Index
Using the Command-Line Interface

The command-line interface (CLI) is a text-based way to manage and monitor the system. You can access the CLI by using a direct serial connection or by using a remote logical connection with telnet or SSH.

This chapter describes the CLI syntax, conventions, and modes. It contains the following sections:

- Licensing and Command Support
- Command Syntax
- Command Conventions
- Common Parameter Values
- Unit/Slot/Port Naming Convention
- Using a Command’s “No” Form
- Managed Switch Modules
- Command Modes
- Command Completion and Abbreviation
- CLI Error Messages
- CLI Line-Editing Conventions
- Using CLI Help
- Accessing the CLI

Licensing and Command Support

As shown in the following table, some command groups or commands require a license and some are supported on particular switch models. For those requiring a license, license keys are available from your VAR or NETGEAR authorized e-commerce portal. License activation is described in the Software Setup Manual.
### Using the Command-Line Interface

</table>
A command is one or more words that might be followed by one or more parameters. Parameters can be required or optional values.

Some commands, such as `show network` or `clear vlan`, do not require parameters. Other commands, such as `network parms`, require that you supply a value after the command. You must type the parameter values in a specific order, and optional parameters follow required parameters. The following example describes the `network parms` command syntax:

**Format**
```
network parms <ipaddr> <netmask> [gateway]
```

- `network parms` is the command name.
- `<ipaddr>` and `<netmask>` are parameters and represent required values that you must enter after you type the command keywords.

---

</tbody>
</table>
• `{gateway}` is an optional parameter, so you are not required to enter a value in place of the parameter.

The *New Template User Manual* lists each command by the command name and provides a brief description of the command. Each command reference also contains the following information:

- Format shows the command keywords and the required and optional parameters.
- Mode identifies the command mode you must be in to access the command.
- Default shows the default value, if any, of a configurable setting on the device.

The `show` commands also contain a description of the information that the command shows.

### Command Conventions

In this document, the command name is in **bold** font. Parameters are in *italic* font. You must replace the parameter name with an appropriate value, which might be a name or number. Parameters are order dependent.

The parameters for a command might include mandatory values, optional values, or keyword choices. Table 1 describes the conventions this document uses to distinguish between value types.

**Table 1. Parameter Conventions**

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;&gt; angle brackets</td>
<td><code>&lt;value&gt;</code></td>
<td>Indicates that you must enter a value in place of the brackets and text inside them.</td>
</tr>
<tr>
<td>[] square brackets</td>
<td><code>[value]</code></td>
<td>Indicates an optional parameter that you can enter in place of the brackets and text inside them.</td>
</tr>
<tr>
<td>{} curly braces</td>
<td>`{choice1</td>
<td>choice2}`</td>
</tr>
<tr>
<td></td>
<td>Vertical bars</td>
<td>`choice1</td>
</tr>
<tr>
<td>[[[]] Braces within square brackets</td>
<td>`[[{choice1</td>
<td>choice2}]]`</td>
</tr>
</tbody>
</table>

### Common Parameter Values

Parameter values might be names (strings) or numbers. To use spaces as part of a name parameter, enclose the name value in double quotes. For example, the expression “System
Name with Spaces” forces the system to accept the spaces. Empty strings (““) are not valid user-defined strings. Table 2 describes common parameter values and value formatting.

**Table 2. Parameter Descriptions**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>This parameter is a valid IP address. You can enter the IP address in the following formats:</td>

</tr>
<tr>
<td></td>
<td>FE80:0:0:0:20F:24FF:128:141:49:32</td>
</tr>
<tr>
<td></td>
<td>For additional information, refer to RFC 3513.</td>
</tr>
<tr>
<td>Interface or</td>
<td>Valid slot and port number separated by forward slashes. For example, 0/1 represents slot number 0 and port number 1.</td>
</tr>
<tr>
<td>unit/slot/port</td>
<td></td>
</tr>
<tr>
<td>Logical Interface</td>
<td>Represents a logical slot and port number. This is applicable in the case of a port-channel (LAG). You can use the logical unit/slot/port to configure the port-channel.</td>
</tr>
<tr>
<td>Character strings</td>
<td>Use double quotation marks to identify character strings, for example, “System Name with Spaces”. An empty string (““) is not valid.</td>
</tr>
</tbody>
</table>

**Unit/Slot/Port Naming Convention**

Managed switch software references physical entities such as cards and ports by using a unit/slot/port naming convention. The software also uses this convention to identify certain logical entities, such as Port-Channel interfaces.

The slot number has two uses. In the case of physical ports, it identifies the card containing the ports. In the case of logical and CPU ports it also identifies the type of interface or port.

**Table 3. Type of Slots**

<table>
<thead>
<tr>
<th>Slot Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical slot numbers</td>
<td>Physical slot numbers begin with zero, and are allocated up to the maximum number of physical slots.</td>
</tr>
<tr>
<td>Logical slot numbers</td>
<td>Logical slots immediately follow physical slots and identify port-channel (LAG) or router interfaces.</td>
</tr>
<tr>
<td>CPU slot numbers</td>
<td>The CPU slots immediately follow the logical slots.</td>
</tr>
</tbody>
</table>
The port identifies the specific physical port or logical interface being managed on a given slot.

**Table 4. Type of Ports**

<table>
<thead>
<tr>
<th>Port Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical Ports</td>
<td>The physical ports for each slot are numbered sequentially starting from zero.</td>
</tr>
<tr>
<td>Logical Interfaces</td>
<td>Port-channel or Link Aggregation Group (LAG) interfaces are logical interfaces that are only used for bridging functions. VLAN routing interfaces are only used for routing functions. Loopback interfaces are logical interfaces that are always up. Tunnel interfaces are logical point-to-point links that carry encapsulated packets.</td>
</tr>
<tr>
<td>CPU ports</td>
<td>CPU ports are handled by the driver as one or more physical entities located on physical slots.</td>
</tr>
</tbody>
</table>

**Note:** In the CLI, loopback and tunnel interfaces do not use the unit/slot/port format. To specify a loopback interface, you use the loopback ID. To specify a tunnel interface, you use the tunnel ID.

**Using a Command’s “No” Form**

The **no** keyword is a specific form of an existing command and does not represent a new or distinct command. Almost every configuration command has a no form. In general, use the no form to reverse the action of a command or reset a value back to the default. For example, the no shutdown configuration command reverses the shutdown of an interface. Use the command without the keyword no to re-enable a disabled feature or to enable a feature that is disabled by default. Only the configuration commands are available in the no form.

**Managed Switch Modules**

Managed switch software consists of flexible modules that can be applied in various combinations to develop advanced Layer 2/3/4+ products. The commands and command modes available on your switch depend on the installed modules. Additionally, for some show commands, the output fields might change based on the modules included in the software.

The software suite includes the following modules:

- Switching (Layer 2)
- Routing (Layer 3)
- IPv6—IPv6 routing
- Multicast
• Quality of Service
• Management (CLI, Web UI, and SNMP)
• IPv6 Management—Allows management of the device through an IPv6 through an IPv6 address without requiring the IPv6 Routing package in the system. The management address can be associated with the network port (front-panel switch ports) and a routine interface (port or VLAN).
• Stacking

Not all modules are available for all platforms or software releases.

Command Modes

The CLI groups commands into modes according to the command function. Each of the command modes supports specific software commands. The commands in one mode are not available until you switch to that particular mode, with the exception of the User EXEC mode commands. You can execute the User EXEC mode commands in the Privileged EXEC mode.

The command prompt changes in each command mode to help you identify the current mode. Table 5 describes the command modes and the prompts visible in that mode.

---

**Note:** The command modes available on your switch depend on the software modules that are installed. For example, a switch that does not support BGPv4 does not have the Router BGPv4 Command Mode.

---

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Prompt</th>

<td>ARP Access-List Config Mode</td>
<td>From the Global Config mode, enter the <code>arp access-list command</code>.</td>
<td>To exit to the Global Config mode, enter the <code>exit</code> command. To return to the Privileged EXEC mode, enter <code>Ctrl-Z</code>.</td>
</tr>
</tbody>
</table>

Command Completion and Abbreviation

Command completion finishes spelling the command when you type enough letters of a command to uniquely identify the command keyword. Once you have entered enough letters, press the SPACEBAR or TAB key to complete the word.

Command abbreviation allows you to execute a command when you have entered there are enough letters to uniquely identify the command. You must enter all of the required keywords and parameters before you enter the command.
CLI Error Messages

If you enter a command and the system is unable to execute it, an error message appears. Table 7 describes the most common CLI error messages.

Table 7. CLI Error Messages

<table>
<thead>
<tr>
<th>Message Text</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Invalid input detected at '^' marker.</td>
<td>Indicates that you entered an incorrect or unavailable command. The carat (^) shows where the invalid text is detected. This message also appears if any of the parameters or values are not recognized.</td>
</tr>
<tr>
<td>Command not found / Incomplete command. Use ? to list commands.</td>
<td>Indicates that you did not enter the required keywords or values.</td>
</tr>
<tr>
<td>Ambiguous command</td>
<td>Indicates that you did not enter enough letters to uniquely identify the command.</td>
</tr>
</tbody>
</table>

CLI Line-Editing Conventions

Table 8 describes the key combinations you can use to edit commands or increase the speed of command entry. You can access this list from the CLI by entering help from the User or Privileged EXEC modes.

Table 8. CLI Editing Conventions

<table>
<thead>
<tr>
<th>Key Sequence</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEL or Backspace</td>
<td>Delete previous character</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Go to beginning of line</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Go to end of line</td>
</tr>
<tr>
<td>Ctrl-F</td>
<td>Go forward one character</td>
</tr>
<tr>
<td>Ctrl-B</td>
<td>Go backward one character</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td>Delete current character</td>
</tr>
<tr>
<td>Ctrl-U, X</td>
<td>Delete to beginning of line</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td>Delete to end of line</td>
</tr>
<tr>
<td>Ctrl-W</td>
<td>Delete previous word</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transpose previous character</td>
</tr>
<tr>
<td>Ctrl-P</td>
<td>Go to previous line in history buffer</td>
</tr>
<tr>
<td>Ctrl-R</td>
<td>Rewrites or pastes the line</td>
</tr>
<tr>
<td>Ctrl-N</td>
<td>Go to next line in history buffer</td>
</tr>
</tbody>
</table>
Using CLI Help

Enter a question mark (?) at the command prompt to display the commands available in the current mode.

```
(switch) >?
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enter into user privilege mode.</td>
</tr>
<tr>
<td>help</td>
<td>Display help for various special keys.</td>
</tr>
<tr>
<td>logout</td>
<td>Exit this session. Any unsaved changes are lost.</td>
</tr>
<tr>
<td>ping</td>
<td>Send ICMP echo packets to a specified IP address.</td>
</tr>
<tr>
<td>quit</td>
<td>Exit this session. Any unsaved changes are lost.</td>
</tr>
<tr>
<td>show</td>
<td>Display Switch Options and Settings.</td>
</tr>
<tr>
<td>telnet</td>
<td>Telnet to a remote host.</td>
</tr>
</tbody>
</table>

Enter a question mark (?) after each word you enter to display available command keywords or parameters.

```
(switch) #network ?
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>javamode</td>
<td>Enable/Disable.</td>
</tr>
<tr>
<td>mgmt_vlan</td>
<td>Configure the Management VLAN ID of the switch.</td>
</tr>
<tr>
<td>parms</td>
<td>Configure Network Parameters of the router.</td>
</tr>
<tr>
<td>protocol</td>
<td>Select DHCP, BootP, or None as the network config protocol.</td>
</tr>
</tbody>
</table>

If the help output shows a parameter in angle brackets, you must replace the parameter with a value.

```
(switch) #network parms ?
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;ipaddr&gt;</td>
<td>Enter the IP address.</td>
</tr>
</tbody>
</table>

If there are no additional command keywords or parameters, or if additional parameters are optional, the following message appears in the output:

```
<cr> Press Enter to execute the command
```
You can also enter a question mark (?) after typing one or more characters of a word to list the available command or parameters that begin with the letters, as shown in the following example:

(switch) #show m?

mac-addr-table     mac-address-table     monitor

Accessing the CLI

You can access the CLI by using a direct console connection or by using a telnet or SSH connection from a remote management host.

For the initial connection, you must use a direct connection to the console port. You cannot access the system remotely until the system has an IP address, subnet mask, and default gateway. You can set the network configuration information manually, or you can configure the system to accept these settings from a BOOTP or DHCP server on your network. For more information, see Network Interface Commands on page 638.
This chapter contains the following sections:

- Dedicated Port Stacking
- Stacking Commands
- Non-Stop Forwarding Commands
- Stack Firmware Synchronization Commands

The commands in this chapter are in two functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.

The Primary Management Unit is the unit that controls the stack.

Note: When configuring a stack using M5300 Series switches and GSM7328S V2H1, GSM7352S V2H1, GSM7228PS V1H1, or GSM7228PS V1H1 switches, refer to `sdm prefer (Mixed Stacking)` on page 715.

### Dedicated Port Stacking

This section describes the commands you use to configure dedicated port stacking.

**stack**

This command sets the mode to Stack Global Config.

Format: `stack`

Mode: Global Config

**member**

This command configures a switch. The `<unit>` is the switch identifier of the switch to be added/removed from the stack. The `<switchindex>` is the index into the database of the
supported switch types, indicating the type of the switch being preconfigured. The switch index is a 32-bit integer. This command is executed on the Primary Management Unit.

**Format**

member <unit> <switchindex>

**Mode**

Stack Global Config

**Note:** Switch index can be obtained by executing the show supported switchtype command in User EXEC mode.

---

**no member**

This command removes a switch from the stack. The <unit> is the switch identifier of the switch to be removed from the stack. This command is executed on the Primary Management Unit.

**Format**

no member <unit>

**Mode**

Stack Global Config

---

**switch priority**

This command configures the ability of a switch to become the Primary Management Unit. The <unit> is the switch identifier. The <value> is the preference parameter that allows the user to specify, priority of one backup switch over another. The range for priority is 1 to 15. The switch with the highest priority value will be chosen to become the Primary Management Unit if the active Primary Management Unit fails. The switch priority defaults to the hardware management preference value 1. Switches that do not have the hardware capability to become the Primary Management Unit are not eligible for management.

**Default**

enabled

**Format**

switch <unit> priority <value>

**Mode**

Global Config

---

**switch renumber**

This command changes the switch identifier for a switch in the stack. The <oldunit> is the current switch identifier on the switch whose identifier is to be changed. The <newunit> is the updated value of the switch identifier. Upon execution, the switch will be configured with the configuration information for the new switch, if any. The old switch configuration information will be retained, however the old switch will be operationally unplugged. This command is executed on the Primary Management Unit.
**Note:** If the management unit is renumbered, then the running configuration is no longer applied (that is, the stack acts as if the configuration had been cleared).

---

**Format**

```
switch <oldunit> renumber <newunit>
```

**Mode**

Global Config

---

**movemanagement**

This command moves the Primary Management Unit functionality from one switch to another. The `<fromunit>` is the switch identifier on the current Primary Management Unit. The `<tounit>` is the switch identifier on the new Primary Management Unit. Upon execution, the entire stack (including all interfaces in the stack) is unconfigured and reconfigured with the configuration on the new Primary Management Unit. After the reload is complete, all stack management capability must be performed on the new Primary Management Unit. To preserve the current configuration across a stack move, execute the `copy system:running-config nvram:startup-config` (in Privileged EXEC) command before performing the stack move. A stack move causes all routes and layer 2 addresses to be lost. This command is executed on the Primary Management Unit. The system prompts you to confirm the management move.

**Note:** The movemanagement command does not NSF (non-stop forwarding). To move the management unit to the backup unit, use `initiate failover` instead. For more information, see `initiate failover` on page 33.

---

**Format**

```
movemanagement <fromunit> <tounit>
```

**Mode**

Stack Global Config

---

**standby**

Use this command to configure a unit as a Standby Management Unit (STBY).

**Format**

```
standby <unit number>
```

**Mode**

Stack Global Config
Stacking Commands

Note: The Standby Management Unit cannot be the current Management Unit. The Standby unit should be a management-capable unit.

slot

This command configures a slot in the system. The <unit/slot> is the slot identifier of the slot. The <cardindex> is the index into the database of the supported card types, indicating the type of the card being preconfigured in the specified slot. The card index is a 32-bit integer. If a card is currently present in the slot that is unconfigured, the configured information will be deleted and the slot will be re-configured with default information for the card.

Format:  slot <unit/slot> <cardindex>
Mode:    Global Config

Note: Card index can be obtained by executing show supported cardtype command in User EXEC mode.

no slot

This command removes configured information from an existing slot in the system.

Format:  no slot <unit/slot> <cardindex>
Mode:    Global Config

Note: Card index can be obtained by executing show supported cardtype command in User EXEC mode.

set slot disable

This command configures the administrative mode of the slot(s). If you specify [all], the command is applied to all slots, otherwise the command is applied to the slot identified by <unit/slot>.

If a card or other module is present in the slot, this administrative mode will effectively be applied to the contents of the slot. If the slot is empty, this administrative mode will be applied
ProSafe Managed Switch

to any module that is inserted into the slot. If a card is disabled, all the ports on the device are operationally disabled and shown as “unplugged” on management screens.

Format set slot disable [<unit/slot> | all]
Mode    Global Config

no set slot disable

This command unconfigures the administrative mode of the slot(s). If you specify [all], the command removes the configuration from all slots, otherwise the configuration is removed from the slot identified by <unit/slot>.

If a card or other module is present in the slot, this administrative mode removes the configuration from the contents of the slot. If the slot is empty, this administrative mode removes the configuration from any module inserted into the slot. If a card is disabled, all the ports on the device are operationally disabled and shown as “unplugged” on management screens.

Format no set slot disable [<unit/slot> | all]
Mode    Global Config

set slot power

This command configures the power mode of the slot(s) and allows power to be supplied to a card located in the slot. If you specify [all], the command is applied to all slots, otherwise the command is applied to the slot identified by <unit/slot>.

Use this command when installing or removing cards. If a card or other module is present in this slot, the power mode is applied to the contents of the slot. If the slot is empty, the power mode is applied to any card inserted into the slot.

Format set slot power [<unit/slot> | all]
Mode    Global Config

no set slot power

This command unconfigures the power mode of the slot(s) and prohibits power from being supplied to a card located in the slot. If you specify [all], the command prohibits power to all slots, otherwise the command prohibits power to the slot identified by <unit/slot>.

Use this command when installing or removing cards. If a card or other module is present in this slot, power is prohibited to the contents of the slot. If the slot is empty, power is prohibited to any card inserted into the slot.

Format no set slot power [<unit/slot> | all]
Mode    Global Config
**reload (Stack)**

This command resets the entire stack or the identified `<unit>`. The `<unit>` is the switch identifier. The system prompts you to confirm that you want to reset the switch.

**Format**
```
reload [<unit>]
```

**Mode**
User EXEC

**show slot**

This command displays information about all the slots in the system or for a specific slot.

**Format**
```
show slot [<unit/slot>]
```

**Mode**
User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot</td>
<td>The slot identifier in a <code>&lt;unit/slot&gt;</code> format.</td>
</tr>
<tr>
<td>Slot Status</td>
<td>The slot is empty, full, or has encountered an error</td>
</tr>
<tr>
<td>Admin State</td>
<td>The slot administrative mode is enabled or disabled.</td>
</tr>
<tr>
<td>Power State</td>
<td>The slot power mode is enabled or disabled.</td>
</tr>
<tr>
<td>Configured Card</td>
<td>Model Identifier is a 32-character field used to identify a card.</td>
</tr>
<tr>
<td>Model Identifier</td>
<td>The model identifier of the card preconfigured in the slot.</td>
</tr>
<tr>
<td>Pluggable</td>
<td>Cards are pluggable or non-pluggable in the slot.</td>
</tr>
<tr>
<td>Power Down</td>
<td>Indicates whether the slot can be powered down.</td>
</tr>
</tbody>
</table>

If you supply a value for `<unit/slot>`, the following additional information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inserted Card Model Identifier</td>
<td>The model identifier of the card inserted in the slot. Model Identifier is a 32-character field used to identify a card. This field is displayed only if the slot is full.</td>
</tr>
<tr>
<td>Inserted Card Description</td>
<td>The card description. This field is displayed only if the slot is full.</td>
</tr>
<tr>
<td>Configured Card Description</td>
<td>The card description of the card preconfigured in the slot.</td>
</tr>
</tbody>
</table>
show supported cardtype

This commands displays information about all card types or specific card types supported in the system.

Format  
show supported cardtype [<cardindex>]

Mode    User EXEC

If you do not supply a value for <cardindex>, the following output appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Card Index (CID)</td>
<td>The index into the database of the supported card types. This index is used when preconfiguring a slot.</td>
</tr>
<tr>
<td>Card Model Identifier</td>
<td>The model identifier for the supported card type.</td>
</tr>
</tbody>
</table>

If you supply a value for <cardindex>, the following output appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Card Type</td>
<td>The 32-bit numeric card type for the supported card.</td>
</tr>
<tr>
<td>Model Identifier</td>
<td>The model identifier for the supported card type.</td>
</tr>
<tr>
<td>Card Description</td>
<td>The description for the supported card type.</td>
</tr>
</tbody>
</table>

show switch

This command displays information about all units in the stack or a single unit when you specify the unit value. For units that would normally be allowed to join the stack but do not have a matching stack template ID, their switch status is shown as “STM Mismatch.”

Format  
show switch [<unit>]

Mode    Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch</td>
<td>The unit identifier assigned to the switch.</td>
</tr>
</tbody>
</table>

When you do not specify a value for <unit>, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management Status</td>
<td>Indicates whether the switch is the Primary Management Unit, a stack member, or the status is unassigned.</td>
</tr>
<tr>
<td>Preconfigured Model Identifier</td>
<td>The model identifier of a preconfigured switch ready to join the stack. The Model Identifier is a 32-character field assigned by the device manufacturer to identify the device.</td>
</tr>
</tbody>
</table>
### ProSafe Managed Switch

The model identifier of the switch in the stack. Model Identifier is a 32-character field assigned by the device manufacturer to identify the device.

The switch status. Possible values for this state are: OK, Unsupported, Code Mismatch, Config Mismatch, or Not Present.

The detected version of code on this switch.

When you specify a value for `<unit>`, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management Status</td>
<td>Indicates whether the switch is the Primary Management Unit, a stack member, or the status is unassigned.</td>
</tr>
<tr>
<td>Hardware Management Preference</td>
<td>The hardware management preference of the switch. The hardware management preference can be disabled or unassigned.</td>
</tr>
<tr>
<td>Admin Management Preference</td>
<td>The administrative management preference value assigned to the switch. This preference value indicates how likely the switch is to be chosen as the Primary Management Unit.</td>
</tr>
<tr>
<td>Switch Type</td>
<td>The 32-bit numeric switch type.</td>
</tr>
<tr>
<td>Model Identifier</td>
<td>The model identifier for this switch. Model Identifier is a 32-character field assigned by the device manufacturer to identify the device.</td>
</tr>
<tr>
<td>Switch Status</td>
<td>The switch status. Possible values are OK, Unsupported, Code Mismatch, Config Mismatch, or Not Present.</td>
</tr>
<tr>
<td>Switch Description</td>
<td>The switch description.</td>
</tr>
<tr>
<td>Expected Code Version</td>
<td>The expected code version.</td>
</tr>
<tr>
<td>Detected Code Version</td>
<td>The version of code running on this switch. If the switch is not present and the data is from pre-configuration, then the code version is “None”.</td>
</tr>
<tr>
<td>Detected Code in Flash</td>
<td>The version of code that is currently stored in FLASH memory on the switch. This code executes after the switch is reset. If the switch is not present and the data is from pre-configuration, then the code version is “None”.</td>
</tr>
<tr>
<td>Stack Template ID</td>
<td>The ID of the stack template currently in use. For example: 3.</td>
</tr>
<tr>
<td>Stack Template Description</td>
<td>The stack template description. For example: v1 and v2 Mix.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The system up time.</td>
</tr>
</tbody>
</table>
show supported switchtype

This commands displays information about all supported switch types or a specific switch type.

Format  

```
show supported switchtype [switchindex]
```  

Modes  

- User EXEC
- Privileged EXEC

If you do not supply a value for `<switchindex>`, the following output appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch Index (SID)</td>
<td>The index into the database of supported switch types. This index is used when preconfiguring a member to be added to the stack.</td>
</tr>
<tr>
<td>Model Identifier</td>
<td>The model identifier for the supported switch type.</td>
</tr>
<tr>
<td>Management Preference</td>
<td>The management preference value of the switch type.</td>
</tr>
<tr>
<td>Code Version</td>
<td>The code load target identifier of the switch type.</td>
</tr>
</tbody>
</table>

If you supply a value for `<switchindex>`, the following output appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch Type</td>
<td>The 32-bit numeric switch type for the supported switch.</td>
</tr>
<tr>
<td>Model Identifier</td>
<td>The model identifier for the supported switch type.</td>
</tr>
<tr>
<td>Switch Description</td>
<td>The description for the supported switch type.</td>
</tr>
</tbody>
</table>

Stacking Commands

This section describes the commands you use to view and configure stacking information.

stack-port

This command sets stacking per port to either stack or ethernet mode.

Default  

```
stack
```

Format  

```
stack-port <unit/slot/port> [ethernet | stack]
```  

Mode  

```
Stack Global Config
```
**show stack-port**

This command displays summary stack-port information for all interfaces.

**Format**

```
show stack-port
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOS Mode</td>
<td>Stacking QOS Mode for all Interfaces.</td>
</tr>
</tbody>
</table>

For Each Interface:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>The unit number.</td>
</tr>
<tr>
<td>Interface</td>
<td>The slot and port numbers.</td>
</tr>
<tr>
<td>Configured Stack Mode</td>
<td>Stack or Ethernet.</td>
</tr>
<tr>
<td>Running Stack Mode</td>
<td>Stack or Ethernet.</td>
</tr>
<tr>
<td>Link Status</td>
<td>Status of the link.</td>
</tr>
<tr>
<td>Link Speed</td>
<td>Speed (Gbps) of the stack port link.</td>
</tr>
</tbody>
</table>

**show stack-port counters**

This command displays summary data counter information for all interfaces.

**Format**

```
show stack-port counters
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>The unit number.</td>
</tr>
<tr>
<td>Interface</td>
<td>The slot and port numbers.</td>
</tr>
<tr>
<td>Tx Data Rate</td>
<td>Trashing data rate in megabits per second on the stacking port.</td>
</tr>
<tr>
<td>Tx Error Rate</td>
<td>Platform-specific number of transmit errors per second.</td>
</tr>
<tr>
<td>Tx Total Error</td>
<td>Platform-specific number of total transmit errors since power-up.</td>
</tr>
<tr>
<td>Rx Data Rate</td>
<td>Receive data rate in megabits per second on the stacking port.</td>
</tr>
</tbody>
</table>

**Stacking Commands**

30
ProSafe Managed Switch

### Stacking Commands

#### show stack-port diag

This command shows stacking diagnostics for each port and is only intended for Field Application Engineers (FAEs) and developers. An FAE will advise on the necessity to run this command and capture this information.

**Format**

```
show stack-port diag
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx Error Rate</td>
<td>Platform-specific number of receive errors per second.</td>
</tr>
<tr>
<td>Rx Total Errors</td>
<td>Platform-specific number of total receive errors since power-up.</td>
</tr>
</tbody>
</table>

### Non-Stop Forwarding Commands

Non-stop forwarding allows the stack units to continue to forward packets if the stack management unit restarts because of a power failure, hardware failure, or software fault.

#### nsf

Use this command to enable nonstop forwarding feature on the stack. When nonstop forwarding is enabled, if the management unit of a stack fails, the backup unit takes over as the master without clearing the hardware tables of any of the surviving units. Data traffic continues to be forwarded in hardware while the management functions initialize on the backup unit. NSF is enabled by default on platforms that support it. The administrator can disable NSF to redirect the CPU resources consumed by data checkpointing. If a unit that does not support NSF is connected to the stack, then NSF is disabled on all stack members. If a unit that does not support NSF is disconnected from the stack and all other units support NSF, and NSF is administratively enabled, then NSF operation resumes.

**Default**

Enabled
Stacking Commands

**ProSafe Managed Switch**

**Format**

nsf

**Mode**

Stack Global Config

**no nsf**

This command disables non-stop forwarding on the stack.

**Format**

no nsf

**Mode**

Stack Global Config

**show nsf**

This command displays global and per-unit information on NSF configuration on the stack.

**Format**

show nsf

Time Until Next Copy.................... 28 seconds
Unit NSF Support
---- -----------
  1 Yes
  2 Yes
  3 Yes

**initiate failover**

Use this command to force the backup unit to take over as the management unit and perform a “warm restart” of the stack. On a warm restart, the backup unit becomes the management unit without clearing its hardware tables (on a cold restart, hardware tables are cleared). Applications apply checkpointed data from the former management unit. The original management unit reboots. If the system is not ready for a warm restart, for example because no backup unit has been elected or one or more members of the stack do not support nonstop forwarding, the command fails with a warning message. The movemanagement command also transfers control from the current management unit; however, the hardware is cleared and all units reinitialize.

---

**Note:** Use this command instead of movemanagement if you expect nsf during management unit changes.

---

**Format**

initiate failover

**Mode**

Stack Global Config Mode
**show checkpoint statistics**

Use this command to display general information about the checkpoint service operation.

**Format**

```
show checkpoint statistics
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>

Privileged EXEC
Stack Firmware Synchronization Commands

Stack firmware synchronization provides an automatic mechanism to synchronize the firmware on stack members whose firmware version differs from the version running on the stack manager. This operation can result in either an upgrade or downgrade of firmware on the mismatched stack member. However, this operation does not attempt to synchronize the stack to the latest firmware in the stack.

During firmware transfer and upgrade, operations such as code download and move management can result in undesirable behavior, such as firmware corruption on a code mismatched stack member. As a result, you receive an error if you try to access the following operations from the user interface during stack firmware synchronization:

- Move management
- Unit renumbering
- Code download
- Delete image
- Update bootcode
- Clear config

A reboot operation is allowed during stack firmware synchronization.

If the firmware is corrupted during stack firmware synchronization, manual intervention by the administrator is required to restore the switch to working condition.

During stack firmware synchronization, traps are generated on start, completion, or failure.

- Non-deterministic upgrade behavior
  
  On bootup, the image that gets synchronized depends on the one that becomes the manager. Which code version the new stack synchronizes to is fully deterministic, but might not be obvious to the user as it depends entirely on which unit becomes the manager. This might be decided by a MAC address comparison. If the administrator wants a particular version to be used by the stack, he should first ensure that this particular unit becomes stack manager.

- Bootcode Upgrades
  
  Bootcode upgrades are not initiated by the stack firmware synchronization.

**boot auto-copy-sw**

This command enables or disables stack firmware synchronization.

| Default | Disabled |
| Format  | boot auto-copy-sw |
| Mode    | Privileged EXEC |
**no boot auto-copy-sw**

This command disables stack firmware synchronization.

**Format**

```
no boot auto-copy-sw
```

**Mode**

Privileged EXEC

**boot auto-copy-sw trap**

This command sends SNMP traps related to stack firmware synchronization.

**Default**

Enabled

**Format**

```
boot auto-copy-sw trap
```

**Mode**

Privileged EXEC

**no boot auto-copy-sw trap**

This command disables sending SNMP traps related to stack firmware synchronization.

**Format**

```
no boot auto-copy-sw trap
```

**Mode**

Privileged EXEC

**boot auto-copy-sw allow-downgrade**

This command enables downgrading the firmware version on the stack member if the firmware version on the manager is older than the firmware version on the member.

**Default**

Enabled

**Format**

```
boot auto-copy-sw allow-downgrade
```

**Mode**

Privileged EXEC

**no boot auto-copy-sw allow-downgrade**

This command disables downgrading the image.

**Format**

```
no boot auto-copy-sw allow-downgrade
```

**Mode**

Privileged EXEC
show auto-copy-sw

This command displays the stack firmware synchronization configuration status.

Format show auto-copy-sw
Mode Privileged EXEC

Example:

(Switch)#show auto-copy-sw
Stack Firmware Synchronization
    Synchronization: Enabled
    SNMP Trap status: Enabled
    Allow Downgrade: Enabled
This chapter describes the switching commands available in the managed switch CLI.

This chapter contains the following sections:

- Port Configuration Commands
- Loopback Interface Commands
- Spanning Tree Protocol (STP) Commands
- VLAN Commands
- Double VLAN Commands
- Voice VLAN Commands
- Provisioning (IEEE 802.1p) Commands
- Protected Ports Commands
- Private Group Commands
- Private VLAN
- GARP Commands
- GVRP Commands
- GMRP Commands
- Port-Based Network Access Control Commands
- 802.1X Supplicant Commands
- Storm-Control Commands
- Flow Control Commands
- Port Mirroring
- Static MAC Filtering
- DHCP L2 Relay Agent Commands
- DHCP Client Commands
- DHCP Snooping Configuration Commands
- Dynamic ARP Inspection Commands
- IGMP Snooping Configuration Commands
- IGMP Snooping Querier Commands
- MLD Snooping Commands
• **MLD Snooping Querier Commands**
• **Port Security Commands**
• **LLDP (802.1AB) Commands**
• **LLDP-MED Commands**
• **Denial of Service Commands**
• **MAC Database Commands**
• **ISDP Commands**
• **Priority-Based Flow Control Commands**

The commands in this chapter are in three functional groups:

• Show commands display switch settings, statistics, and other information.
• Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
• Clear commands clear some or all of the settings to factory defaults.

## Port Configuration Commands

This section describes the commands you use to view and configure port settings.

### interface

This command gives you access to the Interface Config mode, which allows you to enable or modify the operation of an interface (port).

**Format**

```
interface <unit/slot/port>
```

**Mode**

Global Config

### interface vlan

This command gives you access to the vlan virtual interface mode, which allows certain port configurations (for example, the IP address) to be applied to the VLAN interface. Type a question mark (?) after entering the interface configuration mode to see the available options.

**Format**

```
interface vlan <vlan id>
```

**Mode**

Global Config

### interface lag

This command gives you access to the LAG (link aggregation, or port channel) virtual interface, which allows certain port configurations to be applied to the LAG interface. Type a question mark (?) after entering the interface configuration mode to see the available options.
**Note:** The IP address cannot be assigned to a LAG virtual interface. The interface must be put under a VLAN group and an IP address assigned to the VLAN group.

**Format**
interface lag <lag id>

**Mode**
Global Config

**auto-negotiate**

This command enables automatic negotiation on a port.

**Default**
 enabled

**Format**
auto-negotiate

**Mode**
Interface Config

**no auto-negotiate**

This command disables automatic negotiation on a port.

**Note:** Automatic sensing is disabled when automatic negotiation is disabled.

**auto-negotiate all**

This command enables automatic negotiation on all ports.

**Default**
 enabled

**Format**
auto-negotiate all

**Mode**
Global Config

**no auto-negotiate all**

This command disables automatic negotiation on all ports.

**Format**
no auto-negotiate all

**Mode**
Global Config
description

Use this command to create an alpha-numeric description of the port.

Format:  
```
description <description>
```

Mode:  Interface Config

mtu

Use the `mtu` command to set the maximum transmission unit (MTU) size, in bytes, for frames that ingress or egress the interface. You can use the `mtu` command to configure jumbo frame support for physical and port-channel (LAG) interfaces. For the standard 7000 series implementation, the MTU size is a valid integer between 1522 - 9216 for tagged packets and a valid integer between 1518 - 9216 for untagged packets.

**Note:** To receive and process packets, the Ethernet MTU must include any extra bytes that Layer-2 headers might require. To configure the IP MTU size, which is the maximum size of the IP packet (IP Header + IP payload), see `ip mtu` on page 252.

Default: 1518 (untagged)

Format:  
```
mtu <1518-9216>
```

Mode:  Interface Config

no mtu

This command sets the default MTU size (in bytes) for the interface.

Format:  
```
no mtu
```

Mode:  Interface Config

shutdown

This command disables a port.

**Note:** You can use the `shutdown` command on physical and port-channel (LAG) interfaces, but not on VLAN routing interfaces.
no shutdown

This command enables a port.

Format

no shutdown

Mode

Interface Config

shutdown all

This command disables all ports.

Format

shutdown all

Mode

Global Config

no shutdown all

This command enables all ports.

Format

no shutdown all

Mode

Global Config

speed

This command sets the speed and duplex setting for the interface.

Format

speed [{auto}] [{<100 | 10 | 10G} {<half-duplex | full-duplex}>]}

Mode

Interface Config

<tr>
<td>VLAN</td>
<td>The VLAN associated with this Protocol Group.</td>
</tr>
<tr>
<td>Interface(s)</td>
<td>Lists the unit/slot/port interface(s) that are associated with this Protocol Group.</td>
</tr>
</tbody>
</table>

### show port description

This command displays the port description for every port.

**Format**

```
show port description <unit/slot/port>
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes</td>
</tr>
<tr>
<td>Description</td>
<td>Shows the port description configured via the “description” command</td>
</tr>
</tbody>
</table>
**show port status**

This command displays the Protocol-Based VLAN information for either the entire system, or for the indicated group.

**Format**

```
show port status {<unit/slot/port> | all}
```

**Mode**

- Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Media Type</td>
<td>“Copper” or “Fiber” for combo port.</td>
</tr>
<tr>
<td>STP Mode</td>
<td>Indicate the spanning tree mode of the port.</td>
</tr>
<tr>
<td>Physical Mode</td>
<td>Either “Auto” or fixed speed and duplex mode.</td>
</tr>
<tr>
<td>Physical Status</td>
<td>The actual speed and duplex mode.</td>
</tr>
<tr>
<td>Link Status</td>
<td>Whether the link is Up or Down.</td>
</tr>
<tr>
<td>Loop Status</td>
<td>Whether the port is in loop state or not.</td>
</tr>
<tr>
<td>Partner Flow Control</td>
<td>Whether the remote side is using flow control or not.</td>
</tr>
</tbody>
</table>

**Loopback Interface Commands**

The commands in this section describe how to create, delete, and manage loopback interfaces. A loopback interface is always expected to be up. This interface can provide the source address for sent packets and can receive both local and remote packets. The loopback interface is typically used by routing protocols.

To assign an IP address to the loopback interface, see `ip address` on page 247. To assign an IPv6 address to the loopback interface, see `ipv6 address` on page 377.

**interface loopback**

Use this command to enter the Interface Config mode for a loopback interface. The range of the loopback ID is 0 to 7.

**Format**

```
interface loopback <loopback-id>
```

**Mode**

- Global Config
no interface loopback

This command removes the loopback interface and associated configuration parameters for the specified loopback interface.

Format  no interface loopback <loopback-id>
Mode    Global Config

show interface loopback

This command displays information about configured loopback interfaces.

Format  show interface loopback [<loopback-id>]
Mode    Privileged EXEC

If you do not specify a loopback ID, the following information appears for each loopback interface on the system:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loopback ID</td>
<td>The loopback ID associated with the rest of the information in the row.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface name.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IPv4 address of the interface.</td>
</tr>
<tr>
<td>Received Packets</td>
<td>The number of packets received on this interface.</td>
</tr>
<tr>
<td>Sent Packets</td>
<td>The number of packets transmitted from this interface.</td>
</tr>
<tr>
<td>IPv6 Address</td>
<td>The IPv6 address of this interface.</td>
</tr>
</tbody>
</table>

If you specify a loopback ID, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Link Status</td>
<td>Shows whether the link is up or down.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IPv4 address of the interface.</td>
</tr>
<tr>
<td>IPv6 is enabled (disabled)</td>
<td>Shows whether IPv6 is enabled on the interface.</td>
</tr>
<tr>
<td>IPv6 Prefix is</td>
<td>The IPv6 address of the interface.</td>
</tr>
<tr>
<td>MTU size</td>
<td>The maximum transmission size for packets on this interface, in bytes.</td>
</tr>
</tbody>
</table>
Spanning Tree Protocol (STP) Commands

This section describes the commands you use to configure Spanning Tree Protocol (STP). STP helps prevent network loops, duplicate messages, and network instability.

**spanning-tree**

This command sets the spanning-tree operational mode to enabled.

- **Default**: enabled
- **Format**: `spanning-tree`
- **Mode**: Global Config

**no spanning-tree**

This command sets the spanning-tree operational mode to disabled. While disabled, the spanning-tree configuration is retained and can be changed, but is not activated.

- **Format**: `no spanning-tree`
- **Mode**: Global Config

**spanning-tree auto-edge**

This command enables auto-edge on the interface or range of interfaces. When enabled, the interface becomes an edge port if it does not see BPDUs for edge delay time.

- **Default**: enabled
- **Format**: `spanning-tree auto-edge`
- **Mode**: Interface Config

**no spanning-tree auto-edge**

This command disables auto-edge on the interface or range of interfaces.

- **Format**: `no spanning-tree auto-edge`
- **Mode**: Interface Config

**spanning-tree bpdufilter**

Use this command to enable BPDU Filter on an interface or range of interfaces.

- **Default**: disabled
- **Format**: `spanning-tree bpdufilter`
- **Mode**: Interface Config
no spanning-tree bpdufilter

Use this command to disable BPDU Filter on the interface or range of interfaces.

Default: disabled
Format: no spanning-tree bpdufilter
Mode: Interface Config

spanning-tree bpdufilter default

Use this command to enable BPDU Filter on all the edge port interfaces.

Default: disabled
Format: spanning-tree bpdufilter
Mode: Global Config

no spanning-tree bpdufilter default

Use this command to disable BPDU Filter on all the edge port interfaces.

Default: enabled
Format: no spanning-tree bpdufilter default
Mode: Global Config

spanning-tree bpduflood

Use this command to enable BPDU Flood on the interface.

Default: disabled
Format: spanning-tree bpduflood
Mode: Interface Config

no spanning-tree bpduflood

Use this command to disable BPDU Flood on the interface.

Format: no spanning-tree bpduflood
Mode: Interface Config
**spanning-tree bpduguard**

Use this command to enable BPDU Guard on the switch.

<table>
<thead>
<tr>
<th>Default</th>
<th>disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>spanning-tree bpduguard</td>
</tr>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**no spanning-tree bpduguard**

Use this command to disable BPDU Guard on the switch.

<table>
<thead>
<tr>
<th>Format</th>
<th>no spanning-tree bpduguard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**spanning-tree bpdumigrationcheck**

Use this command to force a transmission of rapid spanning tree (RSTP) and multiple spanning tree (MSTP) BPDUs. Use the `<unit/slot/port>` parameter to transmit a BPDU from a specified interface, or use the `all` keyword to transmit BPDUs from all interfaces. This command forces the BPDU transmission when you execute it, so the command does not change the system configuration or have a “no” version.

<table>
<thead>
<tr>
<th>Format</th>
<th>spanning-tree bpdumigrationcheck <code>&lt;unit/slot/port&gt;</code></th>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
<td></td>
</tr>
</tbody>
</table>

**spanning-tree configuration name**

This command sets the Configuration Identifier Name for use in identifying the configuration that this switch is currently using. The `<name>` is a string of up to 32 characters.

<table>
<thead>
<tr>
<th>Default</th>
<th>base MAC address in hexadecimal notation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>spanning-tree configuration name <code>&lt;name&gt;</code></td>
</tr>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**no spanning-tree configuration name**

This command resets the Configuration Identifier Name to its default.

<table>
<thead>
<tr>
<th>Format</th>
<th>no spanning-tree configuration name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>
spanning-tree configuration revision

This command sets the Configuration Identifier Revision Level for use in identifying the configuration that this switch is currently using. The Configuration Identifier Revision Level is a number in the range of 0 to 65535.

Default: 0
Format: spanning-tree configuration revision <0-65535>
Mode: Global Config

no spanning-tree configuration revision

This command sets the Configuration Identifier Revision Level for use in identifying the configuration that this switch is currently using to the default value.

Format: no spanning-tree configuration revision
Mode: Global Config

spanning-tree edgeport

This command specifies that this port is an Edge Port within the common and internal spanning tree. This allows this port to transition to Forwarding State without delay.

Default: enabled
Format: spanning-tree edgeport
Mode: Interface Config

no spanning-tree edgeport

This command specifies that this port is not an Edge Port within the common and internal spanning tree.

Format: no spanning-tree edgeport
Mode: Interface Config

spanning-tree forceversion

This command sets the Force Protocol Version parameter to a new value.

Default: 802.1s
Format: spanning-tree forceversion <802.1d | 802.1s | 802.1w>
Mode: Global Config

- Use 802.1d to specify that the switch transmits ST BPDUs rather than MST BPDUs (IEEE 802.1d functionality supported).
• Use 802.1s to specify that the switch transmits MST BPDUs (IEEE 802.1s functionality supported).
• Use 802.1w to specify that the switch transmits RST BPDUs rather than MST BPDUs (IEEE 802.1w functionality supported).

**no spanning-tree forceversion**

This command sets the Force Protocol Version parameter to the default value.

**Format**
```
no spanning-tree forceversion
```

**Mode**
Global Config

**spanning-tree forward-time**

This command sets the Bridge Forward Delay parameter to a new value for the common and internal spanning tree. The forward-time value is in seconds within a range of 4 to 30, with the value being greater than or equal to “(Bridge Max Age / 2) + 1”.

**Default**
15

**Format**
```
spanning-tree forward-time <4-30>
```

**Mode**
Global Config

**no spanning-tree forward-time**

This command sets the Bridge Forward Delay parameter for the common and internal spanning tree to the default value.

**Format**
```
no spanning-tree forward-time
```

**Mode**
Global Config

**spanning-tree guard**

This command selects whether loop guard or root guard is enabled on an interface. If neither is enabled, then the port operates in accordance with the multiple spanning tree protocol.

**Default**
none

**Format**
```
spanning-tree guard { none | root | loop }
```

**Mode**
Interface Config

**no spanning-tree guard**

This command disables loop guard or root guard on the interface.

**Format**
```
no spanning-tree guard
```

**Mode**
Interface Config
**spanning-tree tcnguard**

This command enables the propagation of received topology change notifications and topology changes to other ports.

**Default**

disable

**Format**

spanning-tree tcnguard

**Mode**

Interface Config

**no spanning-tree tcnguard**

This command disables the propagation of received topology change notifications and topology changes to other ports.

**Format**

no spanning-tree tcnguard

**Mode**

Interface Config

**spanning-tree max-age**

This command sets the Bridge Max Age parameter to a new value for the common and internal spanning tree. The max-age value is in seconds within a range of 6 to 40, with the value being less than or equal to 2 x (Bridge Forward Delay - 1).

**Default**

20

**Format**

spanning-tree max-age <6-40>

**Mode**

Global Config

**no spanning-tree max-age**

This command sets the Bridge Max Age parameter for the common and internal spanning tree to the default value.

**Format**

no spanning-tree max-age

**Mode**

Global Config

**spanning-tree max-hops**

This command sets the MSTP Max Hops parameter to a new value for the common and internal spanning tree. The max-hops value is a range from 6 to 40.

**Default**

20

**Format**

spanning-tree max-hops <1-127>

**Mode**

Global Config
**no spanning-tree max-hops**

This command sets the Bridge Max Hops parameter for the common and internal spanning tree to the default value.

**Format**

```
no spanning-tree max-hops
```

**Mode**

Global Config

**spanning-tree mst**

This command sets the Path Cost or Port Priority for this port within the multiple spanning tree instance or in the common and internal spanning tree. If you specify an `<mstid>` parameter that corresponds to an existing multiple spanning tree instance, the configurations are done for that multiple spanning tree instance. If you specify 0 (defined as the default CIST ID) as the `<mstid>`, the configurations are done for the common and internal spanning tree instance.

If you specify the **cost** option, the command sets the path cost for this port within a multiple spanning tree instance or the common and internal spanning tree instance, depending on the `<mstid>` parameter. You can set the path cost as a number in the range of 1 to 200000000 or **auto**. If you select **auto** the path cost value is set based on Link Speed.

If you specify the **external-cost** option, this command sets the external-path cost for MST instance ‘0’ i.e. CIST instance. You can set the external cost as a number in the range of 1 to 200000000 or **auto**. If you specify auto, the external path cost value is set based on Link Speed.

If you specify the **port-priority** option, this command sets the priority for this port within a specific multiple spanning tree instance or the common and internal spanning tree instance, depending on the `<mstid>` parameter. The port-priority value is a number in the range of 0 to 240 in increments of 16.

**Default**

- **cost**—auto
- **external-cost**—auto
- **port-priority**—128

**Format**

```
spanning-tree mst <mstid> {{cost <1-200000000> | auto} | (external-cost <1-200000000> | auto) | port-priority <0-240>})
```

**Mode**

Interface Config

**no spanning-tree mst**

This command sets the Path Cost or Port Priority for this port within the multiple spanning tree instance, or in the common and internal spanning tree to the respective default values. If you specify an `<mstid>` parameter that corresponds to an existing multiple spanning tree instance, you are configuring that multiple spanning tree instance. If you specify 0 (defined as the default CIST ID) as the `<mstid>`, you are configuring the common and internal spanning tree instance.
If you specify **cost**, this command sets the path cost for this port within a multiple spanning tree instance or the common and internal spanning tree instance, depending on the `<mstid>` parameter, to the default value, i.e. a path cost value based on the Link Speed.

If you specify **external-cost**, this command sets the external path cost for this port for mst ‘0’ instance, to the default value, i.e. a path cost value based on the Link Speed.

If you specify **port-priority**, this command sets the priority for this port within a specific multiple spanning tree instance or the common and internal spanning tree instance, depending on the `<mstid>` parameter, to the default value.

**Format**

```
no spanning-tree mst <mstid> <cost | external-cost | port-priority>
```

**Mode**

Interface Config

---

**spanning-tree mst instance**

This command adds a multiple spanning tree instance to the switch. The parameter `<mstid>` is a number within a range of 1 to 4094, that corresponds to the new instance ID to be added. The maximum number of multiple instances supported by the switch is 4.

**Default**

none

**Format**

```
spanning-tree mst instance <mstid>
```

**Mode**

Global Config

---

**no spanning-tree mst instance**

This command removes a multiple spanning tree instance from the switch and reallocates all VLANs allocated to the deleted instance to the common and internal spanning tree. The parameter `<mstid>` is a number that corresponds to the desired existing multiple spanning tree instance to be removed.

**Format**

```
no spanning-tree mst instance <mstid>
```

**Mode**

Global Config

---

**spanning-tree mst priority**

This command sets the bridge priority for a specific multiple spanning tree instance. The parameter `<mstid>` is a number that corresponds to the desired existing multiple spanning tree instance. The priority value is a number within a range of 0 to 61440 in increments of 4096.

If you specify 0 (defined as the default CIST ID) as the `<mstid>`, this command sets the Bridge Priority parameter to a new value for the common and internal spanning tree. The bridge priority value is a number within a range of 0 to 61440. The twelve least significant bits
are masked according to the 802.1s specification. This causes the priority to be rounded down to the next lower valid priority.

**Default**
32768

**Format**
```
spanning-tree mst priority <mstid> <0-61440>
```

**Mode**
Global Config

**no spanning-tree mst priority**

This command sets the bridge priority for a specific multiple spanning tree instance to the default value. The parameter `<mstid>` is a number that corresponds to the desired existing multiple spanning tree instance.

If 0 (defined as the default CIST ID) is passed as the `<mstid>`, this command sets the Bridge Priority parameter for the common and internal spanning tree to the default value.

**Format**
```
no spanning-tree mst priority <mstid>
```

**Mode**
Global Config

**spanning-tree mst vlan**

This command adds an association between a multiple spanning tree instance and one or more VLANs so that the VLAN(s) are no longer associated with the common and internal spanning tree. The parameter `<mstid>` is a number that corresponds to the desired existing multiple spanning tree instance. The vlan range can be specified as a list or as a range of values. To specify a list of VLANs, enter a list of VLAN IDs, each separated by a comma with no spaces in between. To specify a range of VLANs, separate the beginning and ending VLAN ID with a dash ("-").

**Format**
```
spanning-tree mst vlan <mstid> <vlanid>
```

**Mode**
Global Config

**no spanning-tree mst vlan**

This command removes an association between a multiple spanning tree instance and one or more VLANs so that the VLAN(s) are again associated with the common and internal spanning tree.

**Format**
```
no spanning-tree mst vlan <mstid> <vlanid>
```

**Mode**
Global Config
**spanning-tree port mode**

This command sets the Administrative Switch Port State for this port to enabled.

**Default** enabled
**Format** spanning-tree port mode
**Mode** Interface Config

**no spanning-tree port mode**

This command sets the Administrative Switch Port State for this port to disabled.

**Format** no spanning-tree port mode
**Mode** Interface Config

**spanning-tree port mode all**

This command sets the Administrative Switch Port State for all ports to enabled.

**Default** enabled
**Format** spanning-tree port mode all
**Mode** Global Config

**no spanning-tree port mode all**

This command sets the Administrative Switch Port State for all ports to disabled.

**Format** no spanning-tree port mode all
**Mode** Global Config

**spanning-tree edgeport all**

This command specifies that every port is an Edge Port within the common and internal spanning tree. This allows all ports to transition to Forwarding State without delay.

**Format** spanning-tree edgeport all
**Mode** Global Config

**no spanning-tree edgeport all**

This command disables Edge Port mode for all ports within the common and internal spanning tree.

**Format** no spanning-tree edgeport all
**Mode** Global Config
**spanning-tree bpduforwarding**

Normally a switch will not forward Spanning Tree Protocol (STP) BPDU packets if STP is disabled. However, if in some network setup, the user wishes to forward BDPU packets received from other network devices, this command can be used to enable the forwarding.

Default: disabled

**Format:** spanning-tree bpduforwarding

**Mode:** Global Config

**no spanning-tree bpduforwarding**

This command will cause the STP BPDU packets received from the network to be dropped if STP is disabled.

**Format:** no spanning-tree bpduforwarding

**Mode:** Global Config

**show spanning-tree**

This command displays spanning tree settings for the common and internal spanning tree. The following details are displayed.

**Format:** show spanning-tree

**Mode:**
- Privileged EXEC
- User EXEC

<table>

</tr>
</tbody>
</table>

**VLAN Commands**

This section describes the commands you use to configure VLAN settings.
vlan database

This command gives you access to the VLAN Config mode, which allows you to configure VLAN characteristics.

Format: `vlan database`
Mode: Privileged EXEC

network mgmt_vlan

This command configures the Management VLAN ID.

Default: 1
Format: `network mgmt_vlan <1-4093>`
Mode: Privileged EXEC

no network mgmt_vlan

This command sets the Management VLAN ID to the default.

Format: `no network mgmt_vlan`
Mode: Privileged EXEC

vlan

This command creates a new VLAN and assigns it an ID. The ID is a valid VLAN identification number (ID 1 is reserved for the default VLAN). The vlan-list contains VlanId's in range <1-4093>. Separate non-consecutive IDs with ',' and no spaces and no zeros in between the range; Use '-' for range.

Format: `vlan <vlan-list>`
Mode: VLAN Config

no vlan

This command deletes an existing VLAN. The ID is a valid VLAN identification number (ID 1 is reserved for the default VLAN). The vlan-list contains VlanId's in range <1-4093>. Separate non-consecutive IDs with ',' and no spaces and no zeros in between the range; Use '-' for range.

Format: `no vlan <vlan-list>`
Mode: VLAN Config
**vlan acceptframe**

This command sets the frame acceptance mode per interface. For VLAN Only mode, untagged frames or priority frames received on this interface are discarded. For Admit All mode, untagged frames or priority frames received on this interface are accepted and assigned the value of the interface VLAN ID for this port. With either option, VLAN tagged frames are forwarded in accordance with the IEEE 802.1Q VLAN Specification.

**Default**

all

**Format**

`vlan acceptframe {untaggedonly | vlanonly | all}`

**Mode**

Interface Config

**no vlan acceptframe**

This command resets the frame acceptance mode for the interface to the default value.

**Format**

`no vlan acceptframe`

**Mode**

Interface Config

**vlan ingressfilter**

This command enables ingress filtering. If ingress filtering is disabled, frames received with VLAN IDs that do not match the VLAN membership of the receiving interface are admitted and forwarded to ports that are members of that VLAN.

**Default**

`disabled`

**Format**

`vlan ingressfilter`

**Mode**

Interface Config

**no vlan ingressfilter**

This command disables ingress filtering. If ingress filtering is disabled, frames received with VLAN IDs that do not match the VLAN membership of the receiving interface are admitted and forwarded to ports that are members of that VLAN.

**Format**

`no vlan ingressfilter`

**Mode**

Interface Config
**vlan makestatic**

This command changes a dynamically created VLAN (one that is created by GVRP registration) to a static VLAN (one that is permanently configured and defined). The ID is a valid VLAN identification number. VLAN range is 2-4093.

**Format**

```
vlan makestatic <2-4093>
```

**Mode**

VLAN Config

**vlan name**

This command changes the name of a VLAN. The name is an alphanumeric string of up to 32 characters, and the ID is a valid VLAN identification number. ID range is 1-4093.

**Default**

- VLAN ID 1 - default
- other VLANS - blank string

**Format**

```
vlan name <1-4093> <name>
```

**Mode**

VLAN Config

**no vlan name**

This command sets the name of a VLAN to a blank string.

**Format**

```
no vlan name <1-4093>
```

**Mode**

VLAN Config

**vlan participation**

This command configures the degree of participation for a specific interface in a VLAN. The ID is a valid VLAN identification number, and the interface is a valid interface number.

**Format**

```
vlan participation {exclude | include | auto} <1-4093>
```

**Mode**

Interface Config

Participation options are:

<table>
<thead>
<tr>
<th>Participation Options</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>include</td>
<td>The interface is always a member of this VLAN. This is equivalent to registration fixed.</td>
</tr>
<tr>
<td>exclude</td>
<td>The interface is never a member of this VLAN. This is equivalent to registration forbidden.</td>
</tr>
<tr>
<td>auto</td>
<td>The interface is dynamically registered in this VLAN by GVRP. The interface will not participate in this VLAN unless a join request is received on this interface. This is equivalent to registration normal.</td>
</tr>
</tbody>
</table>
**vlan participation all**

This command configures the degree of participation for all interfaces in a VLAN. The ID is a valid VLAN identification number.

**Format**

```
vlan participation all {exclude | include | auto} <1-4093>
```

**Mode**

Global Config

You can use the following participation options:

<table>
<thead>
<tr>
<th>Participation Options</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>include</td>
<td>The interface is always a member of this VLAN. This is equivalent to registration fixed.</td>
</tr>
<tr>
<td>exclude</td>
<td>The interface is never a member of this VLAN. This is equivalent to registration forbidden.</td>
</tr>
<tr>
<td>auto</td>
<td>The interface is dynamically registered in this VLAN by GVRP. The interface will not participate in this VLAN unless a join request is received on this interface. This is equivalent to registration normal.</td>
</tr>
</tbody>
</table>

**vlan port acceptframe all**

This command sets the frame acceptance mode for all interfaces.

Default: all

**Format**

```
vlan port acceptframe all {vlanonly | all}
```

**Mode**

Global Config

The modes defined as follows:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Only mode</td>
<td>Untagged frames or priority frames received on this interface are discarded.</td>
</tr>
<tr>
<td>Admit All mode</td>
<td>Untagged frames or priority frames received on this interface are accepted and assigned the value of the interface VLAN ID for this port.</td>
</tr>
</tbody>
</table>

With either option, VLAN tagged frames are forwarded in accordance with the IEEE 802.1Q VLAN Specification.

**no vlan port acceptframe all**

This command sets the frame acceptance mode for all interfaces to Admit All. For Admit All mode, untagged frames or priority frames received on this interface are accepted and
assigned the value of the interface VLAN ID for this port. With either option, VLAN tagged frames are forwarded in accordance with the IEEE 802.1Q VLAN Specification.

**Format**
```
no vlan port acceptframe all
```

**Mode**
Global Config

**vlan port ingressfilter all**

This command enables ingress filtering for all ports. If ingress filtering is disabled, frames received with VLAN IDs that do not match the VLAN membership of the receiving interface are admitted and forwarded to ports that are members of that VLAN.

**Default**
```
disabled
```

**Format**
```
vlan port ingressfilter all
```

**Mode**
Global Config

**no vlan port ingressfilter all**

This command disables ingress filtering for all ports. If ingress filtering is disabled, frames received with VLAN IDs that do not match the VLAN membership of the receiving interface are admitted and forwarded to ports that are members of that VLAN.

**Format**
```
no vlan port ingressfilter all
```

**Mode**
Global Config

**vlan port pvid all**

This command changes the VLAN ID for all interface.

**Default**
```
1
```

**Format**
```
vlan port pvid all <1-4093>
```

**Mode**
Global Config

**no vlan port pvid all**

This command sets the VLAN ID for all interfaces to 1.

**Format**
```
no vlan port pvid all
```

**Mode**
Global Config
**vlan port tagging all**

This command configures the tagging behavior for all interfaces in a VLAN to enabled. If tagging is enabled, traffic is transmitted as tagged frames. If tagging is disabled, traffic is transmitted as untagged frames. The ID is a valid VLAN identification number.

**Format**

`vlan port tagging all <1-4093>`

**Mode**

Global Config

**no vlan port tagging all**

This command configures the tagging behavior for all interfaces in a VLAN to disabled. If tagging is disabled, traffic is transmitted as untagged frames. The ID is a valid VLAN identification number.

**Format**

`no vlan port tagging all`

**Mode**

Global Config

**vlan protocol group**

This command adds protocol-based VLAN groups to the system. When it is created, the protocol group will be assigned a unique number (1-128) that will be used to identify the group in subsequent commands.

**Format**

`vlan protocol group <1-128>`

**Mode**

Global Config

**no vlan protocol group**

This command removes a protocol group.

**Format**

`no vlan protocol group <1-128>`

**Mode**

Global Config

**vlan protocol group name**

This command assigns a name to a protocol-based VLAN groups. The *groupname* variable can be a character string of 0 to 16 characters.

**Format**

`vlan protocol group name <1-128> <groupname>`

**Mode**

Global Config
no vlan protocol group name

This command removes the name from a protocol-based VLAN groups.

Format: no vlan protocol group name <1-128>

Mode: Global Config

vlan protocol group add protocol

This command adds the protocol to the protocol-based VLAN identified by groupid. A group may have more than one protocol associated with it. Each interface and protocol combination can only be associated with one group. If adding a protocol to a group causes any conflicts with interfaces currently associated with the group, this command fails and the protocol is not added to the group. The possible values for protocol-list includes the keywords ip, arp, and ipx and hexadecimal or decimal values ranging from 0x0600 (1536) to 0xFFFF (65535). The protocol list can accept up to 16 protocols separated by a comma.

Default: none

Format: vlan protocol group add protocol <groupid> ethertype

Mode: Global Config

no vlan protocol group add protocol

This command removes the <protocol> from this protocol-based VLAN group that is identified by this <groupid>. The possible values for protocol are ip, arp, and ipx.

Format: no vlan protocol group add protocol <groupid> ethertype

Mode: Global Config

protocol group

This command attaches a <vlanid> to the protocol-based VLAN identified by <groupid>. A group may only be associated with one VLAN at a time, however the VLAN association can be changed.

Default: none

Format: protocol group <groupid> <vlanid>

Mode: VLAN Config
no protocol group

This command removes the <vlanid> from this protocol-based VLAN group that is identified by this <groupid>.

Format        no protocol group <groupid> <vlanid>
Mode          VLAN Config

protocol vlan group

This command adds the physical interface to the protocol-based VLAN identified by <groupid>. You can associate multiple interfaces with a group, but you can only associate each interface and protocol combination with one group. If adding an interface to a group causes any conflicts with protocols currently associated with the group, this command fails and the interface(s) are not added to the group.

Default       none
Format        protocol vlan group <groupid>
Mode          Interface Config

no protocol vlan group

This command removes the interface from this protocol-based VLAN group that is identified by this <groupid>.

Format        no protocol vlan group <groupid>
Mode          Interface Config

protocol vlan group all

This command adds all physical interfaces to the protocol-based VLAN identified by <groupid>. You can associate multiple interfaces with a group, but you can only associate each interface and protocol combination with one group. If adding an interface to a group causes any conflicts with protocols currently associated with the group, this command will fail and the interface(s) will not be added to the group.

Default       none
Format        protocol vlan group all <groupid>
Mode          Global Config
no protocol vlan group all

This command removes all interfaces from this protocol-based VLAN group that is identified by this <groupid>.

**Format**

no protocol vlan group all <groupid>

**Mode**

Global Config

**vlan pvid**

This command changes the VLAN ID per interface.

**Default**

1

**Format**

vlan pvid <1-4093>

**Mode**

Interface Config

no vlan pvid

This command sets the VLAN ID per interface to 1.

**Format**

no vlan pvid

**Mode**

Interface Config

**vlan tagging**

This command configures the tagging behavior for a specific interface in a VLAN to enabled. If tagging is enabled, traffic is transmitted as tagged frames. If tagging is disabled, traffic is transmitted as untagged frames. The vlan-list contains VlanId's in range <1-4093>. Separate non-consecutive IDs with ',' and no spaces and no zeros in between the range; Use '-' for range.

