rule:
Enter an IP address or an IP address range. You can enter a relevant wildcard mask to apply this criteria. If this field is left empty, it means any.

The wildcard mask determines which bits are used and which bits are ignored. A wildcard mask of 255.255.255.255 indicates that none of the bits are important. A wildcard of 0.0.0.0 indicates that all of the bits are important.

- **Src L4.** The options are available only when the protocol is set to TCP or UDP. Use the source L4 port option to specify relevant matching conditions for L4 port numbers in the extended ACL rule.

You can either enter the port number yourself (from 0 to 65535) or select one of the following protocols from the menu:

- The source TCP port protocols are *domain, echo, ftp, ftpdata, www-http, smtp, telnet, pop2, pop3, and bgp.*
- The source UDP port protocols are *domain, echo, snmp, ntp, rip, time, who,* and *tftp.*

Each of these values translates into its equivalent port number.

Select **Other** from the menu to enter a port number. If you select **Other** from the menu but leave the field blank, it means any.

- **Dst.** In the **Dst** field, enter a destination IP address, using dotted-decimal notation, to be compared to a packet’s destination IP address as a match criterion for the selected IP ACL rule:

Enter an IP address or an IP address range. You can enter a relevant wildcard mask to apply this criteria. If this field is left empty, it means any.

The wildcard mask determines which bits are used and which bits are ignored. A wildcard mask of 255.255.255.255 indicates that none of the bits are important. A wildcard of 0.0.0.0 indicates that all of the bits are important.

- **Dst L4.** The options are available only when the protocol is set to TCP or UDP. Use the destination L4 port option to specify relevant matching conditions for L4 port numbers in the extended ACL rule.

You can either enter the port number yourself (from 0 to 65535) or select one of the following protocols from the menu:

- The destination TCP port protocols are *domain, echo, ftp, ftpdata, www-http, smtp, telnet, pop2, pop3,* and *bgp.*
- The destination UDP port protocols are *domain, echo, snmp, ntp, rip, time, who,* and *tftp.*

Each of these values translates into its equivalent port number.

Select **Other** from the menu to enter a port number. If you select **Other** from the menu but leave the field blank, it means any.

- **Service Type.** Select a service type match condition for the extended IP ACL rule.
The possible options are **IP DSCP**, **IP precedence**, and **IP TOS**, which are alternative methods to specify a match criterion for the same service type field in the IP header. Each method uses a different user notation. After you make a selection, you can specify the appropriate values:

- **IP DSCP.** This is an optional configuration. Specify the IP DiffServ Code Point (DSCP) field. The DSCP is defined as the high-order 6 bits of the service type octet in the IP header. Enter an integer from 0 to 63. To select the IP DSCP, select one of the DSCP keywords from the menu. To specify a numeric value, select Other and a field displays in which you can enter numeric value of the DSCP.

- **IP Precedence.** This is an optional configuration. The IP precedence field in a packet is defined as the high-order 3 bits of the service type octet in the IP header. Enter an integer from 0 to 7.

- **IP TOS.** This is an optional configuration. The IP ToS field in a packet is defined as all 8 bits of the service type octet in the IP header. The ToS bits value is a hexadecimal number that is composed of numbers 00 to 09 and AA to FF. The ToS mask value is a hexadecimal number that is composed of numbers 00 to FF. The ToS mask denotes the bit positions in the ToS bits value that are used for comparison against the IP ToS field in a packet.

  For example, to check for an IP ToS value for which bit 7 is set and is the most significant value, for which bit 5 is set, and for which bit 1 is cleared, use a ToS bits value of 0xA0 and a ToS mask of 0xFF. 

9. Click the **Apply** button.

Your settings are saved.

Modify the Match Criteria for an Extended IP ACL Rule

**To modify the match criteria for an existing extended IP ACL rule:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Security > ACL > Advanced > IP Extended Rules.**

   The IP Rules page displays.
6. From the **ACL ID** menu, select the ACL that includes the rule that you want to modify.
7. In the Extended ACL Rule Table, click the rule.
   The rule is a hyperlink. The Extended ACL Rule Configuration page displays.
8. Modify the extended IP ACL rule criteria.
9. Click the **Apply** button.
   Your settings are saved.

Delete an Extended IP ACL Rule

**To delete an extended IP ACL rule:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.
   The login window opens.
4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.
5. Select **Security > ACL > Advanced > IP Extended Rules**.
   The IP Rules page displays.
6. From the **ACL ID** menu, select the ACL that includes the rule that you want to delete.
7. In the Extended ACL Rule Table, select the check box that is associated with the rule.
8. Click the **Delete** button.
   The rule is removed.
Configure an IPv6 ACL

An IPv6 ACL consists of a set of rules that are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit or Deny) is taken, and the additional rules are not checked for a match. You can specify the interfaces to which an IPv6 ACL must apply and whether the IPv6 ACL applies to inbound or outbound traffic. After you add the IPv6 ACL, you can create rules for the IPv6 ACL.

Add an IPv6 ACL

To add an IPv6 ACL:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Security > ACL > Advanced > IPv6 ACL.

6. In the IPv6 ACL field, specify a name to identify the IPv6 ACL.
   This is the IPv6 ACL name string, which includes up to 31 alphanumeric characters only. The name must start with an alphabetic character.

7. Click the Add button.
   The IPv6 ACL is added.
The following table describes the nonconfigurable information displayed on the page.

**Table 52. IPv6 Configuration and IPv6 ACL Table information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Number of ACL</td>
<td>The current number of the IP ACLs configured on the switch.</td>
</tr>
<tr>
<td>Maximum ACL</td>
<td>The maximum number of IP ACLs that can be configured on the switch.</td>
</tr>
<tr>
<td>Rules</td>
<td>The number of the rules associated with the IP ACL.</td>
</tr>
<tr>
<td>Type</td>
<td>The type is IPv6 ACL.</td>
</tr>
</tbody>
</table>

Delete an IPv6 ACL

**To delete an IPv6 ACL:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.
   
   The System Information page displays.

5. Select **Security > ACL > Advanced > IPv6 ACL**.
   
   The IPv6 Configuration page displays.

6. Select the check box that is associated with the IPv6 ACL.

7. Click the **Delete** button.
   
   The IPv6 ACL is removed.
Configure IPv6 Rules

You can define rules for IPv6-based ACLs. The access list definition includes rules that specify whether traffic that is matching the criteria is forwarded normally or discarded.

**Note:** An implicit *deny all* rule is included at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit *deny all* rule applies and the packet is dropped.

Add a Rule for an IPv6 ACL

**Add a rule for an ACL IPv6:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   
   The default password is **password**.

   The System Information page displays.

5. Select **Security > ACL > Advanced > IPv6 Rules**.

   The previous figure does not show all columns on the page.

   If no rules exist, the IPv6 ACL Rule Table shows the message *No rules have been configured for this ACL*. If one or more rules exist for the ACL, the rules display in the IPv6 ACL Rule Table.

6. From the **ACL Name** menu, select the IPv6 ACL for which you want to add a rule.
An IPv6 ACL can contain up to 10 rules. However, a single IPv6 rule that includes two IPv6 addresses (one source address and one destination address) occupies the space of two rules. That is, if you create five rules for an IPv6 ACL and each rules includes both a source address and a destination address, you reach the maximum number of rules for that IPv6 ACL.

7. Click the Add button.

8. Configure the following match criteria for the rule:
   - **Action.** Select the ACL forwarding action by selecting one of the following radio buttons:
     - **Permit.** Forward packets that meet the ACL criteria.
     - **Deny.** Drop packets that meet the ACL criteria.
   - **Egress Queue.** If you select the Permit radio button, select the hardware egress queue identifier that is used to handle all packets matching this IPv6 ACL rule. The range of queue IDs is 0 to 7.
   - **Logging.** If you select the Deny radio button, you can enable logging for the ACL by selecting the Enable radio button. (Logging is subject to resource availability in the device.)
   - **Match Every.** Select whether all packet must match the selected IPv6 ACL rule:
     - **False.** Not all packets need to match the selected IPv6 ACL rule. You can configure other match criteria on the page.
     - **True.** All packets must match the selected IPv6 ACL rule and are either permitted or denied. In this case, you cannot configure other match criteria on the page.
   - **Protocol Type.** Specify the IPv6 protocol type in one of the following ways:
     - From the Protocol Type menu, select **IPv6, ICMPv6, TCP, or UDP.**
     - From the Protocol Type menu, select **Other,** and in the associated field, specify an integer ranging from 0 to 255. This number represents the IPv6 protocol.
   - **Src.** In the Src field, enter a source IPv6 address or source IPv6 address range to be compared to a packet’s source IPv6 address as a match criterion for the selected IPv6 ACL rule. If the field or fields are left empty, it means any.
The source IPv6 address argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal numbers using 16-bit values between colons.

- **Src L4.** The options are available only when the protocol is set to TCP or UDP. Use the source L4 port option to specify relevant matching conditions for L4 port numbers in the extended ACL rule.

Either enter the port number yourself or select one of the following protocols from the menu:

- The source IP TCP port protocols are **domain, echo, ftp, ftpdata, www-http, smtp, telnet, pop2, pop3, and bgp.**
- The source IP UDP port protocols are **domain, echo, snmp, ntp, rip, time, who, and tftp.**

Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

Select **Other** from the menu to enter a port number. If you select **Other** from the menu but leave the field blank, it means **any.**

- **Dst.** In the **Dst** field, enter a destination IPv6 address to be compared to a packet’s destination IPv6 address as a match criterion for the selected IPv6 ACL rule. If the field or fields are left empty, it means **any.**

The source IPv6 address argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal numbers using 16-bit values between colons.

- **Dst L4.** The options are available only when the protocol is set to TCP or UDP. Use the destination L4 port option to specify relevant matching conditions for L4 port numbers in the extended ACL rule.