**Format**

vlan tagging <vlan-list>

**Mode**

Interface Config

no vlan tagging

This command configures the tagging behavior for a specific interface in a VLAN to disabled. If tagging is disabled, traffic is transmitted as untagged frames. The vlan-list contains VlanId's in range <1-4093>. Separate non-consecutive IDs with ',' and no spaces and no zeros in between the range; Use '-' for range.

**Format**

no vlan tagging <vlan-list>

**Mode**

Interface Config
**vlan association subnet**

This command associates a VLAN to a specific IP-subnet.

**Format**

```
vlan association subnet <ipaddr> <netmask> <1-4093>
```

**Mode**

VLAN Config

**no vlan association subnet**

This command removes association of a specific IP-subnet to a VLAN.

**Format**

```
no vlan association subnet <ipaddr> <netmask>
```

**Mode**

VLAN Config

**vlan association mac**

This command associates a MAC address to a VLAN.

**Format**

```
vlan association mac <macaddr> <1-4093>
```

**Mode**

VLAN database

**no vlan association mac**

This command removes the association of a MAC address to a VLAN.

**Format**

```
no vlan association mac <macaddr>
```

**Mode**

VLAN database

**show vlan**

This command displays a list of all configured VLAN.

**Format**

```
show vlan
```

**Mode**

- Privileged EXEC
- User EXEC

</tr>
<tr>
<td>VLAN ID</td>
<td>There is a VLAN Identifier (VID) associated with each VLAN.</td>
</tr>
</tbody>
</table>

Double VLAN Commands

This section describes the commands you use to configure double VLAN (DVLAN). Double VLAN tagging is a way to pass VLAN traffic from one customer domain to another through a Metro Core in a simple and cost effective manner. The additional tag on the traffic helps differentiate between customers in the MAN while preserving the VLAN identification of the individual customers when they enter their own 802.1Q domain.
**dvlan-tunnel ethertype**

This command configures the ether-type for all interfaces. The ether-type may have the values of **802.1Q**, **vMAN**, or **custom**. If the ether-type has a value of **custom**, the optional value of the custom ether type must be set to a value from 0 to 65535.

- **Default**: vm
- **Format**: `dvlan-tunnel ethertype {802.1Q | vman | custom} [0-65535]`
- **Mode**: Global Config

**mode dot1q-tunnel**

This command is used to enable Double VLAN Tunneling on the specified interface.

- **Default**: disabled
- **Format**: `mode dot1q-tunnel`
- **Mode**: Interface Config

**no mode dot1q-tunnel**

This command is used to disable Double VLAN Tunneling on the specified interface. By default, Double VLAN Tunneling is disabled.

- **Format**: `no mode dot1q-tunnel`
- **Mode**: Interface Config

**mode dvlan-tunnel**

Use this command to enable Double VLAN Tunneling on the specified interface.

---

**Note:** When you use the `mode dvlan-tunnel` command on an interface, it becomes a service provider port. Ports that do not have double VLAN tunneling enabled are customer ports.

---

- **Default**: disabled
- **Format**: `mode dvlan-tunnel`
- **Mode**: Interface Config
no mode dvlan-tunnel

This command is used to disable Double VLAN Tunneling on the specified interface. By default, Double VLAN Tunneling is disabled.

**Format**

```
no mode dvlan-tunnel
```

**Mode**

```
Interface Config
```

**show dot1q-tunnel**

Use this command without the optional parameters to display all interfaces enabled for Double VLAN Tunneling. Use the optional parameters to display detailed information about Double VLAN Tunneling for the specified interface or all interfaces.

**Format**

```
show dot1q-tunnel [interface {<unit/slot/port> | all}]
```

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Mode</td>
<td>The administrative mode through which Double VLAN Tunneling can be enabled or disabled. The default value for this field is disabled.</td>
</tr>
<tr>
<td>EtherType</td>
<td>A 2-byte hex EtherType to be used as the first 16 bits of the DVLAN tunnel. There are three different EtherType tags. The first is 802.1Q, which represents the commonly used value of 0x8100. The second is vMAN, which represents the commonly used value of 0x88A8. If EtherType is not one of these two values, then it is a custom tunnel value, representing any value in the range of 0 to 65535.</td>
</tr>
</tbody>
</table>

**show dvlan-tunnel**

Use this command without the optional parameters to display all interfaces enabled for Double VLAN Tunneling. Use the optional parameters to display detailed information about Double VLAN Tunneling for the specified interface or all interfaces.

**Format**

```
show dvlan-tunnel [interface {<unit/slot/port> | all}]
```

**Mode**

- Privileged EXEC
- User EXEC

Voice VLAN Commands

This section describes the commands you use for Voice VLAN. Voice VLAN enables switch ports to carry voice traffic with defined priority so as to enable separation of voice and data traffic coming onto the port. The benefits of using Voice VLAN is to ensure that the sound quality of an IP phone could be safeguarded from deteriorating when the data traffic on the port is high.

Also the inherent isolation provided by VLANs ensures that inter-VLAN traffic is under management control and that network-attached clients cannot initiate a direct attack on voice components. QoS-based on IEEE 802.1P class of service (CoS) uses classification and scheduling to sent network traffic from the switch in a predictable manner. The system uses the source MAC of the traffic traveling through the port to identify the IP phone data flow.

voice vlan (Global Config)

Use this command to enable the Voice VLAN capability on the switch.

Default: disabled
Format: voice vlan
Mode: Global Config

no voice vlan (Global Config)

Use this command to disable the Voice VLAN capability on the switch.

Format: no voice vlan
Mode: Global Config

voice vlan (Interface Config)

Use this command to enable the Voice VLAN capability on the interface.

Default: disabled

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>The administrative mode through which Double VLAN Tunneling can be enabled or disabled. The default value for this field is disabled.</td>
</tr>
<tr>
<td>EtherType</td>
<td>A 2-byte hex EtherType to be used as the first 16 bits of the DVLAN tunnel. There are three different EtherType tags. The first is 802.1Q, which represents the commonly used value of 0x8100. The second is vMAN, which represents the commonly used value of 0x88A8. If EtherType is not one of these two values, then it is a custom tunnel value, representing any value in the range of 0 to 65535.</td>
</tr>
</tbody>
</table>
ProSafe Managed Switch

You can configure Voice VLAN in any of the following ways:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-id</td>
<td>Configure the IP phone to forward all voice traffic through the specified VLAN. Valid VLAN IDs are from 1 to 4093 (the maximum supported by the platform).</td>
</tr>
<tr>
<td>dot1p</td>
<td>Configure the IP phone to use 802.1p priority tagging for voice traffic and to use the default native VLAN (VLAN 0) to carry all traffic. Valid <code>&lt;priority&gt;</code> range is 0 to 7.</td>
</tr>
<tr>
<td>none</td>
<td>Allow the IP phone to use its own configuration to send untagged voice traffic.</td>
</tr>
<tr>
<td>untagged</td>
<td>Configure the phone to send untagged voice traffic.</td>
</tr>
</tbody>
</table>

**no voice vlan (Interface Config)**

Use this command to disable the Voice VLAN capability on the interface.

<table>
<thead>
<tr>
<th>Format</th>
<th>no voice vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**voice vlan data priority**

Use this command to either trust or untrust the data traffic arriving on the Voice VLAN port.

<table>
<thead>
<tr>
<th>Default</th>
<th>trust</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>voice vlan data priority [untrust</td>
</tr>
<tr>
<td>Mode</td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**show voice vlan**

| Format       | show voice vlan [interface [<unit/slot/port> | all]] |
|--------------|---------------------------------------------------|
| Mode         | Privileged EXEC                                    |

When the `interface` parameter is not specified, only the global mode of the Voice VLAN is displayed.

<table>
<thead>
<tr>

<td>The <strong>802.1p</strong> priority for the Voice VLAN on the port.</td>
</tr>
<tr>
<td>Voice VLAN Untagged</td>
<td>The tagging option for the Voice VLAN traffic.</td>
</tr>
<tr>
<td>Voice VLAN CoS Override</td>
<td>The Override option for the voice traffic arriving on the port.</td>
</tr>
<tr>
<td>Voice VLAN Status</td>
<td>The operational status of Voice VLAN on the port.</td>
</tr>
</tbody>
</table>

**Provisioning (IEEE 802.1p) Commands**

This section describes the commands you use to configure provisioning, which allows you to prioritize ports.

**vlan port priority all**

This command configures the port priority assigned for untagged packets for all ports presently plugged into the device. The range for the priority is 0-7. Any subsequent per port configuration will override this configuration setting.

- **Format**
  
  ```
  vlan port priority all <priority>
  ```

- **Mode**
  
  Global Config

**vlan priority**

This command configures the default 802.1p port priority assigned for untagged packets for a specific interface. The range for the priority is 0–7.

- **Default**
  
  0

- **Format**
  
  ```
  vlan priority <priority>
  ```

- **Mode**
  
  Interface Config

**Protected Ports Commands**

This section describes commands you use to configure and view protected ports on a switch. Protected ports do not forward traffic to each other, even if they are on the same VLAN. However, protected ports can forward traffic to all unprotected ports in their group. Unprotected ports can forward traffic to both protected and unprotected ports. Ports are unprotected by default.
If an interface is configured as a protected port, and you add that interface to a Port Channel or Link Aggregation Group (LAG), the protected port status becomes operationally disabled on the interface, and the interface follows the configuration of the LAG port. However, the protected port configuration for the interface remains unchanged. Once the interface is no longer a member of a LAG, the current configuration for that interface automatically becomes effective.

**switchport protected (Global Config)**

Use this command to create a protected port group. The `<groupid>` parameter identifies the set of protected ports. Use the `name <name>` pair to assign a name to the protected port group. The name can be up to 32 alphanumeric characters long, including blanks. The default is blank.

---

**Note:** Port protection occurs within a single switch. Protected port configuration does not affect traffic between ports on two different switches. No traffic forwarding is possible between two protected ports.

---

**Format**

```
switchport protected <groupid> name <name>
```

**Mode**

Global Config

**no switchport protected (Global Config)**

Use this command to remove a protected port group. The `groupid` parameter identifies the set of protected ports. Use the `name` keyword to remove the name from the group.

**Format**

```
NO switchport protected <groupid> name
```

**Mode**

Global Config

**switchport protected (Interface Config)**

Use this command to add an interface to a protected port group. The `<groupid>` parameter identifies the set of protected ports to which this interface is assigned. You can only configure an interface as protected in one group.

---

**Note:** Port protection occurs within a single switch. Protected port configuration does not affect traffic between ports on two different switches. No traffic forwarding is possible between two protected ports.

---
Switching Commands

ProSafe Managed Switch

**no switchport protected (Interface Config)**

Use this command to configure a port as unprotected. The `groupid` parameter identifies the set of protected ports to which this interface is assigned.

**Format**

`no switchport protected <groupid>`

**Mode**

Interface Config

**show switchport protected**

This command displays the status of all the interfaces, including protected and unprotected interfaces.

**Format**

`show switchport protected <groupid>`

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group ID</td>
<td>The number that identifies the protected port group.</td>

<td>An optional name of the protected port group. The name can be up to 32 alphanumeric characters long, including blanks. The default is blank.</td>
</tr>
<tr>
<td>List of Physical Ports</td>
<td>List of ports, which are configured as protected for the group identified with <code>&lt;groupid&gt;</code>. If no port is configured as protected for this group, this field is blank.</td>
</tr>
</tbody>
</table>

**show interfaces switchport**

This command displays the status of the interface (protected/unprotected) under the groupid.

**Format**

`show interfaces switchport <unit/slot/port> <groupid>`

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>A string associated with this group as a convenience. It can be up to 32 alphanumeric characters long, including blanks. The default is blank. This field is optional.</td>
</tr>
<tr>
<td>Protected port</td>
<td>Indicates whether the interface is protected or not. It shows TRUE or FALSE. If the group is a multiple groups then it shows TRUE in Group <code>&lt;groupid&gt;</code>.</td>
</tr>
</tbody>
</table>
Private Group Commands

This section describes commands used to configure private group and view private group configuration information.

Private group can be used to create a group of ports that can or can not share traffic to each others in the same VLAN group. The main application is to isolate a group of users from another without using VLAN.

switchport private-group

This command is used to assign one port or a range of ports to private group <privategroup-name> (or <private-group-id>).

The ingress traffic from a port in private group can be forwarded to other ports either in the same private group or anyone in the same VLAN that are not in a private group.

By default, a port does not belong to any private group. A port cannot be in more than one private group. An error message should return when that occurred. To change a port’s private group, first the port must be removed from its private group.

Default: port not associated with any group.

Format: switchport private-group [<privategroup-name>|<private-group-id>]

Mode: Interface Config

no switchport private group

This command is used to remove the specified port from the given private group.

Format: no switchport private-group [<privategroup-name>|<private-group-id>]

Mode: Interface Config

private-group name

This command is used to create a private group with name <private-group-name>. The name string can be up to 24 bytes of non-blank characters. The total number of private groups is 192 such that the valid range for the ID is <1-192>.

The <private-group-id> field is optional. If not specified, a group id not used will be assigned automatically.

The mode can be either “isolated” or “community”. When in “isolated” mode, the member port in the group cannot forward its egress traffic to any other members in the same group. By default, the mode is “community” mode that each member port can forward traffic to other members in the same group, but not to members in other groups.
Format:  
private-group name <private-group-name> [groupid] [mode {community|isolated}]

Mode:  
Global Config

define private-group

This command is used to remove the specified private group.

Format:  
private-group name <private-group-name>

Mode:  
Global Config

show private-group

This command displays the private groups' information.

Format:  
show private-groupname [<private-group-name>|<private-group-id>|port <unit/slot/port>]

Mode:  
Privileged EXEC

<table>
<thead>

</table>

Private VLAN

The Private VLANs feature separates a regular VLAN domain into two or more subdomains. Each subdomain is defined (represented) by a primary VLAN and a secondary VLAN. The primary VLAN ID is the same for all subdomains that belong to a private VLAN. The secondary VLAN ID differentiates subdomains from each other and provides Layer 2 isolation between ports of the same private VLAN. The types of VLANs within a private VLAN are as follows:

- Primary VLAN—Forwards the traffic from the promiscuous ports to isolated ports, community ports and other promiscuous ports in the same private VLAN. Only one
primary VLAN can be configured per private VLAN. All ports within a private VLAN share the same primary VLAN.

- Isolated VLAN—A secondary VLAN that carries traffic from isolated ports to promiscuous ports. Only one isolated VLAN can be configured per private VLAN.
- Community VLAN—A secondary VLAN that forwards traffic between ports that belong to the same community and the promiscuous ports. There can be multiple community VLANs per private VLAN.

Three types of port designations exist within a private VLAN:

- Promiscuous Ports—An endpoint connected to a promiscuous port is allowed to communicate with any endpoint within the private VLAN. Multiple promiscuous ports can be defined for a single private VLAN domain.
- Isolated Ports—An endpoint connected to an isolated port is allowed to communicate with endpoints connected to promiscuous ports only. Endpoints connected to adjacent isolated ports cannot communicate with each other.
- Community Ports—An endpoint connected to a community port is allowed to communicate with the endpoints within a community and with any configured promiscuous port. The endpoints that belong to one community cannot communicate with endpoints that belong to a different community or with endpoints connected to isolated ports.

The Private VLANs can be extended across multiple switches through inter-switch/stack links that transport primary, community and isolated VLANs between devices.

**switchport private-vlan**

This command is used to define a private-VLAN association for an isolated or community port or a mapping for a promiscuous port.

**Format**

```
switchport private-vlan [host-association <primary-vlan-id> <secondary-vlan-id> | mapping <primary-vlan-id> {add | remove} <secondary-vlan-list>]
```

**Mode**

Interface Config

<tr>
<td>add</td>
<td>Associates the secondary VLAN with the primary one.</td>
</tr>
<tr>
<td>remove</td>
<td>Deletes the secondary VLANs from the primary VLAN association.</td>
</tr>
<tr>
<td>secondary-vlan-list</td>
<td>A list of secondary VLANs to be mapped to a primary VLAN.</td>
</tr>
</tbody>
</table>
no switchport private-vlan

This command is used to remove the private-VLAN association or mapping from the port.

**Format**

```
no switchport private-vlan {host-association | mapping}
```

**Mode**

Interface Config

**switchport mode private-vlan**

This command is used to configure a port as a promiscuous or host private VLAN port. Note that the properties of each mode can be configured even when the switch is not in that mode. However, they will only be applicable once the switch is in that particular mode.

**Format**

```
switchport mode private-vlan {host | promiscuous}
```

**Mode**

Interface Config

Default: General

<table>
<thead>

## GARP Commands

This section describes the commands you use to configure Generic Attribute Registration Protocol (GARP) and view GARP status. The commands in this section affect both GARP VLAN Registration Protocol (GVRP) and Garp Multicast Registration Protocol (GMRP). GARP is a protocol that allows client stations to register with the switch for membership in VLANS (by using GVMP) or multicast groups (by using GVMP).

### set garp timer join

This command sets the GVRP join time for one port (Interface Config mode) or all (Global Config mode) and per GARP. Join time is the interval between the transmission of GARP Protocol Data Units (PDUs) registering (or re-registering) membership for a VLAN or multicast group. This command has an effect only when GVRP is enabled. The time is from 10 to 100 (centiseconds). The value 20 centiseconds is 0.2 seconds.

<table>
<thead>
<tr>
<th>Default</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>set garp timer join &lt;10-100&gt;</td>
</tr>
<tr>
<td>Mode</td>
<td>• Interface Config</td>
</tr>
<tr>
<td></td>
<td>• Global Config</td>
</tr>
</tbody>
</table>

### no set garp timer join

This command sets the GVRP join time (for one or all ports and per GARP) to the default and only has an effect when GVRP is enabled.

<table>
<thead>
<tr>
<th>Format</th>
<th>no set garp timer join</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>• Interface Config</td>
</tr>
<tr>
<td></td>
<td>• Global Config</td>
</tr>
</tbody>
</table>
set garp timer leave

This command sets the GVRP leave time for one port (Interface Config mode) or all ports (Global Config mode) and only has an effect when GVRP is enabled. Leave time is the time to wait after receiving an unregister request for a VLAN or a multicast group before deleting the VLAN entry. This can be considered a buffer time for another station to assert registration for the same attribute in order to maintain uninterrupted service. The leave time is 20 to 600 (centiseconds). The value 60 centiseconds is 0.6 seconds.

Default 60
Format set garp timer leave <20-600>
Mode • Interface Config
• Global Config

no set garp timer leave

This command sets the GVRP leave time on all ports or a single port to the default and only has an effect when GVRP is enabled.

Format no set garp timer leave
Mode • Interface Config
• Global Config

set garp timer leaveall

This command sets how frequently Leave All PDUs are generated. A Leave All PDU indicates that all registrations will be unregistered. Participants would need to rejoin in order to maintain registration. The value applies per port and per GARP participation. The time may range from 200 to 6000 (centiseconds). The value 1000 centiseconds is 10 seconds. You can use this command on all ports (Global Config mode) or a single port (Interface Config mode), and it only has an effect only when GVRP is enabled.

Default 1000
Format set garp timer leaveall <200-6000>
Mode • Interface Config
• Global Config

no set garp timer leaveall

This command sets how frequently Leave All PDUs are generated the default and only has an effect when GVRP is enabled.

Format no set garp timer leaveall
Mode • Interface Config
• Global Config
**show garp**

This command displays GARP information.

**Format**

```
show garp
```

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>GMRP Admin Mode</td>
<td>The administrative mode of GARP Multicast Registration Protocol (GMRP) for the system.</td>
</tr>
<tr>
<td>GVRP Admin Mode</td>
<td>The administrative mode of GARP VLAN Registration Protocol (GVRP) for the system.</td>
</tr>
</tbody>
</table>

**GVRP Commands**

This section describes the commands you use to configure and view GARP VLAN Registration Protocol (GVRP) information. GVRP-enabled switches exchange VLAN configuration information, which allows GVRP to provide dynamic VLAN creation on trunk ports and automatic VLAN pruning.

**Note:** If GVRP is disabled, the system does not forward GVRP messages.

**set gvrp adminmode**

This command enables GVRP on the system.

**Default**

```
disabled
```

**Format**

```
set gvrp adminmode
```

**Mode**

Privileged EXEC

**no set gvrp adminmode**

This command disables GVRP.

**Format**

```
no set gvrp adminmode
```

**Mode**

Privileged EXEC
**set gvrp interfacemode**

This command enables GVRP on a single port (Interface Config mode) or all ports (Global Config mode).

**Default:** disabled

**Format:**

```
set gvrp interfacemode
```

**Mode:**

- Interface Config
- Global Config

**no set gvrp interfacemode**

This command disables GVRP on a single port (Interface Config mode) or all ports (Global Config mode). If GVRP is disabled, Join Time, Leave Time and Leave All Time have no effect.

**Format:**

```
no set gvrp interfacemode
```

**Mode:**

- Interface Config
- Global Config

**show gvrp configuration**

This command displays Generic Attributes Registration Protocol (GARP) information for one or all interfaces.

**Format:**

```
show gvrp configuration {<unit/slot/port> | all}
```

**Mode:**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Join Timer</td>
<td>The interval between the transmission of GARP PDUs registering (or re-registering) membership for an attribute. Current attributes are a VLAN or multicast group. There is an instance of this timer on a per-Port, per-GARP participant basis. Permissible values are 10 to 100 centiseconds (0.1 to 1.0 seconds). The factory default is 20 centiseconds (0.2 seconds). The finest granularity of specification is one centisecond (0.01 seconds).</td>
</tr>
<tr>
<td>Leave Timer</td>
<td>The period of time to wait after receiving an unregister request for an attribute before deleting the attribute. Current attributes are a VLAN or multicast group. This may be considered a buffer time for another station to assert registration for the same attribute in order to maintain uninterrupted service. There is an instance of this timer on a per-Port, per-GARP participant basis. Permissible values are 20 to 600 centiseconds (0.2 to 6.0 seconds). The factory default is 60 centiseconds (0.6 seconds).</td>
</tr>
</tbody>
</table>
GMRP Commands

This section describes the commands you use to configure and view GARP Multicast Registration Protocol (GMRP) information. Like IGMP snooping, GMRP helps control the flooding of multicast packets. GMRP-enabled switches dynamically register and de-register group membership information with the MAC networking devices attached to the same segment. GMRP also allows group membership information to propagate across all networking devices in the bridged LAN that support Extended Filtering Services.

Note: If GMRP is disabled, the system does not forward GMRP messages.

set gmrp adminmode

This command enables GARP Multicast Registration Protocol (GMRP) on the system.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>LeaveAll Timer</td>
<td>This Leave All Time controls how frequently LeaveAll PDUs are generated. A LeaveAll PDU indicates that all registrations will shortly be deregistered. Participants will need to rejoin in order to maintain registration. There is an instance of this timer on a per-Port, per-GARP participant basis. The Leave All Period Timer is set to a random value in the range of LeaveAllTime to 1.5*LeaveAllTime. Permissible values are 200 to 6000 centiseconds (2 to 60 seconds). The factory default is 1000 centiseconds (10 seconds).</td>
</tr>
<tr>
<td>Port GVRP Mode</td>
<td>The GVRP administrative mode for the port, which is enabled or disabled (default). If this parameter is disabled, Join Time, Leave Time and Leave All Time have no effect.</td>

Default disabled

Format set gmrp adminmode

Mode Privileged EXEC

no set gmrp adminmode

This command disables GARP Multicast Registration Protocol (GMRP) on the system.

Format no set gmrp adminmode

Mode Privileged EXEC

set gmrp interfacemode

This command enables GARP Multicast Registration Protocol on a single interface (Interface Config mode) or all interfaces (Global Config mode). If an interface which has GARP enabled is enabled for routing or is enlisted as a member of a port-channel (LAG), GARP functionality
is disabled on that interface. GARP functionality is subsequently re-enabled if routing is disabled and port-channel (LAG) membership is removed from an interface that has GARP enabled.

```
Default disabled
Format set gmrp interfacemode
Mode • Interface Config
     • Global Config
```

**no set gmrp interfacemode**

This command disables GARP Multicast Registration Protocol on a single interface or all interfaces. If an interface which has GARP enabled is enabled for routing or is enlisted as a member of a port-channel (LAG), GARP functionality is disabled. GARP functionality is subsequently re-enabled if routing is disabled and port-channel (LAG) membership is removed from an interface that has GARP enabled.

```
Format no set gmrp interfacemode
Mode • Interface Config
     • Global Config
```

**show gmrp configuration**

This command displays Generic Attributes Registration Protocol (GARP) information for one or all interfaces.

```
Format show gmrp configuration {<unit/slot/port> | all}
Mode • Privileged EXEC
     • User EXEC
```

<table>

**Port-Based Network Access Control Commands**

This section describes the commands you use to configure port-based network access control (802.1x). Port-based network access control allows you to permit access to network services only to and devices that are authorized and authenticated.

**clear dot1x statistics**

This command resets the 802.1x statistics for the specified port or for all ports.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac Address</td>
<td>A unicast MAC address for which the switch has forwarding and or filtering information. The format is 6 or 8 two-digit hexadecimal numbers that are separated by colons, for example 01:23:45:67:89:AB. In an IVL system the MAC address is displayed as 8 bytes.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the entry. Static entries are those that are configured by the end user. Dynamic entries are added to the table as a result of a learning process or protocol.</td>
</tr>
<tr>
<td>Description</td>
<td>The text description of this multicast table entry.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:).</td>
</tr>
</tbody>
</table>

**clear dot1x statistics**

This command resets the 802.1x statistics for the specified port or for all ports.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>Mac Address</td>

<td>The text description of this multicast table entry.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:).</td>
</tr>
</tbody>
</table>
**clear radius statistics**

This command is used to clear all RADIUS statistics.

**Format**
```
clear radius statistics
```

**Mode**
Privileged EXEC

**dot1x guest-vlan**

This command configures VLAN as guest vlan on a per port basis. The command specifies an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to the maximum VLAN ID supported by the platform.

**Default**
disabled

**Format**
```
dot1x guest-vlan <vlan-id>
```

**Mode**
Interface Config

**no dot1x guest-vlan**

This command disables Guest VLAN on the interface.

**Default**
disabled

**Format**
```
no dot1x guest-vlan
```

**Mode**
Interface Config

**dot1x initialize**

This command begins the initialization sequence on the specified port. This command is only valid if the control mode for the specified port is “auto” or “mac-based”. If the control mode is not ‘auto’ or “mac-based”, an error will be returned.

**Format**
```
dot1x initialize <unit/slot/port>
```

**Mode**
Privileged EXEC

**dot1x mac-auth-bypass**

This command enables MAC-Based Authentication Bypass (MAB) for 802.1x-unaware clients. MAB provides 802.1x-unaware clients controlled access to the network using the devices’ MAC address as an identifier. This requires that the known and allowable MAC address and corresponding access rights be pre-populated in the authentication server. MAB works only when the port control mode of the port is MAC-based.

**Format**
```
dot1x mac-auth-bypass
```

**Mode**
Interface Config
no dot1x mac-auth-bypass

This command disables MAB for 802.1x-unaware clients.

Format: no dot1x mac-auth-bypass
Mode: Interface Config

dot1x max-req

This command sets the maximum number of times the authenticator state machine on this port will transmit an EAPOL EAP Request/Identity frame before timing out the supplicant. The <count> value must be in the range 1 - 10.

Default: 2
Format: dot1x max-req <count>
Mode: Interface Config

no dot1x max-req

This command sets the maximum number of times the authenticator state machine on this port will transmit an EAPOL EAP Request/Identity frame before timing out the supplicant.

Format: no dot1x max-req
Mode: Interface Config

dot1x max-users

Use this command to set the maximum number of clients supported on the port when MAC-based dot1x authentication is enabled on the port. The maximum users supported per port is dependent on the product. The <count> value is in the range 1 - 48.

Default: 48
Format: dot1x max-users <count>
Mode: Interface Config

no dot1x max-users

This command resets the maximum number of clients allowed per port to its default value.

Format: no dot1x max-req
Mode: Interface Config
ProSafe Managed Switch

**dot1x port-control**

This command sets the authentication mode to use on the specified port. Select
*force-unauthorized* to specify that the authenticator PAE unconditionally sets the
controlled port to unauthorized. Select *force-authorized* to specify that the authenticator
PAE unconditionally sets the controlled port to authorized. Select *auto* to specify that the
authenticator PAE sets the controlled port mode to reflect the outcome of the authentication
exchanges between the supplicant, authenticator and the authentication server. If the
*mac-based* option is specified, then MAC-based dot1x authentication is enabled on the port.

Default: auto

Format: `dot1x port-control {force-unauthorized | force-authorized | auto | mac-based}`

Mode: Interface Config

**no dot1x port-control**

This command sets the 802.1x port control mode on the specified port to the default value.

Format: `no dot1x port-control`

Mode: Interface Config

**dot1x port-control all**

This command sets the authentication mode to use on all ports. Select
*force-unauthorized* to specify that the authenticator PAE unconditionally sets the
controlled port to unauthorized. Select *force-authorized* to specify that the authenticator
PAE unconditionally sets the controlled port to authorized. Select *auto* to specify that the
authenticator PAE sets the controlled port mode to reflect the outcome of the authentication
exchanges between the supplicant, authenticator and the authentication server. If the
*mac-based* option is specified, then MAC-based dot1x authentication is enabled on the port.

Default: auto

Format: `dot1x port-control all {force-unauthorized | force-authorized | auto | mac-based}`

Mode: Global Config

**no dot1x port-control all**

This command sets the authentication mode on all ports to the default value.

Format: `no dot1x port-control all`

Mode: Global Config
**dot1x re-authenticate**

This command begins the re-authentication sequence on the specified port. This command is only valid if the control mode for the specified port is “auto” or “mac-based”. If the control mode is not “auto” or “mac-based”, an error will be returned.

**Format**

dot1x re-authenticate <unit/slot/port>

**Mode**

Privileged EXEC

**dot1x re-authentication**

This command enables re-authentication of the supplicant for the specified port.

**Default**

disabled

**Format**

dot1x re-authentication

**Mode**

Interface Config

**no dot1x re-authentication**

This command disables re-authentication of the supplicant for the specified port.

**Format**

no dot1x re-authentication

**Mode**

Interface Config

**dot1x system-auth-control**

Use this command to enable the dot1x authentication support on the switch. While disabled, the dot1x configuration is retained and can be changed, but is not activated.

**Default**

disabled

**Format**

dot1x system-auth-control

**Mode**

Global Config

**no dot1x system-auth-control**

This command is used to disable the dot1x authentication support on the switch.

**Format**

no dot1x system-auth-control

**Mode**

Global Config
**dot1x timeout**

This command sets the value, in seconds, of the timer used by the authenticator state machine on this port. Depending on the token used and the value (in seconds) passed, various timeout configurable parameters are set. The following tokens are supported:

<table>
<thead>
<tr>
<th>Tokens</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>guest-vlan-period</td>
<td>The time, in seconds, for which the authenticator waits to see if any EAPOL packets are received on a port before authorizing the port and placing the port in the guest vlan (if configured). The guest vlan timer is only relevant when guest vlan has been configured on that specific port.</td>
</tr>
<tr>
<td>reauth-period</td>
<td>The value, in seconds, of the timer used by the authenticator state machine on this port to determine when re-authentication of the supplicant takes place. The reauth-period must be a value in the range 1 - 65535.</td>
</tr>
<tr>
<td>quiet-period</td>
<td>The value, in seconds, of the timer used by the authenticator state machine on this port to define periods of time in which it will not attempt to acquire a supplicant. The quiet-period must be a value in the range 0 - 65535.</td>
</tr>
<tr>
<td>tx-period</td>
<td>The value, in seconds, of the timer used by the authenticator state machine on this port to determine when to send an EAPOL EAP Request/Identity frame to the supplicant. The quiet-period must be a value in the range 1 - 65535.</td>
</tr>
<tr>
<td>supp-timeout</td>
<td>The value, in seconds, of the timer used by the authenticator state machine on this port to timeout the supplicant. The supp-timeout must be a value in the range 1 - 65535.</td>
</tr>
<tr>
<td>server-timeout</td>
<td>The value, in seconds, of the timer used by the authenticator state machine on this port to timeout the authentication server. The supp-timeout must be a value in the range 1 - 65535.</td>
</tr>
</tbody>
</table>

**Default**

- guest-vlan-period: 90 seconds
- reauth-period: 3600 seconds
- quiet-period: 60 seconds
- tx-period: 30 seconds
- supp-timeout: 30 seconds
- server-timeout: 30 seconds

**Format**

```
dot1x timeout [{guest-vlan-period <seconds>} | {reauth-period <seconds>} | {quiet-period <seconds>} | {tx-period <seconds>} | {supp-timeout <seconds>} | {server-timeout <seconds}>}
```

**Mode**

Interface Config

**no dot1x timeout**

This command sets the value, in seconds, of the timer used by the authenticator state machine on this port to the default values. Depending on the token used, the corresponding default values are set.

**Format**

```
no dot1x timeout {guest-vlan-period | reauth-period | quiet-period | tx-period | supp-timeout | server-timeout}
```

**Mode**

Interface Config
Switching Commands

ProSafe Managed Switch

**dot1x unauthenticated-vlan**

Use this command to configure the unauthenticated VLAN associated with that port. The unauthenticated VLAN ID can be a valid VLAN ID from 0-Maximum supported VLAN ID (4093 for 7000 series). The unauthenticated VLAN must be statically configured in the VLAN database to be operational. By default, the unauthenticated VLAN is 0, i.e. invalid and not operational.

**Default**
0

**Format**
dot1x unauthenticated-vlan <vlan id>

**Mode**
Interface Config

**no dot1x unauthenticated-vlan**

This command resets the unauthenticated-vlan associated with the port to its default value.

**Format**
no dot1x unauthenticated-vlan

**Mode**
Interface Config

**dot1x user**

This command adds the specified user to the list of users with access to the specified port or all ports. The `<user>` parameter must be a configured user.

**Format**
dot1x user <user> {<unit/slot/port> | all}

**Mode**
Global Config

**no dot1x user**

This command removes the user from the list of users with access to the specified port or all ports.

**Format**
no dot1x user <user> {<unit/slot/port> | all}

**Mode**
Global Config

**clear dot1x authentication-history**

This command clears the authentication history table captured during successful and unsuccessful authentication on all interface or the specified interface.

**Format**
clear dot1x authentication-history [unit/slot/port]

**Mode**
Global Config
**dot1x dynamic-vlan enable**

Use this command to enable the switch to create VLANs dynamically when a RADIUS assigned VLAN does not exist in the switch.

**Format**

```
dot1x dynamic-vlan enable
```

**Mode**

```
Global Config
```

**Default**

```
Disabled
```

**no dot1x dynamic-vlan enable**

Use this command to disable the switch from creating VLANs dynamically when a RADIUS assigned VLAN does not exist in the switch.

**Format**

```
no dot1x dynamic-vlan enable
```

**Mode**

```
Global Config
```

**dot1x system-auth-control monitor**

Use this command to enable the 802.1X monitor mode on the switch. The purpose of Monitor mode is to help troubleshoot port-based authentication configuration issues without disrupting network access for hosts connected to the switch. In Monitor mode, a host is granted network access to an 802.1X-enabled port even if it fails the authentication process. The results of the process are logged for diagnostic purposes.

**Format**

```
dot1x system-auth-control monitor
```

**Mode**

```
Global Config
```

**Default**

```
Disabled
```

**no dot1x system-auth-control monitor**

Use this command to disable the 802.1X monitor on the switch.

**Format**

```
no dot1x system-auth-control monitor
```

**Mode**

```
Global Config
```

**show dot1x authentication-history**

This command displays 802.1X authentication events and information during successful and unsuccessful Dot1x authentication process for all interfaces or the specified interface. Use the optional keywords to display only failure authentication events in summary or in detail.

**Format**

```
show dot1x authentication-history {unit/slot/port | all} [failedauth-only] [detail]
```

**Mode**

```
Privileged EXEC
```

---

**Switching Commands**

103
show authentication methods

This command displays information about the authentication methods.

Format: show authentication methods

Mode: Privileged EXEC

The following is an example of this command:

Login Authentication Method Lists

<table>
<thead>
<tr>
<th>Console_Default: None</th>
<th>Network_Default: Local</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Authentication Lists</td>
<td></td>

</tbody>
</table>

show dot1x

This command is used to show a summary of the global dot1x configuration, summary information of the dot1x configuration for a specified port or all ports, the detailed dot1x
configuration for a specified port and the dot1x statistics for a specified port - depending on the tokens used.

**Format**
```
show dot1x [ { summary { <unit/slot/port> | all } | detail <unit/slot/port> | statistics <unit/slot/port> } ]
```

**Mode**
Privileged EXEC

If you do not use the optional parameters `<unit/slot/port>` or `<vlanid>`, the command displays the global dot1x mode, the VLAN Assignment mode, and the Dynamic VLAN Creation mode.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Mode</td>
<td>Indicates whether authentication control on the switch is enabled or disabled.</td>
</tr>
<tr>
<td>VLAN Assignment Mode</td>
<td>Indicates whether assignment of an authorized port to a RADIUS assigned VLAN is allowed (enabled) or not (disabled).</td>
</tr>
<tr>
<td>Dynamic VLAN Creation Mode</td>
<td>Indicates whether the switch can dynamically create a RADIUS-assigned VLAN if it does not currently exist on the switch.</td>
</tr>
<tr>
<td>Monitor Mode</td>
<td>Indicates whether the Dot1x Monitor mode on the switch is enabled or disabled.</td>
</tr>
</tbody>
</table>

If you use the optional parameter `summary { <unit/slot/port> | all }`, the dot1x configuration for the specified port or all ports are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface whose configuration is displayed.</td>

<tr>
<td>Server Timeout</td>
<td>The timer used by the authenticator on this port to timeout the authentication server. The value is expressed in seconds and will be in the range of 1 and 65535.</td>
</tr>
<tr>
<td>Maximum Requests</td>
<td>The maximum number of times the authenticator state machine on this port will retransmit an EAPOL EAP Request/Identity before timing out the supplicant. The value will be in the range of 1 and 10.</td>
</tr>
<tr>
<td>VLAN Id</td>
<td>The VLAN assigned to the port by the radius server. This is only valid when the port control mode is not Mac-based.</td>
</tr>
<tr>
<td>VLAN Assigned Reason</td>
<td>The reason the VLAN identified in the VLAN Idfield has been assigned to the port. Possible values are RADIUS, Unauthenticated VLAN, Guest VLAN, default, and Not Assigned. When the VLAN Assigned Reason is ‘Not Assigned’, it means that the port has not been assigned to any VLAN by dot1x. This only valid when the port control mode is not MAC-based.</td>
</tr>
<tr>
<td>Reauthentication Period</td>
<td>The timer used by the authenticator state machine on this port to determine when reauthentication of the supplicant takes place. The value is expressed in seconds and will be in the range of 1 and 65535.</td>
</tr>
<tr>
<td>Reauthentication Enabled</td>
<td>Indicates if reauthentication is enabled on this port. Possible values are ‘True” or “False”.</td>
</tr>
<tr>
<td>Key Transmission Enabled</td>
<td>Indicates if the key is transmitted to the supplicant for the specified port. Possible values are True or False.</td>
</tr>
<tr>
<td>Control Direction</td>
<td>The control direction for the specified port or ports. Possible values are both or in.</td>
</tr>
</tbody>
</table>
The `show dot1x detail <unit/slot/port>` command will display the following MAC-based dot1x fields if the port-control mode for that specific port is MAC-based. For each client authenticated on the port, the `show dot1x detail <unit/slot/port>` command will display the following MAC-based dot1x parameters if the port-control mode for that specific port is MAC-based.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplicant MAC-Address</td>
<td>The MAC-address of the supplicant.</td>

</tbody>
</table>

802.1X Supplicant Commands

802.1X ("dot1x") supplicant functionality is on point-to-point ports. The administrator can configure the user name and password used in authentication and capabilities of the supplicant port.
**dot1x pae**

Use this command to set the port’s dot1x role. The port can serve as either a supplicant or an authenticator.

**Format**

dot1x pae {supplicant | authenticator}

**Mode**

Interface Config

**dot1x supplicant port-control**

Use this command to set the ports authorization state (Authorized or Unauthorized) either manually or by setting the port to auto-authorize upon startup. By default all the ports are authenticators. If the port’s attribute needs to be moved from <authenticator to supplicant> or <supplicant to authenticator>, use this command.

**Format**

dot1x supplicant port-control {auto | force-authorized | force-unauthorized}

**Mode**

Interface Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>The port is in the Unauthorized state until it presents its user name and password credentials to an authenticator. If the authenticator authorizes the port, then it is placed in the Authorized state.</td>
</tr>
<tr>
<td>force-authorized</td>
<td>Sets the authorization state of the port to Authorized, bypassing the authentication process.</td>
</tr>
<tr>
<td>force-unauthorized</td>
<td>Sets the authorization state of the port to Unauthorized, bypassing the authentication process.</td>
</tr>
</tbody>
</table>

**no dot1x supplicant port-control**

Use this command to set the port-control mode to the default, auto.

**Default**

Auto

**Format**

no dot1x supplicant port-control

**Mode**

Interface Config

**dot1x supplicant max-start**

Use this command to configure the number of attempts that the supplicant makes to find the authenticator before the supplicant assumes that there is no authenticator.

**Default**

3

**Format**

dot1x supplicant max-start <1-10>

**Mode**

Interface Config
no dot1x supplicant max-start

Use this command to set the max-start value to the default.

Format: no dot1x supplicant max-start
Mode: Interface Config

dot1x supplicant timeout start-period

Use this command to configure the start period timer interval to wait for the EAP identity request from the authenticator.

Default: 30 seconds
Format: dot1x supplicant timeout start-period <1-65535 seconds>
Mode: Interface Config

no dot1x supplicant timeout start-period

Use this command to set the start-period value to the default.

Format: no dot1x supplicant timeout start-period
Mode: Interface Config

dot1x supplicant timeout held-period

Use this command to configure the held period timer interval to wait for the next authentication on previous authentication fail.

Default: 30 seconds
Format: dot1x supplicant timeout held-period <1-65535 seconds>
Mode: Interface Config

no dot1x supplicant timeout held-period

Use this command to set the held-period value to the default value.

Format: no dot1x supplicant timeout held-period
Mode: Interface Config
**dot1x supplicant timeout auth-period**

Use this command to configure the authentication period timer interval to wait for the next EAP request challenge from the authenticator.

**Default**
30 seconds

**Format**
dot1x supplicant timeout auth-period <1-65535 seconds>

**Mode**
Interface Config

**no dot1x supplicant timeout auth-period**

Use this command to set the auth-period value to the default value.

**Format**
no dot1x supplicant timeout auth-period

**Mode**
Interface Config

**dot1x supplicant user**

Use this command to map the given user to the port.

**Format**
dot1x supplicant user

**Mode**
Interface Config

### Storm-Control Commands

This section describes commands you use to configure storm-control and view storm-control configuration information. A traffic storm is a condition that occurs when incoming packets flood the LAN, which creates performance degradation in the network. The Storm-Control feature protects against this condition.

The 7000 series provides broadcast, multicast, and unicast story recovery for individual interfaces. Unicast Storm-Control protects against traffic whose MAC addresses are not known by the system. For broadcast, multicast, and unicast storm-control, if the rate of traffic ingressing on an interface increases beyond the configured threshold for that type, the traffic is dropped.

To configure storm-control, you will enable the feature for all interfaces or for individual interfaces, and you will set the threshold (storm-control level) beyond which the broadcast, multicast, or unicast traffic will be dropped. The Storm-Control feature allows you to limit the rate of specific types of packets through the switch on a per-port, per-type, basis.

Configuring a storm-control level also enables that form of storm-control. Disabling a storm-control level (using the “no” version of the command) sets the storm-control level back to the default value and disables that form of storm-control. Using the “no” version of the “storm-control” command (not stating a “level”) disables that form of storm-control but
ProSafe Managed Switch

maintains the configured “level” (to be active the next time that form of storm-control is enabled.)

Note: The actual rate of ingress traffic required to activate storm-control is based on the size of incoming packets and the hard-coded average packet size of 512 bytes - used to calculate a packet-per-second (pps) rate - as the forwarding-plane requires pps versus an absolute rate kbps. For example, if the configured limit is 10%, this is converted to ~25000 pps, and this pps limit is set in forwarding plane (hardware). You get the approximate desired output when 512bytes packets are used.

**storm-control broadcast**

Use this command to enable broadcast storm recovery mode for a specific interface. If the mode is enabled, broadcast storm recovery is active and, if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of broadcast traffic will be limited to the configured threshold.

**Default**

enabled

**Format**

storm-control broadcast

**Mode**

Interface Config

**no storm-control broadcast**

Use this command to disable broadcast storm recovery mode for a specific interface.

**Format**

no storm-control broadcast

**Mode**

Interface Config

**storm-control broadcast level**

Use this command to configure the broadcast storm recovery threshold for an interface as a percentage of link speed and enable broadcast storm recovery. If the mode is enabled, broadcast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of broadcast traffic is limited to the configured threshold.

**Default**

5

**Format**

storm-control broadcast level <0-100>

**Mode**

Interface Config
no storm-control broadcast level

This command sets the broadcast storm recovery threshold to the default value for an interface and disables broadcast storm recovery.

Format: `no storm-control broadcast level`
Mode: Interface Config

storm-control broadcast rate

Use this command to configure the broadcast storm recovery threshold for an interface in packets per second. If the mode is enabled, broadcast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of broadcast traffic is limited to the configured threshold.

Default: 0
Format: `storm-control broadcast rate <0-14880000>`
Mode: Interface Config

no storm-control broadcast rate

This command sets the broadcast storm recovery threshold to the default value for an interface and disables broadcast storm recovery.

Format: `no storm-control broadcast rate`
Mode: Interface Config

storm-control broadcast (Global)

This command enables broadcast storm recovery mode for all interfaces. If the mode is enabled, broadcast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of broadcast traffic will be limited to the configured threshold.

Default: disabled
Format: `storm-control broadcast`
Mode: Global Config

no storm-control broadcast

This command disables broadcast storm recovery mode for all interfaces.

Format: `no storm-control broadcast`
Mode: Global Config
storm-control broadcast level (Global)

This command configures the broadcast storm recovery threshold for all interfaces as a percentage of link speed and enables broadcast storm recovery. If the mode is enabled, broadcast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of broadcast traffic will be limited to the configured threshold. This command also enables broadcast storm recovery mode for all interfaces.

**Default**

**Format**

```
storm-control broadcast level <0-100>
```

**Mode**

Global Config

no storm-control broadcast level

This command sets the broadcast storm recovery threshold to the default value for all interfaces and disables broadcast storm recovery.

**Format**

```
no storm-control broadcast level
```

**Mode**

Global Config

storm-control broadcast rate (Global)

Use this command to configure the broadcast storm recovery threshold for all interfaces in packets per second. If the mode is enabled, broadcast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of broadcast traffic is limited to the configured threshold.

**Default**

0

**Format**

```
storm-control broadcast rate <0-14880000>
```

**Mode**

Global Config

no storm-control broadcast rate

This command sets the broadcast storm recovery threshold to the default value for all interfaces and disables broadcast storm recovery.

**Format**

```
no storm-control broadcast rate
```

**Mode**

Global Config

storm-control multicast

This command enables multicast storm recovery mode for an interface. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 multicast traffic ingressing on
an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of multicast traffic will be limited to the configured threshold.

Default: disabled
Format: storm-control multicast
Mode: Interface Config

no storm-control multicast

This command disables multicast storm recovery mode for an interface.

Format: no storm-control multicast
Mode: Interface Config

storm-control multicast level

This command configures the multicast storm recovery threshold for an interface as a percentage of link speed and enables multicast storm recovery mode. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 multicast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of multicast traffic will be limited to the configured threshold.

Default: 5
Format: storm-control multicast level <0-100>
Mode: Interface Config

no storm-control multicast level

This command sets the multicast storm recovery threshold to the default value for an interface and disables multicast storm recovery.

Format: no storm-control multicast level <0-100>
Mode: Interface Config

storm-control multicast rate

Use this command to configure the multicast storm recovery threshold for an interface in packets per second. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of multicast traffic is limited to the configured threshold.

Default: 0
no storm-control multicast rate

This command sets the multicast storm recovery threshold to the default value for an interface and disables multicast storm recovery.

Format:  
no storm-control multicast rate

Mode:  
Interface Config

storm-control multicast (Global)

This command enables multicast storm recovery mode for all interfaces. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 multicast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of multicast traffic will be limited to the configured threshold.

Default:  
disabled

Format:  
storm-control multicast

Mode:  
Global Config

no storm-control multicast

This command disables multicast storm recovery mode for all interfaces.

Format:  
no storm-control multicast

Mode:  
Global Config

storm-control multicast level (Global)

This command configures the multicast storm recovery threshold for all interfaces as a percentage of link speed and enables multicast storm recovery mode. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 multicast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of multicast traffic will be limited to the configured threshold.

Default:  
5

Format:  
storm-control multicast level <0-100>

Mode:  
Global Config
no storm-control multicast level

This command sets the multicast storm recovery threshold to the default value for all interfaces and disables multicast storm recovery.

Format  no storm-control multicast level
Mode    Global Config

storm-control multicast rate (Global)

Use this command to configure the multicast storm recovery threshold for all interfaces in packets per second. If the mode is enabled, multicast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of multicast traffic is limited to the configured threshold.

Default  0
Format    storm-control multicast rate <0-14880000>
Mode      Global Config

no storm-control broadcast rate

This command sets the broadcast storm recovery threshold to the default value for all interfaces and disables broadcast storm recovery.

Format  no storm-control broadcast rate
Mode    Global Config

storm-control unicast

This command enables unicast storm recovery mode for an interface. If the mode is enabled, unicast storm recovery is active, and if the rate of unknown L2 unicast (destination lookup failure) traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of unknown unicast traffic will be limited to the configured threshold.

Default  disabled
Format    storm-control unicast
Mode      Interface Config
no storm-control unicast

This command disables unicast storm recovery mode for an interface.

Format: no storm-control unicast
Mode: Interface Config

storm-control unicast level

This command configures the unicast storm recovery threshold for an interface as a percentage of link speed, and enables unicast storm recovery. If the mode is enabled, unicast storm recovery is active, and if the rate of unknown L2 unicast (destination lookup failure) traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of unknown unicast traffic will be limited to the configured threshold. This command also enables unicast storm recovery mode for an interface.

Default: 5
Format: storm-control unicast level <0-100>
Mode: Interface Config

no storm-control unicast level

This command sets the unicast storm recovery threshold to the default value for an interface and disables unicast storm recovery.

Format: no storm-control unicast level
Mode: Interface Config

storm-control unicast rate

Use this command to configure the unicast storm recovery threshold for an interface in packets per second. If the mode is enabled, unicast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of unicast traffic is limited to the configured threshold.

Default: 0
Format: storm-control unicast rate <0-14880000>
Mode: Interface Config
no storm-control unicast rate

This command sets the unicast storm recovery threshold to the default value for an interface and disables unicast storm recovery.

Format: no storm-control unicast rate
Mode: Interface Config

storm-control unicast (Global)

This command enables unicast storm recovery mode for all interfaces. If the mode is enabled, unicast storm recovery is active, and if the rate of unknown L2 unicast (destination lookup failure) traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of unknown unicast traffic will be limited to the configured threshold.

Default: disabled
Format: storm-control unicast
Mode: Global Config

no storm-control unicast

This command disables unicast storm recovery mode for all interfaces.

Format: no storm-control unicast
Mode: Global Config

storm-control unicast level (Global)

This command configures the unicast storm recovery threshold for all interfaces as a percentage of link speed, and enables unicast storm recovery. If the mode is enabled, unicast storm recovery is active, and if the rate of unknown L2 unicast (destination lookup failure) traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped. Therefore, the rate of unknown unicast traffic will be limited to the configured threshold.

Default: 5
Format: storm-control unicast level <0-100>
Mode: Global Config
no storm-control unicast level

This command sets the unicast storm recovery threshold to the default value and disables unicast storm recovery for all interfaces.

Format:  
```
no storm-control unicast level
```
Mode:  
```
Global Config
```

storm-control unicast rate (Global)

Use this command to configure the unicast storm recovery threshold for all interfaces in packets per second. If the mode is enabled, unicast storm recovery is active, and if the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic is dropped. Therefore, the rate of unicast traffic is limited to the configured threshold.

Default:  
```
0
```
Format:  
```
storm-control unicast rate <0-14880000>
```
Mode:  
```
Global Config
```

no storm-control unicast rate

This command sets the multicast storm recovery threshold to the default value for an interface and disables multicast storm recovery.

Format:  
```
no storm-control unicast rate
```
Mode:  
```
Global Config
```

show storm-control

This command displays switch configuration information. If you do not use any of the optional parameters, this command displays global storm control configuration parameters:

- **Broadcast Storm Control Mode** may be enabled or disabled. The factory default is disabled.
- **Broadcast Storm Control Level** The broadcast storm control level. The factory default is 5%.
- **Multicast Storm Control Mode** may be enabled or disabled. The factory default is disabled.
- **Multicast Storm Control Level** The multicast storm control level. The factory default is 5%.
- **Unicast Storm Control Mode** may be enabled or disabled. The factory default is disabled.
- **Unicast Storm Control Level** The unicast storm control level. The factory default is 5%.
Use the **all** keyword to display the per-port configuration parameters for all interfaces, or specify the **unit/slot/port** to display information about a specific interface.

**Format**

```
show storm-control [all | <unit/slot/port>]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>

</table>

**Flow Control Commands**

In 802.3x flow control, the MAC control PAUSE operation is specified in IEEE 802.3 Annex 31 B. It allows traffic from one device to be throttled for a specified period of time and is defined for devices that are directly connected. A device that needs to inhibit transmission of data frames from another device on the LAN transmits a PAUSE frame as defined in the IEEE specification.

This feature allows the user to configure the switch to use symmetric, asymmetric, or no flow control. Asymmetric flow control allows the switch to respond to received PAUSE frames, but the port cannot generate PAUSE frames. Symmetric flow control allows the switch to both respond to and generate MAC control PAUSE frames.

```
flowcontrol {symmetric|asymmetric}
```

Use this command to enable or disable the symmetric or asymmetric flow control on the switch. Use the no form of command to disable the symmetric or asymmetric flow control. Asymmetric here means that Tx Pause can never be enabled. Only Rx Pause can be enabled.

**Default**

Disabled

**Format**

```
flowcontrol {symmetric|asymmetric}
```

**Mode**

- Global Config
- Interface Config
no flowcontrol

Format  
no flowcontrol

Mode  
• Global Config
• Interface Config

show flowcontrol

Use this command to display the IEEE 802.3 Annex 31B flow control settings and status for a specific interface or all interfaces. It also displays 802.3 Tx and Rx pause counts. Priority Flow Control frames counts are not displayed. If the port is enabled for priority flow control, operational flow control status is displayed as “Inactive”. Operational flow control status for stacking ports is always displayed as “N/A”.

Format  
show flowcontrol [unit/slot/port]

Mode  
Privileged Exec

Examples:

(switch)#show flowcontrol

Admin Flow Control: Symmetric

<table>
<thead>

</tbody>
</table>

Port-Channel/LAG (802.3ad) Commands

This section describes the commands you use to configure port-channels, which are also known as link aggregation groups (LAGs). Link aggregation allows you to combine multiple full-duplex Ethernet links into a single logical link. Network devices treat the aggregation as if it were a single link, which increases fault tolerance and provides load sharing. The LAG feature initially load shares traffic based upon the source and destination MAC address. Assign the port-channel (LAG) VLAN membership after you create a port-channel. If you do not assign VLAN membership, the port-channel might become a member of the management VLAN which can result in learning and switching issues.
A port-channel (LAG) interface can be either static or dynamic, but not both. All members of a port channel must participate in the same protocols.) A static port-channel interface does not require a partner system to be able to aggregate its member ports.

**Note:** If you configure the maximum number of dynamic port-channels (LAGs) that your platform supports, additional port-channels that you configure are automatically static.

---

**addport**

This command adds one port to the port-channel (LAG). The interface is a logical unit/slot/port number or a group ID of a configured port-channel.

**Note:** Before adding a port to a port-channel, set the physical mode of the port. For more information, see `speed` on page 42.

**Format**

```
addport {<logical unit/slot/port>|lag <lag-group-id>}
```

**Mode**

Interface Config

---

**deleteport (Interface Config)**

This command deletes the port from the port-channel (LAG). The interface is a logical unit/slot/port number or a group ID of a configured port-channel.

**Format**

```
deleteport {<logical unit/slot/port>|lag <lag-group-id>}
```

**Mode**

Interface Config

---

**deleteport (Global Config)**

This command deletes all configured ports from the port-channel (LAG). The interface is a logical unit/slot/port number of a configured port-channel. To clear the port channels, see `clear port-channel` on page 565.

**Format**

```
deleteport <logical unit/slot/port>
```

**Mode**

Global Config
**lacp admin key**

Use this command to configure the administrative value of the key for the port-channel. The value range of `<key>` is 0 to 65535.

- **Default**: 0x8000
- **Format**: `lacp admin key <key>`
- **Mode**: Interface Config

**Note**: This command is only applicable to port-channel interfaces.

**no lacp admin key**

Use this command to configure the default administrative value of the key for the port-channel.

- **Format**: `no lacp admin key`
- **Mode**: Interface Config

**lacp collector max-delay**

Use this command to configure the port-channel collector max delay. The valid range of `<delay>` is 0-65535.

- **Default**: 0x8000
- **Format**: `lacp collector max-delay <delay>`
- **Mode**: Interface Config

**Note**: This command is only applicable to port-channel interfaces.

**no lacp collector max delay**

Use this command to configure the default port-channel collector max delay.

- **Format**: `no lacp collector max-delay`
- **Mode**: Interface Config

**lacp actor admin**

Use this command to configure the LACP actor admin parameters.
**lacp actor admin key**

Use this command to configure the administrative value of the LACP actor admin key. The valid range for `<key>` is 0-65535.

**Default**: Internal Interface Number of this Physical Port  
**Format**: `lacp actor admin key <key>`  
**Mode**: Interface Config

---

**Note**: This command is only applicable to physical interfaces.

**no lacp actor admin key**

Use this command to configure the default administrative value of the key.

**Format**: `no lacp actor admin key`  
**Mode**: Interface Config

**lacp actor admin state individual**

Use this command to set LACP actor admin state to individual.

**Format**: `lacp actor admin state individual`  
**Mode**: Interface Config

---

**Note**: This command is only applicable to physical interfaces.

**no lacp actor admin state individual**

Use this command to set the LACP actor admin state to aggregation.

**Format**: `no lacp actor admin state individual`  
**Mode**: Interface Config

**lacp actor admin state longtimeout**

Use this command to set LACP actor admin state to longtimeout.

**Format**: `lacp actor admin state longtimeout`  
**Mode**: Interface Config
**no lacp actor admin state longtimeout**

Use this command to set the LACP actor admin state to short timeout.

**Format**

    no lacp actor admin state longtimeout

**Mode**

    Interface Config

**Note:** This command is only applicable to physical interfaces.

**lACP actor admin state passive**

Use this command to set the LACP actor admin state to passive.

**Format**

    lacp actor admin state passive

**Mode**

    Interface Config

**Note:** This command is only applicable to physical interfaces.

**no lacp actor admin state passive**

Use this command to set the LACP actor admin state to active.

**Format**

    no lacp actor admin state passive

**Mode**

    Interface Config

**lACP actor port priority**

Use this command to configure the priority value assigned to the Aggregation Port. The valid range for `<priority>` is 0 to 255.

**Default**

    0x80

**Format**

    lacp actor port priority <priority>

**Mode**

    Interface Config

**Note:** This command is only applicable to physical interfaces.
**no lacp actor port priority**

Use this command to configure the default priority value assigned to the Aggregation Port.

**Format**

```
no lacp actor port priority
```

**Mode**

```
Interface Config
```

**lacp actor system priority**

Use this command to configure the priority value associated with the LACP Actor's SystemID. The range for `<priority>` is 0 to 65535.

**Default**

```
32768
```

**Format**

```
lacp actor system priority <priority>
```

**Mode**

```
Interface Config
```

---

**Note:** This command is only applicable to physical interfaces.

**no lacp actor system priority**

Use this command to configure the priority value associated with the Actor's SystemID.

**Format**

```
no lacp actor system priority
```

**Mode**

```
Interface Config
```

**lacp partner admin key**

Use this command to configure the administrative value of the Key for the protocol partner. The valid range for `<key>` is 0 to 65535.

**Default**

```
0x0
```

**Format**

```
lacp partner admin key
```

**Mode**

```
Interface Config
```

---

**Note:** This command is only applicable to physical interfaces.
no lacp partner admin key

Use this command to configure the administrative value of the Key for the protocol partner.

Format  
no lacp partner admin key <key>
Mode  
Interface Config

lacp partner admin state individual

Use this command to set LACP partner admin state to individual.

Format  
lacp partner admin state individual
Mode  
Interface Config

Note: This command is only applicable to physical interfaces.

no lacp partner admin state individual

Use this command to set the LACP partner admin state to aggregation.

Format  
no lacp partner admin state individual
Mode  
Interface Config

lacp partner admin state longtimeout

Use this command to set LACP partner admin state to longtimeout.

Format  
lacp partner admin state longtimeout
Mode  
Interface Config

Note: This command is only applicable to physical interfaces.

no lacp partner admin state longtimeout

Use this command to set the LACP partner admin state to short timeout.

Format  
no lacp partner admin state longtimeout
Mode  
Interface Config

Note: This command is only applicable to physical interfaces.
**lacp partner admin state passive**

Use this command to set the LACP partner admin state to passive.

Format: `lacp partner admin state passive`

Mode: Interface Config

**Note:** This command is only applicable to physical interfaces.

**no lacp partner admin state passive**

Use this command to set the LACP partner admin state to active.

Format: `no lacp partner admin state passive`

Mode: Interface Config

**lacp partner port id**

Use this command to configure the LACP partner port id. The valid range for `<port-id>` is 0 to 65535.

Default: `0x80`

Format: `lacp partner portid <port-id>`

Mode: Interface Config

**Note:** This command is only applicable to physical interfaces.

**no lacp partner port id**

Use this command to set the LACP partner port id to the default.

Format: `no lacp partner portid`

Mode: Interface Config

**lacp partner port priority**

Use this command to configure the LACP partner port priority. The valid range for `<priority>` is 0 to 255.

Default: `0x0`
Switching Commands

```
**Note:** This command is applicable only to physical interfaces.

### no lacp partner system priority

Use this command to configure the default administrative value of priority associated with the Partner’s System ID.

**Format**

```
no lacp partner system priority
```

**Mode**

Interface Config

### port-channel local-preference

This command enables the local-preference mode on a port-channel (LAG) interface or range of interfaces. By default, the local-preference mode for a port-channel is disabled. This command can be used only on port-channel interfaces.

**Default**

```
disabled
```

**Format**

```
port-channel local-preference
```

**Mode**

Interface Config

### no port-channel local-preference

This command disables the local-preference mode on a port-channel.

**Format**

```
no port-channel local-preference
```

**Mode**

Interface Config

### port-channel static

This command enables the static mode on a port-channel (LAG) interface. By default the static mode for a new port-channel is disabled, which means the port-channel is dynamic. However if the maximum number of allowable dynamic port-channels are already present in the system, the static mode for a new port-channel enabled, which means the port-channel is static. You can only use this command on port-channel interfaces.

**Default**

```
disabled
```

**Format**

```
port-channel static
```

**Mode**

Interface Config
no port-channel static

This command sets the static mode on a particular port-channel (LAG) interface to the default value. This command will be executed only for interfaces of type port-channel (LAG).

Format: no port-channel static
Mode: Interface Config

port lacpmode

This command enables Link Aggregation Control Protocol (LACP) on a port.

Default: enabled
Format: port lacpmode
Mode: Interface Config

no port lacpmode

This command disables Link Aggregation Control Protocol (LACP) on a port.

Format: no port lacpmode
Mode: Interface Config

port lacpmode enable all

This command enables Link Aggregation Control Protocol (LACP) on all ports.

Format: port lacpmode enable all
Mode: Global Config

no port lacpmode enable all

This command disables Link Aggregation Control Protocol (LACP) on all ports.

Format: no port lacpmode enable all
Mode: Global Config

port lacptimeout (Interface Config)

This command sets the timeout on a physical interface of a particular device type (actor or partner) to either long or short timeout.

Default: long
Format: port lacptimeout {actor | partner} {long | short}
Mode: Interface Config

---

Switching Commands

133
no port lacptimeout

This command sets the timeout back to its default value on a physical interface of a particular device type (actor or partner).

Format  
no port lacptimeout {actor | partner}

Mode    Interface Config

port lacptimeout (Global Config)

This command sets the timeout for all interfaces of a particular device type (actor or partner) to either long or short timeout.

Default  long

Format  
port lacptimeout {actor | partner} {long | short}

Mode    Global Config

no port lacptimeout

This command sets the timeout for all physical interfaces of a particular device type (actor or partner) back to their default values.

Format  
no port lacptimeout {actor | partner}

Mode    Global Config

port-channel adminmode

This command enables a port-channel (LAG). This command sets every configured port-channel with the same administrative mode setting.

Format  
port-channel adminmode all

Mode    Global Config

no port-channel adminmode

This command disables a port-channel (LAG). This command clears every configured port-channel with the same administrative mode setting.

Format  
no port-channel adminmode {all}

Mode    Global Config
**port-channel linktrap**

This command enables link trap notifications for the port-channel (LAG). The interface is a logical unit/slot/port for a configured port-channel. The option `all` enables link trap notifications for all the configured port-channels.

**Default**

enabled

**Format**

`port-channel linktrap {<unit/slot/port> | lag <lag-group-id> | all}`

**Mode**

Global Config

**no port-channel linktrap**

This command disables link trap notifications for the port-channel (LAG). The interface is a logical slot and port for a configured port-channel. The option `all` disables link trap notifications for all the configured port-channels.

**Format**

`no port-channel linktrap {<logical unit/slot/port> | all}`

**Mode**

Global Config

**port-channel load-balance**

This command selects the load-balancing option used on a port-channel (LAG). Traffic is balanced on a port-channel (LAG) by selecting one of the links in the channel over which to transmit specific packets. The link is selected by creating a binary pattern from selected fields in a packet, and associating that pattern with a particular link.

Load-balancing is not supported on every device. The range of options for load-balancing can vary per device. The managed switch also supports enhanced hashing mode, which has the following advantages:

- MODULO-N (where N is the number of active link members in a LAG) operation based on the number of ports in the LAG
- Packet attributes selection based on the packet type: For L2 packets, source and destination MAC address are used for hash computation. For L3 packets, source IP, destination IP address, TCP/UDP ports are used.
- Non-Unicast traffic and unicast traffic is hashed using a common hash algorithm
- Excellent load balancing performance.

**Default**

3

**Format**

`port-channel load-balance { 1 | 2 | 3 | 4 | 5 | 6 | 7} `<br>`{<unit/slot/port> |<all>}`

**Mode**

### Command Descriptions

#### show port-channel system priority

Use this command to display the port-channel system priority.

**Format**

```
show port-channel system priority
```

**Mode**

Privileged EXEC

#### Port Mirroring

Port mirroring, which is also known as port monitoring, selects network traffic that you can analyze with a network analyzer, such as a SwitchProbe device or other Remote Monitoring (RMON) probe.

**monitor session**

This command configures a probe port and a monitored port for monitor session (port monitoring). Use the `source interface <unit/slot/port>` parameter to specify the interface to monitor. Use `rx` to monitor only ingress packets, or use `tx` to monitor only egress packets. If you do not specify an `rx | tx` option, the destination port monitors both ingress and egress packets. Use the `destination interface <unit/slot/port>` to
specify the interface to receive the monitored traffic. Use the mode parameter to enabled the administrative mode of the session. If enabled, the probe port monitors all the traffic received and transmitted on the physical monitored port.

**Format**

```
monitor session <session-id> {source interface <unit/slot/port> [{rx | tx}] | destination interface <unit/slot/port> | mode}
```

**Mode**

Global Config

**no monitor session**

Use this command without optional parameters to remove the monitor session (port monitoring) designation from the source probe port, the destination monitored port and all VLANs. Once the port is removed from the VLAN, you must manually add the port to any desired VLANs. Use the source interface <unit/slot/port> parameter or destination interface <unit/slot/port> to remove the specified interface from the port monitoring session. Use the mode parameter to disable the administrative mode of the session.

---

**Note:** Since the current version of 7000 series software supports only one session, if you do not supply optional parameters, the behavior of this command is similar to the behavior of the no monitor command.

---

**Format**

```
no monitor session <session-id> [{source interface <unit/slot/port> | destination interface <unit/slot/port> | mode}]
```

**Mode**

Global Config

**no monitor**

This command removes all the source ports and a destination port for the and restores the default value for mirroring session mode for all the configured sessions.

---

**Note:** This is a stand-alone “no” command. This command does not have a “normal” form.
**show monitor session**

This command displays the Port monitoring information for a particular mirroring session.

---

**Note:** The `<session-id>` parameter is an integer value used to identify the session. In the current version of the software, the `<session-id>` parameter is always one (1)

---

**Format**

`show monitor session <session-id>`

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>

**Static MAC Filtering**

The commands in this section describe how to configure static MAC filtering. Static MAC filtering allows you to configure destination ports for a static multicast MAC filter irrespective of the platform.

**macfilter**

This command adds a static MAC filter entry for the MAC address `<macaddr>` on the VLAN `<vlanid>`. The value of the `<macaddr>` parameter is a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The restricted MAC Addresses are: 00:00:00:00:00:00, 01:80:C2:00:00:00 to 01:80:C2:00:00:0F, 01:80:C2:00:00:20 to 01:80:C2:00:00:21, and FF:FF:FF:FF:FF:FF. The `<vlanid>` parameter must identify a valid VLAN.

The number of static mac filters supported on the system is different for MAC filters where source ports are configured and MAC filters where destination ports are configured.

- For unicast MAC address filters and multicast MAC address filters with source port lists, the maximum number of static MAC filters supported is 20.
For multicast MAC address filters with destination ports configured, the maximum number of static filters supported is 256.

For example, for current platforms you can configure the following combinations:

- Unicast MAC and source port (max = 20)
- Multicast MAC and source port (max=20)
- Multicast MAC and destination port (only) (max=256)
- Multicast MAC and source ports and destination ports (max=20)

**no macfilter**

This command removes all filtering restrictions and the static MAC filter entry for the MAC address `<macaddr>` on the VLAN `<vlanid>`. The `<macaddr>` parameter must be specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6.

The `<vlanid>` parameter must identify a valid VLAN.

**macfilter adddest**

Use this command to add the interface to the destination filter set for the MAC filter with the given `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The `<vlanid>` parameter must identify a valid VLAN.

**no macfilter adddest**

This command removes a port from the destination filter set for the MAC filter with the given `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be specified as a
6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The `<vlanid>` parameter must identify a valid VLAN.

**Format**

no macfilter adddest <macaddr> <vlanid>

**Mode**

Interface Config

**macfilter adddest all**

This command adds all interfaces to the destination filter set for the MAC filter with the given `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The `<vlanid>` parameter must identify a valid VLAN.

---

**Note:** Configuring a destination port list is only valid for multicast MAC addresses.

---

**Format**

macfilter adddest all <macaddr> <vlanid>

**Mode**

Global Config

**no macfilter adddest all**

This command removes all ports from the destination filter set for the MAC filter with the given `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The `<vlanid>` parameter must identify a valid VLAN.

**Format**

no macfilter adddest all <macaddr> <vlanid>

**Mode**

Global Config

**macfilter addsrc**

This command adds the interface to the source filter set for the MAC filter with the MAC address of `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The `<vlanid>` parameter must identify a valid VLAN.

**Format**

macfilter addsrc <macaddr> <vlanid>

**Mode**

Interface Config

**no macfilter addsrc**

This command removes a port from the source filter set for the MAC filter with the MAC address of `<macaddr>` and VLAN of `<vlanid>`. The `<macaddr>` parameter must be
specified as a 6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The
<vlanid> parameter must identify a valid VLAN.

Format          no macfilter addsrc <macaddr> <vlanid>
Mode            Interface Config

macfilter addsrc all

This command adds all interfaces to the source filter set for the MAC filter with the MAC
address of <macaddr> and <vlanid>. You must specify the <macaddr> parameter as a
6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The <vlanid> parameter
must identify a valid VLAN.

Format          macfilter addsrc all <macaddr> <vlanid>
Mode            Global Config

no macfilter addsrc all

This command removes all interfaces to the source filter set for the MAC filter with the MAC
address of <macaddr> and VLAN of <vlanid>. You must specify the <macaddr> parameter as a
6-byte hexadecimal number in the format of b1:b2:b3:b4:b5:b6. The <vlanid> parameter
must identify a valid VLAN.

Format          no macfilter addsrc all <macaddr> <vlanid>
Mode            Global Config

show mac-address-table static

This command displays the Static MAC Filtering information for all Static MAC Filters. If you
select <all>, all the Static MAC Filters in the system are displayed. If you supply a value for
<macaddr>, you must also enter a value for <vlanid>, and the system displays Static
MAC Filter information only for that MAC address and VLAN.

Format          show mac-address-table static {<macaddr> <vlanid> | all}
Mode            Privileged EXEC

---

**DHCP L2 Relay Agent Commands**

You can enable the switch to operate as a DHCP Layer 2 relay agent to relay DHCP requests from clients to a Layer 3 relay agent or server. The Circuit ID and Remote ID can be added to DHCP requests relayed from clients to a DHCP server. This information is included in DHCP Option 82, as specified in sections 3.1 and 3.2 of RFC3046.

**dhcp l2relay**

Use this command to enable the DHCP Layer 2 Relay agent for an interface, a range of interfaces, or all interfaces. The subsequent commands mentioned in this section can be used only when the DHCP L2 relay is enabled.

**Format**

```
dhcp l2relay
```

**Modes**

- Global Config
- Interface Config

---

Switching Commands

145
no dhcp l2relay

Use this command to disable the DHCP Layer 2 relay agent for an interface or range of interfaces.

Format: no dhcp l2relay
Modes: • Global Config

dhcp l2relay circuit-id vlan

Use this parameter to set the DHCP Option-82 Circuit ID for a VLAN. When enabled, the interface number is added as the Circuit ID in DHCP option 82. Vlan-list range is 1–4093. Separate non-consecutive IDs with a comma (,), and do not insert spaces or zeros in between the range. Use a dash (–) for the range.

Format: dhcp l2relay circuit-id vlan <vlan-list>
Mode: Global Config

no dhcp l2relay circuit-id vlan

Use this parameter to clear the DHCP Option-82 Circuit ID for a VLAN.

Format: no dhcp l2relay circuit-id vlan <vlan-list>
Mode: Global Config

dhcp l2relay remote-id vlan

Use this parameter to set the DHCP Option-82 Remote ID for a VLAN and subscribed service (based on subscription-name). The vlan-list range is 1–4093. Separate non-consecutive IDs with a comma (,), and do not insert spaces or zeros between the range. Use a dash (–) for the range.

Format: dhcp l2relay remote-id <remote-id-string> vlan <vlan-list>
Mode: Global Config

no dhcp l2relay remote-id vlan

Use this parameter to clear the DHCP Option-82 Remote ID for a VLAN and subscribed service (based on subscription-name).

Format: no dhcp l2relay remote-id vlan vlan-list
Mode: Global Config
**dhcp l2relay vlan**

Use this command to enable the DHCP L2 Relay agent for a set of VLANs. All DHCP packets which arrive on interfaces in the configured VLAN are subject to L2 Relay processing.

vlan–list range is 1–4093. Separate non-consecutive IDs with a comma (,), and do not insert spaces or zeros between the range. Use a dash (–) for the range.

**Default**  
disabled

**Format**  
dhcp l2relay vlan <vlan-list>

**Mode**  
Global Config

**no dhcp l2relay vlan**

Use this command to disable the DHCP L2 Relay agent for a set of VLANs.

**Format**  
o dhcp l2relay vlan <vlan-list>

**Mode**  
Global Config

**dhcp l2relay trust**

Use this command to configure an interface or range of interfaces as trusted for Option-82 reception.

**Default**  
untrusted

**Format**  
dhcp l2relay trust

**Mode**  
Interface Config

**no dhcp l2relay trust**

Use this command to configure an interface to the default untrusted for Option-82 reception.

**Format**  
o dhcp l2relay trust

**Mode**  
Interface Config

**show dhcp l2relay all**

Use this command to display the summary of DHCP L2 Relay configuration.

**Format**  
show dhcp l2relay all

**Mode**  
Privileged EXEC

Example: The following shows example CLI display output for the command.

```
(switch) #show dhcp l2relay all
DHCP L2 Relay is Enabled.
Interface         L2RelayMode       TrustMode
----------------- -------------- ----------
```

0/2         0                0                 3                7
0/3         0                0                 0                0
0/4         0                12                0                0
0/5         0                0                 0                0
0/6         3                0                 0                0
0/7         0                0                 0                0
0/8         0                0                 0                0
0/9         0                0                 0                0
```
**show dhcp l2relay agent-option vlan**

Use this command to display the DHCP L2 Relay Option-82 configuration specific to VLAN.

**Format**

```
show dhcp l2relay agent-option vlan vlan-range
```

**Mode**

Privileged EXEC

**Example:** The following shows example CLI display output for the command.

```
(switch) #show dhcp l2relay agent-option vlan 5-10
DHCP L2 Relay is Enabled.
VLAN Id  L2 Relay  CircuitId           RemoteId
---------  ----------  -----------        ------------
   5        Enabled    Enabled            --NULL--
   6        Enabled    Enabled            netgear
   7        Enabled    Disabled           --NULL--
   8        Enabled    Disabled           --NULL--
   9        Enabled    Disabled           --NULL--
  10        Enabled    Disabled           --NULL--
```

**DHCP Client Commands**

DHCP Client can include vendor and configuration information in DHCP client requests relayed to a DHCP server. This information is included in DHCP Option 60, Vendor Class Identifier. The information is a string of 128 octets.

**dhcp client vendor-id-option**

Use this command to enable the inclusion of DHCP Option-60, Vendor Class Identifier included in the requests transmitted to the DHCP server by the DHCP client operating in the switch.

**Format**

```
dhcp client vendor-id-option
```

**Mode**

Global Config

**no dhcp client vendor-id-option**

Use this command to disable the inclusion of DHCP Option-60, Vendor Class Identifier included in the requests transmitted to the DHCP server by the DHCP client operating in the switch.

**Format**

```
no dhcp client vendor-id-option
```

**Mode**

Global Config
**dhcp client vendor-id-option-string**

Use this command to set the DHCP Vendor Option-60 string to be included in requests transmitted to the DHCP server by the DHCP client operating in the switch.

**Format**

dhcp client vendor-id-option-string <string>

**Mode**

Global Config

**no dhcp client vendor-id-option-string**

Use this command to clear the DHCP Vendor Option-60 string.

**Format**

no dhcp client vendor-id-option-string

**Mode**

Global Config

**show dhcp client vendor-id-option**

Use this command to display the configured administration mode of the vendor-id-option and the vendor-id string to be included in Option-43 in DHCP requests.

**Format**

show dhcp client vendor-id-option

**Mode**

Privileged EXEC

Example: The following shows example CLI display output for the command.

(switch) #show dhcp client vendor-id-option
DHCP Client Vendor Identifier Option ........... Enabled
DHCP Client Vendor Identifier Option string .... Client.

**DHCP Snooping Configuration Commands**

This section describes commands you use to configure DHCP Snooping.

**ip dhcp snooping**

Use this command to enable DHCP Snooping globally.

**Default**

disabled

**Format**

ip dhcp snooping

**Mode**

Global Config
no ip dhcp snooping

Use this command to disable DHCP Snooping globally.

Format  no ip dhcp snooping
Mode     Global Config

ip dhcp snooping vlan

Use this command to enable DHCP Snooping on a list of comma-separated VLAN ranges.

Default  disabled
Format    ip dhcp snooping vlan <vlan-list>
Mode     Global Config

no ip dhcp snooping vlan

Use this command to disable DHCP Snooping on VLANs.

Format  no ip dhcp snooping vlan <vlan-list>
Mode     Global Config

ip dhcp snooping verify mac-address

Use this command to enable verification of the source MAC address with the client hardware address in the received DCHP message.

Default  enabled
Format    ip dhcp snooping verify mac-address
Mode     Global Config

no ip dhcp snooping verify mac-address

Use this command to disable verification of the source MAC address with the client hardware address.

Format  no ip dhcp snooping verify mac-address
Mode     Global Config
**ip dhcp snooping database**

Use this command to configure the persistent location of the DHCP Snooping database. This can be local or a remote file on a given IP machine.

**Default**
local

**Format**
ip dhcp snooping database {local|tftp://hostIP/filename}

**Mode**
Global Config

**ip dhcp snooping database write-delay**

Use this command to configure the interval in seconds at which the DHCP Snooping database will be persisted. The interval value ranges from 15 to 86400 seconds.

**Default**
300 seconds

**Format**
ip dhcp snooping database write-delay <in seconds>

**Mode**
Global Config

**no ip dhcp snooping database write-delay**

Use this command to set the write delay value to the default value.

**Format**
no ip dhcp snooping database write-delay

**Mode**
Global Config

**ip dhcp snooping binding**

Use this command to configure static DHCP Snooping binding.

**Format**
ip dhcp snooping binding <mac-address> vlan <vlan id> <ip address>
interface <interface id>

**Mode**
Global Config

**no ip dhcp snooping binding <mac-address>**

Use this command to remove the DHCP static entry from the DHCP Snooping database.

**Format**
no ip dhcp snooping binding <mac-address>

**Mode**
Global Config
ip verify binding

Use this command to configure static IP source guard (IPSG) entries.

Format: ip verify binding <mac-address> vlan <vlan id> <ip address> interface <interface id>

Mode: Global Config

no ip verify binding

Use this command to remove the IPSG static entry from the IPSG database.

Format: no ip verify binding <mac-address> vlan <vlan id> <ip address> interface <interface id>

Mode: Global Config

ip dhcp snooping limit

Use this command to control the rate at which the DHCP Snooping messages come. The default rate is 15 pps with a range from 0 to 30 pps. The default burst level is 1 second with a range of 1 to 15 seconds.

Default: 15 pps for rate limiting and 1 sec for burst interval
Format: ip dhcp snooping limit {rate pps [burst interval seconds]}
Mode: Interface Config

no ip dhcp snooping limit

Use this command to set the rate at which the DHCP Snooping messages come, and the burst level, to the defaults.

Format: no ip dhcp snooping limit
Mode: Interface Config

ip dhcp snooping log-invalid

Use this command to control the logging DHCP messages filtration by the DHCP Snooping application.

Default: disabled
Format: ip dhcp snooping log-invalid
Mode: Interface Config
no ip dhcp snooping log-invalid

Use this command to disable the logging DHCP messages filtration by the DHCP Snooping application.

Format: no ip dhcp snooping log-invalid
Mode: Interface Config

ip dhcp snooping trust

Use this command to configure the port as trusted.

Default: disabled
Format: ip dhcp snooping trust
Mode: Interface Config

no ip dhcp snooping trust

Use this command to configure the port as untrusted.

Format: no ip dhcp snooping trust
Mode: Interface Config

ip verify source

Use this command to configure the IPSG source ID attribute to filter the data traffic in the hardware. Source ID is the combination of IP address and MAC address. Normal command allows data traffic filtration based on the IP address. With the “port-security” option, the data traffic will be filtered based on the IP and MAC addresses.

Default: the source ID is the IP address
Format: ip verify source {port-security}
Mode: Interface Config

no ip verify source

Use this command to disable the IPSG configuration in the hardware. You cannot disable port-security alone if it is configured.

Format: no ip verify source
Mode: Interface Config
**show ip dhcp snooping**

Use this command to display the DHCP Snooping global configurations and per port configurations.

**Format**  
show ip dhcp snooping

**Mode**  
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

</tr>
</tbody>
</table>

**show ip dhcp snooping binding**

Use this command to display the DHCP Snooping binding entries. To restrict the output, use the following options:

- Dynamic: Restrict the output based on DCHP snooping.
- Interface: Restrict the output based on a specific interface.
- Static: Restrict the output based on static entries.
- VLAN: Restrict the output based on VLAN.

**Format**  
show ip dhcp snooping binding [{static/dynamic}] {interface unit/slot/port} [vlan id]

**Mode**  
- Privileged EXEC
- User EXEC

</tbody>
</table>

The following shows sample CLI display output for the command.

```
(switch) #show ip source binding

MAC Address        | IP Address       | Type            | Vlan | Interface
------------------|------------------|-----------------|------|-----------
00:00:00:00:00:08  | 1.2.3.4          | dhcp-snooping   | 2    | 1/0/1     
00:00:00:00:00:09  | 1.2.3.4          | dhcp-snooping   | 3    | 1/0/1     
00:00:00:00:00:0A  | 1.2.3.4          | dhcp-snooping   | 4    | 1/0/1     
```

Dynamic ARP Inspection Commands

Dynamic ARP Inspection (DAI) is a security feature that rejects invalid and malicious ARP packets. DAI prevents a class of man-in-the-middle attacks, where an unfriendly station intercepts traffic for other stations by poisoning the ARP caches of its unsuspecting neighbors. The miscreant sends ARP requests or responses mapping another station’s IP address to its own MAC address.

DAI relies on DHCP snooping. DHCP snooping listens to DHCP message exchanges and builds a binding database of valid {MAC address, IP address, VLAN, and interface} tuples.

When DAI is enabled, the switch drops ARP packets whose sender MAC address and sender IP address do not match an entry in the DHCP snooping bindings database. You can optionally configure additional ARP packet validation.
ip arp inspection vlan

Use this command to enable Dynamic ARP Inspection on a list of comma-separated VLAN ranges.

Default: disabled
Format: ip arp inspection vlan vlan-list
Mode: Global Config

no ip arp inspection vlan

Use this command to disable Dynamic ARP Inspection on a list of comma-separated VLAN ranges.

Format: no ip arp inspection vlan vlan-list
Mode: Global Config

ip arp inspection validate

Use this command to enable additional validation checks like source-mac validation, destination-mac validation, and ip address validation on the received ARP packets. Each command overrides the configuration of the previous command. For example, if a command enables src-mac and dst-mac validations, and a second command enables IP validation only, the src-mac and dst-mac validations are disabled as a result of the second command.

Default: disabled
Format: ip arp inspection validate {[src-mac] [dst-mac] [ip]}
Mode: Global Config

no ip arp inspection validate

Use this command to disable the additional validation checks on the received ARP packets.

Format: no ip arp inspection validate {[src-mac] [dst-mac] [ip]}
Mode: Global Config

ip arp inspection vlan logging

Use this command to enable logging of invalid ARP packets on a list of comma-separated VLAN ranges.

Default: enabled
Format: ip arp inspection vlan vlan-list logging
Mode: Global Config
**no ip arp inspection vlan logging**

Use this command to disable logging of invalid ARP packets on a list of comma-separated VLAN ranges.

**Format**

```
no ip arp inspection vlan vlan-list logging
```

**Mode**

Global Config

**ip arp inspection trust**

Use this command to configure an interface as trusted for Dynamic ARP Inspection.

**Default**

enabled

**Format**

```
ip arp inspection trust
```

**Mode**

Interface Config

**no ip arp inspection trust**

Use this command to configure an interface as untrusted for Dynamic ARP Inspection.

**Format**

```
no ip arp inspection trust
```

**Mode**

Interface Config

**ip arp inspection limit**

Use this command to configure the rate limit and burst interval values for an interface. Configuring none for the limit means the interface is not rate limited for Dynamic ARP Inspections.

**Note:** The user interface will accept a rate limit for a trusted interface, but the limit will not be enforced unless the interface is configured to be untrusted.

**Default**

15 pps for rate and 1 second for burst-interval

**Format**

```
ip arp inspection limit {rate pps [burst interval seconds] | none}
```

**Mode**

Interface Config
no ip arp inspection limit

Use this command to set the rate limit and burst interval values for an interface to the default values of 15 pps and 1 second, respectively.

Format: no ip arp inspection limit
Mode: Interface Config

ip arp inspection filter

Use this command to configure the ARP ACL used to filter invalid ARP packets on a list of comma-separated VLAN ranges. If the static keyword is given, packets that do not match a permit statement are dropped without consulting the DHCP snooping bindings.

Default: No ARP ACL is configured on a VLAN
Format: ip arp inspection filter acl-name vlan vlan-list [static]
Mode: Global Config

no ip arp inspection filter

Use this command to unconfigure the ARP ACL used to filter invalid ARP packets on a list of comma-separated VLAN ranges.

Format: no ip arp inspection filter acl-name vlan vlan-list [static]
Mode: Global Config

arp access-list

Use this command to create an ARP ACL.

Format: arp access-list acl-name
Mode: Global Config

no arp access-list

Use this command to delete a configured ARP ACL.

Format: no arp access-list acl-name
Mode: Global Config
permit ip host mac host

Use this command to configure a rule for a valid IP address and MAC address combination used in ARP packet validation.

Format  permit ip host sender-ip mac host sender-mac
Mode    ARP Access-list Config

no permit ip host mac host

Use this command to delete a rule for a valid IP and MAC combination.

Format  no permit ip host sender-ip mac host sender-mac
Mode    ARP Access-list Config

show ip arp inspection

Use this command to display the Dynamic ARP Inspection global configuration and configuration on all the VLANs. With the vlan-list argument (i.e. comma separated VLAN ranges), the command displays the global configuration and configuration on all the VLANs in the given VLAN list. The global configuration includes the source mac validation, destination mac validation and invalid IP validation information.

Format  show ip arp inspection [vlan <vlan-list>]
Mode    • Privileged EXEC
        • User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source MAC Validation</td>
<td>Displays whether Source MAC Validation of ARP frame is enabled or disabled.</td>
</tr>
<tr>
<td>Destination MAC Validation</td>
<td>Displays whether Destination MAC Validation is enabled or disabled.</td>
</tr>
<tr>
<td>IP Address Validation</td>
<td>Displays whether IP Address Validation is enabled or disabled.</td>
</tr>
<tr>
<td>VLAN</td>
<td>The VLAN ID for each displayed row.</td>
</tr>
<tr>
<td>Configuration</td>
<td>Displays whether DAI is enabled or disabled on the VLAN.</td>
</tr>
<tr>

<td>Displays whether logging of invalid ARP packets is enabled on the VLAN.</td>
</tr>
<tr>
<td>ACL Name</td>
<td>The ARP ACL Name, if configured on the VLAN.</td>
</tr>
<tr>
<td>Static Flag</td>
<td>If the ARP ACL is configured static on the VLAN.</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command.

(Switch) #show ip arp inspection vlan 10-12
Source Mac Validation : Disabled  
Destination Mac Validation : Disabled  
IP Address Validation : Disabled  

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Configuration</th>
<th>Log Invalid</th>
<th>ACL Name</th>
<th>Static flag</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Enabled</td>
<td>Enabled</td>
<td>H2</td>
<td>Enabled</td>
</tr>
<tr>
<td>11</td>
<td>Disabled</td>
<td>Enabled</td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>Enabled</td>
<td>Disabled</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

show ip arp inspection statistics

Use this command to display the statistics of the ARP packets processed by Dynamic ARP Inspection. Give the vlan-list argument and the command displays the statistics on all DAI-enabled VLANs in that list. Give the single vlan argument and the command displays the statistics on that VLAN. If no argument is included, the command lists a summary of the forwarded and dropped ARP packets.

Format
show ip arp inspection statistics [vlan vlan-list]

Mode
• Privileged EXEC  
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN</td>
<td>The VLAN ID for each displayed row.</td>
</tr>
<tr>
<td>Forwarded</td>
<td>The total number of valid ARP packets forwarded in this VLAN.</td>
</tr>
<tr>
<td>Dropped</td>
<td>The total number of not valid ARP packets dropped in this VLAN.</td>
</tr>
<tr>
<td>DHCP Drops</td>
<td>The number of packets dropped due to DHCP snooping binding database match failure.</td>
</tr>
<tr>
<td>ACL Drops</td>
<td>The number of packets dropped due to ARP ACL rule match failure.</td>
</tr>
<tr>
<td>DHCP Permits</td>
<td>The number of packets permitted due to DHCP snooping binding database match.</td>
</tr>
<tr>
<td>ACL Permits</td>
<td>The number of packets permitted due to ARP ACL rule match.</td>
</tr>
<tr>
<td>Bad Src MAC</td>
<td>The number of packets dropped due to Source MAC validation failure.</td>
</tr>
<tr>
<td>Bad Dest MAC</td>
<td>The number of packets dropped due to Destination MAC validation failure.</td>
</tr>
<tr>
<td>Invalid IP</td>
<td>The number of packets dropped due to invalid IP checks.</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command show ip arp inspection statistics which lists the summary of forwarded and dropped ARP packets on all DAI-enabled VLANs.

<table>
<thead>
<tr>
<th>VLAN</th>
<th>Forwarded</th>
<th>Dropped</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>90</td>
<td>14</td>
</tr>
<tr>
<td>20</td>
<td>10</td>
<td>3</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command show ip arp inspection statistics vlan <vlan-list>.
### Clear ARP Inspection Statistics

**clear ip arp inspection statistics**

Use this command to reset the statistics for Dynamic ARP Inspection on all VLANs.

- **Default**: none
- **Format**: `clear ip arp inspection statistics`
- **Mode**: Privileged EXEC

### Show ARP Inspection Interfaces

**show ip arp inspection interfaces**

Use this command to display the Dynamic ARP Inspection configuration on all the DAI-enabled interfaces. An interface is said to be enabled for DAI if at least one VLAN, that the interface is a member of, is enabled for DAI. Given a unit/slot/port interface argument, the command displays the values for that interface whether the interface is enabled for DAI or not.

- **Format**: `show ip arp inspection interfaces [unit/slot/port]`
- **Mode**: • Privileged EXEC
  • User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface ID for each displayed row.</td>
</tr>
<tr>
<td>Trust State</td>
<td>Whether the interface is trusted or untrusted for DAI.</td>
</tr>
<tr>
<td>Rate Limit</td>
<td>The configured rate limit value in packets per second.</td>
</tr>
<tr>
<td>Burst Interval</td>
<td>The configured burst interval value in seconds.</td>
</tr>
</tbody>
</table>

**Example**: The following shows example CLI display output for the command.

```
(Switch) #show ip arp inspection interfaces
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Trust State</th>
<th>Rate Limit</th>
<th>Burst Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>Untrusted</td>
<td>15</td>
<td>1</td>
</tr>
<tr>
<td>0/2</td>
<td>Untrusted</td>
<td>10</td>
<td>10</td>
</tr>
</tbody>
</table>
**show arp access-list**

Use this command to display the configured ARP ACLs with the rules. Giving an ARP ACL name as the argument will display only the rules in that ARP ACL.

**Format**

    show arp access-list [acl-name]

**Mode**

- Privileged EXEC
- User EXEC

Example: The following shows example CLI display output for the command.

```
(Switch) #show arp access-list

ARP access list H2
  permit ip host 1.1.1.1 mac host 00:01:02:03:04:05
  permit ip host 1.1.1.2 mac host 00:03:04:05:06:07

ARP access list H3

ARP access list H4
  permit ip host 2.1.1.2 mac host 00:03:04:05:06:08
```

**IGMP Snooping Configuration Commands**

This section describes the commands you use to configure IGMP snooping. The software supports IGMP Versions 1, 2, and 3. The IGMP snooping feature can help conserve bandwidth because it allows the switch to forward IP multicast traffic only to connected hosts that request multicast traffic. IGMPv3 adds source filtering capabilities to IGMP versions 1 and 2.

**set igmp**

This command enables IGMP Snooping on the system (Global Config Mode) or an interface (Interface Config Mode). This command also enables IGMP snooping on a particular VLAN (VLAN Config Mode) and can enable IGMP snooping on all interfaces participating in a VLAN.

If an interface has IGMP Snooping enabled and you enable this interface for routing or enlist it as a member of a port-channel (LAG), IGMP Snooping functionality is disabled on that interface. IGMP Snooping functionality is re-enabled if you disable routing or remove port-channel (LAG) membership from an interface that has IGMP Snooping enabled.

The IGMP application supports the following activities:

- Validation of the IP header checksum (as well as the IGMP header checksum) and discarding of the frame upon checksum error.
- Maintenance of the forwarding table entries based on the MAC address versus the IP address.
- Flooding of unregistered multicast data packets to all ports in the VLAN.

**Default**

```
disabled
```

**Format**

```
set igmp
```

**Mode**

- Global Config
- Interface Config

**Format**

```
set igmp <vlanid>
```

**Mode**

VLAN Config

---

**no set igmp**

This command disables IGMP Snooping on the system, an interface or a VLAN.

**Format**

```
no set igmp
```

**Mode**

- Global Config
- Interface Config

**Format**

```
no set igmp <vlanid>
```

**Mode**

VLAN Config

---

**set igmp interfacemode**

This command enables IGMP Snooping on all interfaces. If an interface has IGMP Snooping enabled and you enable this interface for routing or enlist it as a member of a port-channel (LAG), IGMP Snooping functionality is disabled on that interface. IGMP Snooping functionality is re-enabled if you disable routing or remove port-channel (LAG) membership from an interface that has IGMP Snooping enabled.

**Default**

```
disabled
```

**Format**

```
set igmp interfacemode
```

**Mode**

Global Config

---

**no set igmp interfacemode**

This command disables IGMP Snooping on all interfaces.

**Format**

```
no set igmp interfacemode
```

**Mode**

Global Config

---

**set igmp fast-leave**

This command enables or disables IGMP Snooping fast-leave admin mode on a selected interface or VLAN. Enabling fast-leave allows the switch to immediately remove the layer 2
LAN interface from its forwarding table entry upon receiving an IGMP leave message for that multicast group without first sending out MAC-based general queries to the interface.

You should enable fast-leave admin mode only on VLANs where only one host is connected to each layer 2 LAN port. This prevents the inadvertent dropping of the other hosts that were connected to the same layer 2 LAN port but were still interested in receiving multicast traffic directed to that group. Also, fast-leave processing is supported only with IGMP version 2 hosts.

**Default**

disabled

**Format**

set igmp fast-leave

**Mode**

Interface Config

**Format**

set igmp fast-leave <vlan_id>

**Mode**

VLAN Config

no set igmp fast-leave

This command disables IGMP Snooping fast-leave admin mode on a selected interface.

**Format**

no set igmp fast-leave

**Mode**

Interface Config

**Format**

no set igmp fast-leave <vlan_id>

**Mode**

VLAN Config

**set igmp groupmembership-interval**

This command sets the IGMP Group Membership Interval time on a VLAN, one interface or all interfaces. The Group Membership Interval time is the amount of time in seconds that a switch waits for a report from a particular group on a particular interface before deleting the interface from the entry. This value must be greater than the IGMPv3 Maximum Response time value. The range is 2 to 3600 seconds.

**Default**

260 seconds

**Format**

set igmp groupmembership-interval <2-3600>

**Mode**

• Interface Config
• Global Config

**Format**

set igmp groupmembership-interval <vlan_id> <2-3600>

**Mode**

VLAN Config
no set igmp groupmembership-interval

This command sets the IGMPv3 Group Membership Interval time to the default value.

**Format**
```plaintext
no set igmp groupmembership-interval
```

**Mode**
- Interface Config
- Global Config

**Format**
```plaintext
no set igmp groupmembership-interval <vlan_id>
```

**Mode**
- VLAN Config

**set igmp maxresponse**

This command sets the IGMP Maximum Response time for the system, or on a particular interface or VLAN. The Maximum Response time is the amount of time in seconds that a switch will wait after sending a query on an interface because it did not receive a report for a particular group in that interface. This value must be less than the IGMP Query Interval time value. The range is 1 to 25 seconds.

**Default**
10 seconds

**Format**
```plaintext
set igmp maxresponse <1-25>
```

**Mode**
- Global Config
- Interface Config

**Format**
```plaintext
set igmp maxresponse <vlan_id> <1-25>
```

**Mode**
- VLAN Config

no set igmp maxresponse

This command sets the max response time (on the interface or VLAN) to the default value.

**Format**
```plaintext
no set igmp maxresponse
```

**Mode**
- Global Config
- Interface Config

**Format**
```plaintext
no set igmp maxresponse <vlan_id>
```

**Mode**
- VLAN Config

**set igmp mcrtexpiretime**

This command sets the Multicast Router Present Expiration time. The time is set for the system, on a particular interface or VLAN. This is the amount of time in seconds that a switch waits for a query to be received on an interface before the interface is removed from the list of
ProSafe Managed Switch

interfaces with multicast routers attached. The range is 0 to 3600 seconds. A value of 0 indicates an infinite time-out, i.e. no expiration.

Default 0
Format set igmp mcrtrexpiretime <0-3600>
Mode • Global Config
• Interface Config

Format set igmp mcrtrexpiretime <vlan_id> <0-3600>
Mode VLAN Config

no set igmp mcrtrexpiretime

This command sets the Multicast Router Present Expiration time to 0. The time is set for the system, on a particular interface or a VLAN.

Format no set igmp mcrtrexpiretime
Mode • Global Config
• Interface Config

Format no set igmp mcrtrexpiretime <vlan_id>
Mode VLAN Config

set igmp mrouter

This command configures the VLAN ID (<vlanId>) that has the multicast router mode enabled.

Format set igmp mrouter <vlan_id>
Mode Interface Config

no set igmp mrouter

This command disables multicast router mode for a particular VLAN ID (<vlan_id>).

Format no set igmp mrouter <vlan_id>
Mode Interface Config
**set igmp mrouter interface**

This command configures the interface as a multicast router interface. When configured as a multicast router interface, the interface is treated as a multicast router interface in all VLANs.

**Default**

disabled

**Format**

set igmp mrouter interface

**Mode**

Interface Config

**no set igmp mrouter interface**

This command disables the status of the interface as a statically configured multicast router interface.

**Format**

no set igmp mrouter interface

**Mode**

Interface Config

**set igmp report-suppression**

Use this command to suppress the IGMP reports on a given VLAN ID. In order to optimize the number of reports traversing the network with no added benefits, a Report Suppression mechanism is implemented. When more than one client responds to an MGMD query for the same Multicast Group address within the max-response-time, only the first response is forwarded to the query and others are suppressed at the switch.

**Default**

Disabled

**Format**

set igmp report-suppression <1-4093>

**Mode**

VLAN Config

**no set igmp report-suppression**

Use this command to restore the system default.

**Format**

no set igmp report-suppression

**Mode**

VLAN Config

**set igmp header-validation**

This command enables the validation of 3 igmp header fields TTL (Time To Live), ToS (Type of Service), and Router Alert options. The fields validated depend on the IGMP version being used. IGMPv1 - Only the TTL field is validated. IGMPv2 - TTL and Router Alert fields are validated.
IGMPv3 - TTL, ToS, and Router Alert fields are validated

Default     Enabled
Format       set igmp header-validation
Mode         Global Config

no set igmp header-validation

This command disables the header validation for IGMP packets.

Format       no set igmp header-validation
Mode         Global Config

mac address-table multicast forbidden-unregistered vlan

Use this command to forbid forwarding unregistered multicast addresses (in other words, unknown multicast traffic) on a given VLAN ID.

Default     Disabled
Format       mac address-table multicast forbidden-unregistered vlan
             <1-4093>
Mode         Global Config

no mac address-table multicast forbidden-unregistered vlan

Use this command to restore the default.

Format       no mac address-table multicast forbidden-unregistered vlan
Mode         Global Config

mac address-table multicast forward-unregistered vlan

Use this command to enable forwarding unregistered multicast address (in other words, unknown multicast traffic) on a given VLAN ID.

Format       mac address-table multicast forward-unregistered vlan
             <1-4093>
Mode         Global Config
**mac address-table multicast forward-all vlan**

Use this command to enable forwarding of all multicast packets on a given VLAN ID.

**Format**
mac address-table multicast forward-all vlan <1-4093>

**Mode**
Global Config

**no mac address-table multicast forward-all vlan**

This command restores the system default.

**Format**
no mac address-table multicast forward-all vlan

**Mode**
Global Config
show igmpsnooping

This command displays IGMP Snooping information. Configured information is displayed whether or not IGMP Snooping is enabled.

Format

show igmpsnooping [<unit/slot/port> | <vlan_id>]

Mode

Privileged EXEC

When the optional arguments <unit/slot/port> or <vlan_id> are not used, the command displays the following information:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Indicates whether or not IGMP Snooping is active on the switch.</td>
</tr>
<tr>
<td>Multicast Control Frame Count</td>
<td>The number of multicast control frames that are processed by the CPU.</td>
</tr>
<tr>
<td>Interface Enabled for IGMP Snooping</td>
<td>The list of interfaces on which IGMP Snooping is enabled.</td>
</tr>
<tr>
<td>VLANS Enabled for IGMP Snooping</td>
<td>The list of VLANS on which IGMP Snooping is enabled.</td>
</tr>
</tbody>
</table>

When you specify the <unit/slot/port> values, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP Snooping Admin Mode</td>
<td>Indicates whether IGMP Snooping is active on the interface.</td>
</tr>
<tr>
<td>Fast Leave Mode</td>
<td>Indicates whether IGMP Snooping Fast-leave is active on the interface.</td>
</tr>
<tr>
<td>Group Membership Interval</td>
<td>The amount of time in seconds that a switch will wait for a report from a particular group on a particular interface before deleting the interface from the entry. This value may be configured.</td>
</tr>
<tr>
<td>Maximum Response Time</td>
<td>The amount of time the switch waits after it sends a query on an interface because it did not receive a report for a particular group on that interface. This value may be configured.</td>
</tr>
<tr>
<td>Multicast Router Expiry Time</td>
<td>The amount of time to wait before removing an interface from the list of interfaces with multicast routers attached. The interface is removed if a query is not received. This value may be configured.</td>
</tr>
</tbody>
</table>
When you specify a value for `<vlan_id>`, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID.</td>
</tr>
<tr>
<td>IGMP Snooping Admin Mode</td>
<td>Indicates whether IGMP Snooping is active on the VLAN.</td>
</tr>
<tr>
<td>Fast Leave Mode</td>
<td>Indicates whether IGMP Snooping Fast-leave is active on the VLAN.</td>
</tr>
<tr>
<td>Group Membership Interval</td>
<td>The amount of time in seconds that a switch will wait for a report from a particular group on a particular interface, which is participating in the VLAN, before deleting the interface from the entry. This value may be configured.</td>
</tr>
<tr>
<td>Maximum Response Time</td>
<td>The amount of time the switch waits after it sends a query on an interface, participating in the VLAN, because it did not receive a report for a particular group on that interface. This value may be configured.</td>
</tr>
<tr>
<td>Multicast Router Expiry Time</td>
<td>The amount of time to wait before removing an interface that is participating in the VLAN from the list of interfaces with multicast routers attached. The interface is removed if a query is not received. This value may be configured.</td>
</tr>
</tbody>
</table>

**show igmpsnooping mrouter interface**

This command displays information about statically configured ports.

**Format**

```
show igmpsnooping mrouter interface <unit/slot/port>
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The port on which multicast router information is being displayed.</td>
</tr>
<tr>
<td>Multicast Router Attached</td>
<td>Indicates whether multicast router is statically enabled on the interface.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The list of VLANs of which the interface is a member.</td>
</tr>
</tbody>
</table>

**show igmpsnooping mrouter vlan**

This command displays information about statically configured ports.

**Format**

```
show igmpsnooping mrouter vlan <unit/slot/port>
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The port on which multicast router information is being displayed.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The list of VLANs of which the interface is a member.</td>
</tr>
</tbody>
</table>
**showmac-address-table igmpsnooping**

This command displays the IGMP Snooping entries in the MFDB table.

**Format**

show mac-address-table igmpsnooping

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>A multicast MAC address for which the switch has forwarding or filtering information. The format is two-digit hexadecimal numbers that are separated by colons, for example 01:23:45:67:89:AB. In an IVL system the MAC address is displayed as a MAC address and VLAN ID combination of 8 bytes.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the entry, which is either static (added by the user) or dynamic (added to the table as a result of a learning process or protocol).</td>
</tr>
<tr>
<td>Description</td>
<td>The text description of this multicast table entry.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:).</td>
</tr>
</tbody>
</table>

**showmac address-table multicast filtering**

Use this command to display the multicast filtering details for a given VLAN.

**Format**

show mac address-table multicast filtering

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-id</td>
<td>A valid VLAN ID</td>
</tr>
<tr>
<td>mode</td>
<td>The filtering mode</td>
</tr>
</tbody>
</table>

The following shows example CLI display output for the command.

```
(netgear switch) #show mac address-table multicast filtering 1
VLAN-ID:....... 1
Mode......... Forward-Forbidden-Unregistered
```
IGMP Snooping Querier Commands

IGMP Snooping requires that one central switch or router periodically query all end-devices on the network to announce their multicast memberships. This central device is the “IGMP Querier”. The IGMP query responses, known as IGMP reports, keep the switch updated with the current multicast group membership on a port-by-port basis. If the switch does not receive updated membership information in a timely fashion, it will stop forwarding multicasts to the port where the end device is located.

This section describes commands used to configure and display information on IGMP Snooping Queriers on the network and, separately, on VLANs.

set igmp querier

Use this command to enable IGMP Snooping Querier on the system, using Global Config mode, or on a VLAN. Using this command, you can specify the IP Address that the Snooping Querier switch should use as the source address while generating periodic queries.

If a VLAN has IGMP Snooping Querier enabled and IGMP Snooping is operationally disabled on it, IGMP Snooping Querier functionality is disabled on that VLAN. IGMP Snooping functionality is re-enabled if IGMP Snooping is operational on the VLAN.

**Note:** The Querier IP Address assigned for a VLAN takes preference over global configuration.

The IGMP Snooping Querier application supports sending periodic general queries on the VLAN to solicit membership reports.

| Default | disabled |
| Format | set igmp querier [<vlan-id>] [address ipv4_address] |
| Mode | • Global Config  
• VLAN Mode |

no set igmp querier

Use this command to disable IGMP Snooping Querier on the system. Use the optional `address` parameter to reset the querier address to 0.0.0.0.

| Format | no set igmp querier [<vlan-id>] [address] |
| Mode | • Global Config  
• VLAN Mode |
**set igmp querier query-interval**

Use this command to set the IGMP Querier Query Interval time. It is the amount of time in seconds that the switch waits before sending another general query.

- **Default**: disabled
- **Format**: `set igmp querier query-interval <1-18000>`
- **Mode**: Global Config

**no set igmp querier query-interval**

Use this command to set the IGMP Querier Query Interval time to its default value.

- **Format**: `no set igmp querier query-interval`
- **Mode**: Global Config

**set igmp querier timer expiry**

Use this command to set the IGMP Querier timer expiration period. It is the time period that the switch remains in Non-Querier mode once it has discovered that there is a Multicast Querier in the network.

- **Default**: 60 seconds
- **Format**: `set igmp querier timer expiry <60-300>`
- **Mode**: Global Config

**no set igmp querier timer expiry**

Use this command to set the IGMP Querier timer expiration period to its default value.

- **Format**: `no set igmp querier timer expiry`
- **Mode**: Global Config

**set igmp querier version**

Use this command to set the IGMP version of the query that the snooping switch is going to send periodically.

- **Default**: 1
- **Format**: `set igmp querier version <1-2>`
- **Mode**: Global Config
no set igmp querier version

Use this command to set the IGMP Querier version to its default value.

Format: no set igmp querier version
Mode: Global Config

set igmp querier election participate

Use this command to enable the Snooping Querier to participate in the Querier Election process when it discovers the presence of another Querier in the VLAN. When this mode is enabled, if the Snooping Querier finds that the other Querier’s source address is better (less) than the Snooping Querier’s address, it stops sending periodic queries. If the Snooping Querier wins the election, then it will continue sending periodic queries.

Default: disabled
Format: set igmp querier election participate
Mode: VLAN Config

no set igmp querier election participate

Use this command to set the Snooping Querier not to participate in querier election but go into non-querier mode as soon as it discovers the presence of another querier in the same VLAN.

Format: no set igmp querier election participate
Mode: VLAN Config

show igmpsnooping querier

Use this command to display IGMP Snooping Querier information. Configured information is displayed whether or not IGMP Snooping Querier is enabled.

Format: show igmpsnooping querier [detail | vlan <vlanid>]
Mode: Privileged EXEC

When the optional argument <vlanid> is not used, the command displays the following information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Indicates whether or not IGMP Snooping Querier is active on the switch.</td>
</tr>
<tr>
<td>Admin Version</td>
<td>The version of IGMP that will be used while sending out the queries.</td>
</tr>
<tr>
<td>Querier Address</td>
<td>The IP Address which will be used in the IPv4 header while sending out IGMP queries. It can be configured using the appropriate command.</td>
</tr>
</tbody>
</table>
When you specify a value for `<vlanid>`, the following additional information appears.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Admin Mode</td>
<td>Indicates whether iGMP Snooping Querier is active on the VLAN.</td>
</tr>
<tr>
<td>VLAN Operational State</td>
<td>Indicates whether IGMP Snooping Querier is in “Querier” or “Non-Querier” state. When the switch is in Querier state, it will send out periodic general queries. When in Non-Querier state, it will wait for moving to Querier state and does not send out any queries.</td>
</tr>
<tr>
<td>VLAN Operational Max Response Time</td>
<td>Indicates the time to wait before removing a Leave from a host upon receiving a Leave request. This value is calculated dynamically from the Queries received from the network. If the Snooping Switch is in Querier state, then it is equal to the configured value.</td>
</tr>
<tr>
<td>Querier Election Participation</td>
<td>Indicates whether the IGMP Snooping Querier participates in querier election if it discovers the presence of a querier in the VLAN.</td>
</tr>
<tr>
<td>Querier VLAN Address</td>
<td>The IP address will be used in the IPv4 header while sending out IGMP queries on this VLAN. It can be configured using the appropriate command.</td>
</tr>
<tr>
<td>Operational Version</td>
<td>The version of IPv4 will be used while sending out IGMP queries on this VLAN.</td>
</tr>
<tr>
<td>Last Querier Address</td>
<td>Indicates the IP address of the most recent Querier from which a Query was received.</td>
</tr>
<tr>
<td>Last Querier Version</td>
<td>Indicates the IGMP version of the most recent Querier from which a Query was received on this VLAN.</td>
</tr>
</tbody>
</table>

When the optional argument `detail` is used, the command shows the global information and the information for all Querier-enabled VLANs.

### MLD Snooping Commands

This section describes commands used for MLD Snooping. In IPv4, Layer 2 switches can use IGMP Snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded only to those interfaces associated with IP multicast addresses. In IPv6, MLD Snooping performs a similar function. With MLD Snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.
**set mld**

Use this command to enable MLD Snooping on the system (Global Config Mode) or an Interface (Interface Config Mode). This command also enables MLD Snooping on a particular VLAN and enables MLD Snooping on all interfaces participating in a VLAN.

If an interface has MLD Snooping enabled and you enable this interface for routing or enlist it as a member of a port-channel (LAG), MLD Snooping functionality is disabled on that interface. MLD Snooping functionality is re-enabled if you disable routing or remove port-channel (LAG) membership from an interface that has MLD Snooping enabled.

MLD Snooping supports the following activities:

- Validation of address version, payload length consistencies and discarding of the frame upon error.
- Maintenance of the forwarding table entries based on the MAC address versus the IPv6 address.
- Flooding of unregistered multicast data packets to all ports in the VLAN.

**Default**

```
<table>
<thead>
<tr>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disabled</td>
</tr>
</tbody>
</table>
```

**no set mld**

Use this command to disable MLD Snooping on the system.

**Default**

```
<table>
<thead>
<tr>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disabled</td>
</tr>
</tbody>
</table>
```

**set mld interfacemode**

Use this command to enable MLD Snooping on all interfaces. If an interface has MLD Snooping enabled and you enable this interface for routing or enlist it as a member of a port-channel (LAG), MLD Snooping functionality is disabled on that interface. MLD Snooping functionality is re-enabled if you disable routing or remove port-channel (LAG) membership from an interface that has MLD Snooping enabled.

**Default**

```
<table>
<thead>
<tr>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disabled</td>
</tr>
</tbody>
</table>
```

**Format**

```
set mld interface-mode
```
no set mld interfacemode

Use this command to disable MLD Snooping on all interfaces.

**Format**

no set mld interfacemode

**Mode**

Global Config

**set mld fast-leave**

Use this command to enable MLD Snooping fast-leave admin mode on a selected interface or VLAN. Enabling fast-leave allows the switch to immediately remove the Layer 2 LAN interface from its forwarding table entry upon receiving an MLD done message for that multicast group without first sending out MAC-based general queries to the interface.

---

**Note:** You should enable fast-leave admin mode only on VLANs where only one host is connected to each Layer 2 LAN port. This prevents the inadvertent dropping of the other hosts that were connected to the same layer 2 LAN port but were still interested in receiving multicast traffic directed to that group.

---

**Note:** Fast-leave processing is supported only with MLD version 1 hosts.

**Default**

disabled

**Format**

set mld fast-leave vlanid

**Mode**

- Interface Config
- VLAN Mode

no set mld fast-leave

Use this command to disable MLD Snooping fast-leave admin mode on a selected interface.

**Format**

no set mld fast-leave vlanid

**Mode**

- Interface Config
- VLAN Mode

**set mld groupmembership-interval**

Use this command to set the MLD Group Membership Interval time on a VLAN, one interface or all interfaces. The Group Membership Interval time is the amount of time in seconds that a switch waits for a report from a particular group on a particular interface before deleting the
interface from the entry. This value must be greater than the MLDv2 Maximum Response time value. The range is 2 to 3600 seconds.

Default: 260 seconds
Format: set mld groupmembership-interval vlanid 2-3600
Mode: Interface Config, Global Config, VLAN Mode

no set groupmembership-interval

Use this command to set the MLDv2 Group Membership Interval time to the default value.

Format: no set mld groupmembership-interval
Mode: Interface Config, Global Config, VLAN Mode

set mld maxresponse

Use this command to set the MLD Maximum Response time for the system, on a particular interface or VLAN. The Maximum Response time is the amount of time in seconds that a switch will wait after sending a query on an interface because it did not receive a report for a particular group in that interface. This value must be less than the MLD Query Interval time value. The range is 1 to 65 seconds.

Default: 10 seconds
Format: set mld maxresponse 1-65
Mode: Global Config, Interface Config, VLAN Mode

no set mld maxresponse

Use this command to set the max response time (on the interface or VLAN) to the default value.

Format: no set mld maxresponse
Mode: Global Config, Interface Config, VLAN Mode

set mld mcrtexpiretime

Use this command to set the Multicast Router Present Expiration time. The time is set for the system, on a particular interface or VLAN. This is the amount of time in seconds that a switch
waits for a query to be received on an interface before the interface is removed from the list of interfaces with multicast routers attached. The range is 0 to 3600 seconds. A value of 0 indicates an infinite timeout, that is, no expiration.

**Default**
0

**Format**
set mld mcrtexpiretime vlanid 0-3600

**Mode**
- Global Config
- Interface Config

**no set mld mcrtexpiretime**

Use this command to set the Multicast Router Present Expiration time to 0. The time is set for the system, on a particular interface or a VLAN.

**Format**
noset mld mcrtexpiretime vlanid

**Mode**
- Global Config
- Interface Config

**set mld mrouter**

Use this command to configure the VLAN ID for the VLAN that has the multicast router attached mode enabled.

**Format**
set mld mrouter vlanid

**Mode**
Interface Config

**no set mld mrouter**

Use this command to disable multicast router attached mode for a VLAN with a particular VLAN ID.

**Format**
noset mld mrouter vlanid

**Mode**
Interface Config

**set mld mrouter interface**

Use this command to configure the interface as a multicast router-attached interface. When configured as a multicast router interface, the interface is treated as a multicast router-attached interface in all VLANs.

**Default**
disabled

**Format**
set mld mrouter interface

**Mode**
Interface Config
no set mld mrouter interface

Use this command to disable the status of the interface as a statically configured multicast router-attached interface.

**Format**

```
no set mld mrouter interface
```

**Mode**

Interface Config

show mldsnooping

Use this command to display MLD Snooping information. Configured information is displayed whether or not MLD Snooping is enabled.

**Format**

```
show mldsnooping [unit/slot/port | vlanid]
```

**Mode**

Privileged EXEC

When the optional arguments `unit/slot/port` or `vlanid` are not used, the command displays the following information.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Indicates whether or not MLD Snooping is active on the switch.</td>
</tr>
<tr>
<td>Interfaces Enabled for MLD Snooping</td>
<td>Interfaces on which MLD Snooping is enabled.</td>
</tr>
<tr>
<td>MLD Control Frame Count</td>
<td>Displays the number of MLD Control frames that are processed by the CPU.</td>
</tr>
<tr>
<td>VLANs Enabled for MLD Snooping</td>
<td>VLANs on which MLD Snooping is enabled.</td>
</tr>
</tbody>
</table>

When you specify the `unit/slot/port` values, the following information displays.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLD Snooping Admin Mode</td>
<td>Indicates whether MLD Snooping is active on the interface.</td>
</tr>
<tr>
<td>Fast Leave Mode</td>
<td>Indicates whether MLD Snooping Fast Leave is active on the VLAN.</td>
</tr>
<tr>
<td>Group Membership Interval</td>
<td>Shows the amount of time in seconds that a switch will wait for a report from a particular group on a particular interface, which is participating in the VLAN, before deleting the interface from the entry. This value may be configured.</td>
</tr>
<tr>
<td>Max Response Time</td>
<td>Displays the amount of time the switch waits after it sends a query on an interface, participating in the VLAN, because it did not receive a report for a particular group on that interface. This value may be configured.</td>
</tr>
<tr>
<td>Multicast Router Present Expiration Time</td>
<td>Displays the amount of time to wait before removing an interface that is participating in the VLAN from the list of interfaces with multicast routers attached. The interface is removed if a query is not received. This value may be configured.</td>
</tr>
</tbody>
</table>
When you specify a value for \textit{vlanid}, the following information appears.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Admin Mode</td>
<td>Indicates whether MLD Snooping is active on the VLAN.</td>
</tr>
</tbody>
</table>

\textit{show mldsnooping mrouter interface}

Use this command to display information about statically configured multicast router attached interfaces.

**Format**

\texttt{show mldsnooping mrouter interface unit/slot/port}

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Shows the interface on which multicast router information is being displayed.</td>
</tr>
<tr>
<td>Multicast Router Attached</td>
<td>Indicates whether multicast router is statically enabled on the interface.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the list of VLANs of which the interface is a member.</td>
</tr>
</tbody>
</table>

\textit{show mldsnooping mrouter vlan}

Use this command to display information about statically configured multicast router-attached interfaces.

**Format**

\texttt{show mldsnooping mrouter vlan unit/slot/port}

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Shows the interface on which multicast router information is being displayed.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the list of VLANs of which the interface is a member.</td>
</tr>
</tbody>
</table>

\textit{show mac-address-table mldsnooping}

Use this command to display the MLD Snooping entries in the Multicast Forwarding Database (MFDB) table.

**Format**

\texttt{show mac-address-table mldsnooping}

**Mode**

Privileged EXEC
MLD Snooping Querier Commands

In an IPv6 environment, MLD Snooping requires that one central switch or router periodically query all end-devices on the network to announce their multicast memberships. This central device is the MLD Querier. The MLD query responses, known as MLD reports, keep the switch updated with the current multicast group membership on a port-by-port basis. If the switch does not receive updated membership information in a timely fashion, it will stop forwarding multicasts to the port where the end device is located.

This section describes the commands you use to configure and display information on MLD Snooping queries on the network and, separately, on VLANs.

set mld querier

Use this command to enable MLD Snooping Querier on the system (Global Config Mode) or on a VLAN. Using this command, you can specify the IP address that the snooping querier switch should use as a source address while generating periodic queries.

If a VLAN has MLD Snooping Querier enabled and MLD Snooping is operationally disabled on it, MLD Snooping Querier functionality is disabled on that VLAN. MLD Snooping functionality is re-enabled if MLD Snooping is operational on the VLAN.

The MLD Snooping Querier sends periodic general queries on the VLAN to solicit membership reports.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN in which the MAC address is learned.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>A multicast MAC address for which the switch has forwarding or filtering information. The format is 6 two-digit hexadecimal numbers that are separated by colons, for example 01:23:45:67:89:AB.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of entry, which is either static (added by the user) or dynamic (added to the table as a result of a learning process or protocol.)</td>
</tr>
<tr>
<td>Description</td>
<td>The text description of this multicast table entry.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:).</td>
</tr>
</tbody>
</table>

Default: disabled

Format: set mld querier [vlan-id] [address ipv6_address]

Mode:
- Global Config
- VLAN Mode
no set mld querier

Use this command to disable MLD Snooping Querier on the system. Use the optional parameter address to reset the querier address.

Format:  
no set mld querier [vlan-id][address]

Mode:  
- Global Config
- VLAN Mode

set mld querier query_interval

Use this command to set the MLD Querier Query Interval time. This is the amount of time in seconds that the switch waits before sending another general query.

Default:  
disabled

Format:  
set mld querier query_interval <1-18000>

Mode:  
Global Config

no set mld querier query_interval

Use this command to set the MLD Querier Query Interval time to its default value.

Format:  
no set mld querier query_interval

Mode:  
Global Config

set mld querier timer expiry

Use this command to set the MLD Querier timer expiration period. This is the time period that the switch remains in Non-Querier mode once it discovers that there is a Multicast Querier in the network.

Default:  
60 seconds

Format:  
set mld querier timer expiry <60-300>

Mode:  
Global Config

no set mld querier timer expiry

Use this command to set the MLD Querier timer expiration period to its default value.

Format:  
no set mld querier timer expiry

Mode:  
Global Config
set mld querier election participate

Use this command to enable the Snooping Querier to participate in the Querier Election process when it discovers the presence of another Querier in the VLAN. When this mode is enabled, if the Snooping Querier finds that the other Querier’s source address is better (less) than the Snooping Querier’s address, it stops sending periodic queries. If the Snooping Querier wins the election, then it will continue sending periodic queries.

**Default**

disabled

**Format**

set mld querier election participate

**Mode**

VLAN Config

no set mld querier election participate

Use this command to set the snooping querier not to participate in querier election, but go into a non-querier mode as soon as it discovers the presence of another querier in the same VLAN.

**Format**

no set mld querier election participate

**Mode**

VLAN Config

show mldsnooping querier

Use this command to display MLD Snooping Querier information. Configured information is displayed whether or not MLD Snooping Querier is enabled.

**Format**

show mldsnooping querier [{detail | vlan <vlanid>}] 

**Mode**

Privileged EXEC

When the optional arguments *vlanid* are not used, the command displays the following information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Indicates whether or not MLD Snooping Querier is active on the switch.</td>
</tr>
<tr>
<td>Admin Version</td>
<td>Indicates the version of MLD that will be used while sending out the queries. This is defaulted to MLD v1 and it cannot be changed.</td>
</tr>
<tr>
<td>Querier Address</td>
<td>Shows the IP address which will be used in the IPv6 header while sending out MLD queries. It can be configured using the appropriate command.</td>
</tr>
<tr>
<td>Query Interval</td>
<td>Shows the amount of time in seconds that a Snooping Querier waits before sending out the periodic general query.</td>
</tr>
<tr>
<td>Querier Timeout</td>
<td>Displays the amount of time to wait in the Non-Querier operational state before moving to a Querier state.</td>
</tr>
</tbody>
</table>
When you specify a value for `vlanid`, the following information appears.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Admin Mode</td>
<td>Indicates whether MLD Snooping Querier is active on the VLAN.</td>
</tr>
<tr>
<td>VLAN Operational State</td>
<td>Indicates whether MLD Snooping Querier is in “Querier” or “Non-Querier” state. When the switch is in Querier state, it will send out periodic general queries. When in Non-Querier state, it will wait for moving to Querier state and does not send out any queries.</td>
</tr>
<tr>
<td>Operational Max Response Time</td>
<td>Indicates the time to wait before removing a Leave from a host upon receiving a Leave request. This value is calculated dynamically from the Queries received from the network. If the Snooping Switch is in Querier state, then it is equal to the configured value.</td>
</tr>
<tr>
<td>Querier Election Participate</td>
<td>Indicates whether the MLD Snooping Querier participates in querier election if it discovers the presence of a querier in the VLAN.</td>
</tr>
<tr>
<td>Querier VLAN Address</td>
<td>The IP address will be used in the IPv6 header while sending out MLD queries on this VLAN. It can be configured using the appropriate command.</td>
</tr>
<tr>
<td>Operational Version</td>
<td>This version of IPv6 will be used while sending out MLD queriers on this VLAN.</td>
</tr>
<tr>
<td>Last Querier Address</td>
<td>Indicates the IP address of the most recent Querier from which a Query was received.</td>
</tr>
<tr>
<td>Last Querier Version</td>
<td>Indicates the MLD version of the most recent Querier from which a Query was received on this VLAN.</td>
</tr>
</tbody>
</table>

When the optional argument `detail` is used, the command shows the global information and the information for all Querier-enabled VLANs.

**Port Security Commands**

This section describes the commands you use to configure Port Security on the switch. Port security, which is also known as port MAC locking, allows you to secure the network by locking allowable MAC addresses on a port. Packets with a matching source MAC address are forwarded normally, and all other packets are discarded.

**Note:** To enable the SNMP trap specific to port security, see `snmp-server enable traps violation` on page 686.
**port-security**

This command enables port locking at the system level (Global Config) or port level (Interface Config).

<table>
<thead>
<tr>
<th>Default</th>
<th>disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>port-security</td>
</tr>
</tbody>
</table>
| Mode             | • Global Config  
                  • Interface Config |

**no port-security**

This command disables port locking for one (Interface Config) or all (Global Config) ports.