Either enter the port number yourself or select one of the following protocols from the menu:

- The destination IP TCP port protocols are **domain, echo, ftp, ftpdata, www-http, smtp, telnet, pop2, pop3, and bgp.**
- The destination IP UDP port protocols are **domain, echo, snmp, ntp, rip, time, who, and tftp.**

Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

Select **Other** from the menu to enter a port number. If you select **Other** from the menu but leave the field blank, it means **any.**

- **IPv6 DSCP Service.** Specify the IP DiffServ Code Point (DSCP) field. This is an optional configuration.

The DSCP is defined as the high-order 6 bits of the service type octet in the IPv6 header. Enter an integer from 0 to 63. To select the IPv6 DSCP, select one of the
DSCP keywords. To specify a numeric value, select Other and enter the numeric value of the DSCP.

9. Click the Apply button.
   Your settings are saved.

Modify the Match Criteria for an IPv6 ACL Rule

To modify the match criteria for an IPv6 ACL rule:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

   The IPv6 Rules page displays.

6. From the ACL Name menu, select the ACL that includes the rule that you want to modify.

7. In the IPv6 ACL Rule Table, click the rule.
   The rule is a hyperlink. The IPv6 ACL Rule Configuration page displays.

8. Modify the IPv6 ACL rule criteria.

9. Click the Apply button.
   Your settings are saved.

Delete an IPv6 ACL Rule

To delete an IPv6 ACL rule:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   
The default password is password.
   
The System Information page displays.

   
The IPv6 Rules page displays.

6. From the ACL Name menu, select the ACL that includes the rule that you want to delete.
7. In the IPv6 ACL Rule Table, select the check box that is associated with the rule.
8. Click the Delete button.
   
The rule is removed.

Configure IP ACL Interface Bindings

You can assign ACL lists to ACL priorities and interfaces. When an ACL is bound to an interface, all the rules that are defined are applied to the selected interface.

If resources on the switch are insufficient, an attempt to bind an ACL to an interface fails. You cannot bind an IPv4 ACL and an IPv6 ACL to the same interface.

To bind an IP ACL to one or more interfaces:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

6. From the **ACL ID** menu, select an existing IP ACL for you which you want to add an IP ACL interface binding.

The fixed selection from the **Direction** menu is **Inbound**, which means that MAC ACL rules are applied to traffic entering the interface.

7. In the **Sequence Number** field, optionally specify a number to indicate the order of the access list relative to other access lists already assigned to this interface and direction.

A low number indicates high precedence order. If a sequence number is already in use for this interface and direction, the specified access list replaces the currently attached access list using that sequence number. If you do not specify the sequence number (meaning that the value is 0), a sequence number that is one number greater than the highest sequence number currently in use for this interface and direction is used. The valid range is 1–4294967295.

8. To add the selected ACL to a port or LAG, in the Ports table or LAG table, click the port or LAG so that a check mark displays.

You can add the ACL to several ports and LAGs.

The Ports and LAG tables display the available and valid interfaces for ACL binding. All nonrouting physical interfaces, VLAN interfaces, and interfaces participating in LAGs are listed.

9. Click the **Apply** button.

Your settings are saved.
The following table describes the nonconfigurable information on the page.

**Table 53. IP Binding Status table**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<td>The sequence number signifying the order of specified ACL relative to other ACLs assigned to the selected interface and direction.</td>
</tr>
</tbody>
</table>

**View or Delete IP ACL Bindings in the IP ACL Binding Table**

You can view or delete the IP ACL bindings.

**To view or delete IP ACL bindings:**

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   - The login window opens.
4. Enter the switch’s password in the **Password** field.
   - The default password is **password**.
   - The System Information page displays.
5. Select **Security > ACL > Advanced > Binding Table**.

![IP Binding Table]

6. To delete an IP ACL-to-interface binding, do the following:
   a. Select the check box next to the interface.
   b. Click the **Delete** button.
The binding is removed.

The following table describes the fields in the IP ACL Binding Table on the page.

### Table 54. IP ACL Binding Table

</table>
This chapter contains the following sections:

- Monitor the Switch and the Ports
- Configure and View Logs
- Configure Port Mirroring
Monitor the Switch and the Ports

You can display information about the amount and type of traffic that is transmitted from and received by the switch.

This section contains the following subsections:

- View Switch Statistics on page 269
- View Port Statistics on page 272
- View Detailed Port Statistics on page 274
- View EAP Statistics on page 280
- Perform a Cable Test on page 282

View Switch Statistics

You can display detailed statistical information about the traffic the switch handles.

To view and clear the switch statistics:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. To view the switch statistics, select Monitoring > Ports > Switch Statistics.
6. Click the **Update** button to refresh the page with the latest information about the switch.

7. Click the **Clear** button to clear all the statistics counters, resetting all switch summary and detailed statistics to default values.

   The discarded packets count cannot be cleared.

The following table describes the switch statistics on the page.

**Table 55. Switch statistics**

<table>
<thead>
<tr>

</tbody>
</table>
View Port Statistics

You can display a summary of per-port traffic statistics on the switch.

To view port statistics:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Monitoring > Ports > Port Statistics.

![Port Statistics Table]

6. Select whether to display physical interfaces, link aggregation groups (LAGs), or both by clicking one of the following links above the table heading:
   - 1 (or the unit ID of the switch). Only physical interfaces are displayed. This is the default setting.
   - LAG. Only link aggregation groups are displayed.
   - All. Both physical interfaces and link aggregation groups are displayed.

To locate an interface quickly, type the interface number using the respective naming convention (for example, g1 or l1) in the Go To Interface field above or below the table and
click the Go button. See Interface Naming Conventions on page 23 for more information. The entry corresponding to the specified interface is selected.

The following table describes the per-port statistics on the page.

### Table 56. Port statistics

<table>
<thead>
<tr>

**Reset Counters for All Interfaces on the Switch**

**To reset the counters for all interfaces on the switch:**

1. Connect your computer to the same network as the switch. You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch. If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

   The login window opens.

4. Enter the switch’s password in the Password field.

   The default password is password.

   The System Information page displays.

5. Select Monitoring > Ports > Port Statistics.

   The Port Statistics page displays.
6. Select the check box in the heading of the table.
7. Click the Clear button.

Reset Counters for a Specific Interface

To reset the counters for a specific interface:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch's password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Monitoring > Ports > Port Statistics.
   The Port Statistics page displays.
6. Select the check box next to the interface for which you want to clear the counters.
   You can also type the interface number using the respective naming convention (for example, g1 or l1) in the Go To Interface field above or below the table and click the Go button. See Interface Naming Conventions on page 23 for more information. The entry corresponding to the specified interface is selected.
7. Click the Clear button.
   The counters for the interface are reset.

View Detailed Port Statistics

You can display a variety of per-port traffic statistics.

To view detailed port statistics and clear the statistics:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

   The System Information page displays.

5. Select **Monitoring > Ports > Port Detailed Statistics**.

   The following figure does not show all fields on the Port Detailed Statistics page.

   ![Port Detailed Statistics](image)

6. From the **Interface** menu, select the interface with the statistics to view.

7. From the **MST ID** menu, select the MST ID associated with the interface (if available).

8. To refresh the page with the latest information about the switch, click the **Update** button.

9. To clear all the counters, click the **Clear** button. This resets all statistics for this port to the default values.
The following table describes the detailed port information displayed on the page. To view information about a different port, select the port number from the Interface menu.

**Table 57. Detailed port statistics**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>This object indicates the ifIndex of the interface table entry associated with this port on an adapter.</td>
</tr>
</tbody>
</table>
| Port Type         | For normal ports this field displays Normal. Otherwise, the possible values are as follows:   
|                   | • **Mirrored.** This port is a participating in port mirroring as a mirrored port. Look at the Port Mirroring pages for more information.  
|                   | • **Probe.** This port is a participating in port mirroring as the probe port. Look at the Port Mirroring pages for more information.         
|                   | • **Trunk Member.** The port is a member of a link aggregation trunk. Look at the Port Channel pages for more information.                |
| Port Channel ID   | If the port is a member of a port channel, the port channel’s interface ID and name are shown. Otherwise, Disable is shown.                |
| Port Role         | Each MST bridge port that is enabled is assigned a port role for each spanning tree. The port role is one of the following values: Root, Designated, Alternate, Backup, Master, or Disabled. |
| STP Mode          | The Spanning Tree Protocol administrative mode associated with the port or port channel. The possible values are as follows:     
|                   | • **Enable.** Spanning tree is enabled for this port.                                                                                   
|                   | • **Disable.** Spanning tree is disabled for this port.                                                                               |
| STP State         | The port’s current Spanning Tree state. This state controls what action a port takes on receipt of a frame. If the bridge detects a malfunctioning port, it places that port into the broken state. The states are defined in IEEE 802.1D:     
|                   | • Disabled  
|                   | • Blocking  
|                   | • Listening  
|                   | • Learning  
|                   | • Forwarding  
|                   | • Broken  
| Admin Mode        | The port control administration state. The port must be enabled for it to be allowed into the network. The default is Enabled.     |
| Flow Control Mode | Indicates whether flow control is enabled or disabled for the port. This field is not valid for LAG interfaces.                      |
| LACP Mode         | Indicates the Link Aggregation Control Protocol administrative state. The mode must be enabled for the port to participate in link aggregation. |
| Physical Mode     | Indicates the port speed and duplex mode. In autonegotiation mode the duplex mode and speed are set from the autonegotiation process. |
| Physical Status   | Indicates the port speed and duplex mode.                                                                                              |
| Link Status       | Indicates whether the link is up or down.                                                                                               |

</table>

View EAP Statistics

You can display information about the incoming EAP packets.

To view EAP statistics and clear the statistics:

1. Connect your computer to the same network as the switch.
You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Monitoring > Ports > EAP Statistics.

6. To refresh the page with the latest information about the switch, click the Update button.

7. To clear the counters for a specific port, select the check box associated with the port and click the Clear button.

8. To clear all the EAP counters for all ports on the switch, select the check box in the row heading and click the Clear button.
    Clicking the button resets all statistics for all ports to default values.

The following table describes the EAP statistics on the page.

### Table 58. EAP statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Selects the port to be displayed. When the selection is changed, a page update occurs causing all fields to be updated for the newly selected port. All physical interfaces are valid.</td>
</tr>
<tr>

<td>This displays the number of valid EAPoL frames of any type that were received by this authenticator.</td>
</tr>
<tr>
<td>EAPOL Frames Transmitted</td>
<td>This displays the number of EAPoL frames of any type that were transmitted by this authenticator.</td>
</tr>
</tbody>
</table>
Perform a Cable Test

You can display information about the cables that are connected to switch ports.

**To perform a cable test:**

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch](#) on page 11.

   The login window opens.

4. Enter the switch’s password in the **Password** field.

   The default password is **password**.

---

**Table 58. EAP statistics**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EAPOL Start Frames Received</td>
<td>This displays the number of EAPoL start frames that were received by this authenticator.</td>
</tr>
<tr>
<td>EAPOL Logoff Frames Received</td>
<td>This displays the number of EAPoL logoff frames that were received by this authenticator.</td>
</tr>
<tr>
<td>EAPOL Last Frame Version</td>
<td>This displays the protocol version number carried in the most recently received EAPoL frame.</td>
</tr>
<tr>
<td>EAPOL Last Frame Source</td>
<td>This displays the source MAC address carried in the most recently received EAPoL frame.</td>
</tr>
<tr>
<td>EAPOL Invalid Frames Received</td>
<td>This displays the number of EAPoL frames that were received by this authenticator in which the frame type is not recognized.</td>
</tr>
<tr>
<td>EAPOL Length Error Frames Received</td>
<td>This displays the number of EAPoL frames that were received by this authenticator in which the frame type is not recognized.</td>

<td>This displays the number of valid EAP response frames (other than resp/ID frames) that were received by this authenticator.</td>
</tr>
<tr>
<td>EAP Request/ID Frames Transmitted</td>
<td>This displays the number of EAP request/identity frames that were transmitted by this authenticator.</td>
</tr>
<tr>
<td>EAP Request Frames Transmitted</td>
<td>This displays the number of EAP request frames (other than request/identity frames) that were transmitted by this authenticator.</td>
</tr>
</tbody>
</table>
The System Information page displays.

5. **Select Monitoring > Ports > Cable Test.**

6. Select the check boxes that are associated with the physical ports for which you want to test the cables.

7. Click the **Apply** button.

A cable test is performed on all selected ports. The cable test might take up to two seconds to complete. If the port forms an active link with a device, the cable status is always Normal. The test returns a cable length estimate if this feature is supported by the PHY for the current link speed. Note that if the link is down and a cable is attached to a 10/100 Ethernet adapter then the cable status might be Open or Short because some Ethernet adapters leave unused wire pairs unterminated or grounded.

The following table describes the nonconfigurable information on the page.

**Table 59. Cable Test information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cable Status</td>
<td>Displays the cable status:</td>
</tr>
<tr>
<td></td>
<td>• Normal. The cable is working correctly.</td>
</tr>
<tr>
<td></td>
<td>• Open. The cable is disconnected or a faulty connector exists.</td>
</tr>
<tr>
<td></td>
<td>• Short. An electrical short exists in the cable.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cable Test Failed</strong>. The cable status could not be determined. The cable might in fact be working.</td>
</tr>
<tr>
<td></td>
<td>• Untested. The cable is not yet tested.</td>
</tr>
<tr>
<td></td>
<td>• Invalid cable type. The cable type is unsupported.</td>
</tr>
<tr>
<td></td>
<td>• No cable. The cable is not present.</td>
</tr>
<tr>
<td>Cable Length</td>
<td>The estimated length of the cable in meters. The length is displayed as a range between the shortest estimated length and the longest estimated length. Unknown is displayed if the cable length could not be determined. The cable length is displayed only if the cable status is Normal.</td>
</tr>
<tr>
<td>Failure Location</td>
<td>The estimated distance in meters from the end of the cable to the failure location. The failure location is displayed only if the cable status is Open or Short.</td>
</tr>
</tbody>
</table>
Configure and View Logs

The switch generates messages in response to events, faults, or errors occurring on the platform as well as changes in configuration or other occurrences. These messages are stored locally and can be forwarded to one or more centralized points of collection for monitoring purposes or long-term archival storage. Local and remote configuration of the logging capability includes filtering of messages logged or forwarded based on severity and generating component.

Manage the Memory Logs

You can set the administrative status and behavior of logs in the system buffer. The memory log stores messages in memory based upon the settings for message component and severity. These log messages are cleared when the switch reboots.

For the message log, only the latest 64 entries are displayed on the page.

To configure the memory log settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Monitoring > Logs > Memory Log.
   The Memory Log page displays.
6. Next to Admin Status, select one of the following radio buttons:
   • Enable. Enable system logging.
   • Disable. Prevent the system from logging messages.
7. From the Behavior menu, specify the behavior of the log when it is full.
   • Wrap. When the buffer is full, the oldest log messages are deleted as the system logs new messages.
   • Stop on Full. When the buffer is full, the system stops logging new messages and preserves all existing log messages.
8. From the **Severity Filter** menu, select one of the following severity levels:
   - **Emergency (0)**. System is unusable.
   - **Alert (1)**. Action must be taken immediately.
   - **Critical (2)**. Critical conditions.
   - **Error (3)**. Error conditions.
   - **Warning (4)**. Warning conditions.
   - **Notice (5)**. Normal but significant conditions.
   - **Informational (6)**. Informational messages.
   - **Debug (7)**. Debug-level messages.

   **Note:** A log records messages equal to or above a configured severity threshold.

9. Click the **Apply** button.

   Your settings are saved.

   The Memory Log table displays on the Memory Log page.

   The Total number of Messages field displays the number of messages the system logged in memory. Only the 64 most recent entries are displayed on the page.

   The rest of the page displays the Memory Log messages. The format of the log message is the same for messages that are displayed for the message log, persistent log, or console log. Messages logged to a collector or relay through syslog support the same format as well.

   The following example shows the standard format for a log message:

   `<14> Jan 01 01:25:47 172.16.166.215-1 HST [75]: weblogin.c(295) 7 %% HTTP Session 1 Login success from 172.16.166.231`

   The number contained in the angle brackets represents the message priority, which is derived from the following values:

   \[ \text{Priority} = \text{severity level} + 8 \]

   The facility value is usually 1, which means it is a user-level message. Therefore, to determine the severity level of the message, add 8 to the severity level. The sample log message shows a severity level of 6 (informational). For more information about the severity of a log message, see **Manage the Server Log** on page 288.

   The message was generated on Jan 01 01:25:47. The component that generated the message is HST, and it came from line 295 of file weblogin.c. This is the 7th message logged with system IP 172.16.166.215 and task-ID 1. The message indicates that the administrator logged in to the local browser interface over an HTTP session from a host with an IP address of 172.16.166.231.

10. To refresh the page with the latest information about the switch, click the **Update** button.

11. To clear the messages from the buffered log in the memory, click the **Clear** button.
Message Log Format

This topic applies to the format of all logged messages that are displayed for the message log, persistent log, or console log.

Messages logged to a collector or relay through syslog use an identical format:

```plaintext
<14> Jan 01 01:25:47 172.16.166.215-1 HST [75]: weblogin.c(295) 7 %
HTTP Session 1 Login success from 172.16.166.231
```

The example indicates a message with severity 6 (info) on the switch and is generated by component HST running in thread ID 75 on Jan 01 01:25:47 by line 295 of file weblogin.c. This is the 7th message logged with system IP 172.16.166.215 and task-ID 1.

Manage the Flash Log

The flash log is a persistent log, that is, is a log that is stored in persistent storage. Persistent storage survives across platform reboots. The first log type is the system startup log. The system startup log stores the first 32 messages received after system reboot. The second log type is the system operation log. The system operation log stores messages received during system operation.

To configure flash log settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Monitoring > Logs > FLASH Log.
   The FLASH Log Configuration page displays.

6. Next to Admin Status, select one of the following options:
   • Enable. A log that is enabled logs messages.
   • Disable. A log that is disabled does not log messages.

7. From the Severity Filter menu, select the logging level for messages that must be sent to the logging host.
Log messages with the selected severity level and all log messages of greater severity are sent to the host. For example, if you select **Error**, the logged messages include Error, Critical, Alert, and Emergency. The default severity level is Alert (1). The severity can be one of the following levels:

- **Emergency** (0). The highest warning level. If the device is down, or not functioning properly, an emergency log message is saved to the device.
- **Alert** (1). The second-highest warning level. An alert log message is saved if a serious device malfunction occurs, such as all device features being down. Action must be taken immediately.
- **Critical** (2). The third-highest warning level. A critical log message is saved if a critical device malfunction occurs, for example, two device ports are not functioning, while the rest of the device ports remain functional.
- **Error** (3). A device error occurred, such as a port being offline.
- **Warning** (4). The lowest level of a device warning.
- **Notice** (5). Normal but significant conditions. Provides the network administrators with device information.
- **Informational** (6). Provides device information.
- **Debug** (7). Provides detailed information about the device.

8. From the **Logs to be Displayed** menu, select one of the following options:
   - **Current Logs**. The log messages for the current switch sessions are displayed. This is the default setting.
   - **Previous Logs**. The previous log messages are displayed, that is, the log messages that are still in the flash memory from before the switch was rebooted.

9. Click the **Apply** button.

Your settings are saved.

The total number of messages field shows the total number of persistent log messages that are stored on the switch. The maximum number of persistent log messages that can be displayed on the switch is 256.

```
000002 : <14> Jan 01 00:01:38 172.16.166.215-1 DHCP [75]: dhcintf.c(1364) 5 % DHCP gets IP address: 172.16.166.215
```

The previous log message example indicates a user-level message (1) with severity 6 (info) on the switch. The message is generated by component DHCP running in thread ID 75 on Jan 01 00:01:38 by line 1364 of file dhcintf.c. This is the 5th message logged.

Messages logged to a collector or relay via syslog support an identical format as the previous log message example.
Manage the Server Log

You can allow the switch to send log messages to remote logging hosts, if you configured any.

Configure the Local Log Server

To configure local log server:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.

   The System Information page displays.

5. Select Monitoring > Logs > Server Log.
   
   The Server Log page displays.