<table>
<thead>
<tr>
<th>Format</th>
<th>no port-security</th>
</tr>
</thead>
</table>
| Mode             | • Global Config  
                  • Interface Config |

**port-security max-dynamic**

This command sets the maximum number of dynamically locked MAC addresses allowed on a specific port.

<table>
<thead>
<tr>
<th>Default</th>
<th>600</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>port-security max-dynamic &lt;maxvalue&gt;</td>
</tr>
<tr>
<td>Mode</td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**no port-security max-dynamic**

This command resets the maximum number of dynamically locked MAC addresses allowed on a specific port to its default value.

<table>
<thead>
<tr>
<th>Format</th>
<th>no port-security max-dynamic</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**port-security max-static**

This command sets the maximum number of statically locked MAC addresses allowed on a port.

<table>
<thead>
<tr>
<th>Default</th>
<th>20</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>port-security max-static &lt;maxvalue&gt;</td>
</tr>
<tr>
<td>Mode</td>
<td>Interface Config</td>
</tr>
</tbody>
</table>
no port-security max-static

This command sets maximum number of statically locked MAC addresses to the default value.

Format: no port-security max-static

Mode: Interface Config

port-security mac-address

This command adds a MAC address to the list of statically locked MAC addresses. The <vid> is the VLAN ID.

Format: port-security mac-address <mac-address> <vid>

Mode: Interface Config

no port-security mac-address

This command removes a MAC address from the list of statically locked MAC addresses.

Format: no port-security mac-address <mac-address> <vid>

Mode: Interface Config

port-security mac-address move

This command converts dynamically locked MAC addresses to statically locked addresses.

Format: port-security mac-address move

Mode: Interface Config

port-security mac-address sticky

This command enables sticky mode Port MAC Locking on a port. If accompanied by a MAC address and a VLAN id (for interface config mode only), it adds a sticky MAC address to the list of statically locked MAC addresses. These sticky addresses are converted back to dynamically locked addresses if sticky mode is disabled on the port. The <vid> is the VLAN ID. The Global command applies the sticky mode to all valid interfaces (physical and LAG). There is no global sticky mode as such.

Sticky addresses that are dynamically learned will appear in show running config as port-security mac-address sticky <mac> <vid> entries. This distinguishes them from static entries.

Format: port-security mac-address sticky [<mac-address> <vid>]

Modes:
- Global Config
- Interface Config

---

Switching Commands

192
**no port-security mac-address sticky**

The no form removes the sticky mode. The sticky MAC address can be deleted by using the command `no port-security mac-address <mac-address> <vid>`.

**Format**

```
no port-security mac-address sticky [<mac-address> <vid>]
```

**Modes**

- Global Config
- Interface Config

**show port-security**

This command displays the port-security settings. If you do not use a parameter, the command displays the settings for the entire system. Use the optional parameters to display the settings on a specific interface or on all interfaces.

**Format**

```
show port-security [{<unit/slot/port> | all}]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Port Locking mode for the entire system. This field displays if you do not supply any parameters.</td>
</tr>
</tbody>
</table>

For each interface, or for the interface you specify, the following information appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Port Locking mode for the Interface.</td>
</tr>
<tr>
<td>Dynamic Limit</td>
<td>Maximum dynamically allocated MAC Addresses.</td>
</tr>
<tr>
<td>Static Limit</td>
<td>Maximum statically allocated MAC Addresses.</td>
</tr>
<tr>
<td>Violation Trap Mode</td>
<td>Whether violation traps are enabled.</td>
</tr>
</tbody>
</table>

**show port-security dynamic**

This command displays the dynamically locked MAC addresses for the port.

**Format**

```
show port-security dynamic [lag <lag-intf-num> | <unit/slot/port>]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>MAC Address of dynamically locked MAC.</td>
</tr>
</tbody>
</table>
**show port-security static**

This command displays the statically locked MAC addresses for port.

**Format**

`show port-security static [lag <lag-intf-num> | <unit/slot/port>]`

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>MAC Address of statically locked MAC.</td>
</tr>
</tbody>
</table>

**show port-security violation**

This command displays the source MAC address of the last packet discarded on a locked port.

**Format**

`show port-security violation [lag <lag-intf-num> | <unit/slot/port>]`

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>MAC Address of discarded packet on locked port.</td>
</tr>
</tbody>
</table>

**LLDP (802.1AB) Commands**

This section describes the command you use to configure Link Layer Discovery Protocol (LLDP), which is defined in the IEEE 802.1AB specification. LLDP allows stations on an 802 LAN to advertise major capabilities and physical descriptions. The advertisements allow a network management system (NMS) to access and display this information.

**lldp transmit**

Use this command to enable the LLDP advertise capability.

**Default**

enabled

**Format**

`lldp transmit`

**Mode**

Interface Config

**no lldp transmit**

Use this command to return the local data transmission capability to the default.

**Format**

`no lldp transmit`

**Mode**

Interface Config
**lldp receive**

Use this command to enable the LLDP receive capability.

**Default**  
enabled

**Format**  
lldp receive

**Mode**  
Interface Config

**no lldp receive**

Use this command to return the reception of LLDPDUs to the default value.

**Format**  
no lldp receive

**Mode**  
Interface Config

**lldp timers**

Use this command to set the timing parameters for local data transmission on ports enabled for LLDP. The `<interval-seconds>` determines the number of seconds to wait between transmitting local data LLDPDUs. The range is 1-32768 seconds. The `<hold-value>` is the multiplier on the transmit interval that sets the TTL in local data LLDPDUs. The multiplier range is 2-10. The `<reinit-seconds>` is the delay before re-initialization, and the range is 1-0 seconds.

**Default**  
• interval—30 seconds
• hold—4
• reinit—2 seconds

**Format**  
lldp timers [interval <interval-seconds>] [hold <hold-value>] [reinit <reinit-seconds>]

**Mode**  
Global Config

**no lldp timers**

Use this command to return any or all timing parameters for local data transmission on ports enabled for LLDP to the default values.

**Format**  
no lldp timers [interval] [hold] [reinit]

**Mode**  
Global Config

**lldp transmit-tlv**

Use this command to specify which optional type length values (TLVs) in the 802.1AB basic management set are transmitted in the LLDPDUs. Use `sys-name` to transmit the system name TLV. To configure the system name, see `snmp-server` on page 683. Use `sys-desc` to transmit the system description TLV. Use `sys-cap` to transmit the system capabilities TLV.
Use `port-desc` to transmit the port description TLV. To configure the port description, see `description` on page 41.

**Default**
all optional TLVs are included

**Format**
```plaintext
lldp transmit-tlv [sys-desc] [sys-name] [sys-cap] [port-desc]
```

**Mode**
Interface Config

**no lldp transmit-tlv**

Use this command to remove an optional TLV from the LLDPDUs. Use the command without parameters to remove all optional TLVs from the LLDPDU.

**Format**
```plaintext
no lldp transmit-tlv [sys-desc] [sys-name] [sys-cap] [port-desc]
```

**Mode**
Interface Config

**lldp transmit-mgmt**

Use this command to include transmission of the local system management address information in the LLDPDUs.

**Default**
enabled

**Format**
```plaintext
lldp transmit-mgmt
```

**Mode**
Interface Config

**no lldp transmit-mgmt**

Use this command to include transmission of the local system management address information in the LLDPDUs. Use this command to cancel inclusion of the management information in LLDPDUs.

**Format**
```plaintext
no lldp transmit-mgmt
```

**Mode**
Interface Config

**lldp notification**

Use this command to enable remote data change notifications.

**Default**
disabled

**Format**
```plaintext
lldp notification
```

**Mode**
Interface Config
no lldp notification

Use this command to disable notifications.

Default
disabled
Format no lldp notification
Mode Interface Config

lldp notification-interval

Use this command to configure how frequently the system sends remote data change notifications. The <interval> parameter is the number of seconds to wait between sending notifications. The valid interval range is 5-3600 seconds.

Default 5
Format lldp notification-interval <interval>
Mode Global Config

no lldp notification-interval

Use this command to return the notification interval to the default value.

Format no lldp notification-interval
Mode Global Config

clear lldp statistics

Use this command to reset all LLDP statistics, including MED-related information.

Format clear lldp statistics
Mode Privileged Exec

clear lldp remote-data

Use this command to delete all information from the LLDP remote data table, including MED-related information.

Format clear lldp remote-data
Mode Global Config
show lldp

Use this command to display a summary of the current LLDP configuration.

Format: `show lldp`

Mode: Privileged Exec

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmit Interval</td>
<td>How frequently the system transmits local data LLDPDUs, in seconds.</td>
</tr>
<tr>
<td>Transmit Hold Multiplier</td>
<td>The multiplier on the transmit interval that sets the TTL in local data LLDPDUs.</td>
</tr>
<tr>
<td>Re-initialization Delay</td>
<td>The delay before re-initialization, in seconds.</td>
</tr>
<tr>
<td>Notification Interval</td>
<td>How frequently the system sends remote data change notifications, in seconds.</td>
</tr>
</tbody>
</table>

show lldp interface

Use this command to display a summary of the current LLDP configuration for a specific interface or for all interfaces.

Format: `show lldp interface <unit/slot/port> | all`

Mode: Privileged Exec

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface in a unit/slot/port format.</td>
</tr>
<tr>
<td>Link</td>
<td>Shows whether the link is up or down.</td>

<tr>
<td>Transmit</td>
<td>Shows whether the interface transmits LLDPDUs.</td>
</tr>
<tr>
<td>Receive</td>
<td>Shows whether the interface receives LLDPDUs.</td>
</tr>
<tr>
<td>Notify</td>
<td>Shows whether the interface sends remote data change notifications.</td>
</tr>
<tr>
<td>TLVs</td>
<td>Shows whether the interface sends optional TLVs in the LLDPDUs. The TLV codes can be 0 (Port Description), 1 (System Name), 2 (System Description), or 3 (System Capability).</td>
</tr>
<tr>
<td>Mgmt</td>
<td>Shows whether the interface transmits system management address information in the LLDPDUs.</td>
</tr>
</tbody>
</table>
show lldp statistics

Use this command to display the current LLDP traffic and remote table statistics for a specific interface or for all interfaces.

**Format**

```
show lldp statistics <unit/slot/port> | all
```

**Mode**

Privileged Exec

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Update</td>
<td>The amount of time since the last update to the remote table in days, hours, minutes, and seconds.</td>
</tr>
<tr>
<td>Total Inserts</td>
<td>Total number of inserts to the remote data table.</td>
</tr>
<tr>
<td>Total Deletes</td>
<td>Total number of deletes from the remote data table.</td>
</tr>
<tr>
<td>Total Drops</td>

<tr>
<td>TVL802.1</td>
<td>Total number of 802.1 LLDP TLVs received on the local ports.</td>
</tr>
<tr>
<td>TVL802.3</td>
<td>Total number of 802.3 LLDP TLVs received on the local ports.</td>
</tr>
</tbody>
</table>
show lldp remote-device

Use this command to display summary information about remote devices that transmit current LLDP data to the system. You can show information about LLDP remote data received on all ports or on a specific port.

**Format**

```
show lldp remote-device {<unit/slot/port> | all}
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local Interface</td>
<td>The interface that received the LLDPDU from the remote device.</td>
</tr>
<tr>
<td>RemID</td>
<td>An internal identifier to the switch to mark each remote device to the system.</td>
</tr>
<tr>
<td>Chassis ID</td>
<td>The ID that is sent by a remote device as part of the LLDP message, it is usually a MAC address of the device.</td>
</tr>
<tr>
<td>Port ID</td>
<td>The port number that transmitted the LLDPDU.</td>
</tr>
<tr>
<td>System Name</td>
<td>The system name of the remote device.</td>
</tr>
</tbody>
</table>

**Example:** The following shows example CLI display output for the command.

```
(switch) #show lldp remote-device all

LLDP Remote Device Summary

**LLDP-MED Commands**

Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED) (ANSI-TIA-1057) provides an extension to the LLDP standard. Specifically, LLDP-MED provides extensions for network configuration and policy, device location, Power over Ethernet (PoE) management and inventory management.

**lldp med**

Use this command to enable MED. By enabling MED, you will be effectively enabling the transmit and receive function of LLDP.

**Default** enabled

**Format** `lldp med`

**Mode** Interface Config

**no lldp med**

Use this command to disable MED.

**Format** `no lldp med`

**Mode** Interface Config

**lldp med confignotification**

Use this command to configure all the ports to send the topology change notification.

**Default** enabled

**Format** `lldp med confignotification`

**Mode** Interface Config
**no lldp med confignotification**

Use this command to disable notifications.

**Format**

```plaintext
no lldp med confignotification
```

**Mode**

Interface Config

**lldp med transmit-tlv**

Use this command to specify which optional Type Length Values (TLVs) in the LLDP MED set will be transmitted in the Link Layer Discovery Protocol Data Units (LLDPDUs).

**Default**

By default, the capabilities and network policy TLVs are included.

**Format**

```plaintext
lldp med transmit-tlv [capabilities] [ex-pd] [ex-pse] [inventory] [location] [network-policy]
```

**Mode**

Interface Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>capabilities</td>
<td>Transmit the LLDP capabilities TLV.</td>
</tr>
<tr>
<td>ex-pd</td>
<td>Transmit the LLDP extended PD TLV.</td>
</tr>
<tr>
<td>ex-pse</td>
<td>Transmit the LLDP extended PSE TLV.</td>
</tr>
<tr>
<td>inventory</td>
<td>Transmit the LLDP inventory TLV.</td>
</tr>
<tr>
<td>location</td>
<td>Transmit the LLDP location TLV.</td>
</tr>
<tr>
<td>network-policy</td>
<td>Transmit the LLDP network policy TLV.</td>
</tr>
</tbody>
</table>

**Note:** The current implementation supports one network policy: the voice VLAN as defined by the `voice vlan` commands.

**no lldp med transmit-tlv**

Use this command to remove a TLV.

**Format**

```plaintext
no lldp med transmit-tlv [capabilities] [network-policy] [ex-pse] [ex-pd] [location] [inventory]
```

**Mode**

Interface Config
**lldp med all**

Use this command to configure LLDP-MED on all the ports.

Format: `lldp med all`
Mode: Global Config

**no lldp med all**

Use this command to remove LLDP-MD on all ports.

Format: `no lldp med all`
Mode: Global Config

**lldp med confignotification all**

Use this command to configure all the ports to send the topology change notification.

Format: `lldp med confignotification all`
Mode: Global Config

**no lldp med confignotification all**

Use this command to disable all the ports to send the topology change notification.

Format: `no lldp med confignotification all`
Mode: Global Config

**lldp med faststartrepeatcount**

Use this command to set the value of the fast start repeat count. `{count}` is the number of LLDP PDUs that will be transmitted when the product is enabled. The range is 1 to 10.

Default: 3
Format: `lldp med faststartrepeatcount {count}`
Mode: Global Config

**no lldp med faststartrepeatcount**

Use this command to return to the factory default value.

Format: `no lldp med faststartrepeatcount`
Mode: Global Config
ProSafe Managed Switch

**lldp med transmit-tlv all**

Use this command to specify which optional Type Length Values (TLVs) in the LLDP MED set will be transmitted in the Link Layer Discovery Protocol Data Units (LLDPDUs).

**Default**
By default, the capabilities and network policy TLVs are included.

**Format**
```
lldp med transmit-tlv all [capabilities] [ex-pd] [ex-pse] [inventory] [location] [network-policy]
```

**Mode**
Global Config

<table>

Denial of Service Commands
This section describes the commands you use to configure Denial of Service (DoS) Control. The software provides support for classifying and blocking specific types of Denial of Service attacks. You can configure your system to monitor and block these types of attacks:

- **SIP=DIP**: Source IP address = Destination IP address.
- **First Fragment**: TCP Header size smaller than configured value.
- **TCP Fragment**: IP Fragment Offset = 1.
- **TCP Flag**: TCP Flag SYN set and Source Port < 1024 or TCP Control Flags = 0 and TCP Sequence Number = 0 or TCP Flags FIN, URG, and PSH set and TCP Sequence Number = 0 or TCP Flags SYN and FIN set.
- **L4 Port**: Source TCP/UDP Port = Destination TCP/UDP Port.
- **ICMP**: Limiting the size of ICMP Ping packets.
- **SMAC = DMAC**: Source MAC address = Destination MAC address.
- **TCP Port**: Source TCP Port = Destination TCP Port.
- **UDP Port**: Source UDP Port = Destination UDP Port.
- **TCP Flag & Sequence**: TCP Flag SYN set and Source Port < 1024 or TCP Control Flags = 0 and TCP Sequence Number = 0 or TCP Flags FIN, URG, and PSH set and TCP Sequence Number = 0 or TCP Flags SYN and FIN set.
- **TCP Offset**: TCP Header Offset = 1.
- **TCP SYN**: TCP Flag SYN set.
- **TCP SYN & FIN**: TCP Flags SYN and FIN set.
- **TCP FIN & URG & PSH**: TCP Flags FIN and URG and PSH set and TCP Sequence Number = 0.
- **ICMP V6**: Limiting the size of ICMPv6 Ping packets.
- **ICMP Fragment**: Checks for fragmented ICMP packets.

### dos-control all

This command enables Denial of Service protection checks globally.

<table>
<thead>
<tr>
<th>Default</th>
<th>disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>dos-control all</td>
</tr>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

### no dos-control all

This command disables Denial of Service prevention checks globally.

<table>
<thead>
<tr>
<th>Format</th>
<th>no dos-control all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>
**dos-control sipdip**

This command enables Source IP address = Destination IP address (SIP=DIP) Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress with SIP=DIP, the packets will be dropped if the mode is enabled.

- Default: disabled
- Format: dos-control sipdip
- Mode: Global Config

**no dos-control sipdip**

This command disables Source IP address = Destination IP address (SIP=DIP) Denial of Service prevention.

- Format: no dos-control sipdip
- Mode: Global Config

**dos-control firstfrag**

This command enables Minimum TCP Header Size Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having a TCP Header Size smaller than the configured value, the packets will be dropped if the mode is enabled. The default is disabled. If you enable dos-control firstfrag, but do not provide a Minimum TCP Header Size, the system sets that value to 20.

- Default: disabled <20>
- Format: dos-control firstfrag [<0-255>]
- Mode: Global Config

**no dos-control firstfrag**

This command sets Minimum TCP Header Size Denial of Service protection to the default value of disabled.

- Format: no dos-control firstfrag
- Mode: Global Config
**dos-control tcpfrag**

This command enables TCP Fragment Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having IP Fragment Offset equal to one (1), the packets will be dropped if the mode is enabled.

Default: disabled
Format: `dos-control tcpfrag`
Mode: Global Config

**no dos-control tcpfrag**

This command disabled TCP Fragment Denial of Service protection.

Format: `no dos-control tcpfrag`
Mode: Global Config

**dos-control tcpflag**

This command enables TCP Flag Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attacks. If packets ingress having TCP Flag SYN set and a source port less than 1024 or having TCP Control Flags set to 0 and TCP Sequence Number set to 0 or having TCP Flags FIN, URG, and PSH set and TCP Sequence Number set to 0 or having TCP Flags SYN and FIN both set, the packets will be dropped if the mode is enabled.

Default: disabled
Format: `dos-control tcpflag`
Mode: Global Config

**no dos-control tcpflag**

This command sets disables TCP Flag Denial of Service protections.

Format: `no dos-control tcpflag`
Mode: Global Config

**dos-control l4port**

This command enables L4 Port Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having Source TCP/UDP Port Number equal to Destination TCP/UDP Port Number, the packets will be dropped if the mode is enabled.
Note: Some applications mirror source and destination L4 ports - RIP for example uses 520 for both. If you enable dos-control l4port, applications such as RIP may experience packet loss which would render the application inoperable.

Default
disabled
Format
dos-control l4port
Mode
Global Config

no dos-control l4port

This command disables L4 Port Denial of Service protections.

Format
no dos-control l4port
Mode
Global Config

dos-control icmp

This command enables Maximum ICMP Packet Size Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If ICMP Echo Request (PING) packets ingress having a size greater than the configured value, the packets will be dropped if the mode is enabled.

Default
disabled <512>
Format
dos-control icmp [<0-1023>]
Mode
Global Config

no dos-control icmp

This command disables Maximum ICMP Packet Size Denial of Service protections.

Format
no dos-control icmp
Mode
Global Config

dos-control smacdmac

This command enables Source MAC address = Destination MAC address (SMAC=DMAC) Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for
this type of attack. If packets ingress with SMAC=DMAC, the packets will be dropped if the mode is enabled.

Default disabled
Format dos-control smacdmac
Mode Global Config

**no dos-control smacdmac**

This command disables Source MAC address = Destination MAC address (SMAC=DMAC) Denial of Service protection.

Format no dos-control smacdmac
Mode Global Config

**dos-control tcpport**

This command enables TCP L4 source = destination port number (Source TCP Port = Destination TCP Port) Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress with Source TCP Port = Destination TCP Port, the packets will be dropped if the mode is enabled.

Default disabled
Format dos-control tcpport
Mode Global Config

**no dos-control tcpport**

This command disables TCP L4 source = destination port number (Source TCP Port = Destination TCP Port) Denial of Service protection.

Format no dos-control tcpport
Mode Global Config

**dos-control udpport**

This command enables UDP L4 source = destination port number (Source UDP Port = Destination UDP Port) Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress with Source UDP Port = Destination UDP Port, the packets will be dropped if the mode is enabled.

Default disabled
Format dos-control udppport
Mode Global Config
no dos-control udpport

This command disables UDP L4 source = destination port number (Source UDP Port = Destination UDP Port) Denial of Service protection.

Format: no dos-control udpport
Mode: Global Config

dos-control tcpflagseq

This command enables TCP Flag and Sequence Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having TCP Flag SYN set and a source port less than 1024 or having TCP Control Flags set to 0 and TCP Sequence Number set to 0 or having TCP Flags FIN, URG, and PSH set and TCP Sequence Number set to 0 or having TCP Flags SYN and FIN both set, the packets will be dropped if the mode is enabled.

Default: disabled
Format: dos-control tcpflagseq
Mode: Global Config

no dos-control tcpflagseq

This command sets disables TCP Flag and Sequence Denial of Service protection.

Format: no dos-control tcpflagseq
Mode: Global Config

dos-control tcpoffset

This command enables TCP Offset Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having TCP Header Offset equal to one (1), the packets will be dropped if the mode is enabled.

Default: disabled
Format: dos-control tcpoffset
Mode: Global Config

no dos-control tcpoffset

This command disabled TCP Offset Denial of Service protection.

Format: no dos-control tcpoffset
Mode: Global Config
**dos-control tcpsyn**

This command enables TCP SYN and L4 source = 0-1023 Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having TCP flag SYN set and an L4 source port from 0 to 1023, the packets will be dropped if the mode is enabled.

Default: disabled
Format: dos-control tcpsyn
Mode: Global Config

**no dos-control tcpsyn**

This command sets disables TCP SYN and L4 source = 0-1023 Denial of Service protection.

Format: no dos-control tcpsyn
Mode: Global Config

**dos-control tcpsynfin**

This command enables TCP SYN and FIN Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having TCP flags SYN and FIN set, the packets will be dropped if the mode is enabled.

Default: disabled
Format: dos-control tcpsynfin
Mode: Global Config

**no dos-control tcpsynfin**

This command sets disables TCP SYN & FIN Denial of Service protection.

Format: no dos-control tcpsynfin
Mode: Global Config

**dos-control tcpfinurgpsh**

This command enables TCP FIN and URG and PSH and SEQ=0 checking Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having TCP FIN, URG, and PSH all set and TCP Sequence Number set to 0, the packets will be dropped if the mode is enabled.

Default: disabled
Format: dos-control tcpfinurgpsh
Mode: Global Config
no dos-control tcpfinurgpsh

This command sets disables TCP FIN and URG and PSH and SEQ=0 checking Denial of Service protections.

Format:   no dos-control tcpfinurgpsh
Mode:     Global Config

dos-control icmpv4

This command enables Maximum ICMPv4 Packet Size Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If ICMPv4 Echo Request (PING) packets ingress having a size greater than the configured value, the packets will be dropped if the mode is enabled.

Default:  disabled <512>
Format:   dos-control icmpv4 <0-16384>
Mode:     Global Config

no dos-control icmpv4

This command disables Maximum ICMP Packet Size Denial of Service protections.

Format:   no dos-control icmpv4
Mode:     Global Config

dos-control icmpv6

This command enables Maximum ICMPv6 Packet Size Denial of Service protections. If the mode is enabled, Denial of Service prevention is active for this type of attack. If ICMPv6 Echo Request (PING) packets ingress having a size greater than the configured value, the packets will be dropped if the mode is enabled.

Default:  disabled <512>
Format:   dos-control icmpv6 <0-16384>
Mode:     Global Config

no dos-control icmpv6

This command disables Maximum ICMP Packet Size Denial of Service protections.

Format:   no dos-control icmpv6
Mode:     Global Config
**dos-control icmpfrag**

This command enables ICMP Fragment Denial of Service protection. If the mode is enabled, Denial of Service prevention is active for this type of attack. If packets ingress having fragmented ICMP packets, the packets will be dropped if the mode is enabled.

**Default**

disabled

**Format**

docontrol icmpfrag

**Mode**

Global Config

**no dos-control icmpfrag**

This command disabled ICMP Fragment Denial of Service protection.

**Format**

no dos-control icmpfrag

**Mode**

Global Config

**show dos-control**

This command displays Denial of Service configuration information.

**Format**

show dos-control

**Mode**

Privileged EXEC

MAC Database Commands

This section describes the commands you use to configure and view information about the MAC databases.

bridge aging-time

This command configures the forwarding database address aging timeout in seconds. The <seconds> parameter must be within the range of 10 to 1,000,000 seconds.

Default 300
Format bridge aging-time <10-1,000,000>
Mode Global Config

no bridge aging-time

This command sets the forwarding database address aging timeout to the default value.

Format no bridge aging-time
Mode Global Config

<table>

**show forwardingdb agetime**

This command displays the timeout for address aging.

- **Default**: 300s
- **Format**: `show forwardingdb agetime`
- **Mode**: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Aging Timeout</td>
<td>This parameter displays the address aging timeout for the associated forwarding database.</td>
</tr>
</tbody>
</table>

**show mac-address-table multicast**

This command displays the Multicast Forwarding Database (MFDB) information. If you enter the command with no parameter, the entire table is displayed. You can display the table entry for one MAC Address by specifying the MAC address as an optional parameter.

- **Format**: `show mac-address-table multicast <macaddr>`
- **Mode**: EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>A multicast MAC address for which the switch has forwarding and or filtering information. The format is two-digit hexadecimal numbers separated by colons, for example 01:23:45:67:89:AB. In an IVL system the MAC address will be displayed as a MAC address and VLAN ID combination of 8 bytes.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the entry. Static entries are those that are configured by the end user. Dynamic entries are added to the table as a result of a learning process or protocol.</td>
</tr>
<tr>
<td>Component</td>
<td>The component that is responsible for this entry in the Multicast Forwarding Database. Possible values are IGMP Snooping, GMRP, and Static Filtering.</td>
</tr>
<tr>
<td>Description</td>
<td>The text description of this multicast table entry.</td>
</tr>
<tr>
<td>Interfaces</td>
<td>The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:).</td>
</tr>
<tr>
<td>Forwarding Interfaces</td>
<td>The resultant forwarding list is derived from combining all the component’s forwarding interfaces and removing the interfaces that are listed as the static filtering interfaces.</td>
</tr>
</tbody>
</table>

**show mac-address-table stats**

This command displays the Multicast Forwarding Database (MFDB) statistics.

- **Format**: `show mac-address-table stats`
- **Mode**: Privileged EXEC
### ISDP Commands

This section describes the commands you use to configure the industry standard Discovery Protocol (ISDP).

**isdp run**

This command enables ISDP on the switch.

**Default**

Enabled

**Format**

`isdp run`

**Mode**

Global Config

**no isdp run**

This command disables ISDP on the switch.

**Format**

`no isdp run`

**Mode**

Global Config

**isdp holdtime**

This command configures the hold time for ISDP packets that the switch transmits. The hold time specifies how long a receiving device should store information sent in the ISDP packet before discarding it. The range is given in seconds.

**Default**

180 seconds

**Format**

`isdp holdtime <10-255>`

**Mode**

Global Config
**isdp timer**

This command sets the period of time between sending new ISDP packets. The range is given in seconds.

**Default**

30 seconds

**Format**

`isdp timer <5-254>`

**Mode**

Global Config

**isdp advertise-v2**

This command enables the sending of ISDP version 2 packets from the device.

**Default**

Enabled

**Format**

`isdp advertise-v2`

**Mode**

Global Config

**no isdp advertise-v2**

This command disables the sending of ISDP version 2 packets from the device.

**Format**

`no isdp advertise-v2`

**Mode**

Global Config

**isdp enable**

This command enables ISDP on the interface.

**Default**

Enabled

**Format**

`isdp enable`

**Mode**

Interface Config

**no isdp enable**

This command disables ISDP on the interface.

**Format**

`no isdp enable`

**Mode**

Interface Config
### clear isdp counters

This command clears ISDP counters.

**Format**
```
clear isdp counters
```

**Mode**
Privileged EXEC

### clear isdp table

This command clears entries in the ISDP table.

**Format**
```
clear isdp table
```

**Mode**
Privileged EXEC

### show isdp

This command displays global ISDP settings.

**Format**
```
show isdp
```

**Mode**
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>The frequency with which this device sends ISDP packets. This value is given in seconds.</td>

<tr>
<td>- macAddress</td>
<td>indicates that the device uses a Layer 2 MAC address as the format for its Device ID.</td>
</tr>
<tr>
<td>- other</td>
<td>indicates that the device uses its platform-specific format as the format for its Device ID.</td>
</tr>
<tr>
<td>Device ID Format</td>
<td>Indicates the Device ID format of the device.</td>
</tr>
<tr>
<td>- serialNumber</td>
<td>indicates that the value is in the form of an ASCII string containing the device serial number.</td>
</tr>
<tr>
<td>- macAddress</td>
<td>indicates that the value is in the form of a Layer 2 MAC address.</td>
</tr>
<tr>
<td>- other</td>
<td>indicates that the value is in the form of a platform specific ASCII string containing info that identifies the device. For example, ASCII string contains serialNumber appended/prepended with system name.</td>
</tr>
</tbody>
</table>
show isdp interface

This command displays ISDP settings for the specified interface.

Format: 
```
show isdp interface {all | <unit/slot/port>}
```

Mode: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>ISDP mode enabled/disabled status for the interface(s).</td>
</tr>
</tbody>
</table>

show isdp entry

This command displays ISDP entries. If the device id is specified, then only entries for that device are shown.

Format: 
```
show isdp entry {all | deviceid}
```

Mode: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device ID</td>
<td>The device ID associated with the neighbor which advertised the information.</td>
</tr>
<tr>
<td>IP Addresses</td>
<td>The IP address(es) associated with the neighbor.</td>
</tr>
<tr>
<td>Platform</td>
<td>The hardware platform advertised by the neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface (slot/port) on which the neighbor's advertisement was received.</td>
</tr>
<tr>
<td>Port ID</td>
<td>The port ID of the interface from which the neighbor sent the advertisement.</td>
</tr>
<tr>
<td>Hold Time</td>
<td>The hold time advertised by the neighbor.</td>
</tr>
<tr>
<td>Version</td>
<td>The software version that the neighbor is running.</td>
</tr>
<tr>
<td>Advertisement Version</td>
<td>The version of the advertisement packet received from the neighbor.</td>
</tr>
<tr>
<td>Capability</td>
<td>ISDP Functional Capabilities advertised by the neighbor.</td>
</tr>
</tbody>
</table>

show isdp neighbors

This command displays the list of neighboring devices.

Format: 
```
show isdp neighbors [ [<unit/slot/port> | detail] ]
```

Mode: Privileged EXEC
**ProSafe Managed Switch**

### Switching Commands

#### show isdp neighbors detail

Example: The following shows example CLI display output for the command.

```
(Switch) #show isdp neighbors detail

Device ID 0001f45f1bc0
Address(es):
  IP Address: 10.27.7.57
Capability Router Trans Bridge Switch IGMP
Platform SecureStack C2
Interface 0/48
Port ID ge.3.14
Holdtime 131
Advertisement Version 2
Entry last changed time 0 days 00:01:59
Version: 05.00.56
```

**show isdp traffic**

This command displays ISDP statistics.

**Format**  
show isdp traffic

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISDP Packets Received</td>
<td>Total number of ISDP packets received</td>
</tr>
<tr>
<td>ISDP Packets Transmitted</td>
<td>Total number of ISDP packets transmitted</td>
</tr>
<tr>
<td>ISDPv1 Packets Received</td>
<td>Total number of ISDPv1 packets received</td>
</tr>
</tbody>
</table>
### Switching Commands

#### ProSafe Managed Switch

**debug isdp packet**

This command enables tracing of ISDP packets processed by the switch. ISDP must be enabled on both the device and the interface in order to monitor packets for a particular interface.

**Format**

debug isdp packet [{receive | transmit}]

**Mode**

Privileged EXEC

**no debug isdp packet**

This command disables tracing of ISDP packets on the receive or the transmit sides or on both sides.

**Format**

no debug isdp packet [{receive | transmit}]

**Mode**

Privileged EXEC

### Priority-Based Flow Control Commands

Ordinarily, when flow control is enabled on a physical link, it applies to all traffic on the link. When congestion occurs, the hardware sends pause frames that temporarily suspend traffic flow. Pausing traffic helps prevent buffer overflow and dropped frames.

Priority-based flow control provides a way to distinguish which traffic on physical link is paused when congestion occurs, based on the priority of the traffic. An interface can be configured to pause only high priority (i.e., loss-sensitive) traffic when necessary to prevent dropped frames, while allowing traffic that has greater loss tolerance to continue to flow on the interface.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ISDPv1 Packets Transmitted</td>
<td>Total number of ISDPv1 packets transmitted</td>
</tr>
<tr>

<tr>
<td>ISDP Invalid Format</td>
<td>Number of invalid packets received</td>
</tr>
<tr>
<td>ISDP Table Full</td>
<td>Number of times a neighbor entry was not added to the table due to a full database</td>
</tr>
<tr>
<td>ISDP IP Address Table Full</td>
<td>Displays the number of times a neighbor entry was added to the table without an IP address.</td>
</tr>
</tbody>
</table>
Priorities are differentiated by the priority field of the IEEE 802.1Q VLAN header, which identifies an IEEE 802.1p priority value. In NETGEAR Managed Switch, these priority values must be mapped to internal class-of-service (CoS) values.

To enable priority-based flow control for a particular CoS value on an interface:

- Ensure that VLAN tagging is enabled on the interface so that the 802.1p priority values are carried through the network.
- Ensure that 802.1p priority values are mapped to IEEE 802.1Q CoS values.
- Use the datacenter-bridging priority-flow-control mode on command to enable priority-based flow control on the interface.
- Use the datacenter-bridging priority-flow-control priority command to specify the CoS values that should be paused ("no-drop") due to greater loss sensitivity. Unless configured as "no-drop," all CoS priorities are considered nonpausable ("drop") when priority-based flow control is enabled.

When priority-flow-control is disabled, the interface defaults to the IEEE 802.3x flow control setting for the interface. When priority-based flow control is enabled, the interface will not pause any CoS unless there is at least one no-drop priority.

**datacenter-bridging**

Use this command to go into datacenter-bridging mode.

**Format**

datacenter-bridging

**Mode**

Interface Config

**priority-flow-control mode**

Use this command to enable or disable priority-based flow control on an interface.

**Format**
priority-flow-control mode [on | off]

**Mode**

Datacenter-Bridging Config

**Default**

Disabled

**priority-flow-control priority**

Use this command to specify the priority group(s) that should be paused when necessary to prevent dropped frames; i.e., the group to receive priority flow control. This configuration has no effect on interfaces not enabled for priority flow control.

VLAN tagging must be enabled to carry the 802.1p value through the network. The number of lossless priorities supported is 2. Additionally, the mapping of class-of-service levels to 802.1p priority values to must be set to one-to-one.

**Format**
priority-flow-control priority priority-list {drop | no-drop}
show interface priority-flow-control

This command displays a summary of the priority flow control configuration for a specified interface or all interfaces.

<table>

```
This chapter contains the following sections:

- About MVR
- MVR Commands

### About MVR

Internet Group Management Protocol (IGMP) Layer 3 is widely used for IPv4 network multicasting. In Layer 2 networks, IGMP uses resources inefficiently. For example, a Layer 2 switch multicasts traffic to all ports, even if there are receivers connected to only a few ports.

To address this problem, the IGMP Snooping protocol was developed. The problem still appears, though, when receivers are in different VLANs.

MVR is intended to solve the problem of receivers in different VLANs. It uses a dedicated manually configured VLAN, called the multicast VLAN, to forward multicast traffic over a Layer 2 network in conjunction with IGMP snooping.

### MVR Commands

**mvr**

This command enables MVR.

**Format**

```
mvr
```

**Mode**

- Global Config
- Interface Config

**Default**

Disabled
no mvr

This command disables MVR.

**Format**  
no mvr

**Mode**  
Global Config  Interface Config

mvr group

This command adds an MVR membership group. <A.B.C.D> is the IP multicast group being added.

The count is the number of incremental multicast groups being added (the first multicast group is A.B.C.D). If a count is not specified, then only one multicast group is added.

**Format**  
mvr group <A.B.C.D> [count]

**Mode**  
Global Config

no mvr group

This command removes the MVR membership group.

**Format**  
no mvr group <A.B.C.D> [count]

**Mode**  
Global Config

mvr mode

This command changes the MVR mode type. If the mode is set to compatible, then the switch does not learn multicast groups; they need to be configured by the operator as the protocol does not forward joins from the hosts to the router. To operate in this mode, the IGMP router needs to be statically configured to transmit all required multicast streams to the MVR switch. If the mode is set to dynamic, then the switch learns existing multicast groups by snooping the IGMP queries from router on source ports and forwarding the IGMP joins from the hosts to the IGMP router on the multicast VLAN (with appropriate translation of the VLAN ID).

**Format**  
mvr mode { compatible | dynamic }

**Mode**  
Global Config  Default compatible
**no mvr mode**

This command sets the mode type to the default value.

- **Format**: `no mvr mode`
- **Mode**: Global Config

**mvr querytime**

This command sets the MVR query response time.

- **Format**: `mvr querytime<1-100>`
- **Mode**: Global Config
- **Default**: 5

**no mvr querytime**

This command sets the MVR query response time to the default value.

- **Format**: `no mvr querytime`
- **Mode**: Global Config

**mvr vlan**

This command sets the MVR multicast VLAN.

- **Format**: `mvr vlan <1-4094>`
- **Mode**: Global Config
- **Default**: 1

**no mvr vlan**

This command sets the MVR multicast VLAN to the default value.

- **Format**: `no mvr vlan`
- **Mode**: Global Config

**mvr immediate**

This command enables MVR immediate leave mode. MVR has two modes of operating with the IGMP Leave messages: normal leave and immediate leave:

- In normal leave mode, when a leave is received, the general IGMP query is sent from a Layer 2 switch to the receiver port, where the leave was received. Then reports are
received from other interested hosts that are also connected to that port, for example, using hub.

- In immediate leave mode, when a leave is received, the switch is immediately reconfigured not to forward a specific multicast stream to the port where a message is received. This mode is used only for ports where only one client might be connected.

**Format**

```
mvr immediate
```

**Mode**  
Interface Config

**Default**  
Disabled

**no mvr immediate**

This command sets the MVR multicast VLAN to the default value.

**Format**

```
no mvr immediate
```

**Mode**  
Interface Config

**mvr type**

This command sets the MVR port type. When a port is set as source, it is the port to which the multicast traffic flows using the multicast VLAN. When a port is set to receiver, it is the port where a listening host is connected to the switch.

**Format**

```
mvr type { receiver|source }
```

**Mode**  
Interface Config

**Default**  
none

**no mvr type**

Use this command to set the MVR port type to none.

**Format**

```
no mvr type
```

**Mode**  
Interface Config

**mvr vlan group**

Use this command to include the port in the specific MVR group. `<mVLAN>` is the multicast VLAN, and `<A.B.C.D>` is the IP multicast group.

**Format**

```
mvr vlan `<mVLAN>` group `<A.B.C.D>`
```

**Mode**  
Interface Config
**no mvr vlan**

Use this command to exclude the port from the specific MVR group.

**Format**

```
no mvr vlan <mVLAN> group <A.B.C.D>
```

**Mode** Interface Config

**show mvr**

This command displays global MVR settings.

**Format**

```
show mvr
```

**Mode** Privileged EXEC

The following table explains the output parameters.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVR Running</td>
<td>MVR running state. It can be enabled or disabled.</td>
</tr>
<tr>
<td>MVR multicast VLAN</td>
<td>Current MVR multicast VLAN. It can be in the range from 1 to 4094.</td>
</tr>
<tr>
<td>MVR Max Multicast Groups</td>
<td>The maximum number of multicast groups supported by MVR.</td>
</tr>
<tr>
<td>MVR Current multicast groups</td>
<td>The current number of MVR groups allocated.</td>
</tr>
<tr>
<td>MVR Query response time</td>
<td>The current MVR query response time.</td>
</tr>
<tr>
<td>MVR Mode</td>
<td>The current MVR mode. It can be compatible or dynamic.</td>
</tr>
</tbody>
</table>

**Example:**

```
(Switch)#show mvr
MVR Running............................... TRUE
MVR multicast VLAN...................... 1200
MVR Max Multicast Groups.............. 256
MVR Current multicast groups........... 1
MVR Global query response time........ 10 (tenths of sec)
MVR Mode.................................. compatible
```

**show mvr members**

This command displays the MVR membership groups allocated. `<A.B.C.D>` is a valid multicast address in IPv4 dotted notation.

**Format**

```
show mvr members [<A.B.C.D>]
```

**Mode** Privileged EXEC
The following table describes the output parameters.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVR Group IP</td>
<td>MVR group multicast IP address.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of the specific MVR group. It can be active or inactive.</td>
</tr>
<tr>
<td>Members</td>
<td>The list of ports that participates in the specified MVR group.</td>
</tr>
</tbody>
</table>

Example:

```
(switch)#show mvr members
MVR Group IP    Status     Members
------------------  ---------------  ---------------------
224.1.1.1         INACTIVE     1/0/1, 1/0/2, 1/0/3

(switch)#show mvr members 224.1.1.1
MVR Group IP    Status     Members
------------------  ---------------  ---------------------
224.1.1.1         INACTIVE     1/0/1, 1/0/2, 1/0/3
```

**show mvr interface**

This command displays the MVR-enabled interfaces configuration.

**Format**

```
show mvr interface [<interface-id > [members [vlan <vid>]] ]
```

**Mode**

Privileged EXEC

The following table explains the output parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Interface number</td>
</tr>
<tr>
<td>Type</td>
<td>The MVR port type. It can be none, receiver, or source type.</td>
</tr>
</tbody>
</table>
| Status        | The interface status. It consists of two characteristics:
|               |  • active or inactive indicates whether the port is forwarding.            |
|               |  • inVLAN or notInVLAN indicates whether the port is part of any VLAN.     |
| Immediate Leave | The state of immediate mode. It can be enabled or disabled.              |

Example:

```
(switch)#show mvr interface
Port    Type    Status      Immediate Leave
-------- -------------- ----------- -------------------
1/0/9    RECEIVER     ACTIVE/inVLAN    DISABLED
```
(switch)#show mvr interface 1/0/9
Type: RECEIVER Status: ACTIVE   Immediate Leave: DISABLED

(switch)#show mvr interface Fa1/0/23 members
235.0.0.1 STATIC  ACTIVE

(switch)#show mvr interface Fa1/0/23 members vlan 12
235.0.0.1 STATIC  ACTIVE
235.1.1.1 STATIC  ACTIVE

show mvr traffic
This command displays global MVR statistics.

Format       show mvr traffic
Mode         Privileged EXEC

The following table explains the output parameters.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGMP Query Received</td>
<td>Number of received IGMP queries</td>
</tr>
<tr>

IGMP Report V1 Received.................................... 0
IGMP Report V2 Received.................................... 3
IGMP Leave Received........................................ 0
IGMP Query Transmitted.................................... 2
IGMP Report V1 Transmitted........................................ 0
IGMP Report V2 Transmitted...................................... 3
IGMP Leave Transmitted........................................... 1
IGMP Packet Receive Failures.................................... 0
IGMP Packet Transmit Failures................................. 0
Routing Commands

This chapter describes the routing commands available in the 7000 series CLI.

**Note:** Some commands described in this chapter require a license. For more information, see *Licensing and Command Support* on page 8.

This chapter contains the following sections:

- Address Resolution Protocol (ARP) Commands
- IP Routing Commands
- Router Discovery Protocol Commands
- Virtual LAN Routing Commands
- Virtual Router Redundancy Protocol Commands
- DHCP and BOOTP Relay Commands
- IP Helper Commands
- Open Shortest Path First (OSPF) Commands
- OSPF Graceful Restart Commands
- Routing Information Protocol (RIP) Commands
- ICMP Throttling Commands

The commands in this chapter are in three functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
- Clear commands clear some or all of the settings to factory defaults.

**Address Resolution Protocol (ARP) Commands**

This section describes the commands you use to configure ARP and to view ARP information on the switch. ARP associates IP addresses with MAC addresses and stores the information as ARP entries in the ARP cache.
**Routing Commands**

*ProSafe Managed Switch*

**arp**

This command creates an ARP entry. The value for `<ipaddress>` is the IP address of a device on a subnet attached to an existing routing interface. `<macaddr>` is a unicast MAC address for that device.

The format of the MAC address is 6 two-digit hexadecimal numbers that are separated by colons, for example 00:06:29:32:81:40.

**Format**

```
arp <ipaddress> <macaddr>
```

**Mode**

Global Config

**no arp**

This command deletes an ARP entry. The value for `<arpentry>` is the IP address of the interface. The value for `<ipaddress>` is the IP address of a device on a subnet attached to an existing routing interface. `<macaddr>` is a unicast MAC address for that device.

**Format**

```
no arp <ipaddress> <macaddr>
```

**Mode**

Global Config

**ip local-proxy-arp**

This command enables local-proxy-arp on interface or range of interfaces. The switch only responds if all next hops in its route to the destination are through interfaces other than the interface that received the ARP request. Enabling local proxy ARP removes this restriction.

**Default**

disabled

**Format**

```
ip local-proxy-arp
```

**Mode**

Interface Config

**no ip local-proxy-arp**

This command disables local-proxy-arp on the interface or a range of interfaces.

**Format**

```
no ip local-proxy-arp
```

**Mode**

Interface Config

**ip proxy-arp**

This command enables proxy ARP on a router interface. Without proxy ARP, a device only responds to an ARP request if the target IP address is an address configured on the interface where the ARP request arrived. With proxy ARP, the device may also respond if the target IP
address is reachable. The device only responds if all next hops in its route to the destination are through interfaces other than the interface that received the ARP request.

**Default**
- enabled

**Format**
- ip proxy-arp

**Mode**
- Interface Config

**no ip proxy-arp**

This command disables proxy ARP on a router interface.

**Format**
- no ip proxy-arp

**Mode**
- Interface Config

**arp cachesize**

This command configures the ARP cache size. The ARP cache size value is a platform specific integer value. The default size also varies depending on the platform.

**Format**
- arp cachesize <platform specific integer value>

**Mode**
- Global Config

**no arp cachesize**

This command configures the default ARP cache size.

**Format**
- no arp cachesize

**Mode**
- Global Config

**arp dynamicrenew**

This command enables the ARP component to automatically renew dynamic ARP entries when they age out.

**Default**
- enabled

**Format**
- arp dynamicrenew

**Mode**
- Privileged EXEC

**no arp dynamicrenew**

This command prevents dynamic ARP entries from renewing when they age out.

**Format**
- no arp dynamicrenew

**Mode**
- Privileged EXEC
arp purge

This command causes the specified IP address to be removed from the ARP cache. Only entries of type dynamic or gateway are affected by this command.

Format arp purge <ipaddr>
Mode Privileged EXEC

arp resptime

This command configures the ARP request response timeout.

The value for <seconds> is a valid positive integer, which represents the IP ARP entry response timeout time in seconds. The range for <seconds> is between 1-10 seconds.

Default 1
Format arp resptime <1-10>
Mode Global Config

no arp resptime

This command configures the default ARP request response timeout.

Format no arp resptime
Mode Global Config

arp retries

This command configures the ARP count of maximum request for retries.

The value for <retries> is an integer, which represents the maximum number of request for retries. The range for <retries> is an integer between 0-10 retries.

Default 4
Format arp retries <0-10>
Mode Global Config

no arp retries

This command configures the default ARP count of maximum request for retries.

Format no arp retries
Mode Global Config
**arp timeout**

This command configures the ARP entry ageout time.

The value for `<seconds>` is a valid positive integer, which represents the IP ARP entry ageout time in seconds. The range for `<seconds>` is between 15-21600 seconds.

**Default**

1200

**Format**

`arp timeout <15-21600>`

**Mode**

Global Config

**no arp timeout**

This command configures the default ARP entry ageout time.

**Format**

`no arp timeout`

**Mode**

Global Config

**clear arp-cache**

This command causes all ARP entries of type dynamic to be removed from the ARP cache. If the `gateway` keyword is specified, the dynamic entries of type gateway are purged as well.

**Format**

`clear arp-cache [gateway]`

**Mode**

Privileged EXEC

**clear arp-switch**

Use this command to clear the contents of the switch’s Address Resolution Protocol (ARP) table that contains entries learned through the Management port. To observe whether this command is successful, `ping` from the remote system to the DUT. Issue the `show arp switch` command to see the ARP entries. Then issue the `clear arp-switch` command and check the `show arp switch` entries. There will be no more arp entries.

**Format**

`clear arp-switch`

**Mode**

Privileged EXEC

**show arp**

This command displays the Address Resolution Protocol (ARP) cache. The displayed results are not the total ARP entries. To view the total ARP entries, the operator should view the `show arp` results in conjunction with the `show arp switch` results.

**Format**

`show arp`

**Mode**

Privileged EXEC
### Age Time (seconds)
The time it takes for an ARP entry to age out. This is configurable. Age time is measured in seconds.

### Response Time (seconds)
The time it takes for an ARP request timeout. This value is configurable. Response time is measured in seconds.

### Retries
The maximum number of times an ARP request is retried. This value is configurable.

### Cache Size
The maximum number of entries in the ARP table. This value is configurable.

### Dynamic Renew Mode
Displays whether the ARP component automatically attempts to renew dynamic ARP entries when they age out.

### Total Entry Count Current / Peak
The total entries in the ARP table and the peak entry count in the ARP table.

### Static Entry Count Configured/Active / Max
The static entry count in the ARP table, the active entry count in the ARP table, the active entry count in the ARP table, and maximum static entry count in the ARP table.

The following are displayed for each ARP entry:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>The IP address of a device on a subnet attached to an existing routing interface.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The hardware MAC address of that device.</td>
</tr>
<tr>
<td>Interface</td>
<td>The routing unit/slot/port associated with the device ARP entry.</td>
</tr>
<tr>
<td>Type</td>
<td>The type that is configurable. The possible values are Local, Gateway, Dynamic and Static.</td>
</tr>
<tr>
<td>Age</td>
<td>The current age of the ARP entry since last refresh (in hh:mm:ss format)</td>
</tr>
</tbody>
</table>

**show arp brief**

This command displays the brief Address Resolution Protocol (ARP) table information.

**Format**

```
show arp brief
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age Time (seconds)</td>
<td>The time it takes for an ARP entry to age out. This value is configurable. Age time is measured in seconds.</td>
</tr>
<tr>
<td>Response Time (seconds)</td>
<td>The time it takes for an ARP request timeout. This value is configurable. Response time is measured in seconds.</td>
</tr>
<tr>
<td>Retries</td>
<td>The maximum number of times an ARP request is retried. This value is configurable.</td>
</tr>
<tr>
<td>Cache Size</td>
<td>The maximum number of entries in the ARP table. This value is configurable.</td>
</tr>
</tbody>
</table>

Routing Commands

Routing Commands

ProSafe Managed Switch

show arp switch

This command displays the contents of the switch’s Address Resolution Protocol (ARP) table.

Format: show arp switch
Mode: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic Renew Mode</td>
<td>Displays whether the ARP component automatically attempts to renew dynamic ARP entries when they age out.</td>
</tr>
<tr>
<td>Total Entry Count Current / Peak</td>
<td>The total entries in the ARP table and the peak entry count in the ARP table.</td>
</tr>
<tr>
<td>Static Entry Count Current / Max</td>
<td>The static entry count in the ARP table and maximum static entry count in the ARP table.</td>
</tr>
</tbody>
</table>

IP Routing Commands

This section describes the commands you use to enable and configure IP routing on the switch.

routing

This command enables IPv4 and IPv6 routing for an interface. You can view the current value for this function with the show ip brief command. The value is labeled as “Routing Mode.”

Default: disabled
Format: routing
Mode: Interface Config

no routing

This command disables routing for an interface.
You can view the current value for this function with the `show ip brief` command. The value is labeled as “Routing Mode.”

**Format**
```
no routing
```
**Mode**
```
Interface Config
```

**ip routing**

This command enables the IP Router Admin Mode for the master switch.

**Format**
```
ip routing
```
**Mode**
```
Global Config
```

**no ip routing**

This command disables the IP Router Admin Mode for the master switch.

**Format**
```
no ip routing
```
**Mode**
```
Global Config
```

**ip address**

This command configures an IP address on an interface. You can also use this command to configure one or more secondary IP addresses on the interface. The value for `<ipaddr>` is the IP address of the interface. The value for `<subnetmask>` is a 4-digit dotted-decimal number which represents the subnet mask of the interface. The subnet mask must have contiguous ones and be no longer than 30 bits, for example 255.255.255.0. This command adds the label IP address in `show ip interface`.

**Format**
```
ip address <ipaddr> <subnetmask> [secondary]
```
**Mode**
```
Interface Config
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>The IP address of the interface.</td>
</tr>
<tr>
<td>subnetmask</td>
<td>A four-digit dotted-decimal number that represents the subnet mask of the interface</td>
</tr>
<tr>
<td>masklen</td>
<td>Implements RFC 3021. Using the / notation of the subnet mask, this is an integer that indicates the length of the subnet mask. Range is 5 to 32 bits.</td>
</tr>
</tbody>
</table>

**no ip address**

This command deletes an IP address from an interface. The value for `<ipaddr>` is the IP address of the interface in a.b.c.d format where the range for a, b, c, and d is 1-255. The value for `<subnetmask>` is a 4-digit dotted-decimal number which represents the Subnet
Mask of the interface. To remove all of the IP addresses (primary and secondary) configured on the interface, enter the command `no ip address`.

Format:  
```
no ip address [{<ipaddr> <subnetmask> [secondary]}]
```

Mode:  

Interface Config

**ip address dhcp**

Use this command to enable the DHCPv4 client on an in-band interface so that it can acquire network information, such as the IP address, subnet mask, and default gateway from a network DHCP server. When DHCP is enabled on the interface, the system automatically deletes all manually configured IPv4 addresses on the interface.

Default: disabled

Format:  
```
ip address dhcp
```

Mode:  

Interface Config

**no ip address dhcp**

Use this command to release a leased address and disable DHCPv4 on an interface.

Format:  
```
no ip address dhcp
```

Mode:  

Interface Config

**ip default-gateway**

Use this command to manually configure a default gateway for the switch. Only one default gateway can be configured. If you use this command multiple times, each command replaces the previous value.

Format:  
```
ip default-gateway <ipaddr>
```

Mode:  

Global Config

**no ip default-gateway**

Use this command to remove the default gateway address from the configuration.

Format:  
```
no ip default-gateway <ipaddr>
```

Mode:  

Interface Config
**release dhcp**

Use this command to force the DHCPv4 client to release the leased address from the specified interface.

**Format**

```
release dhcp <unit/slot/port>
```

**Mode**

Privileged EXEC

**renew dhcp**

Use this command to force the DHCPv4 client to immediately renew an IPv4 address lease on the specified interface.

**Format**

```
renew dhcp {<unit/slot/port>|network-port}
```

**Mode**

Privileged EXEC

---

**Note:** This command can be used on in-band ports as well as network (out-of-band) port.

---

**show dhcp lease**

Use this command to display a list of IPv4 addresses currently leased from a DHCP server on a specific in-band interface or all in-band interfaces. This command does not apply to service or network ports.

**Format**

```
show dhcp lease [interface <unit/slot/port>]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address, Subnet mask</td>
<td>The IP address and network mask leased from the DHCP server.</td>
</tr>
<tr>
<td>DHCP Lease server</td>
<td>The IPv4 address of the DHCP server that leased the address.</td>
</tr>
<tr>
<td>State</td>
<td>State of the DHCPv4 Client on this interface.</td>
</tr>
<tr>
<td>DHCP transaction ID</td>
<td>The transaction ID of the DHCPv4 Client.</td>
</tr>
<tr>
<td>Lease</td>
<td>The time (in seconds) that the IP address was leased by the server.</td>
</tr>
<tr>
<td>Renewal</td>
<td>The time (in seconds) when the next DHCP renew Request is sent by DHCPv4 Client to renew the leased IP address.</td>
</tr>
<tr>
<td>Rebind</td>
<td>The time (in seconds) when the DHCP Rebind process starts.</td>
</tr>
<tr>
<td>Retry count</td>
<td>Number of times the DHCPv4 client sends a DHCP REQUEST message before the server responds.</td>
</tr>
</tbody>
</table>
ip route

This command configures a static route. The <ipaddr> parameter is a valid IP address, and <subnetmask> is a valid subnet mask. The <nexthopip> parameter is a valid IP address of the next hop router. Specifying Null0 as nexthop parameter adds a static reject route. The optional <preference> parameter is an integer (value from 1 to 255) that allows you to specify the preference value (sometimes called “administrative distance”) of an individual static route. Among routes to the same destination, the route with the lowest preference value is the route entered into the forwarding database. By specifying the preference of a static route, you control whether a static route is more or less preferred than routes from dynamic routing protocols. The preference also controls whether a static route is more or less preferred than other static routes to the same destination. A route with a preference of 255 cannot be used to forward traffic.

For the static routes to be visible, you must perform the following steps:

- Enable ip routing globally.
- Enable ip routing for the interface.
- Confirm that the associated link is also up.

Default: preference=1

Format: ip route <ipaddr> <subnetmask> [〈nexthopip> | Null0] [〈preference>]

Mode: Global Config

no ip route

This command deletes a single next hop to a destination static route. If you use the <nexthopip> parameter, the next hop is deleted. If you use the <preference> value, the preference value of the static route is reset to its default.

Format: no ip route <ipaddr> <subnetmask> [〈nexthopip> [〈preference>]] | Null0]

Mode: Global Config

ip route default

This command configures the default route. The value for <nexthopip> is a valid IP address of the next hop router. The <preference> is an integer value from 1 to 255. A route with a preference of 255 cannot be used to forward traffic.

Default: preference=1

Format: ip route default <nexthopip> [〈preference>]

Mode: Global Config
no ip route default

This command deletes all configured default routes. If the optional `<nexthopip>` parameter is designated, the specific next hop is deleted from the configured default route and if the optional preference value is designated, the preference of the configured default route is reset to its default.

Format: `no ip route default [{<nexthopip> | <preference>}]`
Mode: Global Config

ip route distance

This command sets the default distance (preference) for static routes. Lower route distance values are preferred when determining the best route. The `ip route` and `ip route default` commands allow you to optionally set the distance (preference) of an individual static route. The default distance is used when no distance is specified in these commands. Changing the default distance does not update the distance of existing static routes, even if they were assigned the original default distance. The new default distance will only be applied to static routes created after invoking the `ip route distance` command.

Default: 1
Format: `ip route distance <1-255>`
Mode: Global Config

no ip route distance

This command sets the default static route preference value in the router. Lower route preference values are preferred when determining the best route.

Format: `no ip route distance`
Mode: Global Config

ip netdirbcast

This command enables the forwarding of network-directed broadcasts. When enabled, network directed broadcasts are forwarded. When disabled they are dropped.

Default: disabled
Format: `ip netdirbcast`
Mode: Interface Config
no ip netdirbcast

This command disables the forwarding of network-directed broadcasts. When disabled, network directed broadcasts are dropped.

Format: no ip netdirbcast
Mode: Interface Config

ip mtu

This command sets the IP Maximum Transmission Unit (MTU) on a routing interface. The IP MTU is the size of the largest IP packet that can be transmitted on the interface without fragmentation. The software currently does not fragment IP packets.

- Packets forwarded in hardware ignore the IP MTU.
- Packets forwarded in software are dropped if they exceed the IP MTU of the outgoing interface.

Packets originated on the router, such as OSPF packets, may be fragmented by the IP stack. The IP stack uses its default IP MTU and ignores the value set using the ip mtu command.

OSPF advertises the IP MTU in the Database Description packets it sends to its neighbors during database exchange. If two OSPF neighbors advertise different IP MTUs, they will not form an adjacency. (unless OSPF has been instructed to ignore differences in IP MTU with the ip ospf mtu-ignore command.)

---

**Note:** The IP MTU size refers to the maximum size of the IP packet (IP Header + IP payload). It does not include any extra bytes that may be required for Layer-2 headers. To receive and process packets, the Ethernet MTU (see mtu on page 41) must take into account the size of the Ethernet header.

Default: 1500 bytes
Format: ip mtu <68-9198>
Mode: Interface Config

no ip mtu

This command resets the ip mtu to the default value.

Format: no ip mtu <mtu>
Mode: Interface Config
**encapsulation**

This command configures the link layer encapsulation type for the packet. The encapsulation type can be **ethernet** or **snap**.

- **Default**: ethernet
- **Format**: `encapsulation {ethernet | snap}`
- **Mode**: Interface Config

**Note:** Routed frames are always ethernet encapsulated when a frame is routed to a VLAN.

**clear ip route all**

This command removes all the route entries learned over the network.

- **Format**: `clear ip route all`
- **Mode**: Privileged EXEC
- **Protocol**: Tells which protocol added the specified route. The possibilities are: local, static, OSPF, or RIP.
- **Total Number of Routes**: The total number of routes.

**clear ip route counters**

This command resets to zero the IPv4 routing table counters reported in `show ip route summary`. The command resets only the event counters. Counters that report the current state of the routing table, such as the number of routes of each type, are not reset.

- **Format**: `clear ip route counters`
- **Mode**: Privileged EXEC

**show ip brief**

This command displays all the summary information of the IP, including the ICMP rate limit configuration and the global ICMP Redirect configuration.

- **Format**: `show ip brief`
- **Modes**: Privileged EXEC, User EXEC
Routing Commands

ProSafe Managed Switch

The following shows example CLI display output for the command.

(Switch) #show ip brief

Default Time to Live........................... 64
Routing Mode................................... Disabled
Maximum Next Hops.............................. 4
Maximum Routes................................. 6000
ICMP Rate Limit Interval....................... 1000 msec
ICMP Rate Limit Burst Size..................... 100 messages
ICMP Echo Replies.............................. Enabled
ICMP Redirects................................. Enabled

The following shows example CLI display output for the command.

(Switch) #show ip brief

Default Time to Live........................... 64
Routing Mode................................... Disabled
Maximum Next Hops.............................. 4
Maximum Routes................................. 6000
ICMP Rate Limit Interval....................... 1000 msec
ICMP Rate Limit Burst Size..................... 100 messages
ICMP Echo Replies.............................. Enabled
ICMP Redirects................................. Enabled

show ip interface

This command displays all pertinent information about the IP interface.