6. Next to Admin Status, select one of the following:
   
   • Enable. Send log messages to all configured hosts (syslog collectors or relays) using the values configured for each host.
   
   • Disable. Stop logging to all syslog hosts. Disable means no messages are sent to any collector or relay.

7. In the Local UDP Port field, specify the port on the switch from which syslog messages must be sent.

8. Click the Apply button.
   
   Your settings are saved.

   The Server Log Configuration section displays the following information:

   • The Messages Relayed field shows the number of messages forwarded by the syslog function to a syslog host. Messages forwarded to multiple hosts are counted once for each host.
   
   • The Messages Ignored field shows the number of messages that were ignored.

Add a Remote Syslog Host

A remote syslog host is the same as a remote log server.
To add a remote syslog host:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Monitoring > Logs > Server Log.
   The Server Log Configuration page displays.

6. Specify the following settings:
   - IP Address Type. Specify the IP address type of the host, which can be IPv4, IPv6, or DNS.
   - Host Address. Specify the IP address or host name of the syslog host.
   - Port. Specify the port on the host to which syslog messages must be sent. The default port number is 514.
   - Severity Filter. Use the menu to select the severity of the logs that must be sent to the logging host. Logs with the selected severity level and all logs of greater severity are sent to the host. For example, if you select Error, the logged messages include Error, Critical, Alert, and Emergency. The default severity level is Alert (1). The severity can be one of the following levels:
     - Emergency (0). The highest warning level. If the device is down or not functioning properly, an emergency log is saved to the device.
     - Alert (1). The second-highest warning level. An alert log is saved if a serious device malfunction occurs, such as all device features being down.
     - Critical (2). The third-highest warning level. A critical log is saved if a critical device malfunction occurs, for example, two device ports are not functioning, while the rest of the device ports remain functional.
     - Error (3). A device error occurred, such as a port being offline.
     - Warning (4). The lowest level of a device warning.
     - Notice (5). Provides the network administrators with device information.
     - Informational (6). Provides device information.
     - Debug (7). Provides detailed information about the log.

7. Click the Add button.
The Status field in the Server Configuration table shows whether the remote logging host is currently active.

Modify the Settings for a Remote Syslog Host

To modify the settings for a remote syslog host:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select Monitoring > Logs > Server Log.
   
   The Server Log Configuration page displays.

6. Select the check box that is associated with the host.

7. Change the information as needed.

8. Click the Apply button.
   
   Your settings are saved.

Delete the Settings for a Remote Syslog Host

To delete the settings for a remote syslog host:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch’s password in the Password field.
   
   The default password is password.
The System Information page displays.

5. Select **Monitoring > Logs > Server Log**.
   The Server Log Configuration page displays.

6. Select the check box that is associated with the host.
7. Click the **Delete** button.
   The host is removed.

**View the Trap Logs**

You can view information about the SNMP traps generated on the switch. The information can be retrieved as a file.

You can also view information about the traps that were sent.

**View the trap logs and clear the counters:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Monitoring > Logs > Trap Logs**.

6. To clear all counters, click the **Clear** button.
All statistics for the trap logs are reset to their default values.

The following table describes the nonconfigurable information on the page.

Table 60. Trap Logs information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Traps Since Last Reset</td>
<td>The number of traps that occurred since the switch last rebooted.</td>
</tr>
<tr>
<td>Trap Log Capacity</td>
<td>The maximum number of traps stored in the log. If the number of traps exceeds the capacity, the entries overwrite the oldest entries.</td>
</tr>
<tr>
<td>Number of Traps since log last viewed</td>
<td>The number of traps that occurred since the traps were last displayed. Displaying the traps by any method (terminal interface display, web display, upload file from switch, and so on) causes this counter to be cleared to 0.</td>
</tr>
<tr>
<td>Log</td>
<td>The sequence number of this trap.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>The time when this trap occurred, expressed in days, hours, minutes, and seconds, since the last reboot of the switch.</td>
</tr>
<tr>
<td>Trap Information</td>
<td>Information identifying the trap.</td>
</tr>
</tbody>
</table>

Configure Port Mirroring

Port mirroring selects the network traffic for analysis by a network analyzer. This is done for specific ports of the switch. As such, many switch ports are configured as source ports and one switch port is configured as a destination port. You can configure how traffic is mirrored on a source port. Packets that are received on the source port, that are transmitted on a port, or are both received and transmitted can be mirrored to the destination port.

The packet that is copied to the destination port is in the same format as the original packet on the wire. This means that if the mirror is copying a received packet, the copied packet is VLAN tagged or untagged as it was received on the source port. If the mirror is copying a transmitted packet, the copied packet is VLAN tagged or untagged as it is being transmitted on the source port.

To globally enable port mirroring, specify the destination port, and specify one or more source ports:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.

   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Monitoring > Mirroring > Port Mirroring**.

6. Select an Admin Mode radio button:
   - **True.** Port mirroring is enabled.
   - **False.** Port mirroring is enabled.

7. From the **Destination Port** menu, select the destination port to which port traffic must be copied.
   You can configure only one destination port on the switch. The port functions as a probe port and receives traffic from all configured source ports. If no port is configured, None is displayed. The default is None.

8. Click the **Apply** button.
   Your settings are saved.
   The following steps must be performed in the Source Interface Configuration section.

9. Use one of the following methods to narrow down the ports that are displayed:
   - Click the **1** link to display the physical ports of the selected unit.
   - Click the **LAG** link to display a list of LAGs only.
   - Click the **CPU** link to display a list of CPUs only.
   - Click the **All** link to display a list of all physical ports, LAGs, CPUs, and VLANs.

10. Use one of the following methods to select one or more source ports:
    - Select a specific interface by specifying the interface number using the respective naming convention (for example, g1 or l1) in the **Go To Interface** field and clicking the **Go** button. See Interface Naming Conventions on page 23 for more information. The entry corresponding to the specified interface is selected.
• Select one or more check boxes in the Interface column.
Traffic from the selected ports is sent to the probe port.

11. From the **Direction** menu, specify the direction of the traffic that must be mirrored from the selected source ports:
• **None.** The value is not configured. This is the default setting.
• **Tx and Rx.** Monitors transmitted and received packets.
• **Rx.** Monitors received (ingress) packets only.
• **Tx.** Monitors transmitted (egress) packets only.

12. Click the **Apply** button.
Your settings are saved.
The Status field indicates the interface status.
This chapter contains the following sections:

- Reboot the Switch
- Reset the Switch to Its Factory Default Settings
- Upload a File From the Switch
- Download a File to the Switch
- Manage Files
- Perform Troubleshooting
Reboot the Switch

You can reboot the switch from the local browser interface.

To reboot the switch:
1. Connect your computer to the same network as the switch. You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch. If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11. The login window opens.
4. Enter the switch's password in the Password field. The default password is password. The System Information page displays.
5. Select Maintenance > Reset > Device Reboot.

   ![Device Reboot](image)

   Check this box and click APPLY above to reboot

6. Select the check box.
7. Click the Apply button. The switch reboots.

Reset the Switch to Its Factory Default Settings

You can reset the system configuration to the factory default values. All changes that you made are lost. If the IP address changes, your web session might disconnect.
Note: If you reset the switch to the default configuration, the IP address is reset to 192.168.0.239, and the DHCP client is enabled. If you lose network connectivity after you reset the switch to the factory defaults, see Change the Default IP Address of the Switch on page 11.

To reset the switch to the factory default settings:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Maintenance > Reset > Factory Default.

   ![Factory Default](image)
   Check this box and click APPLY above to return all configuration settings to default values

6. Select the check box.

7. Click the Apply button.
   A confirmation pop-up window opens.

8. Click the Yes button to confirm.
   All configuration settings are reset to their factory default values. All changes that you made are lost, even if you saved the configuration.

Upload a File From the Switch

You can upload configuration (ASCII), log (ASCII), and image (binary) files from the switch to the TFTP or HTTP server. The switch supports system file uploads from the switch to a remote system by using either TFTP or HTTP.
Upload a File to the TFTP Server

You can upload configuration (ASCII), log (ASCII), and image (binary) files from the switch to a TFTP server on the network.

To upload a file from the switch to the TFTP server:

1. Connect your computer to the same network as the switch.
   - You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   - If you do not know the IP address of the switch, see [Change the Default IP Address of the Switch on page 11](#).
   - The login window opens.
4. Enter the switch's password in the Password field.
   - The default password is password.
   - The System Information page displays.
6. From the File Type menu, select the type of file:
   - **Archive.** The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy, while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the nonactive image. This is a safety feature for faults occurring during the boot upgrade process. The default setting is Archive.
   - **Text Configuration.** A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name or IP address), and download it to that device.
   - **Error Log.** The system error (persistent) log, also referred to as the event log.
   - **Trap Log.** The trap log with the system trap records.
• Buffered Log. The system buffered (in-memory) log.

7. If the selection from the File Type menu is Archive, the Image Name menu is displayed and you must select the software image on the switch that must be uploaded to the TFTP server:
   • image1. Select image1 to upload image1.
   • image2. Select image2 to upload image2.

8. From the Server Address Type menu, select the format for the Server Address field:
   • IPv4. Indicates that the TFTP server address is an IP address in dotted-decimal format. This is the default setting.
   • DNS. Indicates that the TFTP server address is a host name.

9. In the Server Address field, enter the IP address of the server in accordance with the format indicated by the server address type.
   The default is the IPv4 address 0.0.0.0.

10. In the Transfer File Path field, specify the path on the TFTP server where you want to save the file.
    You can enter up to 32 characters. Include the backslash at the end of the path. A path name with a space is not accepted. Leave this field blank to save the file to the root TFTP directory.

11. In the Transfer File Name field, specify a destination file name for the file to be uploaded.
    You can enter up to 32 characters. The transfer fails if you do not specify a file name. For an archive transfer, use a .stk file extension.

12. Select the Start File Transfer check box.

13. Click the Apply button.
    The file transfer begins.
    The page displays information about the file transfer progress. The page refreshes automatically when the file transfer completes (or if it fails).

Upload a File Using HTTP

You can upload files of various types from the switch to the management system through an HTTP session by using your web browser.

To upload a file from the switch to another system by using HTTP:
1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.

The default password is password.

The System Information page displays.

5. Select Maintenance > Upload > HTTP File Upload.

6. From the File Type menu, select the type of file:
   - **Archive.** The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy, while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the nonactive image. This is a safety feature for faults occurring during the boot upgrade process. The default setting is Archive.
   - **Text Configuration.** A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name or IP address), and download it to that device.

7. If the selection from the File Type menu is Archive, the Image Name menu is displayed and you must select the software image on the switch that must be uploaded to the other system:
   - **image1.** Select image1 to upload image1.
   - **image2.** Select image2 to upload image2.

8. Click the Apply button.

The file transfer begins.

The page displays information about the file transfer progress. The page refreshes automatically when the file transfer completes (or if it fails).

### Download a File to the Switch

The switch supports system file downloads from a remote system to the switch by using either TFTP or HTTP.
Download a File to the Switch Using TFTP

You can download device software, the image file, and the configuration files from a TFTP server to the switch.

Before you download a file to the switch, the following conditions must be true:

• The file to download from the TFTP server is on the server in the appropriate directory.
• The file is in the correct format.
• The switch contains a path to the TFTP server.

You can also download files by using HTTP. See Download a File to the Switch Using HTTP on page 302 for additional information.

To download a file to the switch from a TFTP server:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Maintenance > Download > TFTP File Download.

6. From the File Type menu, select the type of file:
   • Archive. The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy, while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the
nonactive image. This is a safety feature for faults occurring during the boot upgrade process. The default setting is Archive.

- **Text Configuration.** A text-based configuration file enables you to edit a configured text file (`startup-config`) offline as needed. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name or IP address), and download it to that device.

7. If the selection from the **File Type** menu is **Archive**, the **Image Name** menu is displayed and you must select the software image that must be downloaded to the switch:

   - **image1.** Select image1 to upload image1.
   - **image2.** Select image2 to upload image2.

   **Note:** We recommended that you do not overwrite the active image. If you do so, the switch displays a warning that you are trying to overwrite the active image.

8. From the **Server Address Type** menu, select the format for the **TFTP Server IP** field:
   - **IPv4.** Indicates that the TFTP server address is an IP address in dotted-decimal format. This is the default setting.
   - **DNS.** Indicates that the TFTP server address is a host name.

9. In the **TFTP Server IP** field, enter the IP address of the TFTP server indicated by the server address type.

   The default is the IPv4 address 0.0.0.0.

10. In the **Transfer File Path** field, specify the path on the TFTP server where the file is located.

    Enter up to 160 characters. Include the backslash at the end of the path. A path name with a space is not accepted. Leave this field blank to save the file to the root TFTP directory.

11. In the **Remote File Name** field, specify the name of the file to download from the TFTP server.

    You can enter up to 32 characters. A file name with a space is not accepted.

12. Select the **Start File Transfer** check box to initiate the file upload.

13. Click the **Apply** button.

    The file transfer begins.

    The page displays information about the progress of the file transfer. The page refreshes automatically when the file transfer completes (or if it fails).

---

**Download a File to the Switch Using HTTP**

You can download files of various types to the switch through an HTTP session by using your web browser.
To download a file to the switch using HTTP:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   
   The login window opens.

4. Enter the switch's password in the Password field.
   
   The default password is password.
   
   The System Information page displays.

5. Select Maintenance > Download > HTTP File Download.

6. From the File Type menu, select the type of file:
   
   • Archive. The system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy, the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the nonactive image. This is a safety feature for faults occurring during the boot upgrade process. The default setting is Archive.
   
   • Text Configuration. A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name, serial number, IP address), and download it to that device.

7. If the selection from the File Type menu is Archive, the Image Name menu is displayed and you must select the software image that must be downloaded to the switch:
   
   • image1. Select image1 to upload image1.
   
   • image2. Select image2 to upload image2.

   Note: We recommended that you do not overwrite the active image. If you do so, the switch displays a warning that you are trying to overwrite the active image.
8. Next to Select File, click the **Browse** button and locate the file that you want to download. The file name can contain up to 80 characters.

9. Click the **Apply** button.

   The file transfer begins.

   The page displays information about the progress of the file transfer. The page refreshes automatically when the file transfer completes (or if it fails).

---

**Note:** After a file transfer is started, wait until the page refreshes. When the page refreshes, the option to select a file option is no longer available, indicating that the file transfer is complete.

---

**Note:** After a text configuration file is downloaded, the switch applies the configuration automatically.

---

**Manage Files**

The system maintains two versions of the switch software in permanent storage. One image is the active image, and the second image is the backup image. The active image is loaded during subsequent switch restarts. This feature reduces switch down time when you are upgrading or downgrading the switch software.

A legacy software version can ignore (that is, might not load) a configuration file that is created by a newer software version. When a configuration file created by the newer software version is discovered by the system running an older version of the software, the system displays an appropriate warning.

**Configure Dual Image Settings**

The Dual Image feature allows the switch to retain two images in permanent storage. You can select which image must load during the next boot cycle, configure an image description, or delete an image. This feature reduces switch down time when you are upgrading or downgrading the software image.

**To change the image that loads during the boot process:**

1. Connect your computer to the same network as the switch.

   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.
4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.
5. Select Maintenance > File Management > Dual Image Configuration.

   ![Dual Image Configuration](image.png)

6. From the Image Name menu, select the image that is not the image displayed in the Current-active field.
   The Current-active field displays the name of the active image.
7. To specify a name for the selected image, enter one in the Image Description field.
8. Select the Activate Image check box.
9. Click the Apply button.
   Your settings are saved.

---

**Note:** After activating an image, you must perform a system reset of the switch to run the new code. The switch continues running the image shown in the Current-active field until the switch reboots.

### Delete an Image

**To delete an image:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.
3. In the address field of your web browser, enter the IP address of the switch.
If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.

The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Maintenance > File Management > Dual Image Configuration.
   The Dual Image Configuration page displays.

6. From the Image Name menu, select the image that is not the image displayed in the Current-active field.
   The Current-active field displays the name of the active image. You cannot delete the active image.

7. Select the Delete Image check box.
8. Click the Apply button.
   The image is removed.

Display the Dual Image Status

You can display information about the active and backup images on the switch.

To display the dual image status:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

The following table describes the nonconfigurable information on the page.

Table 61. Dual Image Status information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image1 Ver</td>
<td>The version of the image1 code file.</td>

<td>The description associated with the image1 code file.</td>
</tr>
<tr>
<td>Image2 Description</td>
<td>The description associated with the image2 code file.</td>
</tr>
</tbody>
</table>

Perform Troubleshooting

You can send a ping and perform a memory dump.

Ping an IPv4 Address

You can specify that the switch must send a ping request to a specified IP address. You can use this to check whether the switch can communicate with a particular IP station. When you click the **Apply** button, the switch sends a specified number of ping requests and the results are displayed.

If a reply to the ping is not received, the following message displays:

```
Tx = Count, Rx = 0 Min/Max/Avg RTT = 0/0/0 msec
```

If a reply to the ping is received, the following message displays:

```
Reply From a.b.c.d: icmp_seq = 0. time= xyz usec.
Reply From a.b.c.d: icmp_seq = 1. time= abc usec.
Reply From a.b.c.d: icmp_seq = 2. time= def usec.
Tx = count, Rx = count Min/Max/Avg RTT = xyz/abc/def msec
```

To configure the settings and ping a host on the network:

1. Connect your computer to the same network as the switch.
   
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
The login window opens.

4. Enter the switch’s password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Maintenance > Troubleshooting > Ping IPv4**.

   ![Ping Details](image)
   
   6. In the **IP Address/Host Name** field, enter the IP address or host name of the device that must be pinged.
   7. In the **Count** field, enter the number of echo requests that must be sent.
      The default is 3. The range is 1 to 15.
   8. In the **Interval** field, enter the time between ping packets in seconds.
      The default is 3 seconds. The range is 1 to 60.
   9. In the **Size** field, enter the size of the ping packet. The default is 0 bytes. The range is 0 to 1518.
   10. Click the **Apply** button.
       The specified address is pinged. The results are displayed below the configurable data in the **Results** field.

**Ping an IPv6 Address**

You can send a ping request to a specified host name or IPv6 address. You can use this to check whether the switch can communicate with a particular IPv6 station. When you click the **Apply** button, the switch sends a specified number of ping requests and the results are displayed below the configurable data. The output displays the following:

Send count=n, Receive count=n from (IPv6 Address). Average round trip time = n ms.

**To send an IPv6 ping:**

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.
2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch's password in the **Password** field.
   The default password is **password**.
   The System Information page displays.

5. Select **Maintenance > Troubleshooting > Ping IPv6**.

   ![Ping IPv6](image)

6. In the **IPv6 Address/Hostname** field, enter the IPv6 address or host name of the station that must be pinged.
   The format is xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/ Max 255 characters. The maximum number of characters is 255.

7. In the **Count** field, enter the number of echo requests that must be sent.
   The range is 1 to 15. The default is 3.

8. In the **Interval** field, enter the time in seconds between ping packets.
   The range is 1 to 60. The default is 3.

9. In the **Datagram Size** field, enter the datagram size.
   The valid range is 0 to 13000. The default is 0 bytes.

10. Click the **Apply** button.
    The specified address is pinged. The results are displayed below the configurable data in the **Results** field.

**Enable and Perform Remote Diagnostics**

You can enable or disable the option to access the switch remotely. When remote access is enabled, you can perform diagnostics services.
To enable remote diagnostics:

1. Connect your computer to the same network as the switch.
   You can use a WiFi or wired connection to connect your computer to the network, or connect directly to a switch that is off-network using an Ethernet cable.

2. Launch a web browser.

3. In the address field of your web browser, enter the IP address of the switch.
   If you do not know the IP address of the switch, see Change the Default IP Address of the Switch on page 11.
   The login window opens.

4. Enter the switch’s password in the Password field.
   The default password is password.
   The System Information page displays.