Format
show ip interface {<unit/slot/port>|vlan <1-4093>|loopback <0-7>}

Modes
• Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

</tbody>
</table>
### show ip route

This command displays the routing table. The `<ip-address>` specifies the network for which the route is to be displayed and displays the best matching best-route for the address. The `<mask>` specifies the subnet mask for the given `<ip-address>`. When you use the `longer-prefixes` keyword, the `<ip-address>` and `<mask>` pair becomes the prefix, and the command displays the routes to the addresses that match that prefix. Use the `<protocol>` parameter to specify the protocol that installed the routes. The value for `<protocol>` can be `connected`, `ospf`, `rip`, or `static`. Use the `all` parameter to display all routes including best and non-best routes. If you do not use the `all` parameter, the command only displays the best route.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always</td>
<td>Whether default advertisement depends on having a default route in the common routing table.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric configured to be advertised with the default route.</td>
</tr>
<tr>
<td>Metric Type</td>
<td>The metric type for the default route.</td>
</tr>
<tr>
<td>Redist Source</td>
<td>A type of routes that OSPF is redistributing.</td>
</tr>
<tr>
<td>Metric</td>
<td>The metric to advertise for redistributed routes of this type.</td>
</tr>
<tr>
<td>Metric Type</td>
<td>The metric type to advertise for redistributed routes of this type.</td>
</tr>
<tr>
<td>Subnets</td>
<td>Whether OSPF redistributes subnets of classful addresses, or only classful prefixes.</td>
</tr>
<tr>
<td>Dist List</td>
<td>A distribute list used to filter routes of this type. Only routes that pass the distribute list are redistributed.</td>
</tr>
<tr>
<td>Number of Active Areas</td>
<td>The number of OSPF areas with at least one interface running on this router. Also broken down by area type.</td>
</tr>
<tr>
<td>ABR Status</td>
<td>Whether the router is currently an area border router. A router is an area border router if it has interfaces that are up in more than one area.</td>
</tr>
<tr>
<td>ASBR Status</td>
<td>Whether the router is an autonomous system boundary router. The router is an ASBR if it is redistributing any routes or originating a default route.</td>
</tr>
<tr>
<td>RIP</td>
<td></td>
</tr>
<tr>
<td>Split Horizon Mode</td>
<td>Whether RIP advertises routes on the interface where they were received.</td>
</tr>
<tr>
<td>Default Metric</td>
<td>The metric assigned to redistributed routes.</td>
</tr>
<tr>
<td>Default Route Advertise</td>
<td>Whether this router is originating a default route.</td>
</tr>
<tr>
<td>Distance</td>
<td>The administrative distance for RIP routes.</td>
</tr>
<tr>
<td>Redistribution</td>
<td>A table showing information for each source protocol (connected, static, bgp, and ospf). For each of these source the distribution list and metric are shown. Fields which are not configured are left blank. For ospf, configured ospf match parameters are also shown.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interfaces where RIP is enabled and the version sent and accepted on each interface.</td>
</tr>
</tbody>
</table>

---

Routing Commands

257
A “T” flag appended to a route indicates that it is an ECMP route, but only one of its next hops has been installed in the forwarding table. The forwarding table might limit the number of ECMP routes or the number of ECMP groups. When an ECMP route cannot be installed because such a limit is reached, the route is installed with a single next hop. Such truncated routes can be identified by a “T” after the interface name.

**Note:** If you use the connected keyword for `<protocol>`, the all option is not available because there are no best or non-best connected routes.

**Format**

```
show ip route [{<ip-address> [<protocol>] | {<ip-address> <mask> [longer-prefixes] [<protocol>] | <protocol>} [all] | all}]
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route Codes</td>
<td>The key for the routing protocol codes that might appear in the routing table output.</td>
</tr>
</tbody>
</table>

The `show ip route` command displays the routing tables in the following format:

```
Code   IP-Address/Mask [Preference/Metric] via Next-Hop, Route-Timestamp, Interface
```

The columns for the routing table display the following information:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The codes for the routing protocols that created the routes.</td>
</tr>
<tr>
<td>IP-Address/Mask</td>
<td>The IP-Address and mask of the destination network corresponding to this route.</td>
</tr>
<tr>
<td>Preference</td>
<td>The administrative distance associated with this route. Routes with low values are preferred over routes with higher values.</td>
</tr>
<tr>
<td>Metric</td>
<td>The cost associated with this route.</td>
</tr>
<tr>
<td>via Next-Hop</td>
<td>The outgoing router IP address to use when forwarding traffic to the next router (if any) in the path toward the destination.</td>
</tr>
</tbody>
</table>
| Route-Timestamp | The last updated time for dynamic routes. The format of Route-Timestamp will be  
  • Days:Hours:Minutes if days > 1  
  • Hours:Minutes:Seconds if days < 1  |
| Interface       | The outgoing router interface to use when forwarding traffic to the next destination. For reject routes, the next hop interface would be Null0 interface. |

To administratively control the traffic destined to a particular network and prevent it from being forwarded through the router, you can configure a static reject route on the router. Such traffic would be discarded and the ICMP destination unreachable message is sent back to the
source. This is typically used for preventing routing loops. The reject route added in the RTO is of the type OSPF Inter-Area. Reject routes (routes of REJECT type installed by any protocol) are not redistributed by OSPF/RIP. Reject routes are supported in both OSPFv2 and OSPFv3.

The following shows example CLI display output for the command.

(Switch) #show ip route

Route Codes: R - RIP Derived, O - OSPF Derived, C - Connected, S - Static
B - BGP Derived, IA - OSPF Inter Area
E1 - OSPF External Type 1, E2 - OSPF External Type 2
N1 - OSPF NSSA External Type 1, N2 - OSPF NSSA External Type 2

C 1.1.1.0/24 [0/1] directly connected, 0/11
C 2.2.2.0/24 [0/1] directly connected, 0/1
C 5.5.5.0/24 [0/1] directly connected, 0/5
S 7.0.0.0/8 [1/0] directly connected, Null0
OIA 10.10.10.0/24 [110/6] via 5.5.5.2, 00h:00m:01s, 0/5
C 11.11.11.0/24 [0/1] directly connected, 0/11
S 12.0.0.0/8 [5/0] directly connected, Null0
S 23.0.0.0/8 [3/0] directly connected, Null0

**show ip route ecmp-groups**

This command reports all current ECMP groups in the IPv4 routing table. An ECMP group is a set of two or more next hops used in one or more routes. The groups are numbered arbitrarily from 1 to $n$. The output indicates the number of next hops in the group and the number of routes that use the set of next hops. The output lists the IPv4 address and outgoing interface of each next hop in each group.

**Format**

show ip route ecmp-groups

**Mode**

Privileged EXEC

**Example**

(switch) #show ip route ecmp-groups

ECMP Group 1 with 2 next hops (used by 1 route)
172.20.33.100 on interface 2/33
172.20.34.100 on interface 2/34

ECMP Group 2 with 3 next hops (used by 1 route)
172.20.32.100 on interface 2/32
172.20.33.100 on interface 2/33
172.20.34.100 on interface 2/34

ECMP Group 3 with 4 next hops (used by 1 route)
172.20.31.100 on interface 2/31
172.20.32.100 on interface 2/32
172.20.33.100 on interface 2/33
172.20.34.100 on interface 2/34
**show ip route summary**

Use this command to display the routing table summary. Use the optional `all` parameter to show the number of all routes, including best and non-best routes. To include only the number of best routes, do not use the optional parameter.

When the optional keyword `all` is given, some statistics, such as the number of routes from each source, include counts for alternate routes. An alternate route is a route that is not the most preferred route to its destination and therefore is not installed in the forwarding table. When this keyword is not given, the output reports only for the best routes.

**Format**  
`show ip route summary [all]`

**Modes**  
- Privileged EXEC
- User EXEC

</tbody>
</table>

**show ip stats**

This command displays IP statistical information. Refer to RFC 1213 for more information about the fields that are displayed.

**Format**

```
show ip stats
```

**Modes**

- Privileged EXEC
- User EXEC

**show routing heap summary**

This command displays a summary of the memory allocation from the routing heap. The routing heap is a chunk of memory set aside when the system boots for use by the routing applications.

**Format**

```
show routing heap summary
```

**Mode**

Privileged EXEC
Routing Commands

ProSafe Managed Switch

### Routing Commands

The following shows example CLI display output for the command.

```
(netgear switch) #show routing heap summary
Heap Size....................... 92594000 bytes
Memory In Use................... 149598 bytes (0%)
Memory on Free List............. 78721 bytes (0%)
Memory Available in Heap........ 92365249 bytes (99%)
In Use High Water Mark.......... 210788 bytes (0%)
```

### Router Discovery Protocol Commands

This section describes the commands you use to view and configure Router Discovery Protocol settings on the switch. The Router Discovery Protocol enables a host to discover the IP address of routers on the subnet.

#### ip irdp

This command enables Router Discovery on an interface.

- **Default**
  - disabled
- **Format**
  - ip irdp
- **Mode**
  - Interface Config

#### no ip irdp

This command disables Router Discovery on an interface.

- **Format**
  - no ip irdp
- **Mode**
  - Interface Config

---

### Examples

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heap Size</td>
<td>The amount of memory, in bytes, allocated at startup for the routing heap.</td>
</tr>
<tr>
<td>Memory In Use</td>
<td>The number of bytes currently allocated.</td>
</tr>
<tr>
<td>Memory on Free List</td>
<td>The number of bytes currently on the free list. When a chunk of memory from</td>
</tr>
<tr>
<td></td>
<td>the routing heap is freed, it is placed on a free list for future reuse.</td>
</tr>
<tr>
<td>Memory Available in Heap</td>
<td>The number of bytes in the original heap that have never been allocated.</td>
</tr>
<tr>
<td>In Use High Water Mark</td>
<td>The maximum memory in use since the system last rebooted.</td>
</tr>
</tbody>
</table>
**ip irdp multicast**

This command configures the address that the interface uses to send the router discovery advertisements. The address is 224.0.0.1, which is the all-hosts IP multicast address.

**Default**

224.0.0.1

**Format**

ip irdp multicast

**Mode**

Interface Config

**no ip irdp multicast**

This command configures the address used to advertise the router to the Broadcast address (255.255.255.155).

**Format**

no ip irdp multicast

**Mode**

Interface Config

**ip irdp holdtime**

This command configures the value, in seconds, of the holdtime field of the router advertisement sent from this interface. The holdtime range is the value of `<maxadvertinterval>` to 9000 seconds.

**Default**

3 * maxinterval

**Format**

ip irdp holdtime `<maxadvertinterval>-9000`

**Mode**

Interface Config

**no ip irdp holdtime**

This command configures the default value, in seconds, of the holdtime field of the router advertisement sent from this interface.

**Format**

no ip irdp holdtime

**Mode**

Interface Config

**ip irdp maxadvertinterval**

This command configures the maximum time, in seconds, allowed between sending router advertisements from the interface. The range for maxadvertinterval is 4 to 1800 seconds.

**Default**

600

**Format**

ip irdp maxadvertinterval `<4-1800>`

**Mode**

Interface Config
**no ip irdp maxadvertinterval**

This command configures the default maximum time, in seconds.

**Format**
```
no ip irdp maxadvertinterval
```

**Mode**
```
Interface Config
```

**ip irdp minadvertinterval**

This command configures the minimum time, in seconds, allowed between sending router advertisements from the interface. The range for minadvertinterval is three to the value of maxadvertinterval.

**Default**
```
0.75 * maxadvertinterval
```

**Format**
```
ip irdp minadvertinterval <3-maxadvertinterval>
```

**Mode**
```
Interface Config
```

**no ip irdp minadvertinterval**

This command sets the default minimum time to the default.

**Format**
```
no ip irdp minadvertinterval
```

**Mode**
```
Interface Config
```

**ip irdp preference**

This command configures the preferability of the address as a default router address, relative to other router addresses on the same subnet.

**Default**
```
0
```

**Format**
```
ip irdp preference <-2147483648 to 2147483647>
```

**Mode**
```
Interface Config
```

**no ip irdp preference**

This command configures the default preferability of the address as a default router address, relative to other router addresses on the same subnet.

**Format**
```
no ip irdp preference
```

**Mode**
```
Interface Config
```
**show ip irdp**

This command displays the router discovery information for all interfaces, or a specified interface.

**Format**

```
show ip irdp {<unit/slot/port> | all}
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The <code>&lt;unit/slot/port&gt;</code> that matches the rest of the information in the row.</td>
</tr>
<tr>
<td>Ad Mode</td>
<td>The advertise mode, which indicates whether router discovery is enabled or disabled on this interface.</td>
</tr>
<tr>
<td>Advertise Address</td>
<td>The IP address to which the interface sends the advertisement.</td>
</tr>
<tr>
<td>Max Int</td>
<td>The maximum advertise interval, which is the maximum time, in seconds, allowed between sending router advertisements from the interface.</td>
</tr>
<tr>
<td>Min Int</td>
<td>The minimum advertise interval, which is the minimum time, in seconds, allowed between sending router advertisements from the interface.</td>
</tr>
<tr>
<td>Hold Time</td>
<td>The amount of time, in seconds, that a system should keep the router advertisement before discarding it.</td>
</tr>
<tr>
<td>Preference</td>
<td>The preference of the address as a default router address, relative to other router addresses on the same subnet.</td>

</tbody>
</table>

**Virtual LAN Routing Commands**

This section describes the commands you use to view and configure VLAN routing and to view VLAN routing status information.

**vlan routing**

This command enables routing on a VLAN. The vlanid value has a range from 1 to 4093. The [interface ID] value has a range from 1 to 128. Typically, you will not supply the interface ID argument, and the system automatically selects the interface ID. However, if you specify an interface ID that is already in use, the CLI displays an error message and does not create the VLAN interface.

**Format**

```
vlan routing <vlanid> [interface ID]
```

**Mode**

VLAN Config
no vlan routing

This command deletes routing on a VLAN. The <vlanid> value has a range from 1 to 4093.

Format
no vlan routing <vlanid>

Mode
VLAN Config

show ip vlan

This command displays the VLAN routing information for all VLANs with routing enabled.

Format
show ip vlan

Modes
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address used by</td>
<td>The MAC Address associated with the internal bridge-router interface (IBRI). The same</td>

</table>

Virtual Router Redundancy Protocol Commands

This section describes the commands you use to view and configure Virtual Router Redundancy Protocol (VRRP) and to view VRRP status information. VRRP helps provide failover and load balancing when you configure two devices as a VRRP pair.

ip vrrp (Global Config)

Use this command in Global Config mode to enable the administrative mode of VRRP on the router.

Default
none

Format
ip vrrp

Mode
Global Config
**no ip vrrp**

Use this command in Global Config mode to disable the default administrative mode of VRRP on the router.

**Format**

no ip vrrp  

**Mode**

Global Config

**ip vrrp (Interface Config)**

Use this command in Interface Config mode to create a virtual router associated with the interface. The parameter `<vrid>` is the virtual router ID, which has an integer value range from 1 to 255.

**Format**

ip vrrp <vrid>

**Mode**

Interface Config

**no ip vrrp**

Use this command in Interface Config mode to delete the virtual router associated with the interface. The virtual Router ID, `<vrid>`, is an integer value that ranges from 1 to 255.

**Format**

no ip vrrp <vrid>

**Mode**

Interface Config

**ip vrrp mode**

This command enables the virtual router configured on the specified interface. Enabling the status field starts a virtual router. The parameter `<vrid>` is the virtual router ID which has an integer value ranging from 1 to 255.

**Default**

disabled

**Format**

ip vrrp <vrid> mode

**Mode**

Interface Config

**no ip vrrp mode**

This command disables the virtual router configured on the specified interface. Disabling the status field stops a virtual router.

**Format**

no ip vrrp <vrid> mode

**Mode**

Interface Config
**ip vrrp ip**

This command sets the virtual router IP address value for an interface. The value for `<ipaddr>` is the IP address which is to be configured on that interface for VRRP. The parameter `<vrid>` is the virtual router ID which has an integer value range from 1 to 255. You can use the optional `[secondary]` parameter to designate the IP address as a secondary IP address.

**Default**  
none

**Format**  
```
ip vrrp <vrid> ip <ipaddr> [secondary]
```

**Mode**  
Interface Config

**no ip vrrp ip**

Use this command in Interface Config mode to delete a secondary IP address value from the interface. To delete the primary IP address, you must delete the virtual router on the interface.

**Format**  
```
nop ip vrrp <vrid> <ipaddress> secondary
```

**Mode**  
Interface Config

**ip vrrp authentication**

This command sets the authorization details value for the virtual router configured on a specified interface. The parameter `{none | simple}` specifies the authorization type for virtual router configured on the specified interface. The parameter `[key]` is optional, it is only required when authorization type is simple text password. The parameter `<vrid>` is the virtual router ID which has an integer value ranges from 1 to 255.

**Default**  
no authorization

**Format**  
```
ip vrrp <vrid> authentication {none | simple <key>}
```

**Mode**  
Interface Config

**no ip vrrp authentication**

This command sets the default authorization details value for the virtual router configured on a specified interface.

**Format**  
```
nop ip vrrp <vrid> authentication
```

**Mode**  
Interface Config
**ip vrrp preempt**

This command sets the preemption mode value for the virtual router configured on a specified interface. The parameter `<vrid>` is the virtual router ID, which is an integer from 1 to 255.

- **Default**: enabled
- **Format**: `ip vrrp <vrid> preempt`
- **Mode**: Interface Config

**no ip vrrp preempt**

This command sets the default preemption mode value for the virtual router configured on a specified interface.

- **Format**: `no ip vrrp <vrid> preempt`
- **Mode**: Interface Config

**ip vrrp priority**

This command sets the priority of a router within a VRRP group. Higher values equal higher priority. The range is from 1 to 254. The parameter `<vrid>` is the virtual router ID, whose range is from 1 to 255.

The router with the highest priority is elected master. If a router is configured with the address used as the address of the virtual router, the router is called the “address owner.” The priority of the address owner is always 255 so that the address owner is always master. If the master has a priority less than 255 (it is not the address owner) and you configure the priority of another router in the group higher than the master’s priority, the router will take over as master only if preempt mode is enabled.

- **Default**: 100 unless the router is the address owner, in which case its priority is automatically set to 255.
- **Format**: `ip vrrp <vrid> priority <i-254>`
- **Mode**: Interface Config

**no ip vrrp priority**

This command sets the default priority value for the virtual router configured on a specified interface.

- **Format**: `no ip vrrp <vrid> priority`
- **Mode**: Interface Config
ip vrrp timers advertise

This command sets the frequency, in seconds, that an interface on the specified virtual router sends a virtual router advertisement.

Default 1

Format ip vrrp <vrid> timers advertise <1-255>

Mode Interface Config

no ip vrrp timers advertise

This command sets the default virtual router advertisement value for an interface.

Format no ip vrrp <vrid> timers advertise

Mode Interface Config

ip vrrp track interface

Use this command to alter the priority of the VRRP router based on the availability of its interfaces. This command is useful for tracking interfaces that are not configured for VRRP. Only IP interfaces are tracked. A tracked interface is up if the IP on that interface is up. Otherwise, the tracked interface is down.

When the tracked interface is down or the interface has been removed from the router, the priority of the VRRP router will be decremented by the value specified in the <priority> argument. When the interface is up for IP protocol, the priority will be incremented by the <priority> value.

A VRRP configured interface can track more than one interface. When a tracked interface goes down, then the priority of the router will be decreased by 10 (the default priority decrement) for each downed interface. The default priority decrement is changed using the <priority> argument. The default priority of the virtual router is 100, and the default decrement priority is 10. By default, no interfaces are tracked. If you specify just the interface to be tracked, without giving the optional priority, then the default priority will be set. The default priority decrement is 10.

Default priority: 10

Format ip vrrp <vrid> track interface <unit/slot/port> [decrement <priority>]

Mode Interface Config
no ip vrrp track interface

Use this command to remove the interface from the tracked list or to restore the priority decrement to its default.

**Format**

```
no ip vrrp <vrid> track interface <unit/slot/port> [decrement]
```

**Mode**

Interface Config

**ip vrrp track ip route**

Use this command to track the route reachability. When the tracked route is deleted, the priority of the VRRP router will be decremented by the value specified in the `<priority>` argument. When the tracked route is added, the priority will be incremented by the same.

A VRRP configured interface can track more than one route. When a tracked route goes down, then the priority of the router will be decreased by 10 (the default priority decrement) for each downed route. By default no routes are tracked. If you specify just the route to be tracked, without giving the optional priority, then the default priority will be set. The default priority decrement is 10. The default priority decrement is changed using the `<priority>` argument.

**Default**

```
priority: 10
```

**Format**

```
ip vrrp <vrid> track ip route <ip-address/prefix-length> [decrement <priority>]
```

**Mode**

Interface Config

**no ip vrrp track ip route**

Use this command to remove the route from the tracked list or to restore the priority decrement to its default. When removing a tracked IP route from the tracked list, the priority should be incremented by the decrement value if the route is not reachable.

**Format**

```
no ip vrrp <vrid> track ip route <ip-address/prefix-length> [decrement]
```

**Mode**

Interface Config

**ip vrrp `<vrid>` accept-mode**

This command is used to allow a router to respond to ICMP Echo Requests sent to an address on a VRRP virtual router. VRRP supports responding to pings, but does not allow the VRRP Master to accept other types of packets. A new configuration option controls whether the router responds to Echo Requests sent to a VRRP IP address.

The VRRP Master responds to both fragmented and un-fragmented ICMP Echo Request packets. The VRRP Master responds to Echo Requests sent to the virtual router's primary address or any of its secondary addresses.
Ping to a VRRP IP address only works from the host side (where the VRRP router is configured). There is no value in pinging to the VRRP IP from another interface because packet flow from the network to the host doesn't involve VRRP. This is used only to troubleshoot a connectivity problem for traffic originating on the VRRP protected LAN.

Members of the virtual router who are in backup state discard ping packets destined to VRRP address(es), just as they discard any Ethernet frame sent to a VRRP MAC address. When the VRRP master responds with an Echo Reply, the source IPv4 address is the VRRP address and source MAC address is the virtual router's MAC address.

There is a separate command "ip icmp echo-reply" that controls whether the router responds to ICMP Echo Requests. When Echo Replies are disabled using that command, the VRRP master does not respond to Echo Requests, even if this new option is enabled.

Default: disabled

Format: `ip vrrp <vrid> accept-mode`

Mode: Interface Config

`no ip vrrp vrid accept-mode`

This command is used to allow a router to respond to ICMP Echo Requests sent to an address on a VRRP virtual router.

Format: `no ip vrrp <vrid> accept-mode`

Mode: Interface Config

`show ip vrrp interface stats`

This command displays the statistical information about each virtual router configured on the switch.

Format: `show ip vrrp interface stats <unit/slot/port> <vrid>`

Modes:
- Privileged EXEC
- User EXEC

<table>

</tr>
</tbody>
</table>
show ip vrrp interface

This command displays all configuration information and VRRP router statistics of a virtual router configured on a specific interface. Use the output of the command to verify the track interface and track IP route configurations.

**Format**
```
show ip vrrp interface <interface-name> <vrid>
```

**Modes**
- Privileged EXEC
- User EXEC

<table>

**DHCP and BOOTP Relay Commands**

This section describes the commands you use to configure BootP/DHCP Relay on the switch. A DHCP relay agent operates at Layer 3 and forwards DHCP requests and replies between clients and servers when they are not on the same physical subnet.

**bootpdhcprelay cidoptmode**

This command enables the circuit ID option mode for BootP/DHCP Relay on the system.

**Default**  
disabled

**Format**  
bootpdhcprelay cidoptmode

**Mode**  
Global Config

**no bootpdhcprelay cidoptmode**

This command disables the circuit ID option mode for BootP/DHCP Relay on the system.

**Format**  
no bootpdhcprelay cidoptmode

**Mode**  
Global Config

Routing Commands

276
**bootpdhcprelay maxhopcount**

This command configures the maximum allowable relay agent hops for BootP/DHCP Relay on the system. The `<hops>` parameter has a range of 1 to 16.

**Default** 4
**Format** `bootpdhcprelay maxhopcount <1-16>`
**Mode** Global Config

**no bootpdhcprelay maxhopcount**

This command configures the default maximum allowable relay agent hops for BootP/DHCP Relay on the system.

**Format** `no bootpdhcprelay maxhopcount`
**Mode** Global Config

**bootpdhcprelay minwaittime**

This command configures the minimum wait time in seconds for BootP/DHCP Relay on the system. When the BOOTP relay agent receives a BOOTREQUEST message, it MAY use the seconds-since-client-began-booting field of the request as a factor in deciding whether to relay the request or not. The parameter has a range of 0 to 100 seconds.

**Default** 0
**Format** `bootpdhcprelay minwaittime <0-100>`
**Mode** Global Config

**no bootpdhcprelay minwaittime**

This command configures the default minimum wait time in seconds for BootP/DHCP Relay on the system.

**Format** `no bootpdhcprelay minwaittime`
**Mode** Global Config

**show bootpdhcprelay**

This command displays the BootP/DHCP Relay information.

**Format** `show bootpdhcprelay`
**Modes**
- Privileged EXEC
- User EXEC
**ProSafe Managed Switch**

**Routing Commands**

### IP Helper Commands

This section describes the commands to configure a DHCP relay agent with multiple DHCP server addresses per routing interface, and to use different server addresses for client packets arriving on different interfaces on the relay agent.

**clear ip helper statistics**

Use this command to reset the statistics displayed in the `show ip helper statistics` command to zero.

**Format**

`clear ip helper statistics`

**Mode**

Privileged EXEC

**ip helper-address (Global Config)**

Use the Global Configuration `ip helper-address` command to have the switch forward User Datagram Protocol (UDP) broadcasts received on an interface. To disable the forwarding of broadcast packets to specific addresses, use the no form of this command.

The `ip helper-address` command forwards specific UDP broadcast from one interface to another. You can define many helper addresses but the total number of address-port pairs is limited to 128 for the whole device. The setting of a helper address for a specific interface has precedence over a setting of a helper address for all interfaces.

**Ip-address:** Destination broadcast or host address to be used when forwarding UDP broadcasts. You can specify 0.0.0.0 to indicate not to forward the UDP packet to any host and use "255.255.255.255" to broadcast the UDP packets to all hosts on the target subnet.

<table>
<thead>

</tbody>
</table>
udp-port-list: The broadcast packet destination UDP port number to forward. If not specified, packets for the default services are forwarded to the helper address. Valid range, 0-65535.

Default: Disabled

Format: `ip helper-address <ip-address>`

Mode: Global Config

### no ip helper-address (Global Config)

Use this command to remove the IP address from the previously configured list. The no command without an `<ip-address>` argument removes the entire list of helper addresses on that interface.

Format: `no ip helper-address {<ip-address>}`

Mode: Global Config

### ip helper enable

Use this command to enable relay of UDP packets. This command can be used to temporarily disable IP helper without deleting all IP helper addresses. This command replaces the `bootpdhcprelay enable` command, but affects not only relay of DHCP packets, but also relay of any other protocols for which an IP helper address has been configured.

Default: disabled

Format: `ip helper enable`

Mode: Global Config

### no ip helper enable

Use this command to disable relay of all UDP packets.

Format: `no ip helper enable`

Mode: Global Config

### ip helper-address

Use this command to add a unicast helper address to the list of helper addresses on an interface. This is the address of a DHCP server. This command can be applied multiple times.
on the routing interface to form the helper addresses list until the list reaches the maximum supported helper addresses.

**Format**  
`ip helper-address <ip-address>`  
`{<1-65535>|dhcp|domain|isakmp|mobile-ip|nameserver|netbios-dgm|netbios-ns|ntp|pim-auto-rip|rip|tacacs|tftp|time}`

**Mode**  
Interface Config

**no ip helper-address**  
Use this command to remove the IP address from the previously configured list. The no command without an `<ip-address>` argument removes the entire list of helper addresses on that interface.

**Format**  
`no ip helper-address {<ip-address>}`  
`{<1-65535>|dhcp|domain|isakmp|mobile-ip|nameserver|netbios-dgm|netbios-ns|ntp|pim-auto-rip|rip|tacacs|tftp|time}`

**Mode**  
Interface Config

**ip helper-address discard**  
Use this command to drop matching packets.

**Format**  
`ip helper-address discard`  
`{<1-65535>|dhcp|domain|isakmp|mobile-ip|nameserver|netbios-dgm|netbios-ns|ntp|pim-auto-rip|rip|tacacs|tftp|time}`

**Mode**  
Interface Config

**no ip helper-address discard**  
Use this command to permit the matching packets.

**Format**  
`no ip helper-address discard`  
`{<1-65535>|dhcp|domain|isakmp|mobile-ip|nameserver|netbios-dgm|netbios-ns|ntp|pim-auto-rip|rip|tacacs|tftp|time}`

**Mode**  
Interface Config

**show ip helper-address**  
Use this command to display the configured helper addresses on the given interface.

**Format**  
`show ip helper-address <interface>`

**Mode**  
- Privileged EXEC  
- User EXEC

The following shows example CLI display output for the command.

```
(switch) #show ip helper-address 1/0/1
```

---

**Routing Commands**

280
show ip helper statistics

Use this command to display the number of DHCP and other UDP packets processed and relayed by the UDP relay agent.

**Format**
show ip helper statistics

**Mode**
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP client messages received</td>
<td>The number of valid messages received from a DHCP client. The count is incremented only if IP helper is enabled globally, the ingress routing interface is up, and the packet passes a number of validity checks, such as having a TTL&gt;1 and having valid source and destination IP addresses.</td>
</tr>
<tr>
<td>DHCP client messages relayed</td>
<td>The number of DHCP client messages relayed to a server. If a message is relayed to multiple servers, the count is incremented once for each server.</td>
</tr>
<tr>
<td>DHCP server messages received</td>
<td>The number of DHCP responses received from the DHCP server. This count includes only messages that the DHCP server unicasts to the relay agent for relay to the client.</td>
</tr>
<tr>
<td>DHCP server messages relayed</td>
<td>The number of DHCP server messages relayed to a client.</td>
</tr>
<tr>
<td>UDP clients messages received</td>
<td>The number of valid UDP packets received. This count includes DHCP messages and all other protocols relayed. Conditions are similar to those for the first statistic in this table.</td>
</tr>
<tr>
<td>UDP clients messages relayed</td>
<td>The number of UDP packets relayed. This count includes DHCP messages relayed as well as all other protocols. The count is incremented for each server to which a packet is sent.</td>
</tr>
<tr>
<td>DHCP message hop count exceeded max</td>
<td>The number of DHCP client messages received whose hop count is larger than the maximum allowed. The maximum hop count is a configurable value listed in show bootpdhcprelay. A log message is written for each such failure. The DHCP relay agent does not relay these packets.</td>
</tr>
<tr>
<td>DHCP message with secs field below min</td>
<td>The number of DHCP client messages received whose secs field is less than the minimum value. The minimum secs value is a configurable value and is displayed in show bootpdhcprelay. A log message is written for each such failure. The DHCP relay agent does not relay these packets.</td>
</tr>
<tr>
<td>DHCP message with giaddr set to local address</td>
<td>The number of DHCP client messages received whose gateway address, giaddr, is already set to an IP address configured on one of the relay agent’s own IP addresses. In this case, another device is attempting to spoof the relay agent’s address. The relay agent does not relay such packets. A log message gives details for each occurrence.</td>
</tr>
</tbody>
</table>
This section describes the commands you use to view and configure OSPF, which is a link-state routing protocol that you use to route traffic within a network.

**router ospf**

Use this command to enter Router OSPF mode.

**Format**

    router ospf

**Mode**

Global Config

**enable (OSPF)**

This command resets the default administrative mode of OSPF in the router (active).

**Default**

    enabled

**Format**

    enable

**Mode**

    Router OSPF Config

**no enable (OSPF)**

This command sets the administrative mode of OSPF in the router to inactive.

**Format**

    no enable

**Mode**

    Router OSPF Config

**network area (OSPF)**

Use this command to enable OSPFv2 on an interface and set its area ID if the IP address of an interface is covered by this network command.

**Default**

    disabled

**Format**

    network <ip-address> <wildcard-mask> area <area-id>

**Mode**

    Router OSPF Config
**no network area (OSPF)**

Use this command to disable the OSPFv2 on a interface if the IP address of an interface was earlier covered by this network command.

Format  
```
no network <ip-address> <wildcard-mask> area <area-id>
```

Mode  
Router OSPF Config

**ip ospf area**

Use this command to enable OSPFv2 and set the area ID of an interface. The `<area-id>` is an IP address formatted as a 4-digit dotted-decimal number or a decimal value in the range of `<0-4294967295>`. This command supersedes the effects of the `network area` command. It can also be used to configure the advertiseability of the secondary addresses on this interface into the OSPFv2 domain.

Default  
disabled

Format  
```
ip ospf area <area-id> [secondaries none]
```

Mode  
Interface Config

**no ip ospf area**

Use this command to disable OSPF on an interface.

Format  
```
no ip ospf area [secondaries none]
```

Mode  
Interface Config

**1583compatibility**

This command enables OSPF 1583 compatibility.

---

**Note:** 1583 compatibility mode is enabled by default. If all OSPF routers in the routing domain are capable of operating according to RFC 2328, OSPF 1583 compatibility mode should be disabled.

Default  
enabled

Format  
```
1583compatibility
```

Mode  
Router OSPF Config
no 1583compatibility

This command disables OSPF 1583 compatibility.

Format: no 1583compatibility
Mode: Router OSPF Config

area default-cost (OSPF)

This command configures the default cost for the stub area. You must specify the area ID and an integer value between 1-16777215.

Format: area <areaid> default-cost <1-16777215>
Mode: Router OSPF Config

area nssa (OSPF)

This command configures the specified areaid to function as an NSSA.

Format: area <areaid> nssa
Mode: Router OSPF Config

no area nssa

This command disables nssa from the specified area id.

Format: no area <areaid> nssa
Mode: Router OSPF Config

area nssa default-info-originate (OSPF)

This command configures the metric value and type for the default route advertised into the NSSA. The optional metric parameter specifies the metric of the default route and is to be in a range of 1-16777214. If no metric is specified, the default value is 10. The metric type can be comparable (nssa-external 1) or non-comparable (nssa-external 2).

Format: area <areaid> nssa default-info-originate [<metric>] [{comparable | non-comparable}]
Mode: Router OSPF Config
no area nssa default-info originate (OSPF)

This command disables the default route advertised into the NSSA.

Format:  
no area <areaid> nssa default-info originate [<metric>] [{comparable | non-comparable}]

Mode:  
Router OSPF Config

area nssa no-redistribute (OSPF)

This command configures the NSSA Area Border router (ABR) so that learned external routes will not be redistributed to the NSSA.

Format:  
area <areaid> nssa no-redistribute

Mode:  
Router OSPF Config

no area nssa no-redistribute (OSPF)

This command disables the NSSA ABR so that learned external routes are redistributed to the NSSA.

Format:  
no area <areaid> nssa no-redistribute

Mode:  
Router OSPF Config

area nssa no-summary (OSPF)

This command configures the NSSA so that summary LSAs are not advertised into the NSSA.

Format:  
area <areaid> nssa no-summary

Mode:  
Router OSPF Config

no area nssa no-summary (OSPF)

This command disables nssa from the summary LSAs.

Format:  
no area <areaid> nssa no-summary

Mode:  
Router OSPF Config

area nssa translator-role (OSPF)

This command configures the translator role of the NSSA. A value of always causes the router to assume the role of the translator the instant it becomes a border router and a value
of candidate causes the router to participate in the translator election process when it attains border router status.

**Format**  
area <areaid> nssa translator-role {always | candidate}

**Mode**  
Router OSPF Config

**no area nssa translator-role (OSPF)**

This command disables the nssa translator role from the specified area id.

**Format**  
no area <areaid> nssa translator-role {always | candidate}

**Mode**  
Router OSPF Config

**area nssa translator-stab-intv (OSPF)**

This command configures the translator <stabilityinterval> of the NSSA. The <stabilityinterval> is the period of time that an elected translator continues to perform its duties after it determines that its translator status has been deposed by another router.

**Format**  
area <areaid> nssa translator-stab-intv <stabilityinterval>

**Mode**  
Router OSPF Config

**no area nssa translator-stab-intv (OSPF)**

This command disables the nssa translator’s <stabilityinterval> from the specified area id.

**Format**  
no area <areaid> nssa translator-stab-intv <stabilityinterval>

**Mode**  
Router OSPF Config

**area range (OSPF)**

Use this command in Router Configuration mode to configure a summary prefix that an area border router advertises for a specific area.

**Default**  
No area ranges are configured by default. No cost is configured by default.

**Format**  
area areaid range prefix netmask {summarylink | nssaexternallink} [advertise | not-advertise] [cost cost]

**Mode**  
OSPFv2 Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>area-id</td>
<td>The area identifier for the area whose networks are to be summarized.</td>
</tr>
<tr>
<td>prefix netmask</td>
<td>The summary prefix to be advertised when the ABR computes a route to one or more networks within this prefix in this area.</td>
</tr>
</tbody>
</table>
The no form of this command deletes a specified area range or reverts an option to its default.

**Format**

```
no area areaid range prefix netmask {summarylink | nssaexternallink} [advertise | not-advertise] [cost]
```

**Mode**

OSPFv2 Router Configuration

**area stub (OSPF)**

This command creates a stub area for the specified area ID. A stub area is characterized by the fact that AS External LSAs are not propagated into the area. Removing AS External LSAs and Summary LSAs can significantly reduce the link state database of routers within the stub area.

**Format**

```
area <areaid> stub
```

**Mode**

Router OSPF Config

**no area stub**

This command deletes a stub area for the specified area ID.

**Format**

```
no area <areaid> stub
```

**Mode**

Router OSPF Config

---

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summarylink</td>
<td>When this keyword is given, the area range is used when summarizing prefixes advertised in type 3 summary LSAs.</td>
</tr>
<tr>
<td>nssaexternallink</td>
<td>When this keyword is given, the area range is used when translating type 7 LSAs to type 5 LSAs.</td>
</tr>
<tr>
<td>advertise</td>
<td>[Optional] When this keyword is given, the summary prefix is advertised when the area range is active. This is the default.</td>
</tr>
<tr>
<td>not-advertise</td>
<td>[Optional] When this keyword is given, neither the summary prefix nor the contained prefixes are advertised when the area range is active. When the not-advertise option is given, any static cost previously configured is removed from the system configuration.</td>
</tr>
<tr>
<td>cost</td>
<td>[Optional] If an optional cost is given, OSPF sets the metric field in the summary LSA to the configured value rather than setting the metric to the largest cost among the networks covered by the area range. A static cost may only be configured if the area range is configured to advertise the summary. The range is 0 to 16,777,215. If the cost is set to 16,777,215 for type 3 summarization, a type 3 summary LSA is not advertised, but contained networks are suppressed. This behavior is equivalent to specifying the not-advertise option. If the range is configured for type 7 to type 5 translation, a type 5 LSA is sent if the metric is set to 16,777,215; however, other routers will not compute a route from a type 5 LSA with this metric.</td>
</tr>
</tbody>
</table>

---

**no area range**

The no form of this command deletes a specified area range or reverts an option to its default.
**area stub no-summary (OSPF)**

This command configures the Summary LSA mode for the stub area identified by `<areaid>`. Use this command to prevent LSA Summaries from being sent.

**Default**

`disabled`

**Format**

`area <areaid> stub no-summary`

**Mode**

Router OSPF Config

**no area stub no-summary**

This command configures the default Summary LSA mode for the stub area identified by `<areaid>`.

**Format**

`no area <areaid> stub no-summary`

**Mode**

Router OSPF Config

**area virtual-link (OSPF)**

This command creates the OSPF virtual interface for the specified `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

`area <areaid> virtual-link <neighbor>`

**Mode**

Router OSPF Config

**no area virtual-link**

This command deletes the OSPF virtual interface from the given interface, identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

`no area <areaid> virtual-link <neighbor>`

**Mode**

Router OSPF Config

**area virtual-link authentication**

This command configures the authentication type and key for the OSPF virtual interface identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor. The value for `<type>` is either none, simple, or encrypt. The `[key]` is composed of standard displayable, non-control keystrokes from a Standard 101/102-key keyboard. The authentication key must be 8 bytes or less if the authentication type is simple. If the type is encrypt, the key may be up to 16 bytes. Unauthenticated interfaces do not need an authentication key. If the type is encrypt, a key id in the range of 0 and 255 must be
specified. The default value for authentication type is none. Neither the default password key
nor the default key id are configured.

Default none

Format area <areaid> virtual-link <neighbor> authentication {none | {simple <key> | [encrypt <key> <keyid>])

Mode Router OSPF Config

no area virtual-link authentication

This command configures the default authentication type for the OSPF virtual interface
identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of
the neighbor.

Format no area <areaid> virtual-link <neighbor> authentication

Mode Router OSPF Config

area virtual-link dead-interval (OSPF)

This command configures the dead interval for the OSPF virtual interface on the virtual
interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor. The range for seconds is 1 to 65535.

Default 40

Format area <areaid> virtual-link <neighbor> dead-interval <seconds>

Mode Router OSPF Config

no area virtual-link dead-interval

This command configures the default dead interval for the OSPF virtual interface on the
virtual interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor.

Format no area <areaid> virtual-link <neighbor> dead-interval

Mode Router OSPF Config

area virtual-link hello-interval (OSPF)

This command configures the hello interval for the OSPF virtual interface on the virtual
interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor. The range for <seconds> is 1 to 65535.

Default 10

Format area <areaid> virtual-link <neighbor> hello-interval <1-65535>

Mode Router OSPF Config
no area virtual-link hello-interval

This command configures the default hello interval for the OSPF virtual interface on the virtual interface identified by \(<\text{areaid}>\) and \(<\text{neighbor}>\). The \(<\text{neighbor}>\) parameter is the Router ID of the neighbor.

Format \textit{no area <areaid> virtual-link <neighbor> hello-interval}

Mode Router OSPF Config

\textbf{area virtual-link retransmit-interval (OSPF)}

This command configures the retransmit interval for the OSPF virtual interface on the virtual interface identified by \(<\text{areaid}>\) and \(<\text{neighbor}>\). The \(<\text{neighbor}>\) parameter is the Router ID of the neighbor. The range for seconds is 0 to 3600.

Default 5

Format \textit{area <areaid> virtual-link <neighbor> retransmit-interval <seconds>}

Mode Router OSPF Config

\textbf{no area virtual-link retransmit-interval}

This command configures the default retransmit interval for the OSPF virtual interface on the virtual interface identified by \(<\text{areaid}>\) and \(<\text{neighbor}>\). The \(<\text{neighbor}>\) parameter is the Router ID of the neighbor.

Format \textit{no area <areaid> virtual-link <neighbor> retransmit-interval}

Mode Router OSPF Config

\textbf{area virtual-link transmit-delay (OSPF)}

This command configures the transmit delay for the OSPF virtual interface on the virtual interface identified by \(<\text{areaid}>\) and \(<\text{neighbor}>\). The \(<\text{neighbor}>\) parameter is the Router ID of the neighbor. The range for seconds is 0 to 3600 (1 hour).

Default 1

Format \textit{area <areaid> virtual-link <neighbor> transmit-delay <seconds>}

Mode Router OSPF Config

\textbf{no area virtual-link transmit-delay}

This command resets the default transmit delay for the OSPF virtual interface to the default value.

Format \textit{no area <areaid> virtual-link <neighbor> transmit-delay}

Mode Router OSPF Config
auto-cost (OSPF)

By default, OSPF computes the link cost of each interface from the interface bandwidth. Faster links have lower metrics, making them more attractive in route selection. The configuration parameters in the `auto-cost reference-bandwidth` and `bandwidth` commands give you control over the default link cost. You can configure for OSPF an interface bandwidth that is independent of the actual link speed. A second configuration parameter allows you to control the ratio of interface bandwidth to link cost. The link cost is computed as the ratio of a reference bandwidth to the interface bandwidth \((\text{ref\_bw} / \text{interface bandwidth})\), where interface bandwidth is defined by the `bandwidth` command. Because the default reference bandwidth is 100 Mbps, OSPF uses the same default link cost for all interfaces whose bandwidth is 100 Mbps or greater. Use the `auto-cost` command to change the reference bandwidth, specifying the reference bandwidth in megabits per second (Mbps). The reference bandwidth range is 1-4294967 Mbps. The different reference bandwidth can be independently configured for OSPFv2 and OSPFv3.

**Default**

100Mbps

**Format**

`auto-cost reference-bandwidth <1 to 4294967>`

**Mode**

Router OSPF Config

no auto-cost reference-bandwidth (OSPF)

Use this command to set the reference bandwidth to the default value.

**Format**

`no auto-cost reference-bandwidth`

**Mode**

Router OSPF Config

bandwidth

By default, OSPF computes the link cost of an interface as the ratio of the reference bandwidth to the interface bandwidth. Reference bandwidth is specified with the `auto-cost` command. For the purpose of the OSPF link cost calculation, use the `bandwidth` command to specify the interface bandwidth. The bandwidth is specified in kilobits per second. If no bandwidth is configured, the bandwidth defaults to the actual interface bandwidth for port-based routing interfaces and to 10 Mbps for VLAN routing interfaces. This command does not affect the actual speed of an interface.

**Default**

actual interface bandwidth

**Format**

`bandwidth <1-10000000>`

**Mode**

Interface Config
no bandwidth

Use this command to set the interface bandwidth to its default value.

Format: no bandwidth
Mode: Interface Config

capability opaque

Use this command to enable Opaque Capability on the Router. The information contained in Opaque LSAs may be used directly by OSPF or indirectly by an application wishing to distribute information throughout the OSPF domain. The 7000 series supports the storing and flooding of Opaque LSAs of different scopes.

Default: disabled
Format: capability opaque
Mode: Router OSPF Config

no capability opaque

Use this command to disable opaque capability on the router.

Format: no capability opaque
Mode: Router OSPF Config

clear ip ospf

Use this command to disable and re-enable OSPF.

Format: clear ip ospf
Mode: Privileged EXEC

clear ip ospf configuration

Use this command to reset the OSPF configuration to factory defaults.

Format: clear ip ospf configuration
Mode: Privileged EXEC

clear ip ospf counters

Use this command to reset global and interface statistics.

Format: clear ip ospf counters
Mode: Privileged EXEC
**clear ip ospf neighbor**

Use this command to drop the adjacency with all OSPF neighbors. On each neighbor’s interface, send a one-way hello. Adjacencies may then be re-established. To drop all adjacencies with a specific router ID, specify the neighbor’s Router ID using the optional parameter `[neighbor-id]`.

**Format**

```
clear ip ospf neighbor [neighbor-id]
```

**Mode**

Privileged EXEC

**clear ip ospf neighbor interface**

To drop adjacency with all neighbors on a specific interface, use the optional parameter `[unit/slot/port]`. To drop adjacency with a specific router ID on a specific interface, use the optional parameter `[neighbor-id]`.

**Format**

```
clear ip ospf neighbor interface [unit/slot/port] [neighbor-id]
```

**Mode**

Privileged EXEC

**clear ip ospf redistribution**

Use this command to flush all self-originated external LSAs. Reapply the redistribution configuration and re-originate prefixes as necessary.

**Format**

```
clear ip ospf redistribution
```

**Mode**

Privileged EXEC

**clear ip ospf stub-router**

OSPF can enter stub router mode due to resource exhaustion (too many LSA's, too many routes, memory allocation failures etc). When this happens, the user can get out of this mode by issuing the command after the cause of the overload has been resolved.

**Format**

```
clear ip ospf stub-router
```

**Mode**

Privileged EXEC

**default-information originate (OSPF)**

This command is used to control the advertisement of default routes.

**Default**

- metric—unspecified
- type—2

**Format**

```
default-information originate [always] [metric <0-16777214>] [metric-type {1 | 2}]
```

**Mode**

Router OSPF Config
no default-information originate (OSPF)

This command is used to control the advertisement of default routes.

**Format**

```
no default-information originate [metric] [metric-type]
```

**Mode**

Router OSPF Config

**default-metric (OSPF)**

This command is used to set a default for the metric of distributed routes.

**Format**

```
default-metric <1-16777214>
```

**Mode**

Router OSPF Config

**no default-metric (OSPF)**

This command is used to set a default for the metric of distributed routes.

**Format**

```
no default-metric
```

**Mode**

Router OSPF Config

**distance ospf (OSPF)**

This command sets the route preference value of OSPF in the router. Lower route preference values are preferred when determining the best route. The type of OSPF route can be *intra*, *inter*, or *external*. All the external type routes are given the same preference value. The range of `<preference>` value is 1 to 255.

**Default**

```
110
```

**Format**

```
distance ospf {intra-area <1-255> | inter-area <1-255> | external <1-255>}
```

**Mode**

Router OSPF Config

**no distance ospf**

This command sets the default route preference value of OSPF routes in the router. The type of OSPF can be intra, inter, or external. All the external type routes are given the same preference value.

**Format**

```
no distance ospf {intra-area | inter-area | external}
```

**Mode**

Router OSPF Config
**distribute-list out (OSPF)**

Use this command to specify the access list to filter routes received from the source protocol.

**Format**
```
distribute-list <1-199> out {rip | static | connected}
```

**Mode**
Router OSPF Config

**no distribute-list out**

Use this command to specify the access list to filter routes received from the source protocol.

**Format**
```
no distribute-list <1-199> out {rip | static | connected}
```

**Mode**
Router OSPF Config

**exit-overflow-interval (OSPF)**

This command configures the exit overflow interval for OSPF. It describes the number of seconds after entering overflow state that a router will wait before attempting to leave the overflow state. This allows the router to again originate non-default AS-external-LSAs. When set to 0, the router will not leave overflow state until restarted. The range for seconds is 0 to 2147483647 seconds.

**Default**
0

**Format**
```
exit-overflow-interval <seconds>
```

**Mode**
Router OSPF Config

**no exit-overflow-interval**

This command configures the default exit overflow interval for OSPF.

**Format**
```
no exit-overflow-interval
```

**Mode**
Router OSPF Config

**external-lsdb-limit (OSPF)**

This command configures the external LSDB limit for OSPF. If the value is -1, then there is no limit. When the number of non-default AS-external-LSAs in a router's link-state database reaches the external LSDB limit, the router enters overflow state. The router never holds more than the external LSDB limit non-default AS-external-LSAs in it database. The external LSDB limit MUST be set identically in all routers attached to the OSPF backbone and/or any regular OSPF area. The range for limit is -1 to 2147483647.

**Default**
-1

**Format**
```
external-lsdb-limit <limit>
```

**Mode**
Router OSPF Config
no external-lsdb-limit

This command configures the default external LSDB limit for OSPF.

Format: no external-lsdb-limit
Mode: Router OSPF Config

log-adjacency-changes

To enable logging of OSPFv2 neighbor state changes, use this command in router configuration mode. State changes are logged with INFORMATIONAL severity.

Default: Adjacency state changes are logged, but without the detail option.
Format: log-adjacency-changes [detail]
Mode: OSPFv2 Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>(Optional) When this keyword is specified, all adjacency state changes are logged. Otherwise, OSPF only logs transitions to FULL state and when a backwards transition occurs.</td>
</tr>
</tbody>
</table>

no log-adjacency-changes

Use the no form of the command to disable state change logging.

Format: no log-adjacency-changes [detail]
Mode: OSPFv2 Router Configuration

ip ospf authentication

This command sets the OSPF Authentication Type and Key for the specified interface. The value of <type> is either none, simple or encrypt. The <key> is composed of standard displayable, non-control keystrokes from a Standard 101/102-key keyboard. The authentication key must be 8 bytes or less if the authentication type is simple. If the type is encrypt, the key may be up to 16 bytes. If the type is encrypt a <keyid> in the range of 0 and 255 must be specified. Unauthenticated interfaces do not need an authentication key or authentication key ID. There is no default value for this command.

Format: ip ospf authentication {none | {simple <key>} | {encrypt <key> <keyid>}}
Mode: Interface Config
**no ip ospf authentication**

This command sets the default OSPF Authentication Type for the specified interface.

**Format**

no ip ospf authentication

**Mode**

Interface Config

**ip ospf cost**

This command configures the cost on an OSPF interface. The `<cost>` parameter has a range of 1 to 65535.

**Default**

10

**Format**

ip ospf cost <1-65535>

**Mode**

Interface Config

**no ip ospf cost**

This command configures the default cost on an OSPF interface.

**Format**

no ip ospf cost

**Mode**

Interface Config

**ip ospf database-filter all out**

Use this command in Interface Configuration mode to disable OSPFv2 LSA flooding on an interface.

**Default**

Disabled

**Format**

ip ospf database-filter all out

**Mode**

Interface Configuration

**no ip ospf database-filter all out**

Use this command in Interface Configuration mode to enable OSPFv2 LSA flooding on an interface.

**Default**

Disabled

**Format**

no ip ospf database-filter all out

**Mode**

Interface Configuration
**ip ospf dead-interval**

This command sets the OSPF dead interval for the specified interface. The value for `<seconds>` is a valid positive integer, which represents the length of time in seconds that a router’s Hello packets have not been seen before its neighbor routers declare that the router is down. The value for the length of time must be the same for all routers attached to a common network. This value should be some multiple of the Hello Interval (i.e. 4). Valid values range in seconds from 1 to 2147483647.

**Default**

40

**Format**

`ip ospf dead-interval <seconds>`

**Mode**

Interface Config

**no ip ospf dead-interval**

This command sets the default OSPF dead interval for the specified interface.

**Format**

`no ip ospf dead-interval`

**Mode**

Interface Config

**ip ospf hello-interval**

This command sets the OSPF hello interval for the specified interface. The value for seconds is a valid positive integer, which represents the length of time in seconds. The value for the length of time must be the same for all routers attached to a network. Valid values range from 1 to 65535.

**Default**

10

**Format**

`ip ospf hello-interval <seconds>`

**Mode**

Interface Config

**no ip ospf hello-interval**

This command sets the default OSPF hello interval for the specified interface.

**Format**

`no ip ospf hello-interval`

**Mode**

Interface Config

**ip ospf network**

Use this command to configure OSPF to treat an interface as a point-to-point rather than broadcast interface. The `broadcast` option sets the OSPF network type to broadcast. The `point-to-point` option sets the OSPF network type to point-to-point. OSPF treats interfaces as broadcast interfaces by default. (Loopback interfaces have a special loopback network type, which cannot be changed.) When there are only two routers on the network,
OSPF can operate more efficiently by treating the network as a point-to-point network. For point-to-point networks, OSPF does not elect a designated router or generate a network link state advertisement (LSA). Both endpoints of the link must be configured to operate in point-to-point mode.

Default: broadcast
Format: ip ospf network {broadcast|point-to-point}
Mode: Interface Config

no ip ospf network

Use this command to return the OSPF network type to the default.

Format: no ip ospf network
Mode: Interface Config

ip ospf priority

This command sets the OSPF priority for the specified router interface. The priority of the interface is a priority integer from 0 to 255. A value of 0 indicates that the router is not eligible to become the designated router on this network.

Default: 1, which is the highest router priority
Format: ip ospf priority <0-255>
Mode: Interface Config

no ip ospf priority

This command sets the default OSPF priority for the specified router interface.

Format: no ip ospf priority
Mode: Interface Config

ip ospf retransmit-interval

This command sets the OSPF retransmit Interval for the specified interface. The retransmit interval is specified in seconds. The value for <seconds> is the number of seconds between link-state advertisement retransmissions for adjacencies belonging to this router interface. This value is also used when retransmitting database description and link-state request packets. Valid values range from 0 to 3600 (1 hour).

Default: 5
Format: ip ospf retransmit-interval <0-3600>
Mode: Interface Config
no ip ospf retransmit-interval

This command sets the default OSPF retransmit Interval for the specified interface.

Format  no ip ospf retransmit-interval
Mode     Interface Config

ip ospf transmit-delay

This command sets the OSPF Transit Delay for the specified interface. The transmit delay is specified in seconds. In addition, it sets the estimated number of seconds it takes to transmit a link state update packet over this interface. Valid values for \(<seconds>\) range from 1 to 3600 (1 hour).

Default  1
Format    ip ospf transmit-delay <1-3600>
Mode      Interface Config

no ip ospf transmit-delay

This command sets the default OSPF Transit Delay for the specified interface.

Format  no ip ospf transmit-delay
Mode     Interface Config

ip ospf mtu-ignore

This command disables OSPF maximum transmission unit (MTU) mismatch detection. OSPF Database Description packets specify the size of the largest IP packet that can be sent without fragmentation on the interface. When a router receives a Database Description packet, it examines the MTU advertised by the neighbor. By default, if the MTU is larger than the router can accept, the Database Description packet is rejected and the OSPF adjacency is not established.

Default  enabled
Format    ip ospf mtu-ignore
Mode      Interface Config

no ip ospf mtu-ignore

This command enables the OSPF MTU mismatch detection.

Format  no ip ospf mtu-ignore
Mode     Interface Config
**router-id (OSPF)**

This command sets a 4-digit dotted-decimal number uniquely identifying the router ospf id. The `<ipaddress>` is a configured value.

**Format**
```
router-id <ipaddress>
```

**Mode**
Router OSPF Config

**redistribute (OSPF)**

This command configures OSPF protocol to allow redistribution of routes from the specified source protocol/routers.

**Default**
- metric—unspecified
- type—2
- tag—0

**Format**
```
redistribute {rip | static | connected} [metric <0-16777214>] [metric-type {1 | 2}] [tag <0-4294967295>] [subnets]
```

**Mode**
Router OSPF Config

**no redistribute**

This command configures OSPF protocol to prohibit redistribution of routes from the specified source protocol/routers.

**Format**
```
no redistribute {rip | static | connected} [metric] [metric-type] [tag] [subnets]
```

**Mode**
Router OSPF Config

**maximum-paths (OSPF)**

This command sets the number of paths that OSPF can report for a given destination where `maxpaths` is platform dependent.

**Default**

```
4
```

**Format**
```
maximum-paths <maxpaths>
```

**Mode**
Router OSPF Config

**no maximum-paths**

This command resets the number of paths that OSPF can report for a given destination back to its default value.

**Format**
```
no maximum-paths
```

**Mode**
Router OSPF Config

---

**Routing Commands**

301
passive-interface default (OSPF)

Use this command to enable global passive mode by default for all interfaces. It overrides any interface level passive mode. OSPF will not form adjacencies over a passive interface.

Default: disabled
Format: passive-interface default
Mode: Router OSPF Config

no passive-interface default

Use this command to disable the global passive mode by default for all interfaces. Any interface previously configured to be passive reverts to non-passive mode.

Format: no passive-interface default
Mode: Router OSPF Config

passive-interface (OSPF)

Use this command to set the interface or tunnel as passive. It overrides the global passive mode that is currently effective on the interface or tunnel.

Default: disabled
Format: passive-interface {<unit/slot/port>}
Mode: Router OSPF Config

no passive-interface

Use this command to set the interface or tunnel as non-passive. It overrides the global passive mode that is currently effective on the interface or tunnel.

Format: no passive-interface {<unit/slot/port>}
Mode: Router OSPF Config

timers pacing flood

To adjust the rate at which OSPFv2 sends LS Update packets, use this command in router OSPFv2 global configuration mode. OSPF distributes routing information in Link State Advertisements (LSAs), which are bundled into Link State Update (LS Update) packets. To reduce the likelihood of sending a neighbor more packets than it can buffer, OSPF rate limits the transmission of LS Update packets. By default, OSPF sends up to 30 updates per second on each interface (1/the pacing interval). Use this command to adjust this packet rate.

Default: 33 milliseconds
ProSafe Managed Switch

**Format**

```plaintext
timers pacing flood milliseconds
```

**Mode**

OSPFv2 Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>milliseconds</td>
<td>The average time between transmission of LS Update packets. The range is from 5 ms to 100 ms. The default is 33 ms.</td>
</tr>
</tbody>
</table>

**no timers pacing flood**

To revert LSA transmit pacing to the default rate, use the no timers pacing flood command.

**Format**

```plaintext
no timers pacing flood
```

**Mode**

OSPFv2 Router Configuration

**timers pacing lsa-group**

To adjust how OSPF groups LSAs for periodic refresh, use this command in OSPFv2 Router Configuration mode. OSPF refreshes self-originated LSAs approximately once every 30 minutes. When OSPF refreshes LSAs, it considers all self-originated LSAs whose age is from 1800 to 1800 plus the pacing group size. Grouping LSAs for refresh allows OSPF to combine refreshed LSAs into a minimal number of LS Update packets. Minimizing the number of Update packets makes LSA distribution more efficient. When OSPF originates a new or changed LSA, it selects a random refresh delay for the LSA. When the refresh delay expires, OSPF refreshes the LSA. By selecting a random refresh delay, OSPF avoids refreshing a large number of LSAs at one time, even if a large number of LSAs are originated at one time.

**Default**

60 seconds

**Format**

```plaintext
timers pacing lsa-group seconds
```

**Mode**

OSPFv2 Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Width of the window in which LSAs are refreshed. The range for the pacing group window is from 10 to 1800 seconds.</td>
</tr>
</tbody>
</table>

**timers spf**

Use this command to configure the SPF delay time and hold time. The valid range for both parameters is 0-65535 seconds.

**Default**

- delay-time—5
- hold-time—10
trapflags (OSPF)

Use this command to enable individual OSPF traps, enable a group of trap flags at a time, or enable all the trap flags at a time. The different groups of trapflags, and each group’s specific trapflags to enable or disable, are listed in Table 1.

Table 1. Trapflags Groups

show ip ospf abr

This command displays the internal OSPF routing table entries to Area Border Routers (ABR). This command takes no options.

Format  show ip ospf abr
Mode
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>The type of the route to the destination. It can be either:</td>
</tr>
<tr>
<td></td>
<td>• intra — Intra-area route</td>
</tr>
<tr>
<td></td>
<td>• inter — Inter-area route</td>
</tr>
<tr>
<td>Router ID</td>
<td>Router ID of the destination.</td>
</tr>
<tr>
<td>Cost</td>
<td>Cost of using this route.</td>
</tr>
<tr>
<td>Area ID</td>
<td>The area ID of the area from which this route is learned.</td>
</tr>
<tr>
<td>Next Hop</td>
<td>Next hop toward the destination.</td>
</tr>
<tr>
<td>Next Hop Intf</td>
<td>The outgoing router interface to use when forwarding traffic to the next hop.</td>
</tr>
</tbody>
</table>

show ip ospf area

This command displays information about the area. The <areaid> identifies the OSPF area that is being displayed.

Format  show ip ospf area <areaid>
Modes
- Privileged EXEC
- User EXEC
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>AreaID</td>
<td>The area id of the requested OSPF area.</td>
</tr>
<tr>
<td>External Routing</td>
<td>A number representing the external routing capabilities for this area.</td>
</tr>
<tr>
<td>Spf Runs</td>
<td>The number of times that the intra-area route table has been calculated using this area's link-state database.</td>
</tr>
<tr>
<td>Area Border Router Count</td>
<td>The total number of area border routers reachable within this area.</td>
</tr>
<tr>
<td>Area LSA Count</td>
<td>Total number of link-state advertisements in this area's link-state database, excluding AS External LSA's.</td>
</tr>
<tr>
<td>Area LSA Checksum</td>
<td>A number representing the Area LSA Checksum for the specified AreaID excluding the external (LS type 5) link-state advertisements.</td>
</tr>
<tr>
<td>Import Summary LSAs</td>
<td>Shows whether to import summary LSAs.</td>
</tr>
<tr>
<td>OSPF Stub Metric Value</td>
<td>The metric value of the stub area. This field displays only if the area is a configured as a stub area.</td>
</tr>
</tbody>
</table>

The following OSPF NSSA specific information displays only if the area is configured as an NSSA:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Summary LSAs</td>
<td>Shows whether to import summary LSAs into the NSSA.</td>
</tr>
<tr>
<td>Redistribute into NSSA</td>
<td>Shows whether to redistribute information into the NSSA.</td>
</tr>
<tr>
<td>Default Information Originate</td>
<td>Shows whether to advertise a default route into the NSSA.</td>
</tr>
<tr>
<td>Default Metric</td>
<td>The metric value for the default route advertised into the NSSA.</td>
</tr>
<tr>
<td>Default Metric Type</td>
<td>The metric type for the default route advertised into the NSSA.</td>
</tr>
<tr>
<td>Translator Role</td>
<td>The NSSA translator role of the ABR, which is always or candidate.</td>
</tr>
<tr>
<td>Translator Stability Interval</td>
<td>The amount of time that an elected translator continues to perform its duties after it determines that its translator status has been deposed by another router.</td>
</tr>
<tr>
<td>Translator State</td>
<td>Shows whether the ABR translator state is disabled, always, or elected.</td>
</tr>
</tbody>
</table>
**show ip ospf asbr**

This command displays the internal OSPF routing table entries to Autonomous System Boundary Routers (ASBR). This command takes no options.

**Format**

```
show ip ospf asbr
```

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>

<td>Use <code>opaque-link</code> to display link opaque LSAs.</td>
</tr>
<tr>
<td>router</td>
<td>Use <code>router</code> to display router LSAs.</td>
</tr>
<tr>
<td>summary</td>
<td>Use <code>summary</code> to show the LSA database summary information.</td>
</tr>
</tbody>
</table>
ProSafe Managed Switch

Routing Commands

The information below is only displayed if OSPF is enabled.

Format

Mode

• Privileged EXEC
• User EXEC

For each link-type and area, the following information is displayed:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adv Router</td>
<td>The Advertising Router. Is a 32 bit dotted decimal number representing the LSDB interface.</td>
</tr>
<tr>
<td>Age</td>
<td>A number representing the age of the link state advertisement in seconds.</td>
</tr>
<tr>
<td>Sequence</td>
<td>A number that represents which LSA is more recent.</td>
</tr>
<tr>
<td>Checksum</td>
<td>The total number LSA checksum.</td>
</tr>
<tr>
<td>Options</td>
<td>This is an integer. It indicates that the LSA receives special handling during routing calculations.</td>
</tr>
<tr>
<td>Rtr Opt</td>
<td>Router Options are valid for router links only.</td>
</tr>
</tbody>
</table>

show ip ospf database database-summary

Use this command to display the number of each type of LSA in the database for each area and for the router. The command also displays the total number of LSAs in the database.