5. Select Maintenance > Troubleshooting > Remote Diagnostics.
   The Remote Diagnostics page displays.

6. Select the Enable radio button.

7. Click the Apply button.
   Your settings are saved.
This appendix contains information about how to configure the following features.

The appendix contains the following sections:

- Virtual Local Area Networks (VLANs)
- Access Control Lists (ACLs)
- Differentiated Services (DiffServ)
- 802.1X
- MSTP
Virtual Local Area Networks (VLANs)

A local area network (LAN) can generally be defined as a broadcast domain. Hubs, bridges, or switches in the same physical segment or segments connect all end node devices. End nodes can communicate with each other without the need for a router. Routers connect LANs together, routing the traffic to the appropriate port.

A virtual LAN (VLAN) is a local area network with a definition that maps workstations on some basis other than geographic location (for example, by department, type of user, or primary application). To enable traffic to flow between VLANs, traffic must go through a router, just as if the VLANs were on two separate LANs.

A VLAN is a group of computers, servers, and other network resources that behave as if they were connected to a single network segment—even though they might not be. For example, all marketing personnel might be spread throughout a building. Yet if they are all assigned to a single VLAN, they can share resources and bandwidth as if they were connected to the same segment. The resources of other departments can be invisible to the marketing VLAN members, accessible to all, or accessible only to specified individuals, depending on how the IT manager set up the VLANs.

VLANs present a number of advantages:

- It is easy to do network segmentation. Users who communicate most frequently with each other can be grouped into common VLANs, regardless of physical location. Each group's traffic is contained largely within the VLAN, reducing extraneous traffic and improving the efficiency of the whole network.
- They are easy to manage. The addition of nodes, as well as moves and other changes, can be dealt with quickly and conveniently from a management interface rather than from the wiring closet.
- They provide increased performance. VLANs free up bandwidth by limiting node-to-node and broadcast traffic throughout the network.
- They ensure enhanced network security. VLANs create virtual boundaries that can be crossed only through a router. So standard, router-based security measures can be used to restrict access to each VLAN.

Packets received by the switch are treated in the following way:

- When an untagged packet enters a port, it is automatically tagged with the port's default VLAN ID tag number. Each port supports a default VLAN ID setting that is user configurable (the default setting is 1). The default VLAN ID setting for each port can be changed on the Port PVID Configuration page. See Configure Port PVID Settings on page 109.
- When a tagged packet enters a port, the tag for that packet is unaffected by the default VLAN ID setting. The packet proceeds to the VLAN specified by its VLAN ID tag number.
- If the port through which the packet entered is not a member of the VLAN as specified by the VLAN ID tag, the packet is dropped.
• If the port is a member of the VLAN specified by the packet's VLAN ID, the packet can be sent to other ports with the same VLAN ID.

• Packets leaving the switch are either tagged or untagged, depending on the setting for that port's VLAN membership properties. A U for a given port means that packets leaving the switch from that port are untagged. Inversely, a T for a given port means that packets leaving the switch from that port are tagged with the VLAN ID that is associated with the port.

The example given in this section comprises numerous steps to illustrate a wide range of configurations to help provide an understanding of tagged VLANs.

VLAN Configuration Examples

This example demonstrates several scenarios of VLAN use and describes how the switch handles tagged and untagged traffic.

In this example, you create two new VLANs, change the port membership for default VLAN 1, and assign port members to the two new VLANs:

1. On the Basic VLAN Configuration page (see Configure VLANs on page 103), create the following VLANs:
   • A VLAN with VLAN ID 10.
   • A VLAN with VLAN ID 20.

2. On the VLAN Membership page (see Configure VLAN Membership on page 106) specify the VLAN membership as follows:
   • For the default VLAN with VLAN ID 1, specify the following members: port 7 (U) and port 8 (U).
   • For the VLAN with VLAN ID 10, specify the following members: port 1 (U), port 2 (U), and port 3 (T).
   • For the VLAN with VLAN ID 20, specify the following members: port 4 (U), port 5 (T), and port 6 (U).

3. On the Port PVID Configuration page (see Configure Port PVID Settings on page 109), specify the PVID for ports g1 and g4 so that packets entering these ports are tagged with the port VLAN ID:
   • Port g1: PVID 10
   • Port g4: PVID 20

4. With the VLAN configuration that you set up, the following situations produce results as described:
   • If an untagged packet enters port 1, the switch tags it with VLAN ID 10. The packet can access port 2 and port 3. The outgoing packet is stripped of its tag to leave port 2 as an untagged packet. For port 3, the outgoing packet leaves as a tagged packet with VLAN ID 10.
   • If a tagged packet with VLAN ID 10 enters port 3, the packet can access port 1 and port 2. If the packet leaves port 1 or port 2, it is stripped of its tag to leave the switch as an untagged packet.
• If an untagged packet enters port 4, the switch tags it with VLAN ID 20. The packet can access port 5 and port 6. The outgoing packet is stripped of its tag to become an untagged packet as it leaves port 6. For port 5, the outgoing packet leaves as a tagged packet with VLAN ID 20.

Access Control Lists (ACLs)

ACLs ensure that only authorized users can access specific resources while blocking off any unwarranted attempts to reach network resources.

ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and provide security for the network. ACLs are normally used in firewall routers that are positioned between the internal network and an external network, such as the Internet. They can also be used on a router positioned between two parts of the network to control the traffic entering or exiting a specific part of the internal network. The added packet processing required by the ACL feature does not affect switch performance. That is, ACL processing occurs at wire speed.

Access lists are sequential collections of permit and deny conditions. This collection of conditions, known as the filtering criteria, is applied to each packet that is processed by the switch or the router. The forwarding or dropping of a packet is based on whether or not the packet matches the specified criteria.

Traffic filtering requires the following two basic steps:

1. Create an access list definition.

   The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. Additionally, you can assign traffic that matches the criteria to a particular queue or redirect the traffic to a particular port. A default deny all rule is the last rule of every list.

2. Apply the access list to an interface in the inbound direction.

   The switch allow ACLs to be bound to physical ports and LAGs. The switch supports MAC ACLs and IP ACLs.

MAC ACL Sample Configuration

The following example shows how to create a MAC-based ACL that permits Ethernet traffic from the Sales department on specified ports and denies all other traffic on those ports.

1. On the MAC ACL page, create an ACL with the name Sales_ACL for the Sales department of your network (see Configure a MAC ACL on page 237).
   
   By default, this ACL is bound on the inbound direction, which means that the switch examines traffic as it enters the port.

2. On the MAC Rules page, create a rule for the Sales_ACL with the following settings:
• **Sequence Number**: 1
• **Action**: Permit
• **Assign Queue ID**: 0
• **Match Every**: False
• **CoS**: 0
• **Destination MAC**: 01:02:1A:BC:DE:EF
• **Destination MAC Mask**: 00:00:00:00:FF:FF
• **EtherType**: User Value.
• **Source MAC**: 02:02:1A:BC:DE:EF
• **Source MAC Mask**: 00:00:00:00:FF:FF
• **VLAN ID**: 2

For more information about MAC ACL rules, see Configure MAC ACL Rules on page 240.

3. On the MAC Binding Configuration page, assign the Sales_ACL to the interface Gigabit ports 6, 7, and 8, and then click the **Apply** button. (See Configure MAC Bindings on page 243.)

You can assign an optional sequence number to indicate the order of this access list relative to other access lists if any are already assigned to this interface and direction.

4. The MAC Binding Table displays the interface and MAC ACL binding information. (See View or Delete MAC ACL Bindings in the MAC Binding Table on page 245.)

The ACL named Sales_ACL looks for Ethernet frames with destination and source MAC addresses and MAC masks defined in the rule. Also, the frame must be tagged with VLAN ID 2, which is the Sales department VLAN. The CoS value of the frame must be 0, which is the default value for Ethernet frames. Frames that match this criteria are permitted on interfaces 6, 7, and 8 and are assigned to the hardware egress queue 0, which is the default queue. All other traffic is explicitly denied on these interfaces. To allow additional traffic to enter these ports, you must add a new Permit rule with the desired match criteria and bind the rule to interfaces 6, 7, and 8.

**Standard IP ACL Sample Configuration**

The following example shows how to create an IP-based ACL that prevents any IP traffic from the Finance department from being allowed on the ports that are associated with other departments. Traffic from the Finance department is identified by each packet’s network IP address.

1. On the IP ACL page, create a new IP ACL with an IP ACL ID of 1. (See Configure an IP ACL on page 246.)
2. On the IP Rules page, create a rule for IP ACL 1 with the following settings:
   - **Sequence Number**: 1
   - **Action**: Deny
• **Assign Queue ID.** 0 (optional: 0 is the default value)
• **Match Every.** False
• **Source IP Address.** 192.168.187.0
• **Source IP Mask.** 0.0.0.255

For additional information about IP ACL rules, see Configure Rules for a Basic IP ACL on page 248.

3. Click the Add button.
4. On the IP Rules page, create a second rule for IP ACL 1 with the following settings:
   • **Sequence Number.** 2
   • **Action.** Permit
   • **Match Every.** True
5. Click the Add button.
6. On the IP Binding Configuration page, assign ACL ID 1 to the interface Gigabit ports 2, 3, and 4, and assign a sequence number of 1. (See Configure IP ACL Interface Bindings on page 264.)

   By default, this IP ACL is bound on the inbound direction, so it examines traffic as it enters the switch.

7. Click the Apply button.
8. On IP Binding Table page, view the interfaces and IP ACL binding information. (See View or Delete IP ACL Bindings in the IP ACL Binding Table on page 266)

The IP ACL in this example matches all packets with the source IP address and subnet mask of the Finance department’s network and deny it on the Ethernet interfaces 2, 3, and 4 of the switch. The second rule permits all non-Finance traffic on the ports. The second rule is required because an explicit deny all rule exists as the lowest priority rule.

**Differentiated Services (DiffServ)**

Standard IP-based networks are designed to provide best effort data delivery service. Best effort service implies that the network delivers the data in a timely fashion, although there is no guarantee that it does. During times of congestion, packets might be delayed, sent sporadically, or dropped. For typical Internet applications, such as email and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. However, any degradation of service can negatively affect applications with strict timing requirements, such as voice or multimedia.

Quality of Service (QoS) can provide consistent, predictable data delivery by distinguishing between packets with strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given special treatment in a QoS-capable network. With this in mind, all elements of the network must be QoS capable. If one node
cannot meet the necessary timing requirements, this creates a deficiency in the network path and the performance of the entire packet flow is compromised.

Two basic types of QoS are supported:

- **Integrated Services.** Network resources are apportioned based on request and are reserved (resource reservation) according to network management policy (RSVP, for example).
- **Differentiated Services.** Network resources are apportioned based on traffic classification and priority, giving preferential treatment to data with strict timing requirements.

The switch supports DiffServ.

The DiffServ feature contains a number of conceptual QoS building blocks that you can use to construct a differentiated service network. Use these same blocks in different ways to build other types of QoS architectures.

You must configure three key QoS building blocks for DiffServ:

- Class
- Policy
- Service (the assignment of a policy to a directional interface)

**Class**

You can classify incoming packets at Layers 2, 3, and 4 by inspecting the following information for a packet:

- Source/destination MAC address
- EtherType
- Class of Service (802.1p priority) value (first/only VLAN tag)
- VLAN ID range (first/only VLAN tag)
- Secondary 802.1p priority value (second/inner VLAN tag)
- Secondary VLAN ID range (second/inner VLAN tag)
- IP Service Type octet (also known as: ToS bits, Precedence value, DSCP value)
- Layer 4 protocol (TCP, UDP and so on)
- Layer 4 source/destination ports
- Source/destination IP address

From a DiffServ point of view, two types of classes exist:

- DiffServ traffic classes
- DiffServ service levels/forwarding classes
DiffServ Traffic Classes

With DiffServ, you define which traffic classes to track on an ingress interface. You can define simple BA classifiers (DSCP) and a wide variety of multifield (MF) classifiers:

- Layer 2; Layers 3, 4 (IP only)
- Protocol-based
- Address-based

You can combine these classifiers with logical AND or OR operations to build complex MF-classifiers (by specifying a class type of all or any, respectively). That is, within a single class, multiple match criteria are grouped together as an AND expression or a sequential OR expression, depending on the defined class type. Only classes of the same type can be nested; class nesting does not allow for the negation (exclude option) of the referenced class.

To configure DiffServ, you must define service levels, namely the forwarding classes/PHBs identified by a given DSCP value, on the egress interface. You define these service levels by configuring BA classes for each.

Creating Policies

Use DiffServ policies to associate a collection of classes that you configure with one or more QoS policy statements. The result of this association is referred to as a policy.

From a DiffServ perspective, two types of policies exist:

- **Traffic Conditioning Policy.** A policy applied to a DiffServ traffic class
- **Service Provisioning Policy.** A policy applied to a DiffServ service level

You must manually configure the various statements and rules used in the traffic conditioning and service provisioning policies to achieve the desired Traffic Conditioning Specification (TCS) and the Service Level Specification (SLS) operation, respectively.

Traffic Conditioning Policy

Traffic conditioning pertains to actions performed on incoming traffic. Several distinct QoS actions are associated with traffic conditioning:

- **Dropping.** Drop a packet upon arrival. This is useful for emulating access control list operation using DiffServ, especially when DiffServ and ACL cannot coexist on the same interface.

- **Marking IP DSCP or IP Precedence.** Marking/re-marking the DiffServ code point in a packet with the DSCP value representing the service level associated with a particular DiffServ traffic class. Alternatively, the IP precedence value of the packet can be marked/re-marked.

- **Marking CoS (802.1p).** Sets the 3-bit priority field in the first/only 802.1p header to a specified value when packets are transmitted for the traffic class. An 802.1p header is inserted if it does not already exist. This is useful for assigning a Layer 2 priority level based on a DiffServ forwarding class (such as the DSCP or IP precedence value)
definition to convey some QoS characteristics to downstream switches that do not routinely look at the DSCP value in the IP header.

- **Policing.** A method of constraining incoming traffic associated with a particular class so that it conforms to the terms of the TCS. Special treatment can be applied to out-of-profile packets that are either in excess of the conformance specification or are nonconformant. The DiffServ feature supports the following types of traffic policing treatments (actions):
  - **drop.** The packet is dropped.
  - **mark cos.** The 802.1p user priority bits are (re)marked and forwarded.
  - **mark dscp.** The packet DSCP is (re)marked and forwarded.
  - **mark prec.** The packet IP Precedence is (re)marked and forwarded.
  - **send.** The packet is forwarded without DiffServ modification.

**Color Mode Awareness.** Policing in the DiffServ feature uses either color blind or color aware mode. Color blind mode ignores the coloration (marking) of the incoming packet. Color aware mode takes into consideration the current packet marking when the switch determines the policing outcome. An auxiliary traffic class is used in conjunction with the policing definition to specify a value for one of the 802.1p, secondary 802.1p, IP DSCP, or IP precedence fields designating the incoming color value to be used as the conforming color. You can also specify the color of traffic that exceeds the threshold.

- **Counting.** Updating octet and packet statistics to keep track of data handling along traffic paths within DiffServ. In this DiffServ feature, counters are not explicitly configured by the user, but are designed into the system based on the DiffServ policy being created. For more information, see Monitor the Switch and the Ports on page 269.

- **Assigning QoS Queue.** Directs a traffic stream to the specified QoS queue. This allows a traffic classifier to specify which one of the supported hardware queues are used for handling packets belonging to the class.

- **Redirecting.** Forces a classified traffic stream to a specified egress port (physical or LAG). This can occur in addition to any marking or policing action. It can also be specified along with a QoS queue assignment.

**DiffServ Example Configuration**

To create a DiffServ class and policy and attach them to a switch interface, follow these steps:

1. On the QoS Class Configuration page, create a new class with the following settings:
   - **Class Name.** Class1
   - **Class Type.** All

   For more information about this page, see Configure a DiffServ Class on page 170.

2. Click the Class1 hyperlink to view the DiffServ Class Configuration page for this class.

3. Configure the following settings for Class1:
   - **Protocol Type.** UDP
   - **Source IP Address.** 192.12.1.0.
• **Source Mask.** 255.255.255.0.
• **Source L4 Port.** Other, and enter 4567 as the source port value.
• **Destination IP Address.** 192.12.2.0.
• **Destination Mask.** 255.255.255.0.
• **Destination L4 Port.** Other, and enter 4568 as the destination port value.

For more information about this page, see [Configure a DiffServ Class](#) on page 170.

4. Click the **Apply** button.

5. On the Policy Configuration page, create a new policy with the following settings:
   • **Policy Selector.** Policy1
   • **Member Class.** Class1

   For more information about this page, see [Configure a DiffServ Policy](#) on page 180.

6. Click the **Add** button.

   The policy is added.

7. Click the **Policy1** hyperlink to view the Policy Class Configuration page for this policy.

8. Configure the Policy attributes as follows:
   • **Assign Queue.** 3
   • **Policy Attribute.** Simple Policy
   • **Color Mode.** Color Blind
   • **Committed Rate.** 10000 (which means 10000*16 kb/s).
   • **Confirm Action.** Send
   • **Violate Action.** Drop

   For more information about this page, see [Configure a DiffServ Policy](#) on page 180.

9. On the Service Configuration page, select the check box next to interfaces g7 and g8 to attach the policy to these interfaces, and then click the **Apply** button. (See [Configure the DiffServ Service Interface](#) on page 185.)

802.1X

Local area networks (LANs) are often deployed in environments that permit unauthorized devices to be physically attached to the LAN infrastructure, or permit unauthorized users to attempt to access the LAN through equipment already attached. In such environments you might want to restrict access to the services offered by the LAN to those users and devices that are permitted to use those services.

Port-based network access control makes use of the physical characteristics of LAN infrastructures to provide a means of authenticating and authorizing devices attached to a LAN port with point-to-point connection characteristics. If the authentication and authorization process fails, access control prevents access to that port. In this context, a port is a single
point of attachment to the LAN, such as a port of a MAC bridge and an association between stations or access points in IEEE 802.11 wireless LANs.

The IEEE 802.11 standard describes an architectural framework within which authentication and consequent actions take place. It also establishes the requirements for a protocol between the authenticator (the system that passes an authentication request to the authentication server) and the supplicant (the system that requests authentication), as well as between the authenticator and the authentication server.

The switch supports a guest VLAN, which allows unauthenticated users limited access to the network resources.

**Note:** You can use QoS features to provide rate limiting on the guest VLAN to limit the network resources that the guest VLAN provides.

Another 802.1X feature is the ability to configure a port to enable or disable EAPoL packet forwarding support. You can disable or enable the forwarding of EAPoL when 802.1X is disabled on the device.

The ports of an 802.1X authenticator switch provide the means by which it can offer services to other systems reachable through the LAN. Port-based network access control allows the operation of a switch’s ports to be controlled to ensure that access to its services is permitted only by systems that are authorized to do so.

Port access control provides a means of preventing unauthorized access by supplicants to the services offered by a system. Control over the access to a switch and the LAN to which it is connected can be desirable when you restrict access to publicly accessible bridge ports or to restrict access to departmental LANs.

Access control is achieved by enforcing authentication of supplicants that are attached to an authenticator’s controlled ports. The result of the authentication process determines whether the supplicant is authorized to access services on that controlled port.

A port access entity (PAE) is able to adopt one of two distinct roles within an access control interaction:

1. **Authenticator.** A port that enforces authentication before allowing access to services available through that port.
2. **Supplicant.** A port that attempts to access services offered by the authenticator.

Additionally, there exists a third role:

3. **Authentication server.** Performs the authentication function necessary to check the credentials of the supplicant on behalf of the authenticator.

All three roles are required for you to complete an authentication exchange.

The switch supports the authenticator role only, in which the PAE is responsible for communicating with the supplicant. The authenticator PAE is also responsible for submitting the information received from the supplicant to the authentication server for the credentials to be checked, which determines the authorization state of the port. The authenticator PAE
controls the authorized/unauthorized state of the controlled port depending on the outcome of the RADIUS-based authentication process.