Format

show ip ospf database database-summary

Modes

• Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router</td>
<td>Total number of router LSAs in the OSPF link state database.</td>
</tr>
<tr>
<td>Network</td>
<td>Total number of network LSAs in the OSPF link state database.</td>
</tr>
<tr>
<td>Summary Net</td>
<td>Total number of summary network LSAs in the database.</td>
</tr>
<tr>
<td>Summary ASBR</td>
<td>Number of summary ASBR LSAs in the database.</td>
</tr>
</tbody>
</table>
show ip ospf interface

This command displays the information for the IFO object or virtual interface tables.

Format  `show ip ospf interface {<unit/slot/port> | loopback <loopback-id> | vlan <1-4093>}`

Mode
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type-7 Ext</td>
<td>Total number of Type-7 external LSAs in the database.</td>
</tr>
<tr>
<td>Self-Originated Type-7</td>
<td>Total number of self originated AS external LSAs in the OSPFv3 link state database.</td>
</tr>
<tr>
<td>Opaque Link</td>
<td>Number of opaque link LSAs in the database.</td>
</tr>
<tr>
<td>Opaque Area</td>
<td>Number of opaque area LSAs in the database.</td>
</tr>
<tr>
<td>Subtotal</td>
<td>Number of entries for the identified area.</td>
</tr>

<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>The IP address for the specified interface.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>A mask of the network and host portion of the IP address for the OSPF interface.</td>
</tr>
<tr>
<td>Secondary IP Address(es)</td>
<td>The secondary IP addresses if any are configured on the interface.</td>
</tr>
<tr>
<td>OSPF Admin Mode</td>
<td>States whether OSPF is enabled or disabled on a router interface.</td>
</tr>
<tr>
<td>OSPF Area ID</td>
<td>The OSPF Area ID for the specified interface.</td>
</tr>
<tr>
<td>OSPF Network Type</td>
<td>The type of network on this interface that the OSPF is running on.</td>
</tr>
<tr>
<td>Router Priority</td>
<td>A number representing the OSPF Priority for the specified interface.</td>
</tr>
<tr>
<td>Retransmit Interval</td>
<td>A number representing the OSPF Retransmit Interval for the specified interface.</td>
</tr>
<tr>
<td>Hello Interval</td>
<td>A number representing the OSPF Hello Interval for the specified interface.</td>
</tr>
<tr>
<td>Dead Interval</td>
<td>A number representing the OSPF Dead Interval for the specified interface.</td>
</tr>
<tr>
<td>LSA Ack Interval</td>
<td>A number representing the OSPF LSA Acknowledgment Interval for the specified interface.</td>
</tr>
<tr>
<td>Transit Delay Interval</td>
<td>A number representing the OSPF Transit Delay for the specified interface.</td>
</tr>
<tr>
<td>Authentication Type</td>
<td>The OSPF Authentication Type for the specified interface are: none, simple, and encrypt.</td>
</tr>
</tbody>
</table>
The information below will only be displayed if OSPF is enabled.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metric Cost</td>
<td>The cost of the OSPF interface.</td>
</tr>
<tr>
<td>Passive Status</td>
<td>Shows whether the interface is passive or not.</td>
</tr>
<tr>
<td>OSPF MTU-ignore</td>
<td>Indicates whether to ignore MTU mismatches in database descriptor packets sent from neighboring routers.</td>
</tr>
</tbody>
</table>

**show ip ospf interface brief**

This command displays brief information for the IFO object or virtual interface tables.

**Format**

`show ip ospf interface brief`

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPF Area ID</td>
<td>The area id of this OSPF interface.</td>
</tr>
<tr>
<td>Area Border Router Count</td>
<td>The total number of area border routers reachable within this area. This is initially zero, and is calculated in each SPF pass.</td>
</tr>
<tr>
<td>AS Border Router Count</td>
<td>The total number of Autonomous System border routers reachable within this area.</td>
</tr>
<tr>
<td>Area LSA Count</td>
<td>The total number of link-state advertisements in this area's link-state database, excluding AS External LSAs.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address associated with this OSPF interface.</td>
</tr>
<tr>
<td>OSPF Interface Events</td>
<td>The number of times the specified OSPF interface has changed its state, or an error has occurred.</td>
</tr>
<tr>
<td>Virtual Events</td>
<td>The number of state changes or errors that occurred on this virtual link.</td>
</tr>
<tr>
<td>Neighbor Events</td>
<td>The number of times this neighbor relationship has changed state, or an error has occurred.</td>
</tr>
<tr>
<td>External LSA Count</td>
<td>The number of external (LS type 5) link-state advertisements in the link-state database.</td>
</tr>
<tr>
<td>Sent Packets</td>
<td>The number of OSPF packets transmitted on the interface.</td>
</tr>
<tr>
<td>Received Packets</td>
<td>The number of valid OSPF packets received on the interface.</td>
</tr>
<tr>
<td>Discards</td>
<td>The number of received OSPF packets discarded because of an error in the packet or an error in processing the packet.</td>
</tr>
<tr>
<td>Bad Version</td>
<td>The number of received OSPF packets whose version field in the OSPF header does not match the version of the OSPF process handling the packet.</td>
</tr>
</tbody>
</table>
The command lists the number of OSPF packets of each type sent and received on the interface.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Not On Local Subnet</td>
<td>The number of received packets discarded because the source IP address is not within a subnet configured on a local interface. Note: This field only applies to OSPFv2.</td>
</tr>
<tr>
<td>Virtual Link Not Found</td>
<td>The number of received OSPF packets discarded where the ingress interface is in a non-backbone area and the OSPF header identifies the packet as belonging to the backbone, but OSPF does not have a virtual link to the packet’s sender.</td>
</tr>
<tr>
<td>Area Mismatch</td>
<td>The number of OSPF packets discarded because the area ID in the OSPF header is not the area ID configured on the ingress interface.</td>
</tr>
<tr>
<td>Invalid Destination Address</td>
<td>The number of OSPF packets discarded because the packet's destination IP address is not the address of the ingress interface and is not the AllDrRouters or AllSpfRouters multicast addresses.</td>
</tr>
<tr>
<td>Wrong Authentication Type</td>
<td>The number of packets discarded because the authentication type specified in the OSPF header does not match the authentication type configured on the ingress interface. Note: This field only applies to OSPFv2.</td>
</tr>
<tr>
<td>Authentication Failure</td>
<td>The number of OSPF packets dropped because the sender is not an existing neighbor or the sender’s IP address does not match the previously recorded IP address for that neighbor. Note: This field only applies to OSPFv2.</td>
</tr>
<tr>
<td>No Neighbor at Source Address</td>
<td>The number of OSPF packets dropped because the sender is not an existing neighbor or the sender’s IP address does not match the previously recorded IP address for that neighbor. Note: Does not apply to Hellos.</td>
</tr>
<tr>
<td>Invalid OSPF Packet Type</td>
<td>The number of OSPF packets discarded because the packet type field in the OSPF header is not a known type.</td>
</tr>
<tr>
<td>Hellos Ignored</td>
<td>The number of received Hello packets that were ignored by this router from the new neighbors after the limit has been reached for the number of neighbors on an interface or on the system as a whole.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Packet Type</th>

<tr>
<td>LS Update</td>
<td>141</td>
<td>42</td>
</tr>
<tr>
<td>LS Acknowledgment</td>
<td>40</td>
<td>135</td>
</tr>
</tbody>
</table>
**show ip ospf neighbor**

This command displays information about OSPF neighbors. If you do not specify a neighbor IP address, the output displays summary information in a table. If you specify an interface or tunnel, only the information for that interface or tunnel displays. The `<ip-address>` is the IP address of the neighbor, and when you specify this, detailed information about the neighbor displays. The information below only displays if OSPF is enabled and the interface has a neighbor.

**Format**

```
show ip ospf neighbor [interface <unit/slot/port>] [<ip-address>]
```

**Modes**

- Privileged EXEC
- User EXEC

If you do not specify an IP address, a table with the following columns displays for all neighbors or the neighbor associated with the interface that you specify:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router ID</td>
<td>The 4-digit dotted-decimal number of the neighbor router.</td>
</tr>
<tr>
<td>Priority</td>
<td>The OSPF priority for the specified interface. The priority of an interface is a priority integer from 0 to 255. A value of '0' indicates that the router is not eligible to become the designated router on this network.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address of the neighbor.</td>
</tr>
<tr>
<td>Neighbor Interface</td>
<td>The interface of the local router in unit/slot/port format.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the neighboring routers. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Down - initial state of the neighbor conversation - no recent information has been received from the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Attempt - no recent information has been received from the neighbor but a more concerted effort should be made to contact the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Init - an Hello packet has recently been seen from the neighbor, but bidirectional communication has not yet been established.</td>
</tr>
<tr>
<td></td>
<td>• 2 way - communication between the two routers is bidirectional.</td>
</tr>
<tr>
<td></td>
<td>• Exchange start - the first step in creating an adjacency between the two neighboring routers, the goal is to decide which router is the master and to decide upon the initial DD sequence number.</td>
</tr>
<tr>
<td></td>
<td>• Exchange - the router is describing its entire link state database by sending Database Description packets to the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Loading - Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.</td>
</tr>
<tr>
<td></td>
<td>• Full - the neighboring routers are fully adjacent and they will now appear in router-LSAs and network-LSAs.</td>
</tr>
<tr>
<td>Dead Time</td>
<td>The amount of time, in seconds, to wait before the router assumes the neighbor is unreachable.</td>
</tr>
</tbody>
</table>
If you specify an IP address for the neighbor router, the following fields display:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Neighbor IP Address</td>
<td>The IP address of the neighbor router.</td>
</tr>
<tr>
<td>Interface Index</td>
<td>The interface ID of the neighbor router.</td>
</tr>
<tr>
<td>Area ID</td>
<td>The area ID of the OSPF area associated with the interface.</td>
</tr>
<tr>
<td>Options</td>
<td>An integer value that indicates the optional OSPF capabilities supported by the neighbor. The neighbor's optional OSPF capabilities are also listed in its Hello packets. This enables received Hello Packets to be rejected (i.e., neighbor relationships will not even start to form) if there is a mismatch in certain crucial OSPF capabilities.</td>
</tr>
<tr>
<td>Router Priority</td>
<td>The OSPF priority for the specified interface. The priority of an interface is a priority integer from 0 to 255. A value of '0' indicates that the router is not eligible to become the designated router on this network.</td>
</tr>
<tr>
<td>Dead Timer Due</td>
<td>The amount of time, in seconds, to wait before the router assumes the neighbor is unreachable.</td>
</tr>
<tr>
<td>Up Time</td>
<td>Neighbor uptime; how long since the adjacency last reached the Full state.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the neighboring routers.</td>
</tr>
<tr>
<td>Events</td>
<td>The number of times this neighbor relationship has changed state, or an error has occurred.</td>
</tr>
<tr>
<td>Retransmission Queue Length</td>
<td>An integer representing the current length of the retransmission queue of the specified neighbor router Id of the specified interface.</td>
</tr>
</tbody>
</table>

The following shows example CLI display output for the command.

(Switch) #show ip ospf neighbor 170.1.1.50

Interface.................................0/17
Neighbor IP Address......................170.1.1.50
Interface Index...........................17
Area Id....................................0.0.0.2
Options......................................0x2
Router Priority...........................1
Dead timer due in (secs)...............15
Up Time.....................................0 days 2 hrs 8 mins 46 secs
State......................................Full/BACKUP-DR
Events......................................4
Retransmission Queue Length............0
**Routing Commands**

**ProSafe Managed Switch**

**show ip ospf range**

This command displays information about the area ranges for the specified `<areaid>`. The `<areaid>` identifies the OSPF area whose ranges are being displayed.

**Format**

```
show ip ospf range <areaid>
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area ID</td>
<td>The area id of the requested OSPF area.</td>
</tr>
<tr>
<td>IP Address</td>
<td>An IP address which represents this area range.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>A valid subnet mask for this area range.</td>
</tr>
<tr>
<td>Lsdb Type</td>
<td>The type of link advertisement associated with this area range.</td>
</tr>
<tr>
<td>Advertisement</td>
<td>The status of the advertisement. Advertisement has two possible settings: enabled or disabled.</td>
</tr>
</tbody>
</table>

**show ip ospf statistics**

This command displays information about recent Shortest Path First (SPF) calculations. The SPF is the OSPF routing table calculation. The output lists the number of times the SPF has run for each OSPF area. A table follows this information. For each of the 15 most recent SPF runs, the table lists how long ago the SPF ran, how long the SPF took, and the reasons why the SPF was scheduled.

**Format**

```
show ip ospf statistics
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delta T</td>
<td>How long ago the SPF ran. The time is in the format hh:mm:ss, giving the hours, minutes, and seconds since the SPF run.</td>
</tr>
<tr>
<td>SPF Duration</td>
<td>How long the SPF took in milliseconds.</td>
</tr>
<tr>
<td>Reason</td>
<td>The reason the SPF was scheduled. Reason codes are as follows:</td>
</tr>
<tr>
<td></td>
<td>• R - a router LSA has changed</td>
</tr>
<tr>
<td></td>
<td>• N - a network LSA has changed</td>
</tr>
<tr>
<td></td>
<td>• SN - a type 3 network summary LSA has changed</td>
</tr>
<tr>
<td></td>
<td>• SA - a type 4 ASBR summary LSA has changed</td>
</tr>
<tr>
<td></td>
<td>• X - a type 5 or type 7 external LSA has changed</td>
</tr>
</tbody>
</table>
**show ip ospf stub table**

This command displays the OSPF stub table. The information below will only be displayed if OSPF is initialized on the switch.

**Format**  
```
show ip ospf stub table
```

**Modes**  
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area ID</td>
<td>A 32-bit identifier for the created stub area.</td>
</tr>
<tr>
<td>Type of Service</td>
<td>The type of service associated with the stub metric. Switch CLI only supports Normal TOS.</td>
</tr>
<tr>
<td>Metric Val</td>
<td>The metric value is applied based on the TOS. It defaults to the least metric of the type of service among the interfaces to other areas. The OSPF cost for a route is a function of the metric value.</td>
</tr>
<tr>
<td>Import Summary LSA</td>
<td>Controls the import of summary LSAs into stub areas.</td>
</tr>
</tbody>
</table>

**show ip ospf traffic**

This command displays OSPFv2 packet and LSA statistics and OSPFv2 message queue statistics. Packet statistics count the packets and LSAs since OSPFv2 counters were last cleared (using the command `clear ip ospf counters`).

---

**Note:** The `clear ip ospf counters` command does not clear the message queue high water marks.

**Format**  
```
show ip ospf traffic
```

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPFv2 Packet Statistics</td>
<td>The number of packets of each type sent and received since OSPF counters were last cleared.</td>
</tr>
<tr>
<td>LSAs Retransmitted</td>
<td>The number of LSAs retransmitted by this router since OSPF counters were last cleared.</td>
</tr>
<tr>
<td>LS Update Max Receive Rate</td>
<td>The maximum rate of LS Update packets received during any 5-second interval since OSPF counters were last cleared. The rate is in packets per second.</td>
</tr>
<tr>
<td>LS Update Max Send Rate</td>
<td>The maximum rate of LS Update packets transmitted during any 5-second interval since OSPF counters were last cleared. The rate is in packets per second.</td>
</tr>
</tbody>
</table>
ProSafe Managed Switch

The following shows example CLI display output for the command.

```
(netgear switch) #show ip ospf traffic

  T4 (ASBR Summary)..............15
  T5 (External)...................20
  T7 (NSSA External)............0
  T9 (Link Opaque)...............0
  T10 (Area Opaque).............0
  T11 (AS Opaque)...............0
  Total..........................345
OSPFv2 Queue Statistics
   Current   Max   Drops   Limit
   Hello     0     10     0     500
   ACK       2     12     0    1680
   Data      24     47     0    500
   Event     1      8     0    1000
```

**show ip ospf virtual-link**

This command displays the OSPF Virtual Interface information for a specific area and neighbor. The `<areaid>` parameter identifies the area and the `<neighbor>` parameter identifies the neighbor's Router ID.

**Format**

```
show ip ospf virtual-link <areaid> <neighbor>
```

**Modes**

- Privileged EXEC
- User EXEC

**Term** | **Definition**
---|---
Area ID | The area id of the requested OSPF area.
Neighbor Router ID | The input neighbor Router ID.
show ip ospf virtual-link brief

This command displays the OSPF Virtual Interface information for all areas in the system.

Format: show ip ospf virtual-link brief

Modes:
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello Interval</td>
<td>The configured hello interval for the OSPF virtual interface.</td>

**OSPF Graceful Restart Commands**

The OSPF protocol can be configured to participate in the checkpointing service, so that these protocols can execute a graceful restart when the management unit fails. In a graceful restart, the hardware to continues forwarding IPv4 packets using OSPF routes, while a backup switch takes over management unit responsibility.

Graceful restart uses the concept of “helpful neighbors.” A fully adjacent router enters helper mode when it receives a link state announcement (LSA) from the restarting management unit indicating its intention of performing a graceful restart. In helper mode, a switch continues to advertise to the rest of the network that they have full adjacencies with the restarting router,
thereby avoiding announcement of a topology change and the potential for flooding of LSAs and shortest-path-first (SPF) runs, which determine OSPF routes. Helpful neighbors continue to forward packets through the restarting router. The restarting router relearns the network topology from its helpful neighbors.

Graceful restart can be enabled for planned or unplanned restarts, or both. A planned restart is initiated by the operator through the management command initiate failover. The operator may initiate a failover to take the management unit out of service (for example, to address a partial hardware failure), to correct faulty system behavior that cannot be corrected through less severe management actions, or other reasons. An unplanned restart is an unexpected failover, caused by a fatal hardware failure of the management unit or a software hang or crash on the management unit.

**nsf**

Use this command to enable the OSPF graceful restart functionality on an interface. To disable graceful restart, use the no form of the command.

**Default** Disabled

**Format** `nsf [ietf] [planned-only]`

**Modes** OSPF Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf</td>
<td>This keyword is accepted but not required.</td>
</tr>
<tr>
<td>planned-only</td>
<td>This optional keyword indicates that OSPF should perform only a graceful restart when the restart is planned (that is, when the restart is a result of the initiate failover command).</td>
</tr>
</tbody>
</table>

**no nsf**

Use this command to disable graceful restart for all restarts.

**Format** `no nsf`

**Modes** OSPF Router Configuration

**nsf restart-interval**

Use this command to configure the number of seconds that the restarting router asks its neighbors to wait before exiting helper mode. This is called the "grace period." The restarting router includes the grace period in its grace LSAs. For planned restarts (using the initiate failover command), the grace LSAs are sent prior to restarting the management unit, whereas for unplanned restarts, they are sent after reboot begins. The grace period must be
Routing Commands

ProSafe Managed Switch

set long enough to allow the restarting router to reestablish all of its adjacencies and complete a full database exchange with each of those neighbors.

Default: 120 seconds

Format: `nsf [ietf] restart-interval <1-1800>`

Modes: OSPF Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf</td>
<td>This keyword is accepted but not required.</td>
</tr>
<tr>
<td>seconds</td>
<td>The number of seconds that the restarting router asks its neighbors to wait before exiting helper mode. The range is from 1 to 1800 seconds.</td>
</tr>
</tbody>
</table>

`no nsf restart-interval`

Use this command to revert the grace period to its default value.

Format: `no [ietf] nsf restart-interval`

Modes: OSPF Router Configuration

`nsf helper`

Use this command to enable helpful neighbor functionality for the OSPF protocol. You can enable this functionality for planned or unplanned restarts, or both.

Default: OSPF may act as a helpful neighbor for both planned and unplanned restarts

Format: `nsf [ietf] helper [planned-only]`

Modes: OSPF Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf</td>
<td>This keyword is accepted but not required.</td>
</tr>
<tr>
<td>planned-only</td>
<td>This optional keyword indicates that OSPF should only help a restarting router performing a planned restart.</td>
</tr>
</tbody>
</table>

`no nsf helper`

Use this command to disable helpful neighbor functionality for OSPF.

Format: `no nsf [ietf] helper`

Modes: OSPF Router Configuration
nsf helper disable

Use this command to disable helpful neighbor functionality for OSPF.

Note: The commands no nsf helper and nsf ietf helper disable are functionally equivalent. The command nsf ietf helper disable is supported solely for compatibility with other network software CLI.

Format: nsf [ietf] helper disable

Modes: OSPF Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf</td>
<td>This keyword is accepted but not required.</td>
</tr>
</tbody>
</table>

nsf [ietf] helper strict-lsa-checking

The restarting router is unable to react to topology changes. In particular, the restarting router will not immediately update its forwarding table; therefore, a topology change may introduce forwarding loops or black holes that persist until the graceful restart completes. By exiting the graceful restart on a topology change, a router tries to eliminate the loops or black holes as quickly as possible by routing around the restarting router. A helpful neighbor considers a link down with the restarting router to be a topology change, regardless of the strict LSA checking configuration. Use this command to require that an OSPF helpful neighbor exit helper mode whenever a topology change occurs.

Default: Enabled

Format: nsf [ietf] helper strict-lsa-checking

Modes: OSPF Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ietf</td>
<td>This keyword is accepted but not required.</td>
</tr>
</tbody>
</table>

no nsf [ietf] helper strict-lsa-checking

Use this command to allow OSPF to continue as a helpful neighbor in spite of topology changes.

Default: Enabled
max-metric router-lsa

To configure OSPF to enter stub router mode, use this command in Router OSPF Global Configuration mode. When OSPF is in stub router mode, as defined by RFC 3137, OSPF sets the metric in the non-stub links in its router LSA to LsInfinity. Other routers therefore compute very long paths through the stub router, and prefer any alternate path. Doing so eliminates all transit traffic through the stub router, when alternate routes are available. Stub router mode is useful when adding or removing a router from a network or to avoid transient routes when a router reloads. You can administratively force OSPF into stub router mode. OSPF remains in stub router mode until you take OSPF out of stub router mode. Alternatively, you can configure OSPF to start in stub router mode for a configurable period of time after the router boots up.

If you set the summary LSA metric to 16,777,215, other routers skip the summary LSA when they compute routes.

If you have configured the router to enter stub router mode on startup (max-metric router-lsa on-startup), and then enter max-metric router lsa, there is no change. If OSPF is administratively in stub router mode (the max-metric router-lsa command has been given), and you configure OSPF to enter stub router mode on startup (max-metric router-lsa on-startup), OSPF exits stub router mode (assuming the startup period has expired) and the configuration is updated.

Default
OSPF is not in stub router mode by default

Format
max-metric router-lsa [on-startup seconds] [summary-lsa {metric}]

Mode
OSPFv2 Router Configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>on-startup</td>
<td>(Optional) OSPF starts in stub router mode after a reboot.</td>
</tr>
<tr>
<td>seconds</td>
<td>(Required if on-startup) The number of seconds that OSPF remains in stub router mode after a reboot. The range is 5 to 86,400 seconds. There is no default value.</td>
</tr>
<tr>
<td>summary-lsa</td>
<td>(Optional) Set the metric in type 3 and type 4 summary LSAs to LsInfinity (0xFFFFFFF).</td>
</tr>
<tr>
<td>metric</td>
<td>(Optional) Metric to send in summary LSAs when in stub router mode. The range is 1 to 16,777,215. The default is 16,711,680 (0xFF0000).</td>
</tr>
</tbody>
</table>

no max-metric router-lsa

Use this command in OSPFv2 Router Configuration mode to disable stub router mode. The command clears either type of stub router mode (always or on-startup) and resets the summary-lsa option. If OSPF is configured to enter global configuration mode on startup, and during normal operation you want to immediately place OSPF in stub router mode, issue

Routing Commands
The command `no max-metric router-lsa on-startup`. The command `no max-metric router-lsa summary-lsa` causes OSPF to send summary LSAs with metrics computed using normal procedures defined in RFC 2328.

**Format**
```
no max-metric router-lsa [on-startup] [summary-lsa]
```

**Mode**
OSPFv2 Router Configuration

### OSPF Interface Flap Dampening Commands

**Dampening**

Use this command to enable IP event dampening on a routing interface.

**Format**
```
dampening [half-life period] [reuse-threshold suppress-threshold max-suppress-time [restart restart-penalty]]
```

**Mode**
Interface Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Half-life period</td>
<td>The number of seconds it takes for the penalty to reduce by half. The configurable range is 1-30 seconds. Default value is 5 seconds.</td>
</tr>
<tr>
<td>Reuse Threshold</td>
<td>The value of the penalty at which the dampened interface is restored. The configurable range is 1-20,000. Default value is 1000.</td>
</tr>
<tr>
<td>Suppress Threshold</td>
<td>The value of the penalty at which the interface is dampened. The configurable range is 1-20,000. Default value is 2000.</td>
</tr>
<tr>
<td>Max Suppress Time</td>
<td>The maximum amount of time (in seconds) an interface can be in suppressed state after it stops flapping. The configurable range is 1-255 seconds. The default value is four times of half-life period. If half-period value is allowed to default, the maximum suppress time defaults to 20 seconds.</td>
</tr>
<tr>
<td>Restart Penalty</td>
<td>Penalty applied to the interface after the device reloads. The configurable range is 1-20,000. Default value is 2000.</td>
</tr>
</tbody>
</table>

**no dampening**

This command disables IP event dampening on a routing interface.

**Format**
```
no dampening
```

**Mode**
Interface Config
**show dampening interface**

This command summarizes the number of interfaces configured with dampening and the number of interfaces being suppressed.

**Format**

```plaintext
show dampening interface
```

**Mode**

Privileged EXEC

The following shows example CLI display output for the command.

```
(netgear switch)# show dampening interface
2 interfaces are configured with dampening.
1 interface is being suppressed.
```

**show interface dampening**

This command displays the status and configured parameters of the interfaces configured with dampening.

**Format**

```plaintext
show interface dampening
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flaps</td>
<td>The number times the link state of an interface changed from UP to DOWN.</td>
</tr>
<tr>
<td>Penalty</td>
<td>Accumulated Penalty.</td>
</tr>
<tr>
<td>Supp</td>
<td>Indicates whether the interface is suppressed or not.</td>
</tr>
<tr>
<td>ReuseTm</td>
<td>Number of seconds until the interface is allowed to come up again.</td>
</tr>
<tr>
<td>HalfL</td>
<td>Configured half-life period.</td>
</tr>
<tr>
<td>ReuseV</td>
<td>Configured reuse-threshold.</td>
</tr>
<tr>
<td>SuppV</td>
<td>Configured suppress threshold.</td>
</tr>
<tr>
<td>MaxSTm</td>
<td>Configured maximum suppress time in seconds.</td>
</tr>
<tr>
<td>MaxPenalty</td>
<td>Maximum possible penalty.</td>
</tr>
<tr>
<td>Restart</td>
<td>Configured restart penalty.</td>
</tr>
</tbody>
</table>

**Note:** The CLI command `clear counters` resets the flap count to zero.

The interface CLI command `no shutdown` resets the suppressed state to False.
Any change in the dampening configuration resets the current penalty, reuse time, and suppressed state to their default values, meaning 0, 0, and FALSE respectively.

The following shows example CLI display output for the command.

```
(netgear switch)# show interface dampening
Interface 0/2
  Flaps  Penalty  Supp  ReuseTm  HalfL  ReuseV  SuppV  MaxSTm  MaxP  Restart

  6     1865      TRUE    18     20      1000    2001    30     2828    1500
```

Routing Information Protocol (RIP) Commands

This section describes the commands you use to view and configure RIP, which is a distance-vector routing protocol that you use to route traffic within a small network.

`router rip`  
Use this command to enter Router RIP mode.

```
Format        router rip
Mode          Global Config
```

`enable (RIP)`  
This command resets the default administrative mode of RIP in the router (active).

```
Default        enabled
Format        enable
Mode          Router RIP Config
```

`no enable (RIP)`  
This command sets the administrative mode of RIP in the router to inactive.

```
Format        no enable
Mode          Router RIP Config
```
**ip rip**

This command enables RIP on a router interface.

Default: disabled

Format: ip rip

Mode: Interface Config

**no ip rip**

This command disables RIP on a router interface.

Format: no ip rip

Mode: Interface Config

**auto-summary**

This command enables the RIP auto-summarization mode.

Default: disabled

Format: auto-summary

Mode: Router RIP Config

**no auto-summary**

This command disables the RIP auto-summarization mode.

Format: no auto-summary

Mode: Router RIP Config

**default-information originate (RIP)**

This command is used to control the advertisement of default routes.

Format: default-information originate

Mode: Router RIP Config

**no default-information originate (RIP)**

This command is used to control the advertisement of default routes.

Format: no default-information originate

Mode: Router RIP Config
**default-metric (RIP)**

This command is used to set a default for the metric of distributed routes.

*Format*  
default-metric <0-15>

*Mode*  
Router RIP Config

**no default-metric (RIP)**

This command is used to reset the default metric of distributed routes to its default value.

*Format*  
no default-metric

*Mode*  
Router RIP Config

**distance rip**

This command sets the route preference value of RIP in the router. Lower route preference values are preferred when determining the best route. A route with a preference of 255 cannot be used to forward traffic.

*Default*  
15

*Format*  
distance rip <1-255>

*Mode*  
Router RIP Config

**no distance rip**

This command sets the default route preference value of RIP in the router.

*Format*  
no distance rip

*Mode*  
Router RIP Config

**distribute-list out (RIP)**

This command is used to specify the access list to filter routes received from the source protocol.

*Default*  
0

*Format*  
distribute-list <1-199> out {ospf | static | connected}

*Mode*  
Router RIP Config
**no distribute-list out**

This command is used to specify the access list to filter routes received from the source protocol.

**Format**

```
no distribute-list <1-199> out {ospf | static | connected}
```

**Mode**

Router RIP Config

**ip rip authentication**

This command sets the RIP Version 2 Authentication Type and Key for the specified interface. The value of `<type>` is either `none`, `simple`, or `encrypt`. The value for authentication key `<key>` must be 16 bytes or less. The `<key>` is composed of standard displayable, non-control keystrokes from a Standard 101/102-key keyboard. If the value of `<type>` is `encrypt`, a keyid in the range of 0 and 255 must be specified. Unauthenticated interfaces do not need an authentication key or authentication key ID.

**Default**

`none`

**Format**

```
ip rip authentication {none | {simple <key>} | {encrypt <key> <keyid>}}
```

**Mode**

Interface Config

**no ip rip authentication**

This command sets the default RIP Version 2 Authentication Type for an interface.

**Format**

```
no ip rip authentication
```

**Mode**

Interface Config

**ip rip receive version**

This command configures the interface to allow RIP control packets of the specified version(s) to be received.

The value for `<mode>` is one of: `rip1` to receive only RIP version 1 formatted packets, `rip2` for RIP version 2, `both` to receive packets from either format, or `none` to not allow any RIP control packets to be received.

**Default**

`both`

**Format**

```
ip rip receive version {rip1 | rip2 | both | none}
```

**Mode**

Interface Config
no ip rip receive version

This command configures the interface to allow RIP control packets of the default version(s) to be received.

Format: no ip rip receive version
Mode: Interface Config

ip rip send version

This command configures the interface to allow RIP control packets of the specified version to be sent. The value for <mode> is one of: rip1 to broadcast RIP version 1 formatted packets, rip1c (RIP version 1 compatibility mode) which sends RIP version 2 formatted packets via broadcast, rip2 for sending RIP version 2 using multicast, or none to not allow any RIP control packets to be sent.

Default: rip1
Format: ip rip send version {rip1 | rip1c | rip2 | none}
Mode: Interface Config

no ip rip send version

This command configures the interface to allow RIP control packets of the default version to be sent.

Format: no ip rip send version
Mode: Interface Config

hostroutesaccept

This command enables the RIP hostroutesaccept mode.

Default: enabled
Format: hostroutesaccept
Mode: Router RIP Config

no hostroutesaccept

This command disables the RIP hostroutesaccept mode.

Format: no hostroutesaccept
Mode: Router RIP Config
**split-horizon**

This command sets the RIP split horizon mode. Split horizon is a technique for avoiding problems caused by including routes in updates sent to the router from which the route was originally learned. The options are: None - no special processing for this case. Simple - a route will not be included in updates sent to the router from which it was learned. Poisoned reverse - a route will be included in updates sent to the router from which it was learned, but the metric will be set to infinity.

**Default**

```
simple
```

**Format**

```
split-horizon {none | simple | poison}
```

**Mode**

```
Router RIP Config
```

**no split-horizon**

This command sets the default RIP split horizon mode.

**Format**

```
no split-horizon
```

**Mode**

```
Router RIP Config
```

**redistribute (RIP)**

This command configures RIP protocol to redistribute routes from the specified source protocol/routers. There are five possible match options. When you submit the command redistribute ospf match <match-type> the match-type or types specified are added to any match types presently being redistributed. Internal routes are redistributed by default.

**Default**

```
• metric—not-configured
• match—internal
```

**Format for OSPF as source protocol**

```
redistribute ospf [metric <0-15>] [match [internal] [external 1]
[external 2] [nssa-external 1] [nssa-external-2]]
```

**Format for other source protocol**

```
redistribute [static | connected] [metric <0-15>]
```

**Mode**

```
Router RIP Config
```

**no redistribute**

This command de-configures RIP protocol to redistribute routes from the specified source protocol/routers.

**Format**

```
no redistribute {ospf | static | connected} [metric] [match
[internal] [external 1] [external 2] [nssa-external 1]
[nssa-external-2]]
```

**Mode**

```
Router RIP Config
```
**show ip rip**

This command displays information relevant to the RIP router.

**Format**

`show ip rip`

**Modes**

- Privileged EXEC
- User EXEC

no ip icmp echo-reply

Use this command to prevent the generation of ICMP Echo Reply messages by the router.

**Format**

no ip icmp echo-reply

**Mode**

Global Config

ip icmp error-interval

Use this command to limit the rate at which IPv4 ICMP error messages are sent. The rate limit is configured as a token bucket, with two configurable parameters, `burst-size` and `burst-interval`.

The `burst-interval` specifies how often the token bucket is initialized with `burst-size` tokens. `burst-interval` is from 0 to 2147483647 milliseconds (msec).

The `burst-size` is the number of ICMP error messages that can be sent during one `burst-interval`. The range is from 1 to 200 messages.

To disable ICMP rate limiting, set `burst-interval` to zero (0).

**Default**

- `burst-interval` of 1000 msec.
- `burst-size` of 100 messages

**Format**

ip icmp error-interval `<burst-interval>` [`<burst-size>`]

**Mode**

Global Config

no ip icmp error-interval

Use the `no` form of the command to return `burst-interval` and `burst-size` to their default values.

**Format**

no ip icmp error-interval

**Mode**

Global Config
This chapter describes the IP Multicast commands available in the managed switch CLI.

**Note:** Some commands described in this chapter require a license. For more information, see *Licensing and Command Support* on page 8.

This chapter contains the following sections:

- Multicast Commands
- DVMRP Commands
- PIM Commands
- Internet Group Message Protocol (IGMP) Commands
- IGMP Proxy Commands

The commands in this chapter are in two functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.

### Multicast Commands

This section describes the commands you use to configure IP Multicast and to view IP Multicast settings and statistics.

#### ip mcast boundary

This command adds an administrative scope multicast boundary specified by `<groupipaddr>` and `<mask>` for which this multicast administrative boundary is applicable. `<groupipaddr>` is a group IP address and `<mask>` is a group IP mask.

**Format**

```
ip mcast boundary <groupipaddr> <mask>
```

**Mode**

Interface Config
no ip mcast boundary

This command deletes an administrative scope multicast boundary specified by 
<groupipaddr> and <mask> for which this multicast administrative boundary is applicable.  
<groupipaddr> is a group IP address and <mask> is a group IP mask.

Format        no ip mcast boundary <groupipaddr> <mask>
Mode          Interface Config

ip multicast

This command sets the administrative mode of the IP multicast forwarder in the router to 
active.

Default       disabled
Format        ip multicast
Mode          Global Config

no ip multicast

This command sets the administrative mode of the IP multicast forwarder in the router to 
inactive.

Format        no ip multicast
Mode          Global Config

ip multicast ttl-threshold

This command is specific to IPv4. Use this command to apply the given Time-to-Live 
threshold value <ttlthreshold> to a routing interface. The <ttlthreshold> is the TTL 
threshold which is to be applied to the multicast Data packets which are to be forwarded from 
the interface. This command sets the Time-to-Live threshold value such that any data 
packets forwarded over the interface having TTL value below the configured value are 
dropped. The value for <ttlthreshold> ranges from 0 to 255.

Default       1
Format        ip multicast ttl-threshold <ttlvalue>
Mode          Interface Config
no ip multicast ttl-threshold

This command applies the default <ttlthreshold> to a routing interface. The <ttlthreshold> is the TTL threshold which is to be applied to the multicast Data packets which are to be forwarded from the interface.

Format  no ip multicast ttl-threshold
Mode    Interface Config

ip mroute

This command configures an IPv4 Multicast Static Route for a Source.

src-addr is Source IP address of a multicast source or source IP route prefix.
src-mask is Mask associated with the source IP address or source IP route prefix.
rpf-addr is IP address to be used as the RPF address. The interface associated with this IP address, thus, is used as the incoming interface for the mroute.
preference is Administrative distance for the mroute. The lower values have better preference. If the static mroute has the same distance as the other RPF sources, the static mroute will take precedence. The range is from 0 to 255. The default is 0.

Default  No MRoute is configured on the system
Format    ip mroute <src-addr> <src-mask> <rpf-addr> <preference>
Mode      Global Config

no ip mroute

This command removes the configured IP Multicast Static Route.

Format  noip mroute <src-addr>
Mode    Global Config

show ip mcast

This command displays the system-wide multicast information.

Format  show ip mcast
Modes   • Privileged EXEC
        • User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>The administrative status of multicast. Possible values are enabled or disabled.</td>
</tr>
<tr>
<td>Protocol State</td>
<td>The current state of the multicast protocol. Possible values are Operational or Non-Operational.</td>
</tr>
</tbody>
</table>
### IP Multicast Commands

#### show ip mcast boundary

This command displays all the configured administrative scoped multicast boundaries.

**Format**

```
show ip mcast boundary {<unit/slot/port> | all}
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Table Max Size</td>
<td>The maximum number of entries allowed in the multicast table.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast protocol running on the router. Possible values are PIM-DM, PIM-SM, or DVMRP.</td>
</tr>
<tr>
<td>Multicast Forwarding Cache Entry Count</td>
<td>The number of entries in the multicast forwarding cache.</td>
</tr>
</tbody>
</table>

#### show ip mcast interface

This command displays the multicast information for the specified interface.

**Format**

```
show ip mcast interface <unit/slot/port>
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Group Ip</td>
<td>The group IP address.</td>
</tr>
<tr>
<td>Mask</td>
<td>The group IP mask.</td>
</tr>
<tr>
<td>TTL</td>
<td>The time-to-live value for this interface.</td>
</tr>
</tbody>
</table>

#### show ip mcast mroute

This command displays a summary or all the details of the multicast table.

**Format**

```
show ip mcast mroute {detail | summary}
```

**Modes**

- Privileged EXEC
- User EXEC
If you use the `detail` parameter, the command displays the following fields:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The time of expiry of this entry in seconds.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time elapsed since the entry was created in seconds.</td>
</tr>
<tr>
<td>RPF Neighbor</td>
<td>The IP address of the RPF neighbor.</td>
</tr>
<tr>
<td>Flags</td>
<td>The flags associated with this entry.</td>
</tr>
</tbody>
</table>

If you use the `summary` parameter, the command displays the following fields:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast routing protocol by which the entry was created.</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>The interface on which the packet for the source/group arrives.</td>
</tr>
<tr>
<td>Outgoing Interface List</td>
<td>The list of outgoing interfaces on which the packet is forwarded.</td>
</tr>
</tbody>
</table>

### show ip mcast mroute group

This command displays the multicast configuration settings such as flags, timer settings, incoming and outgoing interfaces, RPF neighboring routers, and expiration times of all the entries in the multicast mroute table containing the given `<groupipaddr>`.

**Format**

```
show ip mcast mroute group <groupipaddr> {detail |summary}
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast routing protocol by which this entry was created.</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>The interface on which the packet for this group arrives.</td>
</tr>
<tr>
<td>Outgoing Interface List</td>
<td>The list of outgoing interfaces on which this packet is forwarded.</td>
</tr>
</tbody>
</table>
show ip mcast mroute source

This command displays the multicast configuration settings such as flags, timer settings, incoming and outgoing interfaces, RPF neighboring routers, and expiration times of all the entries in the multicast mroute table containing the given source IP address or source IP address and group IP address pair.

Format

show ip mcast mroute source <sourceipaddr> {summary | detail}

Modes

- Privileged EXEC
- User EXEC

If you use the detail parameter, the command displays the following column headings in the output table:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The time of expiry of this entry in seconds.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time elapsed since the entry was created in seconds.</td>
</tr>
<tr>
<td>RPF Neighbor</td>
<td>The IP address of the RPF neighbor.</td>
</tr>
<tr>
<td>Flags</td>
<td>The flags associated with this entry.</td>
</tr>
</tbody>
</table>

If you use the summary parameter, the command displays the following column headings in the output table:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast routing protocol by which this entry was created.</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>The interface on which the packet for this source arrives.</td>
</tr>
<tr>
<td>Outgoing Interface List</td>
<td>The list of outgoing interfaces on which this packet is forwarded.</td>
</tr>
</tbody>
</table>

DVMRP Commands

This section provides a detailed explanation of the Distance Vector Multicast Routing Protocol (DVMRP) commands.
**ip dvmrp (Global Config)**

This command sets administrative mode of DVMRP in the router to active.

**Default**

disabled

**Format**

ip dvmrp

**Mode**

Global Config

**no ip dvmrp (Global Config)**

This command sets administrative mode of DVMRP in the router to inactive.

**Format**

no ip dvmrp

**Mode**

Global Config

**ip dvmrp metric**

This command configures the metric for an interface. This value is used in the DVMRP messages as the cost to reach this network. This field has a range of 1 to 31.

**Default**

1

**Format**

ip dvmrp metric <metric>

**Mode**

Interface Config

**no ip dvmrp metric**

This command resets the metric for an interface to the default value. This value is used in the DVMRP messages as the cost to reach this network.

**Format**

no ip dvmrp metric

**Mode**

Interface Config

**ip dvmrp trapflags**

This command enables the DVMRP trap mode.

**Default**

disabled

**Format**

ip dvmrp trapflags

**Mode**

Global Config
no ip dvmrp trapflags

This command disables the DVMRP trap mode.

**Format**  
no ip dvmrp trapflags

**Mode**  
Global Config

ip dvmrp

This command sets the administrative mode of DVMRP on an interface to active.

**Default**  
disabled

**Format**  
ip dvmrp

**Mode**  
Interface Config

no ip dvmrp

This command sets the administrative mode of DVMRP on an interface to inactive.

**Format**  
no ip dvmrp

**Mode**  
Interface Config

show ip dvmrp

This command displays the system-wide information for DVMRP.

**Format**  
show ip dvmrp

**Modes**  
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>Indicates whether DVMRP is enabled or disabled.</td>
</tr>
<tr>
<td>Version</td>
<td>The version of DVMRP being used.</td>
</tr>
<tr>
<td>Total Number of Routes</td>
<td>The number of routes in the DVMRP routing table.</td>
</tr>
<tr>
<td>Reachable Routes</td>
<td>The number of entries in the routing table with non-infinite metrics.</td>
</tr>
</tbody>
</table>

The following fields are displayed for each interface.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
</tbody>
</table>
**show ip dvmrp interface**

This command displays the interface information for DVMRP on the specified interface.

**Format**

```
show ip dvmrp interface <unit/slot/port>
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface-Mode</td>
<td>The mode of this interface. Possible values are Enabled and Disabled.</td>
</tr>
<tr>
<td>Operational-status</td>
<td>The current state of DVMRP on this interface. Possible values are Operational or Non-Operational.</td>
</tr>
</tbody>
</table>

The following field is displayed only when DVMRP is operational on the interface.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generation ID</td>
<td>The Generation ID value for the interface. This is used by the neighboring routers to detect that the DVMRP table should be resent.</td>
</tr>
</tbody>
</table>

The following fields are displayed only if DVMRP is enabled on this interface.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received Bad Packets</td>
<td>The number of invalid packets received.</td>
</tr>
<tr>
<td>Received Bad Routes</td>
<td>The number of invalid routes received.</td>
</tr>
<tr>
<td>Sent Routes</td>
<td>The number of routes that have been sent on this interface.</td>
</tr>
</tbody>
</table>

**show ip dvmrp neighbor**

This command displays the neighbor information for DVMRP.

**Format**

```
show ip dvmrp neighbor
```

**Modes**

- Privileged EXEC
- User EXEC
This command displays the next hop information on outgoing interfaces for routing multicast datagrams.

**Format**    
```
show ip dvmrp nexthop
```

**Modes**  
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The sources for which this entry specifies a next hop on an outgoing interface.</td>
</tr>
<tr>
<td>Source Mask</td>
<td>The IP Mask for the sources for which this entry specifies a next hop on an outgoing interface.</td>
</tr>
<tr>
<td>Next Hop Interface</td>
<td>The interface in unit/slot/port format for the outgoing interface for this next hop.</td>
</tr>
<tr>
<td>Type</td>
<td>The network is a LEAF or a BRANCH.</td>
</tr>
</tbody>
</table>
**show ip dvmrp prune**

This command displays the table listing the router’s upstream prune information.

**Format**

```
show ip dvmrp prune
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group IP</td>
<td>The multicast Address that is pruned.</td>
</tr>
<tr>
<td>Source IP</td>
<td>The IP address of the source that has pruned.</td>
</tr>
<tr>
<td>Source Mask</td>
<td>The network Mask for the prune source. It should be all 1s or both the prune source and prune mask must match.</td>
</tr>
<tr>
<td>Expiry Time (secs)</td>
<td>The expiry time in seconds. This is the time remaining for this prune to age out.</td>
</tr>
</tbody>
</table>

**show ip dvmrp route**

This command displays the multicast routing information for DVMRP.

**Format**

```
show ip dvmrp route
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>The multicast address of the source group.</td>
</tr>
<tr>
<td>Source Mask</td>
<td>The IP Mask for the source group.</td>
</tr>
<tr>
<td>Upstream Neighbor</td>
<td>The IP address of the neighbor which is the source for the packets for a specified multicast address.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface used to receive the packets sent by the sources.</td>
</tr>
<tr>
<td>Metric</td>
<td>The distance in hops to the source subnet. This field has a different meaning than the Interface Metric field.</td>
</tr>
<tr>
<td>Expiry Time (secs)</td>
<td>The expiry time in seconds, which is the time left for this route to age out.</td>
</tr>
<tr>
<td>Up Time (secs)</td>
<td>The time when a specified route was learnt, in seconds.</td>
</tr>
</tbody>
</table>

**PIM Commands**

This section describes the commands you use to configure Protocol Independent Multicast (PIM). PIM is a multicast routing protocol that provides scalable inter-domain multicast
routing across the Internet, independent of the mechanisms provided by any particular unicast routing protocol.

**ip pim dense (Global Config)**

This command enables the administrative mode of PIM-DM in the router.

- **Default**: Disabled
- **Format**: `ip pim dense`
- **Mode**: Global Config

**no ip pim dense (Global Config)**

This command disables the administrative mode of PIM-DM in the router.

- **Format**: `no ip pim dense`
- **Mode**: Global Config

**ip pim (Interface Config)**

This command sets administrative mode of PIM on an interface to enabled.

- **Default**: disabled
- **Format**: `ip pim`
- **Mode**: Interface Config

**no ip pim (Interface Config)**

This command sets administrative mode of PIM on an interface to disabled.

- **Format**: `no ip pim`
- **Mode**: Interface Config

**ip pim hello-interval**

This command configures the transmission frequency of PIM Hello messages between PIM enabled neighbors. This field has a range of 0 to 18000 seconds.

- **Default**: 30
- **Format**: `ip pim hello-interval <0-18000>`
- **Mode**: Interface Config
no ip pim hello-interval

This command resets the transmission frequency of hello messages between PIM enabled neighbors to its default value.

Format        no ip pim hello-interval
Mode          Interface Config

show ip pim interface

This command displays the PIM Interface status parameters. If the interface number is not specified, this command displays the status parameters of all the PIM enabled interfaces.

Format        show ip pim interface <unit/slot/port>
Modes         Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Active PIM protocol</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface number.</td>
</tr>
<tr>
<td>Hello Interval</td>
<td>Hello interval value. The frequency at which PIM hello messages are transmitted on this interface. By default, the value is 30 seconds.</td>
</tr>
<tr>
<td>Join-prune Interval</td>
<td>Join-prune interval value.</td>
</tr>
<tr>
<td>DR Priority</td>
<td>DR Priority configured on this Interface. This is not applicable if the interface mode is Dense</td>
</tr>
<tr>
<td>BSR Border</td>
<td>Is this interface configured as a BSR Border?</td>
</tr>
<tr>
<td>Neighbor Count</td>
<td>Number of PIM Neighbors learnt on this interface. This field is displayed only when the interface is operational.</td>
</tr>
<tr>
<td>Designated Router</td>
<td>IP Address of the elected DR on the Interface. This field is displayed only when the interface is operational.</td>
</tr>
</tbody>
</table>

Example 1:
(Switch) #show ip pim interface
Interface 1/0/1
Mode Sparse
Hello Interval (secs) 30
Join Prune Interval (secs) 60
DR Priority 1
BSR Border Disabled
Neighbor Count 1
Designated Router 192.168.10.1

Example 2:
(Switch) #show ip pim interface
Interface 1/0/1
Mode Dense
Hello Interval (secs) 30
Join Prune Interval (secs) 60
DR Priority NA
BSR Border Disabled
Neighbor Count 1
Designated Router NA

show ip pim neighbor

This command displays the neighbor information for PIM on the specified interface.

Format  
Modes  

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor Address</td>
<td>The IP address of the PIM neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface number. Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>UpTime</td>
<td>The time since this neighbor has become active on this interface.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>Time remaining for the neighbor to expire.</td>
</tr>
<tr>
<td>DR Priority</td>
<td>DR Priority configured on this Interface [ PIM -SM only ]</td>
</tr>
</tbody>
</table>

(Switch) #show ip pim neighbor 1/0/1
Neighbor Addr Interface Uptime Expiry Time DR
(hh:mm:ss) (hh:mm:ss) Priority
--------------- -------------- ----------- ----------- --------
192.168.10.2 1/0/1 00:02:55 00:01:15 NA
(Switch) #show ip pim neighbor
Neighbor Addr Interface Uptime Expiry Time DR
(hh:mm:ss) (hh:mm:ss) Priority
--------------- -------------- ----------- ----------- --------
192.168.10.2 1/0/1 00:02:55 00:01:15 1
192.168.20.2 1/0/2 00:03:50 00:02:10 1

ip pim sparse (Global Config)

This command is used to administratively enable PIM Sparse Mode (PIM-SM) multicast routing mode on the router.

Default  
Format  
Mode  

disabled
ip pim sparse
Global Config
no ip pim sparse (Global Config)

This command is used to administratively disable PIM-SM multicast routing mode on the router.

Format: no ip pim sparse
Mode: Global Config

ip pim bsr-border

Use this command to prevent bootstrap router (BSR) messages from being sent or received through an interface.

Default: disabled
Format: ip pim bsr-border
Mode: Interface Config

no ip pim bsr-border

Use this command to disable the interface from being the BSR border.

Format: no ip pim bsr-border
Mode: Interface Config

ip pim bsr-candidate

This command is used to configure the router to announce its candidacy as a bootstrap router (BSR).

Format: ip pim bsr-candidate interface [vlan | <unit/slot/port>] <hash-mask length> <bsr-priority> [interval <interval>]
Mode: Global Config

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash-mask length</td>
<td>Length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash correspond to the same RP. For example, if this value was 24, only the first 24 bits of the group addresses matter. This allows you to get one RP for multiple groups.</td>
</tr>
<tr>
<td>bar-priority</td>
<td>Priority of the candidate BSR. The range is an integer from 0 to 255. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The default value is 0.</td>
</tr>
<tr>
<td>interval</td>
<td>The C-BSR advertisement interval. If the interval values are reduced from the default value of 60 seconds, there could be issues in the network (especially BSR) due to flooding of these packets. However, it will provide RP fast failover.</td>
</tr>
</tbody>
</table>
no ip pim bsr-candidate

This command is used to disable the router to announce its candidacy as a bootstrap router (BSR).

Format: no ip pim bsr-candidate interface [vlan | <unit/slot/port>]
Mode: Global Config

ip pim dr-priority

Use this command to set the priority value for which a router is elected as the designated router (DR).

Default: 1
Format: ip pim dr-priority <0-2147483647>
Mode: Interface Config

no ip pim dr-priority

Use this command to disable the interface from being the BSR border.

Format: no ip pim dr-priority
Mode: Interface Config

ip pim join-prune-interval

This command is used to configure the interface join/prune interval for the PIM router. The join/prune interval is specified in seconds. This parameter can be configured to a value from 0 to 18000.

Default: 60
Format: ip pim join-prune-interval <0-18000>
Mode: Interface Config

no ip pim join-prune-interval

Use this command to set the join/prune interval to the default value.

Format: no ip pim join-prune-interval
Mode: Interface Config

ip pim rp-address

This command is used to statically configure the RP address for one or more multicast groups. The parameter <rp-address> is the IP address of the RP. The parameter
<groupaddress> is the group address supported by the RP. The parameter <groupmask> is the group mask for the group address. The optional keyword override indicates that if there is a conflict, the RP configured with this command prevails over the RP learned by BSR.

Default: disabled

Format: ip pim rp-address <rp-address> <group-address> <group-mask> [override]

Mode: Global Config

**no ip pim rp-address**

This command is used to statically remove the RP address for one or more multicast groups.

Format: no ip pim rp-address <rp-address> <group-address> <group-mask> [override]

Mode: Global Config

**ip pim rp-candidate**

This command is used to configure the router to advertise itself as a PIM candidate rendezvous point (RP) to the bootstrap router (BSR).

Format: ip pim rp-candidate interface <interface-num> <group-address> <group-mask> {interval <interval>}

Mode: Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-num</td>
<td>The IP address associated with this interface type and number is advertised as a candidate RP address. This interface must be enabled with PIM.</td>
</tr>
<tr>
<td>group-address,</td>
<td>The multicast group address and prefix that are advertised in association with the RP address.</td>
</tr>
<tr>
<td>group-mask</td>
<td>(Optional) Indicates the RP candidate advertisement interval. The range is from 1 to 16383 seconds. The default is 60 seconds.</td>
</tr>
</tbody>
</table>

**no ip pim rp-candidate**

This command is used to disable the router to advertise itself as a PIM candidate rendezvous point (RP) to the bootstrap router (BSR).

Format: no ip pim rp-candidate interface <interface-num>

Mode: Global Config
**ip pim ssm**

Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses.

**Default**

disabled

**Format**

`ip pim ssm {default | <group-address> <group-mask>}`

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default-range</td>
<td>Defines the SSM range access list to 232/8.</td>
</tr>
</tbody>
</table>

**no ip pim ssm**

This command is used to disable the Source Specific Multicast (SSM) range.

**Format**

`no ip pim ssm {default | <group-address> <group-mask>}`

**Mode**

Global Config

**ip pim-trapflags**

This command enables the PIM trap mode for both Sparse Mode (SM) and Dense Mode (DM).

**Default**

disabled

**Format**

`ip pim-trapflags`

**Mode**

Global Config

**no ip pim-trapflags**

This command sets the PIM trap mode to the default.

**Format**

`no ip pim-trapflags`

**Mode**

Global Config

**show ip pim**

This command displays the system-wide information for PIM (global configuration mode and interface status).

**Format**

`show ip pim`

**Modes**

Privileged EXEC
### IP Multicast Commands

#### ProSafe Managed Switch

<table>
<thead>
<tr>

<tr>
<td>Interface</td>
<td>Interface number.</td>
</tr>
<tr>
<td>Interface-Mode</td>
<td>Enable status of the interface.</td>
</tr>
<tr>
<td>Operational-Status</td>
<td>Operational Status of the Interface.</td>
</tr>
</tbody>
</table>

**Example 1:**

(Switch) `#show ip pim`  
PIM Mode Dense

<table>
<thead>
<tr>
<th>Interface</th>
<th>Interface-Mode</th>
<th>Operational-Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/0/1</td>
<td>Enabled</td>
<td>Operational</td>
</tr>
<tr>
<td>1/0/3</td>
<td>Disabled</td>
<td>Non-Operational</td>
</tr>
</tbody>
</table>

**Example 2:**

(Switch) `#show ip pim`  
PIM Mode Sparse

<table>
<thead>
<tr>
<th>Interface</th>
<th>Interface-Mode</th>
<th>Operational-Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/0/1</td>
<td>Enabled</td>
<td>Operational</td>
</tr>
<tr>
<td>1/0/3</td>
<td>Disabled</td>
<td>Non-Operational</td>
</tr>
</tbody>
</table>

**show ip pim ssm**

This command shows the configured source specific IP multicast addresses.

**Format**  
`show ip pim ssm`

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Address</td>
<td>The address of the SSM Group.</td>
</tr>
<tr>
<td>Prefix Length</td>
<td>Prefix Length of the SSM Group.</td>
</tr>
</tbody>
</table>

(Switch) `#show ip pim ssm`  
Group Address/Prefix Length

```
232.0.0.0/8
```
show ip pim bsr-router

This command displays the bootstrap router (BSR) information. The output includes elected BSR information and information about the locally configured candidate rendezvous point (RP) advertisement.

**Format**

```
show ip pim bsr-router [candidate | elected]
```

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSR Address</td>
<td>IP address of the BSR.</td>
</tr>
<tr>
<td>BSR Priority</td>
<td>For candidate it is the configured priority and for elected BSR it is the learned priority.</td>
</tr>
<tr>
<td>BSR Hash Mask Length</td>
<td>Configured or learned hash mask length of the BSR.</td>

Next Candidate RP Advertisement (hh:mm:ss) 00:00:02

show ip pim rp-hash

This command displays the rendezvous point selected for the specified group address.

**Format**

```
show ip pim rp-hash <group-address>
```

**Modes**

- Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP Address</td>
<td>Address of the RP for the group specified.</td>
</tr>
<tr>
<td>Type</td>
<td>Origin from where this group mapping is learned.</td>
</tr>
</tbody>
</table>

(Switch) # show ip pim rp-hash 224.1.2.0
RP Address 192.168.10.1
Type Static
show ip pim rp mapping

This command displays the mappings for the PIM group to the active rendezvous points.

Format
show ip pim rp mapping [rp address] | candidate | static]

Modes
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP Address</td>
<td>The IP address of the RP for the group specified.</td>
</tr>
<tr>
<td>Group Address</td>
<td>Address of the multicast group</td>
</tr>
<tr>
<td>Group Mask</td>
<td>Mask for the group address.</td>
</tr>
<tr>
<td>Origin</td>
<td>Origin from where this group mapping is learned.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>Expiry time of the elected RP.</td>
</tr>
</tbody>
</table>

Example 1:
(Switch) #show ip pim rp mapping 192.168.10.1
RP Address 192.168.10.1
Group Address 224.1.2.1
Group Mask 255.255.255.0
Origin Static
Expiry Time (hh:mm:ss) NA

Example 2:
(Switch) #show ip pim rp mapping
RP Address 192.168.10.1
Group Address 224.1.2.1
Group Mask 255.255.255.0
Origin Static
Expiry Time (hh:mm:ss) NA
RP Address 192.168.20.1
Group Address 229.2.0.0
Group Mask 255.255.0.0
Origin Static
Expiry Time (hh:mm:ss) NA

Example 3:
(Switch) #show ip pim rp mapping candidate
RP Address 192.168.10.1
Group Address 224.1.2.1
Group Mask 255.255.255.0
Origin BSR
Expiry Time (hh:mm:ss) 00:00:08

Example 4:
(Switch) #show ip pim rp mapping static
RP Address 192.168.20.1
Group Address 229.2.0.0
Internet Group Message Protocol (IGMP) Commands

This section describes the commands you use to view and configure IGMP settings.

\textbf{ip igmp}

This command sets the administrative mode of IGMP in the system to active.

<table>
<thead>
<tr>
<th>Default</th>
<th>disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>ip igmp</td>
</tr>
</tbody>
</table>
| Modes        | • Global Config  
               • Interface Config |

\textbf{no ip igmp}

This command sets the administrative mode of IGMP in the system to inactive.

| Format       | no ip igmp  |
| Modes        | • Global Config  
               • Interface Config |

\textbf{ip igmp version}

This command configures the version of IGMP for an interface. The value for \textit{<version>} is either 1, 2 or 3.

| Default      | 3 |
| Format       | ip igmp version \textit{<version>}  |
| Modes        | Interface Config |

\textbf{no ip igmp version}

This command resets the version of IGMP to the default value.

| Format       | no ip igmp version  |
| Modes        | Interface Config |
**ip igmp last-member-query-count**

This command sets the number of Group-Specific Queries sent before the router assumes that there are no local members on the interface. The range for `<count>` is 1 to 20.

**Format**

```
ip igmp last-member-query-count <count>
```

**Modes**

Interface Config

**no ip igmp last-member-query-count**

This command resets the number of Group-Specific Queries to the default value.

**Format**

```
o ip igmp last-member-query-count
```

**Modes**

Interface Config

**ip igmp last-member-query-interval**

This command configures the Maximum Response Time inserted in Group-Specific Queries which are sent in response to Leave Group messages. The range for `<seconds>` is 0 to 255 tenths of a second.

**Default**

10 tenths of a second (1 second)

**Format**

```
ip igmp last-member-query-interval <seconds>
```

**Modes**

Interface Config

**no ip igmp last-member-query-interval**

This command resets the Maximum Response Time to the default value.

**Format**

```
o ip igmp last-member-query-interval
```

**Modes**

Interface Config

**ip igmp query-interval**

This command configures the query interval for the specified interface. The query interval determines how fast IGMP Host-Query packets are transmitted on this interface. The range for `<queryinterval>` is 1 to 3600 seconds.

**Default**

125 seconds

**Format**

```
ip igmp query-interval <seconds>
```

**Modes**

Interface Config
no ip igmp query-interval

This command resets the query interval for the specified interface to the default value. This is the frequency at which IGMP Host-Query packets are transmitted on this interface.

**Format**

```
no ip igmp query-interval
```

**Modes**

Interface Config

---

**ip igmp query-max-response-time**

This command configures the maximum response time interval for the specified interface, which is the maximum query response time advertised in IGMPv2 queries on this interface. The time interval is specified in tenths of a second. The range for `<maxresptime>` is 0 to 255 tenths of a second.

**Default**

100

**Format**

```
ip igmp query-max-response-time <seconds>
```

**Mode**

Interface Config

---

no ip igmp query-max-response-time

This command resets the maximum response time interval for the specified interface, which is the maximum query response time advertised in IGMPv2 queries on this interface to the default value. The maximum response time interval is reset to the default time.

**Format**

```
no ip igmp query-max-response-time
```

**Mode**

Interface Config

---

**ip igmp robustness**

This command configures the robustness that allows tuning of the interface. The robustness is the tuning for the expected packet loss on a subnet. If a subnet is expected to have a lot of loss, the Robustness variable may be increased for the interface. The range for `<robustness>` is 1 to 255.

**Default**

2

**Format**

```
ip igmp robustness <robustness>
```

**Mode**

Interface Config

---

no ip igmp robustness

This command sets the robustness value to default.

**Format**

```
no ip igmp robustness
```

**Mode**

Interface Config
**ip igmp startup-query-count**

This command sets the number of Queries sent out on startup, separated by the Startup Query Interval on the interface. The range for `<count>` is 1 to 20.

<table>
<thead>
<tr>
<th>Default</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Format</strong></td>
<td><code>ip igmp startup-query-count &lt;count&gt;</code></td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**no ip igmp startup-query-count**

This command resets the number of Queries sent out on startup, separated by the Startup Query Interval on the interface to the default value.

<table>
<thead>
<tr>
<th><strong>Format</strong></th>
<th><code>no ip igmp startup-query-count</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**ip igmp startup-query-interval**

This command sets the interval between General Queries sent on startup on the interface. The time interval value is in seconds. The range for `<interval>` is 1 to 300 seconds.

<table>
<thead>
<tr>
<th>Default</th>
<th>31</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Format</strong></td>
<td><code>ip igmp startup-query-interval &lt;interval&gt;</code></td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**no ip igmp startup-query-interval**

This command resets the interval between General Queries sent on startup on the interface to the default value.

<table>
<thead>
<tr>
<th><strong>Format</strong></th>
<th><code>no ip igmp startup-query-interval</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mode</strong></td>
<td>Interface Config</td>
</tr>
</tbody>
</table>

**show ip igmp**

This command displays the system-wide IGMP information.

<table>
<thead>
<tr>
<th><strong>Format</strong></th>
<th><code>show ip igmp</code></th>
</tr>
</thead>
</table>
| **Modes**    | • Privileged EXEC  
              • User EXEC |
The administrative status of IGMP. This is a configured value.

Valid slot and port number separated by forward slashes.

Indicates whether IGMP is enabled or disabled on the interface. This is a configured value.

The current state of IGMP on this interface. Possible values are Operational or Non-Operational.

This command displays the registered multicast groups on the interface. If [detail] is specified this command displays the registered multicast groups on the interface in detail.

Format

```
show ip igmp groups <unit/slot/port> [detail]
```

Mode

Privileged EXEC

If you do not use the detail keyword, the following fields appear:

The following fields are not displayed if the interface is not enabled:

If you use the detail keyword, the following fields appear:

The IP address of the interface participating in the multicast group.

The subnet mask of the interface participating in the multicast group.

This displays whether IGMP is enabled or disabled on this interface.

This displays whether the interface has IGMP in Querier mode or Non-Querier mode.

The list of multicast groups that are registered on this interface.

The IP address of the registered multicast group on this interface.

The IP address of the source of the last membership report received for the specified multicast group address on this interface.

The time elapsed since the entry was created for the specified multicast group address on this interface.

The amount of time remaining to remove this entry before it is aged out.
show ip igmp interface

This command displays the IGMP information for the interface.

Format    show ip igmp interface <unit/slot/port>

Modes     • Privileged EXEC
          • User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>

<tr>
<td>Interface IP</td>
<td>The IP address of the interface participating in the multicast group.</td>
</tr>
<tr>
<td>State</td>
<td>The interface that has IGMP in Querier mode or Non-Querier mode.</td>
</tr>
<tr>
<td>Group Compatibility Mode</td>
<td>The group compatibility mode (v1, v2 or v3) for the specified group on this interface.</td>
</tr>
<tr>
<td>Source Filter Mode</td>
<td>The source filter mode (Include/Exclude) for the specified group on this interface. This is “-----” for IGMPv1 and IGMPv2 Membership Reports.</td>
</tr>
</tbody>
</table>

If you use the **detail** keyword, the following fields appear:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid unit, slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Group Compatibility Mode</td>
<td>The group compatibility mode (v1, v2 or v3) for the specified group on this interface.</td>
</tr>
<tr>
<td>Source Filter Mode</td>
<td>The source filter mode (Include/Exclude) for the specified group on this interface. This is “-----” for IGMPv1 and IGMPv2 Membership Reports.</td>
</tr>
<tr>
<td>Source Hosts</td>
<td>The list of unicast source IP addresses in the group record of the IGMPv3 Membership Report with the specified multicast group IP address. This is “-----” for IGMPv1 and IGMPv2 Membership Reports.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The amount of time remaining to remove this entry before it is aged out. This is “-----” for IGMPv1 and IGMPv2 Membership Reports.</td>
</tr>
</tbody>
</table>

**show ip igmp interface stats**

This command displays the IGMP statistical information for the interface. The statistics are only displayed when the interface is enabled for IGMP.

**Format**

```
show ip igmp interface stats <unit/slot/port>
```

**Modes**

- Privileged EXEC
- User EXEC
### IGMP Proxy Commands

The IGMP Proxy is used by IGMP Router (IPv4 system) to enable the system to issue IGMP host messages on behalf of hosts that the system discovered through standard IGMP router interfaces. With IGMP Proxy enabled, the system acts as proxy to all the hosts residing on its router interfaces.

**ip igmp-proxy**

This command enables the IGMP Proxy on the router. To enable the IGMP Proxy on the router, you must enable multicast forwarding. Also, make sure that there are no multicast routing protocols enabled on the router.

**Format**

```
ip igmp-proxy
```

**Mode**

```
Interface Config
```

**no ip igmp-proxy**

This command disables the IGMP Proxy on the router.

**Format**

```
no ip igmp-proxy
```

**Mode**

```
Interface Config
```
**ip igmp-proxy unsolicit-rprt-interval**

This command sets the unsolicited report interval for the IGMP Proxy router. This command is valid only when you enable IGMP Proxy on the interface. The value of `<interval>` can be 1-260 seconds.

Default: 1

Format: `ip igmp-proxy unsolicit-rprt-interval <interval>`

Mode: Interface Config

**no ip igmp-proxy unsolicit-rprt-interval**

This command resets the unsolicited report interval of the IGMP Proxy router to the default value.

Format: `no ip igmp-proxy unsolicit-rprt-interval`

Mode: Interface Config

**ip igmp-proxy reset-status**

This command resets the host interface status parameters of the IGMP Proxy router. This command is valid only when you enable IGMP Proxy on the interface.

Format: `ip igmp-proxy reset-status`

Mode: Interface Config

**show ip igmp-proxy**

This command displays a summary of the host interface status parameters. It displays the following parameters only when you enable IGMP Proxy.

Format: `show ip igmp-proxy`

Modes: Privileged EXEC, User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface index</td>
<td>The interface number of the IGMP Proxy.</td>
</tr>
<tr>
<td>Admin Mode</td>
<td>States whether the IGMP Proxy is enabled or not. This is a configured value.</td>
</tr>
<tr>
<td>Operational Mode</td>
<td>States whether the IGMP Proxy is operationally enabled or not. This is a status parameter.</td>
</tr>
<tr>
<td>Version</td>
<td>The present IGMP host version that is operational on the proxy interface.</td>
</tr>
</tbody>
</table>
ProSafe Managed Switch

### Example:
The following example shows CLI display output for the command.

```
(Switch) #show ip igmp-proxy

Interface Index............................................. 1/0/1
Admin Mode................................................ Enable
Operational Mode........................................... Enable
Version......................................................... 3
Num of Multicast Groups............................. 0
Unsolicited Report Interval.......................... 1
Querier IP Address on Proxy Interface........ 5.5.5.50
Older Version 1 Querier Timeout................ 0
Older Version 2 Querier Timeout................ 00:00:00
Proxy Start Frequency................................. 1
```

**show ip igmp-proxy interface**

This command displays a detailed list of the host interface status parameters. It displays the following parameters only when you enable IGMP Proxy.

**Format**

```
show ip igmp-proxy interface
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Index</td>
<td>The unit/slot/port of the IGMP proxy.</td>
</tr>
</tbody>
</table>

The column headings of the table associated with the interface are as follows:
Example: The following shows example CLI display output for the command.

(Switch) #show ip igmp-proxy interface

<table>
<thead>
<tr>
<th>Interface Index</th>
<th>1/0/1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ver</td>
<td></td>
</tr>
<tr>
<td>Query Rcvd</td>
<td>0</td>
</tr>
<tr>
<td>Report Rcvd</td>
<td>0</td>
</tr>
<tr>
<td>Report Sent</td>
<td>0</td>
</tr>
<tr>
<td>Leave Rcvd</td>
<td>-----</td>
</tr>
<tr>
<td>Leave Sent</td>
<td>-----</td>
</tr>
</tbody>
</table>

**show ip igmp-proxy groups**

This command displays information about the subscribed multicast groups that IGMP Proxy reported. It displays a table of entries with the following as the fields of each column.

<table>
<thead>
<tr>
<th>Format</th>
<th>show ip igmp-proxy groups</th>
</tr>
</thead>
</table>
| Modes  | • Privileged EXEC  
|        | • User EXEC |

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface number of the IGMP Proxy.</td>
</tr>
<tr>
<td>Group Address</td>
<td>The IP address of the multicast group.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>The IP address of host that last sent a membership report for the current group on the network attached to the IGMP Proxy interface (upstream interface).</td>
</tr>
<tr>
<td>Up Time (in secs)</td>
<td>The time elapsed since last created.</td>
</tr>
<tr>
<td>Member State</td>
<td>The status of the entry. Possible values are IDLE_MEMBER or DELAY_MEMBER.</td>
</tr>
<tr>
<td></td>
<td>• IDLE_MEMBER - interface has responded to the latest group membership query for this group.</td>
</tr>
<tr>
<td></td>
<td>• DELAY_MEMBER - interface is going to send a group membership report to respond to a group membership query for this group.</td>
</tr>
</tbody>
</table>
Example: The following shows example CLI display output for the command.

(Switch) #show ip igmp-proxy groups

Interface Index................................. 1/0/1

<table>
<thead>
<tr>
<th>Group Address</th>
<th>Last Reporter</th>
<th>Up Time</th>
<th>Member State</th>
<th>Filter Mode</th>
<th>Sources</th>
</tr>
</thead>
<tbody>
<tr>
<td>225.4.4.4</td>
<td>5.5.5.48</td>
<td>00:02:21</td>
<td>DELAY_MEMBER</td>
<td>Include</td>
<td>3</td>
</tr>
<tr>
<td>226.4.4.4</td>
<td>5.5.5.48</td>
<td>00:02:21</td>
<td>DELAY_MEMBER</td>
<td>Include</td>
<td>3</td>
</tr>
<tr>
<td>227.4.4.4</td>
<td>5.5.5.48</td>
<td>00:02:21</td>
<td>DELAY_MEMBER</td>
<td>Exclude</td>
<td>0</td>
</tr>
<tr>
<td>228.4.4.4</td>
<td>5.5.5.48</td>
<td>00:02:21</td>
<td>DELAY_MEMBER</td>
<td>Include</td>
<td>3</td>
</tr>
</tbody>
</table>

**show ip igmp-proxy groups detail**

This command displays complete information about multicast groups that IGMP Proxy reported. It displays a table of entries with the following as the fields of each column.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface number of the IGMP Proxy.</td>
</tr>
<tr>
<td>Group Address</td>
<td>The IP address of the multicast group.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>The IP address of host that last sent a membership report for the current group, on the network attached to the IGMP-Proxy interface (upstream interface).</td>
</tr>
<tr>
<td>Up Time (in secs)</td>
<td>The time elapsed since last created.</td>
</tr>
<tr>
<td>Member State</td>
<td>The status of the entry. Possible values are IDLE&lt;Member&gt; or DELAY&lt;Member&gt;.</td>
</tr>
<tr>
<td>Filter Mode</td>
<td>Possible values are Include or Exclude.</td>
</tr>
<tr>
<td>Sources</td>
<td>The number of sources attached to the multicast group.</td>
</tr>
</tbody>
</table>
Example: The following shows example CLI display output for the command.

(Switch) #show ip igmp-proxy groups

Interface Index................................. 1/0/1

<table>
<thead>
<tr>
<th>Group Address</th>
<th>Last Reporter</th>
<th>Up Time</th>
<th>Member State</th>
<th>Filter Mode</th>
<th>Sources</th>
</tr>
</thead>
<tbody>
<tr>

This chapter describes the IPv6 commands available in the managed switch CLI.

**Note:** Some commands described in this chapter require a license. For more information, see *Licensing and Command Support* on page 8.

This chapter contains the following sections:

- *Tunnel Interface Commands*
- *IPv6 Routing Commands*
- *OSPFv3 Commands*
- *OSPFv3 Graceful Restart Commands*
- *DHCPv6 Commands*

The commands in this chapter are in three functional groups:

- **Show commands** display switch settings, statistics, and other information.
- **Configuration commands** configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
- **Clear commands** clear some or all of the settings to factory defaults.

**Note:** For information on IPv6 management commands, see *IPv6 Management Commands* on page 716.

**Tunnel Interface Commands**

The commands in this section describe how to create, delete, and manage tunnel interfaces. Several different types of tunnels provide functionality to facilitate the transition of IPv4 networks to IPv6 networks. These tunnels are divided into two classes: configured and automatic. The distinction is that configured tunnels are explicitly configured with a destination or endpoint of the tunnel. Automatic tunnels, in contrast, infer the endpoint of the...
tunnel from the destination address of packets routed into the tunnel. To assign an IP address to the tunnel interface, see `ip address` on page 247. To assign an IPv6 address to the tunnel interface, see `ipv6 address` on page 377.

**interface tunnel**

Use this command to enter the Interface Config mode for a tunnel interface. The `<tunnel-id>` range is 0 to 7.

**Format**

```
interface tunnel <tunnel-id>
```

**Mode**

Global Config

**no interface tunnel**

This command removes the tunnel interface and associated configuration parameters for the specified tunnel interface.

**Format**

```
no interface tunnel <tunnel-id>
```

**Mode**

Global Config

**tunnel source**

This command specifies the source transport address of the tunnel, either explicitly or by reference to an interface.

**Format**

```
tunnel source {<ipv4-address> | ethernet <unit/slot/port>}
```

**Mode**

Interface Config

**tunnel destination**

This command specifies the destination transport address of the tunnel.

**Format**

```
tunnel destination <ipv4-address>
```

**Mode**

Interface Config

**tunnel mode ipv6ip**

This command specifies the mode of the tunnel. With the optional 6to4 argument, the tunnel mode is set to 6to4 automatic. Without the optional 6to4 argument, the tunnel mode is configured.

**Format**

```
tunnel mode ipv6ip [6to4]
```

**Mode**

Interface Config
**IPv6 Commands**

**ProSafe Managed Switch**

### show interface tunnel

This command displays the parameters related to tunnel such as tunnel mode, tunnel source address and tunnel destination address.

**Format**

```
show interface tunnel [<tunnel-id>]
```

**Mode**

Privileged EXEC

If you do not specify a tunnel ID, the command shows the following information for each configured tunnel:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel ID</td>
<td>The tunnel identification number.</td>
</tr>
<tr>
<td>Interface</td>
<td>The name of the tunnel interface.</td>
</tr>
<tr>
<td>Tunnel Mode</td>
<td>The tunnel mode.</td>
</tr>
<tr>
<td>Source Address</td>
<td>The source transport address of the tunnel.</td>
</tr>
<tr>
<td>Destination Address</td>
<td>The destination transport address of the tunnel.</td>
</tr>
</tbody>
</table>

If you specify a tunnel ID, the command shows the following information for the tunnel:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Link Status</td>
<td>Shows whether the link is up or down.</td>
</tr>
<tr>
<td>MTU Size</td>
<td>The maximum transmission unit for packets on the interface.</td>
</tr>
<tr>
<td>IPv6 Prefix is</td>
<td>If you enable IPv6 on the interface and assign an address, the IPv6 address and prefix display.</td>
</tr>
</tbody>
</table>

### IPv6 Routing Commands

This section describes the IPv6 commands you use to configure IPv6 on the system and on the interfaces. This section also describes IPv6 management commands and show commands.

**ipv6 hop-limit**

This command defines the unicast hop count used in ipv6 packets originated by the node. The value is also included in router advertisements. Valid values for `<hops>` are 1-255 inclusive. The default "not configured" means that a value of zero is sent in router
advertisements and a value of 64 is sent in packets originated by the node. Note that this is not the same as configuring a value of 64.

Default: not configured
Format: `ipv6 hop-limit <hops>`
Mode: Global Config

**no ipv6 hop-limit**

This command returns the unicast hop count to the default.

Format: `no ipv6 hop-limit`
Mode: Global Config

**ipv6 unicast-routing**

Use this command to enable the forwarding of IPv6 unicast datagrams.

Default: disabled
Format: `ipv6 unicast-routing`
Mode: Global Config

**no ipv6 unicast-routing**

Use this command to disable the forwarding of IPv6 unicast datagrams.

Format: `no ipv6 unicast-routing`
Mode: Global Config

**ipv6 enable**

Use this command to enable IPv6 routing on an interface, including tunnel and loopback interfaces, that has not been configured with an explicit IPv6 address. When you use this command, the interface is automatically configured with a link-local address. You do not need to use this command if you configured an IPv6 global address on the interface.

Default: disabled
Format: `ipv6 enable`
Mode: Interface Config
IPv6 Commands

ProSafe Managed Switch

no ipv6 enable

Use this command to disable IPv6 routing on an interface.

Format: `no ipv6 enable`

Mode: Interface Config

ipv6 address

Use this command to configure an IPv6 address on an interface, including tunnel and loopback interfaces, and to enable IPv6 processing on this interface. You can assign multiple globally reachable addresses to an interface by using this command. You do not need to assign a link-local address by using this command since one is automatically created. The `<prefix>` field consists of the bits of the address to be configured. The `<prefix_length>` designates how many of the high-order contiguous bits of the address make up the prefix.

You can express IPv6 addresses in eight blocks. Also of note is that instead of a period, a colon now separates each block. For simplification, leading zeros of each 16 bit block can be omitted. One sequence of 16 bit blocks containing only zeros can be replaced with a double colon “::”, but not more than one at a time (otherwise it is no longer a unique representation).

- Dropping zeros: `3ffe:ffff:100:f101:0:0:0:1` becomes `3ffe:ffff:100:f101::1`
- Local host: `0000:0000:0000:0000:0000:0000:0000:0001` becomes `::1`
- Any host: `0000:0000:0000:0000:0000:0000:0000:0000` becomes `::`

The hexadecimal letters in the IPv6 addresses are not case-sensitive. An example of an IPv6 prefix and prefix length is `3ffe:1::1234/64`.

The optional [eui-64] field designates that IPv6 processing on the interfaces was enabled using an EUI-64 interface ID in the low order 64 bits of the address. If you use this option, the value of `<prefix_length>` must be 64 bits.

Format: `ipv6 address <prefix>/<prefix_length> [eui64]`

Mode: Interface Config

no ipv6 address

Use this command to remove all IPv6 addresses on an interface or specified IPv6 address. The `<prefix>` parameter consists of the bits of the address to be configured. The `<prefix_length>` designates how many of the high-order contiguous bits of the address comprise the prefix. The optional [eui-64] field designates that IPv6 processing on the interfaces was enabled using an EUI-64 interface ID in the low order 64 bits of the address.

If you do not supply any parameters, the command deletes all the IPv6 addresses on an interface.

Format: `no ipv6 address [<prefix>/<prefix_length>] [eui64]`

Mode: Interface Config

---

IPv6 Commands

377
ipv6 address autoconfig

This command is used to enable stateless address autoconfiguration capability.

**Note:** When unicast-routing is enabled, autoconfig mode doesn't work.

**Format**

```
ipv6 address autoconfig
```

**Mode**

```
Interface Config
```

ipv6 address autoconfig

This command disables the stateless autoconfiguration.

**Format**

```
no ipv6 address autoconfig
```

**Mode**

```
Interface Config
```

ipv6 address dhcp

This command is used to enable DHCPv6 client capability.

**Format**

```
ipv6 address autoconfig
```

**Mode**

```
Interface Config
```

no ipv6 address dhcp

The "no" form of this command disables the DHCPv6 client capability.

**Format**

```
no ipv6 address autoconfig
```

**Mode**

```
Interface Config
```

ipv6 route

Use this command to configure an IPv6 static route. The `<ipv6-prefix>` is the IPv6 network that is the destination of the static route. The `<prefix_length>` is the length of the IPv6 prefix — a decimal value (usually 0-64) that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the `<prefix_length>`. The `<next-hop-address>` is the IPv6 address of the next hop that can be used to reach the specified network. Specifying Null0 as nexthop parameter adds a static reject route. The `<priority>` parameter is a value the router uses to compare this route with routes from other route sources that have the same destination. The range for `<priority>` is 1 - 255, and the default value is 1. You can specify a `<unit/slot/port>` or `tunnel `<tunnel_id>` interface to identify direct static routes from point-to-point and broadcast interfaces. The interface must be specified when...
IPv6 Commands

using a link-local address as the next hop. A route with a preference of 255 cannot be used to forward traffic.

Default disabled

Format ipv6 route <ipv6-prefix>/<prefix_length> {<next-hop-address> | Null0 | interface {<unit/slot/port> | tunnel <tunnel_id>} <next-hop-address>} [preference]

Mode Global Config

no ipv6 route

Use this command to delete an IPv6 static route. Use the command without the optional parameters to delete all static routes to the specified destination. Use the <preference> parameter to revert the preference of a route to the default preference.

Format no ipv6 route <ipv6-prefix>/<prefix_length> {<next-hop-address> | Null0 | interface {<unit/slot/port> | tunnel <tunnel_id>} <next-hop-address> | <preference>}

Mode Global Config

ipv6 route distance

This command sets the default distance (preference) for IPv6 static routes. Lower route distance values are preferred when determining the best route. The ipv6 route command allows you to optionally set the distance (preference) of an individual static route. The default distance is used when no distance is specified in this command.

Changing the default distance does not update the distance of existing static routes, even if they were assigned the original default distance. The new default distance will only be applied to static routes created after invoking the ipv6 route distance command.

Default 1

Format ipv6 route distance <1-255>

Mode Global Config

no ipv6 route distance

This command resets the default static route preference value in the router to the original default preference. Lower route preference values are preferred when determining the best route.

Format no ipv6 route distance

Mode Global Config
**ipv6 mtu**

This command sets the maximum transmission unit (MTU) size, in bytes, of IPv6 packets on an interface. This command replaces the default or link MTU with a new MTU value.

**Note:** The default MTU value for a tunnel interface is 1480. You cannot change this value.

**Default**  
0 or link speed (MTU value (1500))

**Format**  
`ipv6 mtu <1280-1500>`

**Mode**  
Interface Config

**no ipv6 mtu**

This command resets maximum transmission unit value to default value.

**Format**  
`no ipv6 mtu`

**Mode**  
Interface Config

**ipv6 nd dad attempts**

This command sets the number of duplicate address detection probes transmitted. Duplicate address detection verifies that an IPv6 address on an interface is unique.

**Default**  
1

**Format**  
`ipv6 nd dad attempts <0 - 600>`

**Mode**  
Interface Config

**no ipv6 nd dad attempts**

This command resets to number of duplicate address detection value to default value.

**Format**  
`no ipv6 nd dad attempts`

**Mode**  
Interface Config
ipv6 nd managed-config-flag

This command sets the “managed address configuration” flag in router advertisements. When the value is true, end nodes use DHCPv6. When the value is false, end nodes automatically configure addresses.

Default: false
Format: ipv6 nd managed-config-flag
Mode: Interface Config

no ipv6 nd managed-config-flag

This command resets the “managed address configuration” flag in router advertisements to the default value.

Format: no ipv6 nd managed-config-flag
Mode: Interface Config

ipv6 nd ns-interval

This command sets the interval between router advertisements for advertised neighbor solicitations, in milliseconds. An advertised value of 0 means the interval is unspecified.

Default: 0
Format: ipv6 nd ns-interval {<1000-4294967295> | 0}
Mode: Interface Config

no ipv6 nd ns-interval

This command resets the neighbor solicit retransmission interval of the specified interface to the default value.

Format: no ipv6 nd ns-interval
Mode: Interface Config

ipv6 nd other-config-flag

This command sets the “other stateful configuration” flag in router advertisements sent from the interface.

Default: false
Format: ipv6 nd other-config-flag
Mode: Interface Config
**no ipv6 nd other-config-flag**

This command resets the “other stateful configuration” flag back to its default value in router advertisements sent from the interface.

**Format**

```
no ipv6 nd other-config-flag
```

**Mode**

```
Interface Config
```

**ipv6 nd ra-interval**

This command sets the transmission interval between router advertisements.

**Default**

600

**Format**

```
ipv6 nd ra-interval-max <4-1800>
```

**Mode**

```
Interface Config
```

**no ipv6 nd ra-interval**

This command sets router advertisement interval to the default.

**Format**

```
no ipv6 nd ra-interval-max
```

**Mode**

```
Interface Config
```

**ipv6 nd ra-lifetime**

This command sets the value, in seconds, that is placed in the Router Lifetime field of the router advertisements sent from the interface. The `<lifetime>` value must be zero, or it must be an integer between the value of the router advertisement transmission interval and 9000. A value of zero means this router is not to be used as the default router.

**Default**

1800

**Format**

```
ipv6 nd ra-lifetime <lifetime>
```

**Mode**

```
Interface Config
```

**no ipv6 nd ra-lifetime**

This command resets router lifetime to the default value.

**Format**

```
no ipv6 nd ra-lifetime
```

**Mode**

```
Interface Config
```
**ipv6 nd reachable-time**

This command sets the router advertisement time to consider a neighbor reachable after neighbor discovery confirmation. Reachable time is specified in milliseconds. A value of zero means the time is unspecified by the router.

**Default**

0

**Format**

ipv6 nd reachable-time <0-3600000>

**Mode**

Interface Config

**no ipv6 nd reachable-time**

This command means reachable time is unspecified for the router.

**Format**

no ipv6 nd reachable-time

**Mode**

Interface Config

**ipv6 nd suppress-ra**

This command suppresses router advertisement transmission on an interface.

**Default**

disabled

**Format**

ipv6 nd suppress-ra

**Mode**

Interface Config

**no ipv6 nd suppress-ra**

This command enables router transmission on an interface.

**Format**

no ipv6 nd suppress-ra

**Mode**

Interface Config

**ipv6 nd router-preference**

This is used to configure router preference value in IPv6 router advertisements on an interface. This will indicate whether or not to prefer this router over other default routers.

**Default**

Medium

**Format**

ipv6 nd router-preference <high/low/medium>

**Mode**

Interface Config
**ipv6 nd router-preference**

This command will set the router preference to default.

**Format**

```
no ipv6 router-preference
```

**Mode**

Interface Config

**ipv6 unreachables**

Use this command to enable the generation of ICMPv6 Destination Unreachable messages. By default, the generation of ICMPv6 Destination Unreachable messages is enabled.

**Default**

```
enable
```

**Format**

```
ipv6 unreachables
```

**Mode**

Interface Config

**no ipv6 unreachables**

Use this command to prevent the generation of ICMPv6 Destination Unreachable messages.

**Format**

```
no ipv6 unreachables
```

**Mode**

Interface Config

**ipv6 icmp error-interval**

Use this command to limit the rate at which ICMPv6 error messages are sent. The rate limit is configured as a token bucket, with two configurable parameters, `burst-size` and `burst-interval`.

The `burst-interval` specifies how often the token bucket is initialized with `burst-size` tokens. `burst-interval` is from 0 to 2147483647 milliseconds (msec).

The `burst-size` is the number of ICMPv6 error messages that can be sent during one `burst-interval`. The range is from 1 to 200 messages.

To disable ICMP rate limiting, set `burst-interval` to zero (0).

**Default**

- `burst-interval` of 1000 msec.
- `burst-size` of 100 messages

**Format**

```
ipv6 icmp error-interval <burst-interval> [<burst-size>]
```

**Mode**

Global Config
no ipv6 icmp error-interval

Use the no form of the command to return burst-interval and burst-size to their default values.

Format: no ipv6 icmp error-interval
Mode: Global Config

show ipv6 brief

Use this command to display the IPv6 status of forwarding mode and IPv6 unicast routing mode.

Format: show ipv6 brief
Mode: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Forwarding Mode</td>
<td>Shows whether the IPv6 forwarding mode is enabled.</td>
</tr>
<tr>
<td>IPv6 Unicast Routing Mode</td>
<td>Shows whether the IPv6 unicast routing mode is enabled.</td>
</tr>
<tr>
<td>IPv6 Hop Limit</td>
<td>Shows the unicast hop count used in IPv6 packets originated by the node. For more information, see ipv6 hop-limit on page 375.</td>
</tr>
<tr>
<td>ICMPv6 Rate Limit Error Interval</td>
<td>Shows how often the token bucket is initialized with burst-size tokens. For more information, see ipv6 icmp error-interval on page 384.</td>
</tr>
<tr>
<td>ICMPv6 Rate Limit Burst Size</td>
<td>Shows the number of ICMPv6 error messages that can be sent during one burst-interval. For more information, see ipv6 icmp error-interval on page 384.</td>
</tr>
<tr>
<td>Maximum Routes</td>
<td>Shows the maximum IPv6 route table size.</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command.

(Switch) #show ipv6 brief
IPv6 Forwarding Mode......................... Enable
IPv6 Unicast Routing Mode...................... Enable
IPv6 Hop Limit.................................. 0
ICMPv6 Rate Limit Error Interval............. 1000 msec
ICMPv6 Rate Limit Burst Size............... 100 messages
Maximum Routes............................... 3000
show ipv6 interface

Use this command to show the usability status of IPv6 interfaces and whether ICMPv6 Destination Unreachable messages may be sent.

**Format**
```
show ipv6 interface {brief | <unit/slot/port> | tunnel <0-7> | loopback <0-7>}
```

**Mode**
Privileged EXEC

If you use the *brief* parameter, the following information displays for all configured IPv6 interfaces:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface in unit/slot/port format.</td>
</tr>
<tr>
<td>IPv6 Routing Operational Mode</td>
<td>Shows whether the mode is enabled or disabled.</td>
</tr>
<tr>
<td>IPv6 Address/Length</td>
<td>Shows the IPv6 address and length on interfaces with IPv6 enabled.</td>
</tr>
</tbody>
</table>

If you specify an interface, the following information also appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 is enabled</td>
<td>Appears if IPv6 is enabled on the interface.</td>
</tr>
<tr>
<td>Routing Mode</td>
<td>Shows whether IPv6 routing is enabled or disabled.</td>
</tr>
<tr>
<td>Administrative Mode</td>
<td>Shows whether the interface administrative mode is enabled or disabled.</td>
</tr>
<tr>
<td>Bandwidth</td>
<td>Shows bandwidth of the interface.</td>
</tr>
<tr>
<td>Interface Maximum Transmission Unit</td>
<td>The MTU size, in bytes.</td>
</tr>
<tr>
<td>Router Duplicate Address Detection Transmits</td>
<td>The number of consecutive duplicate address detection probes to transmit.</td>
</tr>
<tr>
<td>Router Advertisement NS Interval</td>
<td>The interval, in milliseconds, between router advertisements for advertised neighbor solicitations.</td>
</tr>
<tr>
<td>Router Advertisement Lifetime</td>
<td>Shows the router lifetime value of the interface in router advertisements.</td>
</tr>
<tr>
<td>Router Advertisement Reachable Time</td>
<td>The amount of time, in milliseconds, to consider a neighbor reachable after neighbor discovery confirmation.</td>
</tr>
</tbody>
</table>
Example: The following shows example CLI display output for the command.

(Switch) #show ipv6 interface 1/0/1

Routing Mode............................... Disabled
Administrative Mode......................... Enabled
IPv6 Routing Operational Mode.............. Disabled
Bandwidth.................................... 100000 kbps
Interface Maximum Transmit Unit........... 1500
Router Duplicate Address Detection Transmits... 1
Router Advertisement NS Interval............ 0
Router Advertisement Lifetime............... 1800
Router Advertisement Reachable Time........ 0
Router Advertisement Interval............... 600
Router Advertisement Managed Config Flag.... Disabled
Router Advertisement Other Config Flag...... Disabled
Router Advertisement Suppress Flag.......... Disabled
IPv6 Destination Unreachables.............. Enabled

No IPv6 prefixes configured.

If an IPv6 prefix is configured on the interface, the following information also appears.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IFIPv6 Prefix is</td>
<td>The IPv6 prefix for the specified interface.</td>
</tr>
<tr>
<td>Preferred Lifetime</td>
<td>The amount of time the advertised prefix is a preferred prefix.</td>
</tr>
<tr>
<td>Valid Lifetime</td>
<td>The amount of time the advertised prefix is valid.</td>
</tr>
<tr>
<td>Onlink Flag</td>
<td>Shows whether the onlink flag is set (enabled) in the prefix.</td>
</tr>
<tr>
<td>Autonomous Flag</td>
<td>Shows whether the autonomous address-configuration flag (autoconfig) is set (enabled) in the prefix.</td>
</tr>
</tbody>
</table>
**show ipv6 neighbor**

Use this command to display information about the IPv6 neighbors.

**Format**

```
show ipv6 neighbor
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface in unit/slot/port format.</td>
</tr>
<tr>
<td>IPv6 Address</td>
<td>IPv6 address of neighbor or interface.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Link-layer Address.</td>
</tr>
<tr>
<td>IsRtr</td>
<td>Shows whether the neighbor is a router. If the value is TRUE, the neighbor is known to be a router, and FALSE otherwise. A value of FALSE might not mean routers are not always known to be routers.</td>
</tr>
<tr>
<td>Neighbor State</td>
<td>State of neighbor cache entry. Possible values are Incomplete, Reachable, Stale, Delay, Probe, and Unknown.</td>
</tr>
<tr>
<td>Last Updated</td>
<td>The time in seconds that has elapsed since an entry was added to the cache.</td>
</tr>
</tbody>
</table>

**clear ipv6 neighbors**

Use this command to clear all entries IPv6 neighbor table or an entry on a specific interface. Use the `<unit/slot/port>` parameter to specify the interface.

**Format**

```
clear ipv6 neighbors [<unit/slot/port>]
```

**Mode**

Privileged EXEC

**show ipv6 route**

This command displays the IPv6 routing table. The `<ipv6-address>` specifies a specific IPv6 address for which the best-matching route would be displayed. The `<ipv6-prefix/ipv6-prefix-length>` specifies a specific IPv6 network for which the matching route would be displayed. The `<interface>` specifies that the routes with next-hops on the `<interface>` be displayed. The `<protocol>` specifies the protocol that installed the routes. The `<protocol>` is one of the following keywords: connected, ospf, static. The all specifies that all routes including best and non-best routes are displayed. Otherwise, only the best routes are displayed.

A “T” flag appended to an IPv6 route indicates that it is an ECMP route, but only one of its next hops has been installed in the forwarding table. The forwarding table might limit the number of ECMP routes or the number of ECMP groups. When an ECMP route cannot be installed because the limit is reached, the route is installed with a single next hop. Such truncated routes can be identified by a “T” after the interface name.
Note: If you use the connected keyword for <protocol>, the all option is not available because there are no best or non-best connected routes.

Format

show ipv6 route [{<ipv6-address> [〈protocol〉]} |
{〈ipv6-prefix/ipv6-prefix-length> | <unit/slot/port>} [〈protocol〉] |
〈protocol〉 | summary] [all] | all]

Modes

• Privileged EXEC
• User EXEC

The show ipv6 route command displays the routing tables in the following format:

Codes: C - connected, S - static
               O - OSPF Intra, OI - OSPF Inter, OE1 - OSPF Ext 1, OE2 - OSPF Ext 2
                    ON1 - OSPF NSSA Ext Type 1, ON2 - OSPF NSSA Ext Type 2

The columns for the routing table display the following information:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>The code for the routing protocol that created this routing entry.</td>
</tr>
<tr>
<td>IPv6-Prefix/IPv6-Prefix-Length</td>
<td>The IPv6-Prefix and prefix-length of the destination IPv6 network corresponding to this route.</td>
</tr>
<tr>
<td>Preference/Metric</td>
<td>The administrative distance (preference) and cost (metric) associated with this route. An example of this output is [1/0], where 1 is the preference and 0 is the metric.</td>
</tr>
<tr>
<td>Tag</td>
<td>The decimal value of the tag associated with a redistributed route, if it is not 0.</td>
</tr>
<tr>
<td>Next-Hop</td>
<td>The outgoing router IPv6 address to use when forwarding traffic to the next router (if any) in the path toward the destination.</td>
</tr>
<tr>
<td>Route-Timestamp</td>
<td>The last updated time for dynamic routes. The format of Route-Timestamp will be</td>
</tr>
<tr>
<td></td>
<td>• Days:Hours:Minutes if days &gt; = 1</td>
</tr>
<tr>
<td></td>
<td>• Hours:Minutes:Seconds if days &lt; 1</td>
</tr>
<tr>
<td>Interface</td>
<td>The outgoing router interface to use when forwarding traffic to the next destination. For reject routes, the next hop interface would be Null0 interface.</td>
</tr>
</tbody>
</table>

To administratively control the traffic destined to a particular network and prevent it from being forwarded through the router, you can configure a static reject route on the router. Such traffic would be discarded and the ICMP destination unreachable message is sent back to the source. This is typically used for preventing routing loops. The reject route added in the RTO is of the type OSPF Inter-Area. Reject routes (routes of REJECT type installed by any protocol) are not redistributed by OSPF/RIP. Reject routes are supported in both OSPFv2 and OSPFv3.
Example: The following shows example CLI display output for the command.

(Switch) #show ipv6 route

IPv6 Routing Table - 3 entries

Codes: C - connected, S - static
      O - OSPF Intra, OI - OSPF Inter, OE1 - OSPF Ext 1, OE2 - OSPF Ext 2
      ON1 - OSPF NSSA Ext Type 1, ON2 - OSPF NSSA Ext Type 2

S  2001::/64 [10/0] directly connected, Null0
C  2003::/64 [0/0]
    via ::, 0/11
S  2005::/64 [1/0]
    via 2003::2, 0/11
C  5001::/64 [0/0]
    via ::, 0/5
OE1 6001::/64 [110/1]
    via fe80::200:42ff:fe7d:2f19, 00h:00m:23s, 0/5
OI  7000::/64 [110/6]
    via fe80::200:4fff:fe35:c8bb, 00h:01m:47s, 0/11

show ipv6 route ecmp-groups

This command reports all current ECMP groups in the IPv6 routing table. An ECMP group is a set of next hops used in one or more routes. The groups are numbered arbitrarily from 1 to n. The output indicates the number of next hops in the group and the number of routes that use the set of next hops. The output lists the IPv6 address and outgoing interface of each next hop in each group.

Format       show ipv6 route ecmp-groups
Mode         Privileged EXEC

Example

(switch) #show ipv6 route ecmp-groups

ECMP Group 1 with 2 next hops (used by 1 route)
  2001:DB8:1::1 on interface 2/1
  2001:DB8:2::14 on interface 2/2

ECMP Group 2 with 3 next hops (used by 1 route)
  2001:DB8:4::15 on interface 2/32
  2001:DB8:7::12 on interface 2/33
  2001:DB8:9::45 on interface 2/34
**show ipv6 route preferences**

Use this command to show the preference value associated with the type of route. Lower numbers have a greater preference. A route with a preference of 255 cannot be used to forward traffic.

**Format**

```
show ipv6 route preferences
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>Preference of directly-connected routes.</td>
</tr>
<tr>
<td>Static</td>
<td>Preference of static routes.</td>
</tr>
<tr>
<td>OSPF Intra</td>
<td>Preference of routes within the OSPF area.</td>
</tr>
<tr>
<td>OSPF Inter</td>
<td>Preference of routes to other OSPF routes that are outside of the area.</td>
</tr>
<tr>
<td>OSPF External</td>
<td>Preference of OSPF external routes.</td>
</tr>
</tbody>
</table>

**show ipv6 route summary**

This command displays the summary of the routing table. Use `all` to display the count summary for all routes, including best and non-best routes. Use the command without parameters to display the count summary for only the best routes.

When the optional keyword `all` is given, some statistics, such as the number of routes from each source, include counts for alternate routes. An alternate route is a route that is not the most preferred route to its destination and therefore is not installed in the forwarding table. When this keyword is not given, the output reports for only the best routes.

**Format**

```
show ipv6 route summary [all]
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected Routes</td>
<td>Total number of connected routes in the routing table.</td>

<td>The number of routes added to the routing table.</td>
</tr>
<tr>
<td>Route Modifies</td>
<td>The number of routes that changed after they were initially added to the routing table.</td>
</tr>
<tr>
<td>Route Deletes</td>
<td>The number of routes deleted from the routing table.</td>
</tr>
<tr>
<td>Unresolved Route Adds</td>
<td>The number of route adds that failed because none of the route's next hops were on a local subnet. Note that static routes can fail to be added to the routing table at startup because the routing interfaces are not up yet. This counter gets incremented in this case. The static routes are added to the routing table when the routing interfaces come up.</td>
</tr>
<tr>
<td>Invalid Route Adds</td>
<td>The number of routes that failed to be added to the routing table because the route was invalid. A log message is written for each of these failures.</td>
</tr>
<tr>
<td>Failed Route Adds</td>
<td>The number of routes that failed to be added to the routing table because of a resource limitation in the routing table.</td>
</tr>
<tr>
<td>Reserved Locals</td>
<td>The number of routing table entries reserved for a local subnet on a routing interface that is down. Space for local routes is always reserved so that local routes can be installed when a routing interface comes up.</td>
</tr>
<tr>
<td>Unique Next Hops</td>
<td>The number of distinct next hops used among all routes currently in the routing table. These include local interfaces for local routes and neighbors for indirect routes.</td>
</tr>
<tr>
<td>Unique Next Hops High Water</td>
<td>The highest count of unique next hops since counters were last cleared.</td>
</tr>
<tr>
<td>Next Hop Groups</td>
<td>The current number of next hop groups in use by one or more routes. Each next hop group includes one or more next hops.</td>
</tr>
<tr>
<td>Next Hop Groups High Water</td>
<td>The highest count of next hop groups since counters were last cleared.</td>
</tr>
<tr>
<td>ECMP Groups</td>
<td>The number of next hop groups with multiple next hops.</td>
</tr>
<tr>
<td>ECMP Routes</td>
<td>The number of routes with multiple next hops currently in the routing table.</td>
</tr>
<tr>
<td>Truncated ECMP Routes</td>
<td>The number of ECMP routes that are currently installed in the forwarding table with just one next hop. The forwarding table might limit the number of ECMP routes or the number of ECMP groups. When an ECMP route cannot be installed because such a limit is reached, the route is installed with a single next hop.</td>
</tr>
<tr>
<td>ECMP Retries</td>
<td>The number of ECMP routes that have been installed in the forwarding table after initially being installed with a single next hop.</td>
</tr>
<tr>
<td>Routes with n Next Hops</td>
<td>The current number of routes with each number of next hops.</td>
</tr>
</tbody>
</table>

show ipv6 vlan

This command displays IPv6 VLAN routing interface addresses.

Format
show ipv6 vlan

Modes
• Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address used by Routing VLANs</td>
<td>Shows the MAC address.</td>
</tr>
</tbody>
</table>

The rest of the output for this command is displayed in a table with the following column headings:

<table>
<thead>
<tr>
<th>Column Headings</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID of a configured VLAN.</td>
</tr>
</tbody>
</table>
show ipv6 traffic

Use this command to show traffic and statistics for IPv6 and ICMPv6. Specify a logical, loopback, or tunnel interface to view information about traffic on a specific interface. If you do not specify an interface, the command displays information about traffic on all interfaces.

Format

```
show ipv6 traffic [{<unit/slot/port> | loopback <loopback-id> | tunnel <tunnel-id>}]`
```

Mode

Privileged EXEC

<table>

<tbody>
<tr>
<td>Total Datagrams Received</td>
<td>Total number of input datagrams received by the interface, including those received in error.</td>
</tr>
<tr>
<td>Received Datagrams Locally Delivered</td>
<td>Total number of datagrams successfully delivered to IPv6 user-protocols (including ICMP). This counter increments at the interface to which these datagrams were addressed, which might not necessarily be the input interface for some of the datagrams.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To Header Errors</td>
<td>Number of input datagrams discarded due to errors in their IPv6 headers, including version number mismatch, other format errors, hop count exceeded, errors discovered in processing their IPv6 options, etc.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To MTU</td>
<td>Number of input datagrams that could not be forwarded because their size exceeded the link MTU of outgoing interface.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To No Route</td>
<td>Number of input datagrams discarded because no route could be found to transmit them to their destination.</td>
</tr>
<tr>
<td>Received Datagrams With Unknown Protocol</td>
<td>Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol. This counter increments at the interface to which these datagrams were addressed, which might not be necessarily the input interface for some of the datagrams.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To Invalid Address</td>
<td>Number of input datagrams discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, ::0) and unsupported addresses (for example, addresses with unallocated prefixes). For entities which are not IPv6 routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To Truncated Data</td>
<td>Number of input datagrams discarded because datagram frame didn't carry enough data.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Received Datagrams Discarded Other</td>
<td>Number of input IPv6 datagrams for which no problems were encountered to prevent their continue processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include datagrams discarded while awaiting re-assembly.</td>
</tr>
<tr>
<td>Received Datagrams Reassembly Required</td>
<td>Number of IPv6 fragments received which needed to be reassembled at this interface. Note that this counter increments at the interface to which these fragments were addressed, which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Datagrams Successfully Reassembled</td>
<td>Number of IPv6 datagrams successfully reassembled. Note that this counter increments at the interface to which these datagrams were addressed, which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Datagrams Failed To Reassemble</td>
<td>Number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.). Note that this is not necessarily a count of discarded IPv6 fragments since some algorithms (notably the algorithm in by combining them as they are received. This counter increments at the interface to which these fragments were addressed, which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Datagrams Forwarded</td>
<td>Number of output datagrams which this entity received and forwarded to their final destinations. In entities which do not act as IPv6 routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route processing was successful. Note that for a successfully forwarded datagram the counter of the outgoing interface increments.</td>
</tr>
<tr>
<td>Datagrams Locally Transmitted</td>
<td>Total number of IPv6 datagrams which local IPv6 user-protocols (including ICMP) supplied to IPv6 in requests for transmission. Note that this counter does not include any datagrams counted in ipv6IfStatsOutForwDatagrams.</td>
</tr>
<tr>
<td>Datagrams Transmit Failed</td>
<td>Number of output IPv6 datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipv6IfStatsOutForwDatagrams if any such packets met this (discretionary) discard criterion.</td>
</tr>
<tr>
<td>Fragments Created</td>
<td>Number of output datagram fragments that have been generated as a result of fragmentation at this output interface.</td>
</tr>
<tr>
<td>Datagrams Successfully Fragmented</td>
<td>Number of IPv6 datagrams that have been successfully fragmented at this output interface.</td>
</tr>
<tr>
<td>Datagrams Failed To Fragment</td>
<td>Number of IPv6 datagrams that have been discarded because they needed to be fragmented at this output interface but could not be.</td>

<tr>
<td>ICMPv6 Messages with errors</td>
<td>Number of ICMP messages which the interface received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, etc.).</td>
</tr>
<tr>
<td>ICMPv6 Destination Unreachable Messages</td>
<td>Number of ICMP Destination Unreachable messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Messages Prohibited Administratively</td>
<td>Number of ICMP destination unreachable/communication administratively prohibited messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Time Exceeded Messages</td>
<td>Number of ICMP Time Exceeded messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Parameter Problem Messages</td>
<td>Number of ICMP Parameter Problem messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 messages with too big packets</td>
<td>Number of ICMP Packet Too Big messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Echo Request Messages Received</td>
<td>Number of ICMP Echo (request) messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Echo Reply Messages Received</td>
<td>Number of ICMP Echo Reply messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Router Solicit Messages Received</td>
<td>Number of ICMP Router Solicit messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Router Advertisement Messages Received</td>
<td>Number of ICMP Router Advertisement messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Neighbor Solicit Messages Received</td>
<td>Number of ICMP Neighbor Solicit messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Neighbor Advertisement Messages Received</td>
<td>Number of ICMP Neighbor Advertisement messages received by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Redirect Messages Received</td>
<td>Number of Redirect messages received by the interface.</td>
</tr>
<tr>
<td>Transmitted</td>
<td>Number of ICMPv6 Group Membership Query messages received by the interface.</td>
</tr>
<tr>
<td>Total ICMPv6 Messages Transmitted</td>
<td>Total number of ICMP messages which this interface attempted to send. Note that this counter includes all those counted by icmpOutErrors.</td>
</tr>
<tr>
<td>ICMPv6 Messages Not Transmitted Due To Error</td>
<td>Number of ICMP messages which this interface did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IPv6 to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.</td>
</tr>
<tr>
<td>ICMPv6 Destination Unreachable Messages Transmitted</td>
<td>Number of ICMP Destination Unreachable messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Messages Prohibited Administratively Transmitted</td>
<td>Number of ICMP destination unreachable/communication administratively prohibited messages sent.</td>
</tr>
</tbody>
</table>
### IPv6 Commands

**clear ipv6 route counters**

This command resets to zero the IPv6 routing table counters reported in `show ipv6 route summary`. The command resets only the event counters. Counters that report the current state of the routing table, such as the number of routes of each type, are not reset.

**Format**

*clear ipv6 route counters*

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>ICMPv6 Time Exceeded Messages Transmitted</td>
<td>Number of ICMP Time Exceeded messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Parameter Problem Messages Transmitted</td>
<td>Number of ICMP Parameter Problem messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Packet Too Big Messages Transmitted</td>
<td>Number of ICMP Packet Too Big messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Echo Request Messages Transmitted</td>
<td>Number of ICMP Echo (request) messages sent by the interface. ICMP echo messages sent.</td>
</tr>
<tr>
<td>ICMPv6 Echo Reply Messages Transmitted</td>
<td>Number of ICMP Echo Reply messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Router Solicit Messages Transmitted</td>
<td>Number of ICMP Router Solicitation messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Router Advertisement Messages Transmitted</td>
<td>Number of ICMP Router Advertisement messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Neighbor Solicit Messages Transmitted</td>
<td>Number of ICMP Neighbor Solicitation messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Neighbor Advertisement Messages Transmitted</td>
<td>Number of ICMP Neighbor Advertisement messages sent by the interface.</td>
</tr>
<tr>
<td>ICMPv6 Redirect Messages Received</td>
<td>Number of Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects.</td>
</tr>
<tr>
<td>ICMPv6 Group Membership Query Messages Received</td>
<td>Number of ICMPv6 Group Membership Query messages sent.</td>
</tr>
<tr>
<td>ICMPv6 Group Membership Response Messages Received</td>
<td>Number of ICMPv6 Group Membership Response messages sent.</td>
</tr>
<tr>
<td>ICMPv6 Group Membership Reduction Messages Received</td>
<td>Number of ICMPv6 Group Membership Reduction messages sent.</td>
</tr>
<tr>
<td>ICMPv6 Duplicate Address Detects</td>
<td>Number of duplicate addresses detected by the interface.</td>
</tr>
</tbody>
</table>
clear ipv6 statistics

Use this command to clear IPv6 statistics for all interfaces or for a specific interface, including loopback and tunnel interfaces. IPv6 statistics display in the output of the show ipv6 traffic command. If you do not specify an interface, the counters for all IPv6 traffic statistics reset to zero.

**Format**
```
clear ipv6 statistics [{<unit/slot/port> | loopback <loopback-id> | tunnel <tunnel-id>}]```

**Mode**
Privileged EXEC

---

**OSPFv3 Commands**

This section describes the commands you use to configure OSPFv3, which is a link-state routing protocol that you use to route traffic within a network.

**ipv6 ospf**

This command enables OSPF on a router interface or loopback interface.

**Default**
disabled

**Format**
```
ipv6 ospf```

**Mode**
Interface Config

**no ipv6 ospf**

This command disables OSPF on a router interface or loopback interface.

**Format**
```
no ipv6 ospf```

**Mode**
Interface Config

**ipv6 ospf area**

This command sets the OSPF area to which the specified router interface belongs. The `<areaid>` is an IPv6 address, formatted as a 4-digit dotted-decimal number or a decimal value in the range of `<0-4294967295>`. The `<areaid>` uniquely identifies the area to which the interface connects. Assigning an area id, which does not exist on an interface, causes the area to be created with default values.

**Format**
```
ipv6 ospf area <areaid>```

**Mode**
Interface Config
**ipv6 ospf cost**

This command configures the cost on an OSPF interface. The `<cost>` parameter has a range of 1 to 65535.

Default: 10

Format: `ipv6 ospf cost <1-65535>`

Mode: Interface Config

**no ipv6 ospf cost**

This command configures the default cost on an OSPF interface.

Format: `no ipv6 ospf cost`

Mode: Interface Config

**ipv6 ospf dead-interval**

This command sets the OSPF dead interval for the specified interface. The value for `<seconds>` is a valid positive integer, which represents the length of time in seconds that a router's Hello packets have not been seen before its neighbor routers declare that the router is down. The value for the length of time must be the same for all routers attached to a common network. This value should be some multiple of the Hello Interval (i.e., 4). Valid values range from 1 to 2147483647.

Default: 40

Format: `ipv6 ospf dead-interval <seconds>`

Mode: Interface Config

**no ipv6 ospf dead-interval**

This command sets the default OSPF dead interval for the specified interface.

Format: `no ipv6 ospf dead-interval`

Mode: Interface Config

**ipv6 ospf hello-interval**

This command sets the OSPF hello interval for the specified interface. The value for `<seconds>` is a valid positive integer, which represents the length of time in seconds. The value for the length of time must be the same for all routers attached to a network. Valid values range from 1 to 65535.

Default: 10
**ipv6 ospf hello-interval**

This command sets the default OSPF hello interval for the specified interface.

```
Format: ipv6 ospf hello-interval <seconds>
Mode: Interface Config
```

**no ipv6 ospf hello-interval**

This command sets the default OSPF hello interval for the specified interface.

```
Format: no ipv6 ospf hello-interval
Mode: Interface Config
```

**ipv6 ospf mtu-ignore**

This command disables OSPF maximum transmission unit (MTU) mismatch detection. OSPF Database Description packets specify the size of the largest IP packet that can be sent without fragmentation on the interface. When a router receives a Database Description packet, it examines the MTU advertised by the neighbor. By default, if the MTU is larger than the router can accept, the Database Description packet is rejected and the OSPF adjacency is not established.

```
Default: enabled
Format: ipv6 ospf mtu-ignore
Mode: Interface Config
```

**no ipv6 ospf mtu-ignore**

This command enables the OSPF MTU mismatch detection.

```
Format: no ipv6 ospf mtu-ignore
Mode: Interface Config
```

**ipv6 ospf network**

This command changes the default OSPF network type for the interface. Normally, the network type is determined from the physical IP network type. By default all Ethernet networks are OSPF type broadcast. Similarly, tunnel interfaces default to point-to-point. When an Ethernet port is used as a single large bandwidth IP network between two routers, the network type can be point-to-point since there are only two routers. Using point-to-point as the network type eliminates the overhead of the OSPF designated router election. It is normally not useful to set a tunnel to OSPF network type broadcast.

```
Default: broadcast
Format: ipv6 ospf network {broadcast | point-to-point}
Mode: Interface Config
```
**no ipv6 ospf network**

This command sets the interface type to the default value.

**Format**
```
no ipv6 ospf network {broadcast | point-to-point}
```

**Mode**
Interface Config

**ipv6 ospf priority**

This command sets the OSPF priority for the specified router interface. The priority of the interface is a priority integer from 0 to 255. A value of 0 indicates that the router is not eligible to become the designated router on this network.

**Default**
1, which is the highest router priority

**Format**
```
ipv6 ospf priority <0-255>
```

**Mode**
Interface Config

**no ipv6 ospf priority**

This command sets the default OSPF priority for the specified router interface.

**Format**
```
no ipv6 ospf priority
```

**Mode**
Interface Config

**ipv6 ospf retransmit-interval**

This command sets the OSPF retransmit Interval for the specified interface. The retransmit interval is specified in seconds. The value for `<seconds>` is the number of seconds between link-state advertisement retransmissions for adjacencies belonging to this router interface. This value is also used when retransmitting database description and link-state request packets. Valid values range from 0 to 3600 (1 hour).

**Default**
5

**Format**
```
ipv6 ospf retransmit-interval <seconds>
```

**Mode**
Interface Config

**no ipv6 ospf retransmit-interval**

This command sets the default OSPF retransmit Interval for the specified interface.

**Format**
```
no ipv6 ospf retransmit-interval
```

**Mode**
Interface Config
**ipv6 ospf transmit-delay**

This command sets the OSPF Transit Delay for the specified interface. The transmit delay is specified in seconds. In addition, it sets the estimated number of seconds it takes to transmit a link state update packet over this interface. Valid values for `<seconds>` range from 1 to 3600 (1 hour).

**Default**

1

**Format**

ipv6 ospf transmit-delay `<seconds>`

**Mode**

Interface Config

**no ipv6 ospf transmit-delay**

This command sets the default OSPF Transit Delay for the specified interface.

**Format**

no ipv6 ospf transmit-delay

**Mode**

Interface Config

**ipv6 router ospf**

Use this command to enter Router OSPFv3 Config mode.

**Format**

ipv6 router ospf

**Mode**

Global Config

**area default-cost (OSPFv3)**

This command configures the monetary default cost for the stub area. The operator must specify the area id and an integer value between 1–16777215.

**Format**

area `<areaid>` default-cost `<1-16777215>`

**Mode**

Router OSPFv3 Config

**area nssa (OSPFv3)**

This command configures the specified areaid to function as an NSSA.

**Format**

area `<areaid>` nssa

**Mode**

Router OSPFv3 Config
no area nssa(OSPFv3)

This command disables nssa from the specified area id.

Format: no area <areaid> nssa

Mode: Router OSPFv3 Config

area nssa default-info-originate (OSPFv3)

This command configures the metric value and type for the default route advertised into the NSSA. The optional metric parameter specifies the metric of the default route and is to be in a range of 1-16777214. If no metric is specified, the default value is 10. The metric type can be comparable (nssa-external 1) or non-comparable (nssa-external 2).

Format: area <areaid> nssa default-info-originate [<metric>] [{comparable | non-comparable}]

Mode: Router OSPFv3 Config

no area nssa default-info-originate (OSPFv3)

This command disables the default route advertised into the NSSA.

Format: no area <areaid> nssa default-info-originate [<metric>] [{comparable | non-comparable}]

Mode: Router OSPF Config

area nssa no-redistribute (OSPFv3)

This command configures the NSSA ABR so that learned external routes will not be redistributed to the NSSA.

Format: area <areaid> nssa no-redistribute

Mode: Router OSPFv3 Config

no area nssa no-redistribute (OSPFv3)

This command disables the NSSA ABR so that learned external routes are redistributed to the NSSA.

Format: no area <areaid> nssa no-redistribute

Mode: Router OSPF Config
area nssa no-summary (OSPFv3)

This command configures the NSSA so that summary LSAs are not advertised into the NSSA.

Format  area <areaid> nssa no-summary
Mode     Router OSPFv3 Config

no area nssa no-summary (OSPFv3)

This command disables nssa from the summary LSAs.

Format  no area <areaid> nssa no-summary
Mode     Router OSPF Config

area nssa translator-role (OSPFv3)

This command configures the translator role of the NSSA. A value of always causes the router to assume the role of the translator the instant it becomes a border router and a value of candidate causes the router to participate in the translator election process when it attains border router status.

Format  area <areaid> nssa translator-role {always | candidate}
Mode     Router OSPFv3 Config

no area nssa translator-role (OSPFv3)

This command disables the nssa translator role from the specified area id.

Format  no area <areaid> nssa translator-role {always | candidate}
Mode     Router OSPF Config

area nssa translator-stab-intv (OSPFv3)

This command configures the translator <stabilityinterval> of the NSSA. The <stabilityinterval> is the period of time that an elected translator continues to perform its duties after it determines that its translator status has been deposed by another router.

Format  area <areaid> nssa translator-stab-intv <stabilityinterval>
Mode     Router OSPFv3 Config
**no area nssa translator-stab-intv (OSPFv3)**

This command disables the nssa translator's `<stabilityinterval>` from the specified area id.

**Format**

```
no area <areaid> nssa translator-stab-intv <stabilityinterval>
```

**Mode**

- Router OSPF Config

**area range (OSPFv3)**

This command creates a specified area range for a specified NSSA. The `<ipaddr>` is a valid IP address. The `<subnetmask>` is a valid subnet mask. The LSDB type must be specified by either `summarylink` or `nssaexternallink`, and the advertising of the area range can be allowed or suppressed.

**Format**

```
area <areaid> range <ipv6-prefix> <prefix-length> {summarylink | nssaexternallink} [advertise | not-advertise]
```

**Mode**

- Router OSPFv3 Config

**no area range (OSPFv3)**

This command deletes a specified area range. The `<ipaddr>` is a valid IP address. The `<subnetmask>` is a valid subnet mask.

**Format**

```
no area <areaid> range <ipv6-prefix> <prefix-length>
```

**Mode**

- Router OSPFv3 Config

**area stub (OSPFv3)**

This command creates a stub area for the specified area ID. A stub area is characterized by the fact that AS External LSAs are not propagated into the area. Removing AS External LSAs and Summary LSAs can significantly reduce the link state database of routers within the stub area.

**Format**

```
area <areaid> stub
```

**Mode**

- Router OSPFv3 Config

**no area stub (OSPFv3)**

This command deletes a stub area for the specified area ID.

**Format**

```
no area <areaid> stub
```

**Mode**

- Router OSPFv3 Config
**area stub no-summary (OSPFv3)**

This command disables the import of Summary LSAs for the stub area identified by `<areaid>`.

**Default** enabled

**Format**

```
area <areaid> stub no-summary
```

**Mode** Router OSPFv3 Config

**no area stub no-summary (OSPFv3)**

This command sets the Summary LSA import mode to the default for the stub area identified by `<areaid>`.

**Format**

```
no area <areaid> stub summarylsa
```

**Mode** Router OSPFv3 Config

**area virtual-link (OSPFv3)**

This command creates the OSPF virtual interface for the specified `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

```
area <areaid> virtual-link <neighbor>
```

**Mode** Router OSPFv3 Config

**no area virtual-link (OSPFv3)**

This command deletes the OSPF virtual interface from the given interface, identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

```
no area <areaid> virtual-link <neighbor>
```

**Mode** Router OSPFv3 Config

**area virtual-link dead-interval (OSPFv3)**

This command configures the dead interval for the OSPF virtual interface on the virtual interface identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor. The range for `<seconds>` is 1 to 65535.

**Default** 40

**Format**

```
area <areaid> virtual-link <neighbor> dead-interval <seconds>
```

**Mode** Router OSPFv3 Config
no area virtual-link dead-interval(OSPFv3)

This command configures the default dead interval for the OSPF virtual interface on the virtual interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor.

Format:  no area <areaid> virtual-link <neighbor> dead-interval

Mode: Router OSPFv3 Config

area virtual-link hello-interval (OSPFv3)

This command configures the hello interval for the OSPF virtual interface on the virtual interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor. The range for <seconds> is 1 to 65535.

Default: 10

Format:  area <areaid> virtual-link <neighbor> hello-interval <seconds>

Mode: Router OSPFv3 Config

no area virtual-link hello-interval(OSPFv3)

This command configures the default hello interval for the OSPF virtual interface on the virtual interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor.

Format:  no area <areaid> virtual-link <neighbor> hello-interval

Mode: Router OSPFv3 Config

area virtual-link retransmit-interval (OSPFv3)

This command configures the retransmit interval for the OSPF virtual interface on the virtual interface identified by <areaid> and <neighbor>. The <neighbor> parameter is the Router ID of the neighbor. The range for <seconds> is 0 to 3600.

Default: 5

Format:  area <areaid> virtual-link <neighbor> retransmit-interval <seconds>

Mode: Router OSPFv3 Config
no area virtual-link retransmit-interval (OSPFv3)

This command configures the default retransmit interval for the OSPF virtual interface on the virtual interface identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

```
no area <areaid> virtual-link <neighbor> retransmit-interval
```

**Mode**

Router OSPFv3 Config

area virtual-link transmit-delay (OSPFv3)

This command configures the transmit delay for the OSPF virtual interface on the virtual interface identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor. The range for `<seconds>` is 0 to 3600 (1 hour).

**Default**

```
1
```

**Format**

```
area <areaid> virtual-link <neighbor> transmit-delay <seconds>
```

**Mode**

Router OSPFv3 Config

no area virtual-link transmit-delay (OSPFv3)

This command configures the default transmit delay for the OSPF virtual interface on the virtual interface identified by `<areaid>` and `<neighbor>`. The `<neighbor>` parameter is the Router ID of the neighbor.

**Format**

```
no area <areaid> virtual-link <neighbor> transmit-delay
```

**Mode**

Router OSPFv3 Config

auto-cost (OSPFv3)

By default, OSPF computes the link cost of each interface from the interface bandwidth. Faster links have lower metrics, making them more attractive in route selection. The configuration parameters in the `auto-cost reference bandwidth` and `bandwidth` commands give you control over the default link cost. You can configure for OSPF an interface bandwidth that is independent of the actual link speed. A second configuration parameter allows you to control the ratio of interface bandwidth to link cost. The link cost is computed as the ratio of a reference bandwidth to the interface bandwidth (ref_bw / interface bandwidth), where interface bandwidth is defined by the `bandwidth` command. Because the default reference bandwidth is 100 Mbps, OSPF uses the same default link cost for all interfaces whose bandwidth is 100 Mbps or greater. Use the `auto-cost` command to change the reference bandwidth, specifying the reference bandwidth in megabits per second (Mbps). The reference bandwidth range is 1–4294967 Mbps. The different reference bandwidth can be independently configured for OSPFv2 and OSPFv3.

**Default**