![Figure 1. 802.1X authentication roles](image)

### 802.1X Example Configuration

This example shows how to configure the switch so that 802.1X-based authentication is required on the ports in a corporate conference room (g5–g8). These ports are available to visitors and must be authenticated before access is granted to the network. The authentication is handled by an external RADIUS server. When the visitor is successfully authenticated, traffic is automatically assigned to the guest VLAN. This example assumes that a VLAN was configured with a VLAN ID of 150 and VLAN name of Guest.

1. On the Port Authentication page (see [Configure 802.1X Settings for a Port on page 214](#)), select ports g5, g6, g7, and g8.
2. From the **Port Control** menu, select **Unauthorized**.

   The selection from the **Port Control** menu for all other ports on which authentication is not needed must be **Authorized**. When the selection from the **Port Control** menu is **Authorized**, the port is unconditionally put in a force-authorized state and does not require any authentication. When the selection from the **Port Control** menu is **Auto**, the authenticator PAE sets the controlled port mode.

3. In the **Guest VLAN** field for ports g5–g8, enter 150 to assign these ports to the guest VLAN.

   You can configure additional settings to control access to the network through the ports. See [Configure a Port Security Interface on page 227](#) for information about the settings.

4. Click the **Apply** button.

5. On the 802.1X Configuration page, set the port based authentication state and guest VLAN mode to **Enable**, and then the **Apply** button. (See [Configure the Global Port Security Mode on page 226](#))
This example uses the default values for the port authentication settings, but you can configure several additional settings. For example, the **EAPOL Flood Mode** field allows you to enable the forwarding of EAPoL frames when 802.1X is disabled on the device.

6. On the RADIUS Server Configuration page (see *[Add a Primary RADIUS Authentication Server to the Switch on page 193]*), configure a RADIUS server with the following settings:
   - **Server Address**: 192.168.10.23
   - **Secret Configured**: Yes
   - **Secret**: secret123
   - **Active**: Primary

   For more information, see *[Configure RADIUS Servers on page 191]*.

7. Click the **Add** button.

8. On the Authentication List page, configure the default list to use RADIUS as the first authentication method. (See *[Configure Authentication Lists on page 202]*.)

This example enables 802.1X-based port security on the switch and prompts the hosts connected on ports g5-g8 for an 802.1X-based authentication. The switch passes the authentication information to the configured RADIUS server.

---

**MSTP**

Spanning Tree Protocol (STP) runs on bridged networks to help eliminate loops. If a bridge loop occurs, the network can become flooded with traffic. IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) supports multiple instances of spanning tree to efficiently channel VLAN traffic over different interfaces. Each instance of the spanning tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree, with slight modifications in the working but not the end effect (chief among the effects is the rapid transitioning of the port to the forwarding state).

The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full-duplex connectivity and ports that are connected to end stations, resulting in rapid transitioning of the port to the Forwarding state and the suppression of Topology Change Notification. These features are represented by the parameters pointtopoint and edgeport. MSTP is compatible to both RSTP and STP. It behaves in a way that is appropriate for STP and RSTP bridges.

An MSTP bridge can be configured to behave entirely as a RSTP bridge or an STP bridge. So, an IEEE 802.1s bridge inherently also supports IEEE 802.1w and IEEE 802.1D.

The MSTP algorithm and protocol provide simple and full connectivity for frames assigned to any given VLAN throughout a bridged LAN comprising arbitrarily interconnected networking devices, each operating MSTP, STP, or RSTP. MSTP allows frames assigned to different VLANs to follow separate paths, each based on an independent Multiple Spanning Tree Instance (MSTI), within Multiple Spanning Tree (MST) regions composed of LANs and or MSTP bridges. These regions and the other bridges and LANs are connected into a single Common Spanning Tree (CST). (IEEE DRAFT P802.1s/D13)
MSTP connects all bridges and LANs with a single Common and Internal Spanning Tree (CIST). The CIST supports the automatic determination of each MST region, choosing its maximum possible extent. The connectivity calculated for the CIST provides the CST for interconnecting these regions, and an Internal Spanning Tree (IST) within each region. MSTP ensures that frames with a given VLAN ID are assigned to one and only one of the MSTIs or the IST within the region, that the assignment is consistent among all the networking devices in the region, and that the stable connectivity of each MSTI and IST at the boundary of the region matches that of the CST. The stable active topology of the bridged LAN with respect to frames consistently classified as belonging to any given VLAN thus simply and fully connects all LANs and networking devices throughout the network, though frames belonging to different VLANs can take different paths within any region, per IEEE DRAFT P802.1s/D13.

All bridges, whether they use STP, RSTP, or MSTP, send information in configuration messages through Bridge Protocol Data Units (BPDUs) to assign port roles that determine each port’s participation in a fully and simply connected active topology based on one or more spanning trees. The information communicated is known as the spanning tree priority vector. The BPDU structure for each of these different protocols is different. An MSTP bridge transmits the appropriate BPDU depending on the received type of BPDU from a particular port.

An MST region comprises of one or more MSTP bridges with the same MST configuration identifier, using the same MSTIs, and without any bridges attached that cannot receive and transmit MSTP BPDUs. The MST configuration identifier includes the following components:

1. Configuration identifier format selector
2. Configuration name
3. Configuration revision level
4. Configuration digest: 16-byte signature of type HMAC-MD5 created from the MST Configuration Table (a VLAN ID to MSTID mapping)

Because multiple instances of spanning tree exist, an MSTP state is maintained on a per-port, per-instance basis (or on a per-port, per-VLAN basis, as any VLAN can be in one and only one MSTI or CIST). For example, port A can be forwarding for instance 1 while discarding for instance 2. The port states changed since IEEE 802.1D specification.

To support multiple spanning trees, configure an MSTP bridge with an unambiguous assignment of VLAN IDs (VIDs) to spanning trees. For such a configuration, ensure the following:

1. The allocation of VIDs to FIDs is unambiguous.
2. Each FID that is supported by the bridge is allocated to exactly one spanning tree instance.

The combination of VID to FID and then FID to MSTI allocation defines a mapping of VIDs to spanning tree instances, represented by the MST Configuration Table.

With this allocation we ensure that every VLAN is assigned to one and only one MSTI. The CIST is also an instance of spanning tree with an MSTID of 0.

VIDs might be not be allocated to an instance, but every VLAN must be allocated to one of the other instances of spanning tree.
The portion of the active topology of the network that connects any two bridges in the same MST region traverses only MST bridges and LANs in that region, and never bridges of any kind outside the region. In other words, connectivity within the region is independent of external connectivity.

**MSTP Example Configuration**

This example shows how to create an MSTP instance from the switch. The example network includes three different switches that serve different locations in the network. In this example, ports 1/0/1–1/0/5 are connected to host stations, so those links are not subject to network loops. Ports 1/0/6–1/0/8 are connected across switches 1, 2, and 3.

![MSTP sample configuration](image)

**Figure 2. MSTP sample configuration**

Perform the following procedures on each switch to configure MSTP:

1. On the VLAN Configuration page, create VLANs 300 and 500 (see Configure VLAN Settings on page 104).

2. On the VLAN Membership page, include ports 1/0/1–1/0/8 as tagged (T) or untagged (U) members of VLAN 300 and VLAN 500 (see Configure VLAN Settings on page 104).

3. On the STP Configuration page, enable the Spanning Tree State option (see Configure STP Settings on page 120).

   Use the default values for the rest of the STP configuration settings. By default, the STP operation mode is MSTP and the configuration name is the switch MAC address.

4. On the CST Configuration page (see Configure CST Port Settings on page 123), set the bridge priority value for each of the three switch connections to force Switch 1 to be the root bridge:
   - **Connection to Switch 1. 4096**
• **Connection to Switch 2.** 12288
• **Connection to Switch 3.** 20480

**Note:** Bridge priority values are multiples of 4096.

If you do not specify a root bridge and all switches are assigned the same bridge priority value, the switch with the lowest MAC address is elected as the root bridge (see Configure CST Settings on page 122).

5. On the CST Port Configuration page, select ports 1/0/1–1/0/8 and select **Enable** from the **STP Status** menu (see Configure CST Port Settings on page 123).

6. Click the **Apply** button.

7. Select ports 1/0/1–1/0/5 (edge ports), and select **Enable** from the **Fast Link** menu.

   Since the edge ports are not at risk for network loops, ports with Fast Link enabled transition directly to the forwarding state.

8. Click the **Apply** button.

   On the CST Port Status page you can view spanning tree information about each port.

9. On the MST Configuration page (see Manage MST Settings on page 128), create a MST instances with the following settings:
   - **MST ID.** 1
   - **Priority.** Use the default (32768)
   - **VLAN ID.** 300

   For more information, see View Rapid STP Information on page 127.

10. Click the **Add** button.

11. Create a second MST instance with the following settings
   - **MST ID.** 2
   - **Priority.** 49152
   - **VLAN ID.** 500

12. Click the **Add** button.

   In this example, assume that Switch 1 became the root bridge for the MST instance 1, and Switch 2 became the root bridge for MST instance 2. Switch 3 supports hosts in the sales department (ports 1/0/1, 1/0/2, and 1/0/3) and in the HR department (ports 1/0/4 and 1/0/5). Switches 1 and 2 also include hosts in the sales and HR departments. The hosts connected from Switch 2 use VLAN 500, MST instance 2 to communicate with the hosts on Switch 3 directly. Likewise, hosts of Switch 1 use VLAN 300, MST instance 1 to communicate with the hosts on Switch 3 directly.

   The hosts use different instances of MSTP to effectively use the links across the switch. The same concept can be extended to other switches and more instances of MSTP.
B

Specifications and Default Settings

This appendix describes the default settings for the switch and for its software features.

The appendix contains the following sections:

• Switch Default Settings
• General Feature Default Settings
• System Setup and Maintenance Settings
• Port Characteristics
• Traffic Control Settings
• Quality of Service Settings
• Security Settings
• System Management Settings
• Settings for Other Features
Switch Default Settings

The following table describes the switch default settings.

**Table 62. Switch default settings**