```
100Mbps
```
no auto-cost reference-bandwidth (OSPFv3)

Use this command to set the reference bandwidth to the default value.

Format: no auto-cost reference-bandwidth
Mode: Router OSPFv3 Config

clear ipv6 ospf

Use this command to disable and re-enable OSPF.

Format: clear ipv6 ospf
Mode: Privileged EXEC

clear ipv6 ospf configuration

Use this command to reset the OSPF configuration to factory defaults.

Format: clear ipv6 ospf configuration
Mode: Privileged EXEC

clear ipv6 ospf counters

Use this command to reset global and interface statistics.

Format: clear ipv6 ospf counters
Mode: Privileged EXEC

clear ipv6 ospf neighbor

Use this command to drop the adjacency with all OSPF neighbors. On each neighbor’s interface, send a one-way hello. Adjacencies may then be re-established. To drop all adjacencies with a specific router ID, specify the neighbor’s Router ID using the optional parameter [neighbor-id].

Format: clear ipv6 ospf neighbor [neighbor-id]
Mode: Privileged EXEC
**clear ipv6 ospf neighbor interface**

To drop adjacency with all neighbors on a specific interface, use the optional parameter `[unit/slot/port]`. To drop adjacency with a specific router ID on a specific interface, use the optional parameter `[neighbor-id]`.

**Format**
```
clear ipv6 ospf neighbor interface [unit/slot/port] [neighbor-id]
```

**Mode**
Privileged EXEC

**clear ipv6 ospf redistribution**

Use this command to flush all self-originated external LSAs. Reapply the redistribution configuration and re-originate prefixes as necessary.

**Format**
```
clear ipv6 ospf redistribution
```

**Mode**
Privileged EXEC

**default-information originate (OSPFv3)**

This command is used to control the advertisement of default routes.

**Default**
- metric—unspecified
- type—2

**Format**
```
default-information originate [always] [metric <1-16777214>] [metric-type {1 | 2}]
```

**Mode**
Router OSPFv3 Config

**no default-information originate (OSPFv3)**

This command is used to control the advertisement of default routes.

**Format**
```
no default-information originate [metric] [metric-type]
```

**Mode**
Router OSPFv3 Config

**default-metric (OSPFv3)**

This command is used to set a default for the metric of distributed routes.

**Format**
```
default-metric <1-16777214>
```

**Mode**
Router OSPFv3 Config
no default-metric (OSPFv3)

This command is used to set a default for the metric of distributed routes.

- **Format**: `no default-metric`
- **Mode**: Router OSPFv3 Config

**distance ospf (OSPFv3)**

This command sets the route preference value of OSPF route types in the router. Lower route preference values are preferred when determining the best route. The type of OSPF route can be intra, inter, or external. All the external type routes are given the same preference value. The range of `<preference>` value is 1 to 255.

- **Default**: 110
- **Format**: `distance ospf {intra-area <1-255> | inter-area <1-255> | external <1-255>}`
- **Mode**: Router OSPFv3 Config

no distance ospf(OSPFv3)

This command sets the default route preference value of OSPF routes in the router. The type of OSPF route can be intra, inter, or external. All the external type routes are given the same preference value.

- **Format**: `no distance ospf {intra-area | inter-area | external}`
- **Mode**: Router OSPFv3 Config

**enable (OSPFv3)**

This command resets the default administrative mode of OSPF in the router (active).

- **Default**: `enabled`
- **Format**: `enable`
- **Mode**: Router OSPFv3 Config

**no enable (OSPFv3)**

This command sets the administrative mode of OSPF in the router to inactive.

- **Format**: `no enable`
- **Mode**: Router OSPFv3 Config
exit-overflow-interval (OSPFv3)

This command configures the exit overflow interval for OSPF. It describes the number of seconds after entering Overflow state that a router will wait before attempting to leave the overflow state. This allows the router to again originate non-default AS-external-LSAs. When set to 0, the router will not leave overflow state until restarted. The range for \(<\text{seconds}>\) is 0 to 2147483647 seconds.

**Default** 0

**Format** `exit-overflow-interval <seconds>`

**Mode** Router OSPFv3 Config

no exit-overflow-interval (OSPFv3)

This command configures the default exit overflow interval for OSPF.

**Format** `no exit-overflow-interval`

**Mode** Router OSPFv3 Config

external-lsdb-limit (OSPFv3)

This command configures the external LSDB limit for OSPF. If the value is –1, then there is no limit. When the number of non-default AS-external-LSAs in a router’s link-state database reaches the external LSDB limit, the router enters overflow state. The router never holds more than the external LSDB limit non-default AS-external-LSAs in its database. The external LSDB limit MUST be set identically in all routers attached to the OSPF backbone and/or any regular OSPF area. The range for \(<\text{limit}>\) is –1 to 2147483647.

**Default** -1

**Format** `external-lsdb-limit <limit>`

**Mode** Router OSPFv3 Config

no external-lsdb-limit

This command configures the default external LSDB limit for OSPF.

**Format** `no external-lsdb-limit`

**Mode** Router OSPFv3 Config
**maximum-paths (OSPFv3)**

This command sets the number of paths that OSPF can report for a given destination where `maxpaths` is platform dependent.

**Default**

4

**Format**

`maximum-paths <maxpaths>`

**Mode**

Router OSPFv3 Config

**no maximum-paths**

This command resets the number of paths that OSPF can report for a given destination back to its default value.

**Format**

`no maximum-paths`

**Mode**

Router OSPFv3 Config

**passive-interface default (OSPFv3)**

Use this command to enable global passive mode by default for all interfaces. It overrides any interface level passive mode. OSPF shall not form adjacencies over a passive interface.

**Default**

disabled

**Format**

`passive-interface default`

**Mode**

Router OSPFv3 Config

**no passive-interface default (OSPFv3)**

Use this command to disable the global passive mode by default for all interfaces. Any interface previously configured to be passive reverts to non-passive mode.

**Format**

`no passive-interface default`

**Mode**

Router OSPFv3 Config

**passive-interface (OSPFv3)**

Use this command to set the interface or tunnel as passive. It overrides the global passive mode that is currently effective on the interface or tunnel.

**Default**

disabled

**Format**

`passive-interface {<unit/slot/port> | tunnel <tunnel-id>}`

**Mode**

Router OSPFv3 Config
no passive-interface (OSPFv3)

Use this command to set the interface or tunnel as non-passive. It overrides the global passive mode that is currently effective on the interface or tunnel.

Format  
no passive-interface {<unit/slot/port> | tunnel <tunnel-id>}

Mode  
Router OSPFv3 Config

redistribute (OSPFv3)

This command configures the OSPFv3 protocol to allow redistribution of routes from the specified source protocol/routers.

Default  
- metric—unspecified
- type—2
- tag—0

Format  
redistribute {static | connected} [metric <0-16777214>] [metric-type {1 | 2}] [tag <0-4294967295>]

Mode  
Router OSPFv3 Config

no redistribute (OSPFv3)

This command configures OSPF protocol to prohibit redistribution of routes from the specified source protocol/routers.

Format  
no redistribute {static | connected} [metric] [metric-type] [tag]

Mode  
Router OSPFv3 Config

router-id (OSPFv3)

This command sets a 4-digit dotted-decimal number uniquely identifying the router ospf id. The <ipaddress> is a configured value.

Format  
router-id <ipaddress>

Mode  
Router OSPFv3 Config
**trapflags (OSPFv3)**

Use this command to enable individual OSPF traps, enable a group of trap flags at a time, or enable all the trap flags at a time. The different groups of trapflags, and each group’s specific trapflags to enable or disable, are listed in *Table 2, Trapflag Groups (OSPFv3).*

**Table 2. Trapflag Groups (OSPFv3)**

<table>
<thead>
<tr>
<th>Group</th>
<th>Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>• authentication-failure</td>
</tr>
<tr>

</tbody>
</table>

- To enable the individual flag, enter the **group name** followed by that particular flag.
- To enable all the flags in that group, give the group name followed by **all**.
IPv6 Commands

To enable all the flags, give the command as `trapflags all`.

**Default**

`disabled`

**Format**

```
trapflags {
  all |
  errors {all | authentication-failure | bad-packet | config-error |
          virt-authentication-failure | virt-bad-packet | virt-config-error} |
  if-rx {all | if-rx-packet} |
  lsa {all | lsa-maxage | lsa-originate} |
  overflow {all | lsdb-overflow | lsdb-approaching-overflow} |
  retransmit {all | packets | virt-packets} |
  rtb {all, rtb-entry-info} |
  state-change {all | if-state-change | neighbor-state-change |
                virtif-state-change | virtneighbor-state-change}
```

**Mode**

Router OSPFv3 Config

**no trapflags (OSPFv3)**

Use this command to revert to the default reference bandwidth.

- To disable the individual flag, enter the group name followed by that particular flag.
- To disable all the flags in that group, give the group name followed by `all`.
- To disable all the flags, give the command as `trapflags all`.

**Format**

```
no trapflags {
  all |
  errors {all | authentication-failure | bad-packet | config-error |
          virt-authentication-failure | virt-bad-packet | virt-config-error} |
  if-rx {all | if-rx-packet} |
  lsa {all | lsa-maxage | lsa-originate} |
  overflow {all | lsdb-overflow | lsdb-approaching-overflow} |
  retransmit {all | packets | virt-packets} |
  rtb {all, rtb-entry-info} |
  state-change {all | if-state-change | neighbor-state-change |
                virtif-state-change | virtneighbor-state-change}
}
```

**Mode**

Router OSPFv3 Config

**show ipv6 ospf**

This command displays information relevant to the OSPF router.

**Format**

`show ipv6 ospf`

**Mode**

Privileged EXEC
**IPv6 Commands**

---

**Note:** Some of the information below displays only if you enable OSPF and configure certain features.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router ID</td>
<td>A 32 bit integer in dotted decimal format identifying the router, about which information is displayed. This is a configured value.</td>

show ipv6 ospf database

This command displays information about the link state database when OSPFv3 is enabled. If you do not enter any parameters, the command displays the LSA headers for all areas. Use the optional `<areaid>` parameter to display database information about a specific area. Use the other optional parameters to specify the type of link state advertisements to display. Use `external` to display the external LSAs. Use `inter-area` to display the inter-area LSAs. Use `link` to display the link LSAs. Use `network` to display the network LSAs. Use `nssa-external` to display NSSA external LSAs. Use `prefix` to display intra-area Prefix LSAs. Use `router` to display router LSAs. Use `unknown area`, `unknown as`, or `unknown link` to display unknown area, AS or link-scope LSAs, respectively. Use `<lsid>` to specify the link state ID (LSID). Use `adv-router` to show the LSAs that are restricted by the advertising router. Use `self originate` to display the LSAs in that are self originated. The information below is only displayed if OSPF is enabled.

**Format**
```
show ipv6 ospf [<areaid>] database [{external | inter-area {prefix | router} | link | network | nssa-external | prefix | router | unknown {area | as | link}]} [<lsid>] [{adv-router [<rtrid>] | self originate}]
```

**Modes**
- Privileged EXEC
- User EXEC

For each link-type and area, the following information is displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Link Id</td>
<td>A number that uniquely identifies an LSA that a router originates from all other self originated LSAs of the same LS type.</td>
</tr>
<tr>
<td>Adv Router</td>
<td>The Advertising Router. Is a 32 bit dotted decimal number representing the LSDB interface.</td>
</tr>
<tr>
<td>Age</td>
<td>A number representing the age of the link state advertisement in seconds.</td>
</tr>
<tr>
<td>Sequence</td>
<td>A number that represents which LSA is more recent.</td>
</tr>
<tr>
<td>Checksum</td>
<td>The total number LSA checksum.</td>
</tr>
<tr>
<td>Options</td>
<td>An integer indicating that the LSA receives special handling during routing calculations.</td>
</tr>
<tr>
<td>Rtr Opt</td>
<td>Router Options are valid for router links only.</td>
</tr>
</tbody>
</table>
**show ipv6 ospf database database-summary**

Use this command to display the number of each type of LSA in the database and the total number of LSAs in the database.

**Format**

```
show ipv6 ospf database database-summary
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

<td>Shows whether the interface is passive or not.</td>
</tr>
<tr>
<td>OSPF MTU-ignore</td>
<td>Shows whether to ignore MTU mismatches in database descriptor packets sent from neighboring routers.</td>
</tr>
</tbody>
</table>

### Term Definition

**Term**
- **OSPF Interface Type**
- **State**
- **Designated Router**
- **Backup Designated Router**
- **Number of Link Events**
- **Metric Cost**

**Definition**
- Broadcast LANs, such as Ethernet and IEEE 802.5, take the value *broadcast*. The OSPF Interface Type will be 'broadcast'.
- The OSPF Interface States are: down, loopback, waiting, point-to-point, designated router, and backup designated router.
- The router ID representing the designated router.
- The router ID representing the backup designated router.
- The number of link events.
- The cost of the OSPF interface.

### show ipv6 ospf interface brief

This command displays brief information for the IFO object or virtual interface tables.

**Format**

`show ipv6 ospf interface brief`

**Modes**

- Privileged EXEC
- User EXEC

---

**IPv6 Commands**

423
show ipv6 ospf interface stats

This command displays the statistics for a specific interface. The command only displays information if OSPF is enabled.

**Format**

show ipv6 ospf interface stats <unit/slot/port>

**Modes**

- Privileged EXEC
- User EXEC

<table>

<td>The number of OSPF packets discarded because the packet’s destination IP address is not the address of the ingress interface and is not the AllDrRouters or AllSpfRouters multicast addresses.</td>
</tr>
<tr>
<td>No Neighbor at Source Address</td>
<td>The number of OSPF packets dropped because the sender is not an existing neighbor or the sender’s IP address does not match the previously recorded IP address for that neighbor. NOTE: Does not apply to Hellos.</td>
</tr>
<tr>
<td>Invalid OSPF Packet Type</td>
<td>The number of OSPF packets discarded because the packet type field in the OSPF header is not a known type.</td>
</tr>
<tr>
<td>Hellos Ignored</td>
<td>The number of received Hello packets that were ignored by this router from the new neighbors after the limit has been reached for the number of neighbors on an interface or on the system as a whole.</td>
</tr>
</tbody>
</table>

See *show ip ospf interface stats* on page 315 for a sample output of the number of OSPF packets of each type sent and received on the interface.

*show ipv6 ospf neighbor*

This command displays information about OSPF neighbors. If you do not specify a neighbor IP address, the output displays summary information in a table. If you specify an interface or tunnel, only the information for that interface or tunnel displays. The *<ip-address>* is the IP address of the neighbor, and when you specify this, detailed information about the neighbor displays. The information below only displays if OSPF is enabled and the interface has a neighbor.

**Format**

```
show ipv6 ospf neighbor [interface {<unit/slot/port> | tunnel <tunnel_id>}] [<ip-address>]
```

**Modes**

- Privileged EXEC
- User EXEC
If you do not specify an IP address, a table with the following columns displays for all neighbors or the neighbor associated with the interface that you specify:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router ID</td>
<td>The 4-digit dotted-decimal number of the neighbor router.</td>
</tr>
<tr>
<td>Priority</td>
<td>The OSPF priority for the specified interface. The priority of an interface is a priority integer from 0 to 255. A value of '0' indicates that the router is not eligible to become the designated router on this network.</td>
</tr>
<tr>
<td>Intf ID</td>
<td>The interface ID of the neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface of the local router in unit/slot/port format.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the neighboring routers. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Down- initial state of the neighbor conversation - no recent information has been received from the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Attempt - no recent information has been received from the neighbor but a more concerted effort should be made to contact the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Init - an Hello packet has recently been seen from the neighbor, but bidirectional communication has not yet been established.</td>
</tr>
<tr>
<td></td>
<td>• 2 way - communication between the two routers is bidirectional.</td>
</tr>
<tr>
<td></td>
<td>• Exchange start - the first step in creating an adjacency between the two neighboring routers, the goal is to decide which router is the master and to decide upon the initial DD sequence number.</td>
</tr>
<tr>
<td></td>
<td>• Exchange - the router is describing its entire link state database by sending Database Description packets to the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• Full - the neighboring routers are fully adjacent and they will now appear in router-LSAs and network-LSAs.</td>
</tr>
<tr>
<td>Dead Time</td>
<td>The amount of time, in seconds, to wait before the router assumes the neighbor is unreachable.</td>
</tr>
</tbody>
</table>

If you specify an IP address for the neighbor router, the following fields display:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface of the local router in unit/slot/port format.</td>
</tr>
<tr>
<td>Area ID</td>
<td>The area ID associated with the interface.</td>
</tr>
<tr>
<td>Options</td>
<td>An integer value that indicates the optional OSPF capabilities supported by the neighbor. These are listed in its Hello packets. This enables received Hello Packets to be rejected (i.e., neighbor relationships will not even start to form) if there is a mismatch in certain crucial OSPF capabilities.</td>
</tr>
<tr>
<td>Router Priority</td>
<td>The router priority for the specified interface.</td>
</tr>
<tr>
<td>Dead Timer Due</td>
<td>The amount of time, in seconds, to wait before the router assumes the neighbor is unreachable.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the neighboring routers.</td>
</tr>
</tbody>
</table>
show ipv6 ospf range

This command displays information about the area ranges for the specified `<areaid>`. The `<areaid>` identifies the OSPF area whose ranges are being displayed.

Format: `show ipv6 ospf range <areaid>`

Modes: • Privileged EXEC
• User EXEC

**Term** | **Definition**
---|---
Events | Number of times this neighbor relationship has changed state, or an error has occurred.
Retransmission Queue Length | An integer representing the current length of the retransmission queue of the specified neighbor router Id of the specified interface.

**show ipv6 ospf stub table**

This command displays the OSPF stub table. The information below will only be displayed if OSPF is initialized on the switch.

Format: `show ipv6 ospf stub table`

Modes: • Privileged EXEC
• User EXEC

**Term** | **Definition**
---|---
Area ID | The area id of the requested OSPF area.
IP Address | An IP address which represents this area range.
Lsdb Type | The type of link advertisement associated with this area range.
Advertisement | The status of the advertisement: enabled or disabled.

**Term** | **Definition**
---|---
Area ID | A 32-bit identifier for the created stub area.
Type of Service | Type of service associated with the stub metric. For this release, Normal TOS is the only supported type.
Metric Val | The metric value is applied based on the TOS. It defaults to the least metric of the type of service among the interfaces to other areas. The OSPF cost for a route is a function of the metric value.
Import Summary LSA | Controls the import of summary LSAs into stub areas.
**show ipv6 ospf virtual-link**

This command displays the OSPF Virtual Interface information for a specific area and neighbor. The `<areaid>` parameter identifies the area and the `<neighbor>` parameter identifies the neighbor’s Router ID.

**Format**
```
show ipv6 ospf virtual-link <areaid> <neighbor>
```

**Modes**
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area ID</td>
<td>The area id of the requested OSPF area.</td>
</tr>
<tr>
<td>Neighbor Router ID</td>
<td>The input neighbor Router ID.</td>
</tr>
<tr>
<td>Hello Interval</td>
<td>The configured hello interval for the OSPF virtual interface.</td>
</tr>
<tr>
<td>Dead Interval</td>
<td>The configured dead interval for the OSPF virtual interface.</td>
</tr>
<tr>
<td>Iftransit Delay Interval</td>
<td>The configured transit delay for the OSPF virtual interface.</td>
</tr>
<tr>
<td>Retransmit Interval</td>
<td>The configured retransmit interval for the OSPF virtual interface.</td>
</tr>
<tr>
<td>Authentication Type</td>
<td>The type of authentication the interface performs on LSAs it receives.</td>
</tr>
<tr>
<td>State</td>
<td>The OSPF Interface States are: down, loopback, waiting, point-to-point, designated router, and backup designated router. This is the state of the OSPF interface.</td>
</tr>
<tr>
<td>Neighbor State</td>
<td>The neighbor state.</td>
</tr>
</tbody>
</table>

**show ipv6 ospf virtual-link brief**

This command displays the OSPFV3 Virtual Interface information for all areas in the system.

**Format**
```
show ipv6 ospf virtual-link brief
```

**Modes**
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Area ID</td>
<td>The area id of the requested OSPFV3 area.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>The neighbor interface of the OSPFV3 virtual interface.</td>
</tr>
<tr>
<td>Hello Interval</td>
<td>The configured hello interval for the OSPFV3 virtual interface.</td>
</tr>
<tr>
<td>Dead Interval</td>
<td>The configured dead interval for the OSPFV3 virtual interface.</td>
</tr>
</tbody>
</table>
The managed switch implementation of OSPFv3 supports graceful restart as specified in RFC 5187 and RFC 3623. Graceful restart works together with managed switch non-stop forwarding (nsf) to enable the hardware to continue forwarding IPv6 packets using OSPFv3 routes while a backup unit takes over management unit responsibility. When OSPF executes a graceful restart, it informs its neighbors that the OSPF control plane is restarting but will be back shortly. Helpful neighbors continue to advertise to the network that they have full adjacencies with the restarting router, avoiding announcement of a topology change and related events (for example, flooding of LSAs and SPF runs). Helpful neighbors continue to forward packets through the restarting router. The restarting router relearns the network topology from its helpful neighbors.

Graceful restart implements both the restarting router and helpful neighbor features described in RFC 3623.

**nsf (OSPFv3)**

This command enables OSPF graceful restart. The `ietf` parameter is used to distinguish the IETF standard implementation of graceful restart from other implementations. Since the IETF implementation is not the only one supported, this parameter is optional. The `planned-only` parameter indicates that OSPF performs a graceful restart only when the restart is planned (that is, when the restart results from the `initiate failover` command).

**Default**

disabled

**Format**

nsf \[ ietf \] \[ planned-only \]

**Mode**

OSPFv3 Router Configuration mode

**no nsf [ietf] (OSPFv3)**

This command disables OSPF graceful restart.

**Format**

no nsf \[ ietf \]

**Mode**

OSPFv3 Router Configuration mode

**nsf helper (OSPFv3)**

This command allows OSPF to act as a helpful neighbor for a restarting router. The `planned-only` parameter indicates that OSPF should only help a restarting router performing a planned restart.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retransmit Interval</td>
<td>The configured retransmit interval for the OSPFV3 virtual interface.</td>
</tr>
<tr>
<td>Transit Delay</td>
<td>The configured transit delay for the OSPFV3 virtual interface.</td>
</tr>
</tbody>
</table>
The grace LSA announcing the graceful restart includes the reason for the restart. Reasons 1 (software restart) and 2 (software reload/upgrade) are considered planned restarts. Reasons 0 (unknown) and 3 (switch to redundant control processor) are considered unplanned restarts.

**Default**
OSPF acts as a helpful neighbor for both planned and unplanned restarts

**Format**
nsf helper [planned-only]

**Mode**
OSPFv3 Router Configuration mode

**nsf ietf helper disable (OSPFv3)**
This command is functionally equivalent to no nsf helper and is supported solely for IS-CLI compatibility.

**Format**
nsf ietf helper disable

**Mode**
OSPFv3 Router Configuration mode

**no nsf helper (OSPFv3)**
This command prevents OSPF from acting as a helpful neighbor.

**Format**
no nsf helper

**Mode**
OSPFv3 Router Configuration mode

**nsf helper strict-lsa-checking (OSPFv3)**
This command requires that an OSPF helpful neighbor exit helper mode when a topology change occurs. The restarting router is unable to react to topology changes. In particular, the restarting router will not immediately update its forwarding table. Therefore, a topology change might introduce forwarding loops or black holes that persist until the graceful restart is completed. By exiting graceful restart when a topology change occurs, a router tries to eliminate the loops or black holes as quickly as possible by routing around the restarting router.

The *ietf* parameter is used to distinguish the IETF standard implementation of graceful restart from other implementations. Since the IETF implementation is not the only one supported, this parameter is optional.

A helpful neighbor considers a link down with the restarting router to be a topology change, regardless of the strict LSA checking configuration.

**Default**
A helpful neighbor exits helper mode when a topology change occurs.

**Format**
nsf [ietf] helper strict-lsa-checking

**Mode**
OSPFv3 Router Configuration mode
**IPv6 Commands**

**no nsf [ietf] helper strict-lsa-checking (OSPFv3)**

This command allows OSPF to continue as a helpful neighbor in spite of topology changes.

**nsf restart-interval (OSPFv3)**

This command configures the length of the grace period on the restarting router. The grace period must be set long enough to allow the restarting router to reestablish all of its adjacencies and complete a full database exchange with each of its neighbors.

The *ietf* parameter is used to distinguish the IETF standard implementation of graceful restart from other implementations. Since the IETF implementation is not the only one supported, this parameter is optional. The *seconds* parameter represents the number of seconds that the restarting router asks its neighbors to wait before exiting helper mode. The restarting router includes the restart interval in its grace LSAs (range 1–1800 seconds).

**Default** 120s  
**Format** `nsf [ietf] restart-interval seconds`  
**Mode** OSPFv3 Router Configuration mode

**no [ietf] nsf restart-interval (OSPFv3)**

This command reverts the grace period to its default.

**DHCPv6 Commands**

This section describes the command you use to configure the DHCPv6 server on the system and to view DHCPv6 information.

**service dhcpv6**

This command enables DHCPv6 configuration on the router.

**Default** disabled  
**Format** `service dhcpv6`  
**Mode** Global Config

**no service dhcpv6**

This command disables DHCPv6 configuration on router.

**Format** `no service dhcpv6`  
**Mode** Global Config
**ipv6 dhcp server**

Use this command to configure DHCPv6 server functionality on an interface. The `<pool-name>` is the DHCPv6 pool containing stateless and/or prefix delegation parameters, `rapid-commit` is an option that allows for an abbreviated exchange between the client and server, and `<pref-value>` is a value used by clients to determine preference between multiple DHCPv6 servers. For a particular interface DHCPv6 server and DHCPv6 relay functions are mutually exclusive.

**Format**

```
ipv6 dhcp server <pool-name> [rapid-commit] [preference <pref-value>]
```

**Mode**

Interface Config

**ipv6 dhcp relay destination**

Use this command to configure an interface for DHCPv6 relay functionality. Use the `destination` keyword to set the relay server IPv6 address. The `<relay-address>` parameter is an IPv6 address of a DHCPv6 relay server. Use the `interface` keyword to set the relay server interface. The `<relay-interface>` parameter is an interface (unit/slot/port) to reach a relay server. The optional `remote-id` is the Relay Agent Information Option “remote ID” sub-option to be added to relayed messages. This can either be the special keyword `duid-ifid`, which causes the “remote ID” to be derived from the DHCPv6 server DUID and the relay interface number, or it can be specified as a user-defined string.

**Note:** If `<relay-address>` is an IPv6 global address, then `<relay-interface>` is not required. If `<relay-address>` is a link-local or multicast address, then `<relay-interface>` is required. Finally, if you do not specify a value for `<relay-address>`, then you must specify a value for `<relay-interface>` and the DHCPV6-ALL-AGENTS multicast address (i.e. FF02::1:2) is used to relay DHCPv6 messages to the relay server.

**Format**

```
ipv6 dhcp relay {destination [<relay-address>] interface
[[<relay-interface>]] | interface [<relay-interface>]) [remote-id
(duid-ifid | <user-defined-string>)]
```

**Mode**

Interface Config

**ipv6 dhcp pool**

Use this command from Global Config mode to enter IPv6 DHCP Pool Config mode. Use the `exit` command to return to Global Config mode. To return to the User EXEC mode, enter `CTRL+Z`. The `<pool-name>` should be less than 31 alpha-numeric characters. DHCPv6 pools are used to specify information for DHCPv6 server to distribute to DHCPv6 clients.
These pools are shared between multiple interfaces over which DHCPv6 server capabilities are configured.

**Format**
ipv6 dhcp pool <pool-name>

**Mode**
Global Config

**no ipv6 dhcp pool**

This command removes the specified DHCPv6 pool.

**Format**
no ipv6 dhcp pool <pool-name>

**Mode**
Global Config

**domain-name (IPv6)**

This command sets the DNS domain name provided to the DHCPv6 client by the DHCPv6 server. The DNS domain name is configured for stateless server support and consists of no more than 31 alpha-numeric characters. The DHCPv6 pool can have up to eight domain names.

**Format**
domain-name <dns-domain-name>

**Mode**
IPv6 DHCP Pool Config

**no domain-name**

This command removes the DHCPv6 domain name from the DHCPv6 pool.

**Format**
no domain-name <dns-domain-name>

**Mode**
IPv6 DHCP Pool Config

**dns-server (IPv6)**

This command sets the ipv6 DNS server address, which is provided to dhcpv6 client by dhcpv6 server. DNS server address is configured for stateless server support. DHCPv6 pool can have multiple number of domain names with maximum of 8.

**Format**
dns-server <dns-server-address>

**Mode**
IPv6 DHCP Pool Config

**no dns-server**

This command will remove DHCPv6 server address from DHCPv6 server.

**Format**
no dns-server <dns-server-address>

**Mode**
IPv6 DHCP Pool Config
**prefix-delegation (IPv6)**

Multiple IPv6 prefixes can be defined within a pool for distributing to specific DHCPv6 Prefix delegation clients. Prefix is the delegated IPv6 prefix. DUID is the client’s unique DUID value (Example: 00:01:00:09:f8:79:4e:00:04:76:73:43:76'). Name is 31 characters textual client’s name, which is useful for logging or tracing only. Valid lifetime is the valid lifetime for the delegated prefix in seconds and preferred lifetime is the preferred lifetime for the delegated prefix in seconds.

**Default**
- valid-lifetime—2592000
- preferred-lifetime—604800

**Format**
```
prefix-delegation <prefix/prefixlength> <DUID> [name <hostname>] [valid-lifetime <0-4294967295>][preferred-lifetime < 0-4294967295>]
```

**Mode**
IPv6 DHCP Pool Config

**no prefix-delegation**

This command deletes a specific prefix-delegation client.

**Format**
```
no prefix-delegation <prefix/prefix-delegation> <DUID>
```

**Mode**
IPv6 DHCP Pool Config

**show ipv6 dhcp**

This command displays the DHCPv6 server name and status.

**Format**
```
show ipv6 dhcp
```

**Mode**
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

</tr>
<tr>
<td>Relay Remote ID</td>
<td>If configured, shows the name of the relay remote.</td>
</tr>
<tr>
<td>Option Flags</td>
<td>Shows whether rapid commit is configured.</td>
</tr>
</tbody>
</table>

If you use the statistics parameter, the command displays the IPv6 DHCP statistics for the specified interface. See show ipv6 dhcp statistics on page 434 for information about the output.

clear ipv6 dhcp

Use this command to clear DHCPv6 statistics for all interfaces or for a specific interface. Use the <unit/slot/port> parameter to specify the interface.

Format clear ipv6 dhcp {statistics | interface <unit/slot/port> statistics}
Mode Privileged EXEC
**show ipv6 dhcp pool**

This command displays configured DHCP pool.

**Format**

```
show ipv6 dhcp pool [pool-name]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCP Pool Name</td>
<td>Unique pool name configuration.</td>

IPv6 Multicast Commands

This chapter describes the IPv6 multicast commands available in the managed switch CLI.

**Note:** Some commands described in this chapter require a license. For more information, see *Licensing and Command Support* on page 8.

This chapter contains the following sections:

- **IPv6 Multicast Forwarder Commands** on page 439
- **IPv6 PIM Commands** on page 442
- **IPv6 MLD Commands** on page 449
- **IPv6 MLD-Proxy Commands** on page 455

The commands in this chapter are in three functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
- Clear commands clear some or all of the settings to factory defaults.

**Note:** There is no specific IP multicast enable for IPv6. Enabling of multicast at global config is common for both IPv4 and IPv6.

IPv6 Multicast Forwarder Commands

**Note:** There is no specific IP multicast enable for IPv6. Enabling of multicast at global config is common for both IPv4 and IPv6.
show ipv6 mroute

Use this command to show the mroute entries specific for IPv6. (This command is the IPv6 equivalent of the IPv4 show ip mcaste mroute command.)

Format: show ipv6 mroute {detail | summary}

Modes: • Privileged EXEC
        • User EXEC

If you use the detail parameter, the command displays the following Multicast Route Table fields:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The time of expiry of this entry in seconds.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time elapsed since the entry was created in seconds.</td>
</tr>
<tr>
<td>RPF Neighbor</td>
<td>The IP address of the RPF neighbor.</td>
</tr>
<tr>
<td>Flags</td>
<td>The flags associated with this entry.</td>
</tr>
</tbody>
</table>

If you use the summary parameter, the command displays the following fields:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast routing protocol by which the entry was created.</td>
</tr>
<tr>
<td>Incoming Interface</td>
<td>The interface on which the packet for the source/group arrives.</td>
</tr>
<tr>
<td>Outgoing Interface List</td>
<td>The list of outgoing interfaces on which the packet is forwarded.</td>
</tr>
</tbody>
</table>

show ipv6 mroute group

This command displays the multicast configuration settings specific to IPv6 such as flags, timer settings, incoming and outgoing interfaces, RPF neighboring routers, and expiration times of all the entries in the multicast mroute table containing the given group IPv6 address <group-address>.

Format: show ipv6 mroute group <group-address> {detail | summary}

Modes: • Privileged EXEC
        • User EXEC
show ipv6 mroute source

This command displays the multicast configuration settings specific to IPv6 such as flags, timer settings, incoming and outgoing interfaces, RPF neighboring routers, and expiration times of all the entries in the multicast mroute table containing the given source IP address or source IP address and group IP address pair.

Format

```
show ipv6 mroute source <source-address> {detail | summary}
```

Modes

- Privileged EXEC
- User EXEC

If you use the `detail` parameter, the command displays the following column headings in the output table:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The time of expiry of this entry in seconds.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time elapsed since the entry was created in seconds.</td>
</tr>
<tr>
<td>RPF Neighbor</td>
<td>The IP address of the RPF neighbor.</td>
</tr>
<tr>
<td>Flags</td>
<td>The flags associated with this entry.</td>
</tr>
</tbody>
</table>

If you use the `summary` parameter, the command displays the following column headings in the output table:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source IP</td>
<td>The IP address of the multicast data source.</td>
</tr>
<tr>
<td>Group IP</td>
<td>The IP address of the destination of the multicast packet.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The multicast routing protocol by which this entry was created.</td>
</tr>
</tbody>
</table>
This section describes the Protocol Independent Multicast (PIM) commands that support the PIM version of IPv6.

`ipv6 pim dense (Global Config)`

Use this command to administratively enable PIM-DM Multicast Routing Mode across the router (Global Config).

**Default**

disabled

**Format**

ipv6 pim dense

**Mode**

- Global Config
- Interface Config

`no ipv6 pim dense (Global Config)`

Use this command to administratively disable PIM-DM Multicast Routing Mode either across the router (Global Config) or on a particular router (Interface Config).

**Format**

no ipv6 pim dense

**Mode**

Global Config

`ipv6 pim (Interface Config)`

Use this command to set the administrative mode of PIM on an interface to enabled.

**Default**

disabled

**Format**

ipv6 pim

**Mode**

Interface Config

`no ipv6 pim (Interface Config)`

Use this command to set the administrative mode of PIM on an interface to disabled.

**Format**

no ipv6 pim

**Mode**

Interface Config

---

**IPv6 PIM Commands**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Incoming Interface</td>
<td>The interface on which the packet for this source arrives.</td>
</tr>
<tr>
<td>Outgoing Interface List</td>
<td>The list of outgoing interfaces on which this packet is forwarded.</td>
</tr>
</tbody>
</table>
**ipv6 pim hello-interval**

Use this command to configure the PIM hello interval for the specified router interface. The hello-interval is specified in seconds and is in the range 10–18000.

- **Default**: 30
- **Format**: `ipv6 pim hello-interval <10-18000>`
- **Mode**: Interface Config

**no ipv6 pim hello-interval**

Use this command to set the PIM hello interval to the default value.

- **Format**: `no ipv6 pim hello-interval`
- **Mode**: Interface Config

**show ipv6 pim**

Use this command to display PIM Global Configuration parameters and PIM interface status.

- **Format**: `show ipv6 pim`
- **Mode**: • Privileged EXEC
  • User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIM Mode</td>
<td>Configured mode of PIM protocol</td>
</tr>
<tr>
<td>Data Threshold Rate</td>
<td>Rate (in kbps) of SPT Threshold</td>
</tr>
<tr>
<td>Register Rate-limit</td>
<td>Rate (in kbps) of Register Threshold</td>
</tr>
<tr>
<td>Interface</td>
<td>Valid unit, slot, and port number separated by forward slashes</td>
</tr>
<tr>
<td>Interface-Mode</td>
<td>Indicates whether PIM-DM is enabled or disabled on this interface</td>
</tr>
<tr>
<td>Operational-Status</td>
<td>The current state of PIM-DM on this interface. Possible values are Operational or Non-Operational.</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command.

```
(Switch) #show ipv6 pim

PIM Mode................................. Dense
Data Threshold Rate (Kbps).............. 0
Register Rate-limit (Kbps).............. 0

<table>
<thead>
<tr>
<th>Interface</th>
<th>Interface Mode</th>
<th>Operational-Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/0/1</td>
<td>Enabled</td>
<td>Non-Operational</td>
</tr>
</tbody>
</table>
```
**show ipv6 pim neighbor**

Use this command to display the PIM neighbor information for all interfaces or for the specified interface.

**Format**

```
show ipv6 pim neighbor [<unit/slot/port>|vlan]
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Neighbor Address</td>
<td>The IP address of the neighbor on an interface.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time since this neighbor has become active on this interface.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The expiry time of the neighbor on this interface.</td>
</tr>
<tr>
<td>DR Priority</td>
<td>DR Priority configured on this interface (PM-SM only).</td>
</tr>
</tbody>
</table>

**Example:** The following shows example CLI display output for the command.

(Switch) #show ipv6 pim neighbor 0/1

<table>
<thead>
<tr>
<th>Interface</th>
<th>Neighbor Address</th>
<th>Up Time (hh:mm:ss)</th>
<th>Expiry Time (hh:mm:ss)</th>
</tr>
</thead>
</table>

**show ipv6 pim interface**

Use this command to display PIM configuration information for all interfaces or for the specified interface. If no interface is specified, configuration of all interfaces is displayed.

**Format**

```
show ipv6 pim interface [<unit/slot/port>|vlan]
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Active PIM protocol.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface number.</td>
</tr>
<tr>
<td>Hello Interval</td>
<td>Hello interval value. The frequency at which PIM hello messages are transmitted on this interface. By default, the value is 30 seconds.</td>
</tr>
<tr>
<td>Join-prune Interval</td>
<td>Join-prune interval value.</td>
</tr>
<tr>
<td>DR Priority</td>
<td>DR priority configured on this interface. This is not applicable if the interface mode is Dense.</td>
</tr>
<tr>
<td>BSR Border</td>
<td>Indicates whether the interface is configured as a BSR border.</td>
</tr>
</tbody>
</table>
IPv6 Multicast Commands

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor Count</td>
<td>Number of PIM neighbors discovered on the interface. This field is displayed only when the interface is operational.</td>
</tr>
<tr>
<td>Designated-Router</td>
<td>IP address of the elected DR on the interface. This field is displayed only when the interface is operational.</td>
</tr>
</tbody>
</table>

(Switch) #show ipv6 pim interface 1/0/1

Interface ............................................. 1/0/1
Mode .................................................. Dense
Hello Interval (secs) ............................... 30
Join Prune Interval (secs) ....................... 60
DR Priority .......................... 1
BSR Border .......................... Disabled

**ipv6 pim bsr-border**

Use this command to prevent bootstrap router (BSR) messages from being sent or received through an interface.

Default  
disabled
Format ipv6 pim bsr-border
Mode Interface Config

**no ipv6 pim bsr-border**

Use this command to disable the interface from being the BSR border.

Format no ipv6 pim bsr-border
Mode Interface Config

**ipv6 pim bsr-candidate**

Use this command to configure the router to announce its candidacy as a bootstrap router (BSR).

Default  
None
Format ipv6 pim bsr-candidate interface [<unit/slot/port> | vlan <1-4093>] [hash-mask-length] [priority] [interval interval]
Mode Global Config
### IPv6 Multicast Commands

#### no ipv6 pim bsr-candidate

Use this command to disable the router to announce its candidacy as a bootstrap router (BSR).

**Format**
```
no ipv6 pim bsr-candidate interface [<unit/slot/port> | vlan <1-4093> | hash-mask-length] [priority]
```

**Mode**
Global Config

#### ipv6 pim dr-priority

Use this command to set the priority value for which a router is elected as the designated router (DR).

**Default**
1

**Format**
```
ipv6 pim dr-priority <0-2147483647>
```

**Mode**
Interface Config

#### no ipv6 pim dr-priority

Use this command to disable the interface from being the BSR border.

**Format**
```
no ipv6 pim dr-priority
```

**Mode**
Interface Config

#### ipv6 pim join-prune-interval

Use this command to configure the interface join/prune interval for the PIM-SM router. The join/prune interval is specified in seconds. This parameter can be configured to a value from 0 to 18000.

**Default**
60

---

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash-mask-length</td>
<td>Length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash correspond to the same RP. For example, if this value was 24, only the first 24 bits of the group addresses matter. This allows you to get one RP for multiple groups.</td>
</tr>
<tr>
<td>priority</td>
<td>Priority of the candidate BSR. The range is an integer from 0 to 255. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The default value is 0.</td>
</tr>
<tr>
<td>interval</td>
<td>(Optional) Indicates the BSR candidate advertisement interval. The range is from 1 to 16383 seconds. The default value is 60 seconds.</td>
</tr>
</tbody>
</table>
IPv6 Multicast Commands

no ipv6 pim join-prune-interval

Use this command to set the join/prune interval to the default value.

Format: no ipv6 pim join-prune-interval
Mode: Interface Config

ipv6 pim rp-address

Use this command to statically configure the RP address for one or more multicast groups. The parameter `<rp-address>` is the IP address of the RP. The parameter `<group-address>` is the group address supported by the RP. The parameter `<group-mask>` is the group mask for the group address. The optional keyword `override` indicates that if there is a conflict, the RP configured with this command prevails over the RP learned by BSR.

Default: 0
Format: ipv6 pim rp-address <rp-address> <group-address> <group-mask> [override]
Mode: Global Config

no ipv6 pim rp-address

Use this command to statically remove the RP address for one or more multicast groups.

Format: no ipv6 pim rp-address <rp-address> <group-address> <group-mask>
Mode: Global Config

ipv6 pim rp-candidate

Use this command to configure the router to advertise itself as a PIM candidate rendezvous point (RP) to the bootstrap router (BSR).

Default: None
Format: ipv6 pim rp-candidate interface <unit/slot/port> <group-address> <group-mask>
Mode: Global Config
**no ipv6 pim rp-candidate**

Use this command to disable the router to advertise itself as a PIM candidate rendezvous point (RP) to the bootstrap router (BSR).

**Format**

```
no ipv6 pim rp-candidate interface <unit/slot/port> <group-address> <group-mask>
```

**Mode**

Global Config

**ipv6 pim ssm**

Use this command to define the Source Specific Multicast (SSM) range of IP multicast addresses.

**Default**

disabled

**Format**

```
ipv6 pim ssm {default | <group-address/prefixlength> <group-mask>}
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Defines the SSM range access list to 232/8.</td>
</tr>
</tbody>
</table>

**no ipv6 pim ssm**

Use this command to disable the Source Specific Multicast (SSM) range.

**Format**

```
o ipv6 pim ssm
```

**Mode**

Global Config

**show ipv6 pim bsr-router**

Use command to display the bootstrap router (BSR) information. The output includes elected BSR information and information about the locally configured candidate rendezvous point (RP) advertisement.

**Format**

```
show ipv6 pim bsr-router [candidate | elected]
```

**Mode**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>BSR Address</td>
<td>IP address of the BSR.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Length of time that this router has been up (in hours, minutes, and seconds).</td>
</tr>
<tr>
<td>BSR Priority</td>
<td>Priority as configured in the <strong>ip pim bsr-candidate</strong> command.</td>
</tr>
</tbody>
</table>
show ipv6 pim rp-hash

Use this command to display which rendezvous point (RP) is being used for a specified group.

**Format**
```
show ipv6 pim rp-hash <group-address>
```

**Modes**
- Privileged EXEC
- User EXEC

**Term** | **Definition**
---|---
Hash Mask Length | Length of a mask (maximum 32 bits) that is to be ANDed with the group address before the hash function is called. This value is configured in the `ip pim bsr-candidate` command.

Next Bootstrap Message In | Time (in hours, minutes, and seconds) in which the next bootstrap message is due from this BSR.

**Term** | **Definition**
---|---
Next Candidate RP advertisement In | Time (in hours, minutes, and seconds) in which the next candidate RP advertisement will be sent.

show ipv6 pim rp mapping

Use this command to display all group-to-RP mappings of which the router is aware (either configured or learned from the bootstrap router (BSR)). If no RP is specified, all active RPs are displayed.

**Format**
```
show ipv6 pim rp mapping [rp address]
```

**Modes**
- Privileged EXEC
- User EXEC

**Term** | **Definition**
---|---
RP | The IP address of the RP for the group specified.
Origin | Indicates the mechanism (BSR or static) by which the RP was selected.

IPv6 MLD Commands

IGMP/MLD Snooping is Layer 2 functionality but IGMP/MLD are Layer 3 multicast protocols. It requires that in a network setup there should be a multicast router (which can act as a querier) to be present to solicit the multicast group registrations. However some network setup does not need a multicast router as multicast traffic is destined to hosts within the same network. In this situation, the 7000 series has an IGMP/MLD Snooping Querier running on one of the switches and Snooping enabled on all the switches. For more information, see *IGMP Snooping Configuration Commands* on page 166 and *MLD Snooping Commands* on page 180.
**ipv6 mld router**

Use this command, in the administrative mode of the router, to enable MLD in the router.

- **Default**: Disabled
- **Format**: `ipv6 mld router`
- **Mode**: - Global Config
  - Interface Config

`no ipv6 mld router`

Use this command, in the administrative mode of the router, to disable MLD in the router.

- **Default**: Disabled
- **Format**: `no ipv6 mld router`
- **Mode**: - Global Config
  - Interface Config

**ipv6 mld query-interval**

Use this command to set the MLD router’s query interval for the interface. The query-interval is the amount of time between the general queries sent when the router is the querier on that interface. The range for `<query-interval>` is 1 to 3600 seconds.

- **Default**: 125
- **Format**: `ipv6 mld query-interval <query-interval>`
- **Mode**: Interface Config

`no ipv6 mld query-interval`

Use this command to reset the MLD query interval to the default value for that interface.

- **Format**: `no ipv6 mld query-interval`
- **Mode**: Interface Config

**ipv6 mld query-max-response-time**

Use this command to set the MLD querier’s maximum response time for the interface and this value is used in assigning the maximum response time in the query messages that are sent on that interface. The range for `<query-max-response-time>` is 0 to 65535 milliseconds.

- **Default**: 10000 milliseconds
- **Format**: `ipv6 mld query-max-response-time <query-max-response-time>`
- **Mode**: Interface Config
**no ipv6 mld query-max-response-time**

This command resets the MLD query max response time for the interface to the default value.

**Format**

```
no ipv6 mld query-max-response-time
```

**Mode**

Interface Config

**ipv6 mld last-member-query-interval**

Use this command to set the last member query interval for the MLD interface, which is the value of the maximum response time parameter in the group specific queries sent out of this interface. The range for `<last-member-query-interval>` is 1 to 65535 milliseconds.

**Default**

1000 milliseconds

**Format**

```
ipv6 mld last-member-query-interval <last-member-query-interval>
```

**Mode**

Interface Config

**no ipv6 mld last-member-query-interval**

Use this command to reset the `<last-member-query-interval>` parameter of the interface to the default value.

**Format**

```
no ipv6 mld last-member-query-interval
```

**Mode**

Interface Config

**ipv6 mld last-member-query-count**

Use this command to set the number of listener-specific queries sent before the router assumes that there are no local members on the interface. The range for `<last-member-query-count>` is 1 to 20.

**Default**

2

**Format**

```
ipv6 mld last-member-query-count <last-member-query-count>
```

**Mode**

Interface Config

**no ipv6 mld last-member-query-count**

Use this command to reset the `<last-member-query-count>` parameter of the interface to the default value.

**Format**

```
no ipv6 mld last-member-query-count
```

**Mode**

Interface Config
**show ipv6 mld groups**

Use this command to display information about multicast groups that MLD reported. The information is displayed only when MLD is enabled on at least one interface. If MLD was not enabled on even one interface, there is no group information to be displayed.

**Format**

```
show ipv6 mld groups {<unit/slot/port> | <group-address>}
```

**Mode**

- Privileged EXEC
- User EXEC

The following fields are displayed as a table when `<unit/slot/port>` is specified.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Address</td>
<td>The address of the multicast group.</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface through which the multicast group is reachable.</td>
</tr>
<tr>
<td>Up Time</td>
<td>Time elapsed in hours, minutes, and seconds since the multicast group has been known.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>Time left in hours, minutes, and seconds before the entry is removed from the MLD membership table.</td>
</tr>
</tbody>
</table>

When `<group-address>` is specified, the following fields are displayed for each multicast group and each interface.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Interface through which the multicast group is reachable.</td>
</tr>
<tr>
<td>Group Address</td>
<td>The address of the multicast group.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>The IP Address of the source of the last membership report received for this multicast group address on that interface.</td>
</tr>
<tr>
<td>Filter Mode</td>
<td>The filter mode of the multicast group on this interface. The values it can take are include and exclude.</td>
</tr>
<tr>
<td>Version 1 Host Timer</td>
<td>The time remaining until the router assumes there are no longer any MLD version-1 Hosts on the specified interface.</td>
</tr>
<tr>
<td>Group Compat Mode</td>
<td>The compatibility mode of the multicast group on this interface. The values it can take are MLDv1 and MLDv2.</td>
</tr>
</tbody>
</table>

The following table is displayed to indicate all the sources associated with this group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Address</td>
<td>The IP address of the source.</td>
</tr>
<tr>
<td>Uptime</td>
<td>Time elapsed in hours, minutes, and seconds since the source has been known.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>Time left in hours, minutes, and seconds before the entry is removed.</td>
</tr>
</tbody>
</table>
Example: The following shows examples of CLI display output for the commands.

(Switch) #show ipv6 mld groups ?
<group-address> Enter Group Address Info.
<unit/slot/port> Enter interface in unit/slot/port format.

(Switch) #show ipv6 mld groups 1/0/1
Group Address................................. FF43::3
Interface...................................... 1/0/1
Up Time (hh:mm:ss)............................ 00:03:04
Expiry Time (hh:mm:ss)....................... -------

(Switch) #show ipv6 mld groups ff43::3
Interface...................................... 1/0/1
Group Address................................. FF43::3
Last Reporter................................ FE80::200:FF:FE00:3
Up Time (hh:mm:ss)............................ 00:02:53
Expiry Time (hh:mm:ss)....................... -------
Filter Mode.................................... Include
Version1 Host Timer............................ -------
Group compat mode............................ v2
Source Address | ExpiryTime
--------------- | --------
2003::10       | 00:04:17
2003::20       | 00:04:17

show ipv6 mld interface

Use this command to display MLD-related information for the interface.

Format show ipv6 mld interface [<unit/slot/port>]
Mode
• Privileged EXEC
• User EXEC

The following information is displayed for each of the interfaces or for only the specified interface.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface number in unit/slot/port format.</td>
</tr>
<tr>
<td>MLD Global Mode</td>
<td>Displays the configured administrative status of MLD.</td>
</tr>
<tr>
<td>MLD Operational Mode</td>
<td>The operational status of MLD on the interface.</td>
</tr>
<tr>
<td>MLD Version</td>
<td>Indicates the version of MLD configured on the interface.</td>
</tr>
<tr>
<td>Query Interval</td>
<td>Indicates the configured query interval for the interface.</td>
</tr>
</tbody>
</table>
The following information is displayed if the operational mode of the MLD interface is enabled.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query Max Response Time</td>
<td>Indicates the configured maximum query response time (in seconds) advertised in MLD queries on this interface.</td>
</tr>
<tr>
<td>Robustness</td>
<td>Displays the configured value for the tuning for the expected packet loss on a subnet attached to the interface.</td>
</tr>
<tr>
<td>Startup Query interval</td>
<td>This value indicates the configured interval between General Queries sent by a Querier on startup.</td>
</tr>
<tr>
<td>Startup Query Count</td>
<td>This value indicates the configured number of Queries sent out on startup, separated by the Startup Query Interval.</td>
</tr>
<tr>
<td>Last Member Query Interval</td>
<td>This value indicates the configured Maximum Response Time inserted into Group-Specific Queries sent in response to Leave Group messages.</td>
</tr>
<tr>
<td>Last Member Query Count</td>
<td>This value indicates the configured number of Group-Specific Queries sent before the router assumes that there are no local members.</td>
</tr>
</tbody>
</table>

**show ipv6 mld traffic**

Use this command to display MLD statistical information for the router.

**Format**

```plaintext
show ipv6 mld traffic
```

**Mode**

- Privileged EXEC
- User EXEC
IPv6 MLD-Proxy Commands

MLD-Proxy is the IPv6 equivalent of IGMP-Proxy. MLD-Proxy commands allow you to configure the network device as well as to view device settings and statistics using either serial interface or telnet session. The operation of MLD-Proxy commands is the same as for IGMP-Proxy: MLD is for IPv6 and IGMP is for IPv4. MGMD is a term used to refer to both IGMP and MLD.

**ipv6 mld-proxy**

Use this command to enable MLD-Proxy on the router. To enable MLD-Proxy on the router, you must enable multicast forwarding. Also, make sure that there are no other multicast routing protocols enabled on the router.

**Format**

```
ipv6 mld-proxy
```

**Mode**

Interface Config

**no ipv6 mld-proxy**

Use this command to disable MLD-Proxy on the router.

**Format**

```
o ipv6 mld-proxy
```

**Mode**

Interface Config

<table>
<thead>
<tr>

</tbody>
</table>
IPv6 mld-proxy unsolicit-rprt-interval

Use this command to set the unsolicited report interval for the MLD-Proxy router. This command is only valid when you enable MLD-Proxy on the interface. The value of \(<interval>\) is 1-260 seconds.

Default 1
Format ipv6 mld-proxy unsolicit-rprt-interval \(<interval>\)
Mode Interface Config

no ipv6 mld-proxy unsolicited-report-interval

Use this command to reset the MLD-Proxy router's unsolicited report interval to the default value.

Format no ipv6 mld-proxy unsolicit-rprt-interval
Mode Interface Config

ipv6 mld-proxy reset-status

Use this command to reset the host interface status parameters of the MLD-Proxy router. This command is only valid when you enable MLD-Proxy on the interface.

Format ipv6 mld-proxy reset-status
Mode Interface Config

show ipv6 mld-proxy

Use this command to display a summary of the host interface status parameters.

Format show ipv6 mld-proxy
Mode • Privileged EXEC
• User EXEC

The command displays the following parameters only when you enable MLD-Proxy.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Index</td>
<td>The interface number of the MLD-Proxy.</td>
</tr>
<tr>
<td>Admin Mode</td>
<td>Indicates whether MLD-Proxy is enabled or disabled. This is a configured value.</td>
</tr>
<tr>
<td>Operational Mode</td>
<td>Indicates whether MLD-Proxy is operationally enabled or disabled. This is a status parameter.</td>
</tr>
<tr>
<td>Version</td>
<td>The present MLD host version that is operational on the proxy interface.</td>
</tr>
</tbody>
</table>
### Example:

The following shows example CLI display output for the command.

```text
(Switch) #show ipv6 mld-proxy

Interface Index................................. 1/0/3
Admin Mode........................................... Enable
Operational Mode.................................... Enable
Version.................................................. 3
Num of Multicast Groups.......................... 0
Unsolicited Report Interval....................... 1
Querier IP Address on Proxy Interface.......... fe80::1:2:5
Older Version 1 Querier Timeout................ 00:00:00
Proxy Start Frequency............................... 

show ipv6 mld-proxy interface

This command displays a detailed list of the host interface status parameters. It displays the following parameters only when you enable MLD-Proxy.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Multicast Groups</td>
<td>The number of multicast groups that are associated with the MLD-Proxy interface.</td>
</tr>
<tr>
<td>Unsolicited Report Interval</td>
<td>The time interval at which the MLD-Proxy interface sends unsolicited group membership report.</td>
</tr>
<tr>
<td>Querier IP Address on Proxy Interface</td>
<td>The IP address of the Querier, if any, in the network attached to the upstream interface (MLD-Proxy interface).</td>
</tr>
<tr>
<td>Older Version 1 Querier Timeout</td>
<td>The interval used to timeout the older version 1 queriers.</td>
</tr>
<tr>
<td>Proxy Start Frequency</td>
<td>The number of times the MLD-Proxy has been stopped and started.</td>
</tr>
</tbody>
</table>

This chapter describes the Quality of Service (QoS) commands available in the managed switch CLI.

This chapter contains the following sections:

- **Class of Service (CoS) Commands**
- **Differentiated Services (DiffServ) Commands**
- **DiffServ Class Commands**
- **DiffServ Policy Commands**
- **DiffServ Service Commands**
- **DiffServ Show Commands**
- **MAC Access Control List (ACL) Commands**
- **IP Access Control List (ACL) Commands**
- **IPv6 Access Control List (ACL) Commands**
- **Time Range Commands for Time-Based ACLs**
- **AutoVOIP**
- **iSCSI Commands**

The commands in this chapter are in two functional groups:

- **Show commands** display switch settings, statistics, and other information.
- **Configuration commands** configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.

## Class of Service (CoS) Commands

This section describes the commands you use to configure and view Class of Service (CoS) settings for the switch. The commands in this section allow you to control the priority and transmission rate of traffic.
Note: Commands you issue in the Interface Config mode only affect a single interface. Commands you issue in the Global Config mode affect all interfaces.

classofservice dot1p-mapping

This command maps an 802.1p priority to an internal traffic class. The `<userpriority>` values can range from 0-7. The `<trafficclass>` values range from 0-6, although the actual number of available traffic classes depends on the platform. For more information about 802.1p priority, see Voice VLAN Commands on page 80.

Format  
```
classofservice dot1p-mapping <userpriority> <trafficclass>
```

Modes  
- Global Config
- Interface Config

no classofservice dot1p-mapping

This command maps each 802.1p priority to its default internal traffic class value.

Format  
```
no classofservice dot1p-mapping
```

Modes  
- Global Config
- Interface Config

classofservice ip-dscp-mapping

This command maps an IP DSCP value to an internal traffic class. The `<ipdscp>` value is specified as either an integer from 0 to 63, or symbolically through one of the following keywords: af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, be, cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, ef.

The `<trafficclass>` values can range from 0-6, although the actual number of available traffic classes depends on the platform.

Format  
```
classofservice ip-dscp-mapping <ipdscp> <trafficclass>
```

Modes  
Global Config

no classofservice ip-dscp-mapping

This command maps each IP DSCP value to its default internal traffic class value.

Format  
```
no classofservice ip-dscp-mapping
```

Modes  
Global Config
**classofservice trust**

This command sets the class of service trust mode of an interface. You can set the mode to trust one of the Dot1p (802.1p), IP DSCP, or IP Precedence packet markings. You can also set the interface mode to untrusted. If you configure an interface to use Dot1p, the mode does not appear in the output of the `show running config` command because Dot1p is the default.

**Note:** The classofservice trust dot1p command will not be supported in future releases of the software because Dot1p is the default value. Use the no classofservice trust command to set the mode to the default value.

<table>
<thead>
<tr>
<th>Default</th>
<th>dot1p</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Format</strong></td>
<td>`classofservice trust {dot1p</td>
</tr>
</tbody>
</table>
| **Modes** | • Global Config  
• Interface Config |

**no classofservice trust**

This command sets the interface mode to the default value.

| **Format** | `no classofservice trust` |
| **Modes** | • Global Config  
• Interface Config |

**cos-queue min-bandwidth**

This command specifies the minimum transmission bandwidth guarantee for each interface queue. The total number of queues supported per interface is platform specific. A value from 0-100 (percentage of link rate) must be specified for each supported queue, with 0 indicating no guaranteed minimum bandwidth. The sum of all values entered must not exceed 100.

| **Format** | `cos-queue min-bandwidth <bw-0> <bw-1> ... <bw-n>` |
| **Modes** | • Global Config  
• Interface Config |
no cos-queue min-bandwidth

This command restores the default for each queue’s minimum bandwidth value.

**Format**
```
no cos-queue min-bandwidth
```

**Modes**
- Global Config
- Interface Config

**cos-queue strict**

This command activates the strict priority scheduler mode for each specified queue.

**Format**
```
cos-queue strict <queue-id-1> [<queue-id-2> ... <queue-id-n>]
```

**Modes**
- Global Config
- Interface Config

no cos-queue strict

This command restores the default weighted scheduler mode for each specified queue.

**Format**
```
no cos-queue strict <queue-id-1> [<queue-id-2> ... <queue-id-n>]
```

**Modes**
- Global Config
- Interface Config

**cos-queue random-detect**

This command activates weighted random early discard (WRED) for each specified queue on the interface. Specific WRED parameters are configured using the randomdetect queue-parms and the random-detect exponential-weighting-constant commands. When specified in Interface Config' mode, this command affects a single interface only, whereas in Global Config mode, it applies to all interfaces. At least one, but no more than n, queue-id values are specified with this command.

Duplicate queue-id values are ignored. Each queue-id value ranges from 0 to (n-1), where n is the total number of queues supported per interface. The number n is platform dependant and corresponds to the number of supported queues (traffic classes).

**Format**
```
cos-queue random-detect queue-id-1 [<queue-id-2> ... queue-id-n]
```

**Modes**
- Global Config
- Interface Config
no cos-queue random-detect

Use this command to disable WRED and restore the default tail drop operation for the specified queues on all interfaces or one interface.

Format: cos-queue random-detect queue-id-1 [queue-id-2 ... queue-id-n]

Modes: • Global Config
       • Interface Config

random-detect exponential weighting-constant

Use this command to configure the WRED decay exponent for a CoS queue interface.

Format: random-detect exponential-weighting-constant 0-15

Modes: • Global Config
       • Interface Config

Default: 9

no random-detect exponential weighting-constant

Use this command to reset the WRED decay exponent to the default value on all interfaces or one interface.

Format: no random-detect exponential-weighting-constant 0-15

Modes: • Global Config
       • Interface Config

random-detect queue-parms

Use this command to configure WRED parameters for each drop precedence level supported by a queue. Use it only when per-COS queue configuration is enabled (using the cos-queue random-detect command).

$min\text{-}thresh$ is the minimum threshold the queue depth (as a percentage) where WRED starts marking and dropping traffic.

$max\text{-}thresh$ is the maximum threshold is the queue depth (as a percentage) above which WRED marks / drops all traffic.

$drop\text{-}probability$ is the percentage probability that WRED will mark/drop a packet, when the queue depth is at the maximum threshold. (The drop probability increases linearly from 0 just before the minimum threshold, to this value at the maximum threshold, then goes to 100% for larger queue depths). Each parameter is specified for each possible drop precedence ("color" of TCP traffic).
The last precedence applies to all non-TCP traffic. For example, in a 3-color system, four of each parameter specified: green TCP, yellow TCP, red TCP, and non-TCP, respectively.

Format

```
random-detect queue-parms queue-id-1 [queue-id-2 ... queue-id-n]
minthresh thresh-prec-1 ... thresh-prec-n max-thresh thresh-prec-1 ...
threshprec-n drop-probability prob-prec-1 ... prob-prec-n
```

Modes

- Global Config
- Interface Config

**no random-detect queue-parms**

Use this command to set the WRED configuration back to the default.

Format

```
no random-detect queue-parms queue-id-1 [queue-id-2 ... queue-id-n]
```

Modes

- Global Config
- Interface Config

**traffic-shape**

This command specifies the maximum transmission bandwidth limit for the interface as a whole. Also known as rate shaping, traffic shaping has the effect of smoothing temporary traffic bursts over time so that the transmitted traffic rate is bounded.

Format

```
traffic-shape <bw>
```

Modes

- Global Config
- Interface Config

**no traffic-shape**

This command restores the interface shaping rate to the default value.

Format

```
no traffic-shape
```

Modes

- Global Config
- Interface Config

**show classofservice dot1p-mapping**

This command displays the current Dot1p (802.1p) priority mapping to internal traffic classes for a specific interface. The `<unit/slot/port>` parameter is optional and is only valid on platforms that support independent per-port class of service mappings. If specified, the 802.1p mapping table of the interface is displayed. If omitted, the most recent global configuration settings are displayed. For more information, see *Voice VLAN Commands* on page 80.

Format

```
show classofservice dot1p-mapping [unit/slot/port>
```

Mode

Privileged EXEC
The following information is repeated for each user priority.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Priority</td>
<td>The 802.1p user priority value.</td>
</tr>
<tr>
<td>Traffic Class</td>
<td>The traffic class internal queue identifier to which the user priority value is mapped.</td>
</tr>
</tbody>
</table>

**show classofservice ip-precedence-mapping**

This command displays the current IP Precedence mapping to internal traffic classes for a specific interface. The unit/slot/port parameter is optional and is only valid on platforms that support independent per-port class of service mappings. If specified, the IP Precedence mapping table of the interface is displayed. If omitted, the most recent global configuration settings are displayed.

**Format**  show classofservice ip-precedence-mapping [<unit/slot/port>]

**Mode**  Privileged EXEC

The following information is repeated for each user priority.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Precedence</td>
<td>The IP Precedence value.</td>
</tr>
<tr>
<td>Traffic Class</td>
<td>The traffic class internal queue identifier to which the IP Precedence value is mapped.</td>
</tr>
</tbody>
</table>

**show classofservice ip-dscp-mapping**

This command displays the current IP DSCP mapping to internal traffic classes for the global configuration settings.

**Format**  show classofservice ip-dscp-mapping

**Mode**  Privileged EXEC

The following information is repeated for each user priority.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP DSCP</td>
<td>The IP DSCP value.</td>
</tr>
<tr>
<td>Traffic Class</td>
<td>The traffic class internal queue identifier to which the IP DSCP value is mapped.</td>
</tr>
</tbody>
</table>

**show classofservice trust**

This command displays the current trust mode setting for a specific interface. The <unit/slot/port> parameter is optional and is only valid on platforms that support independent per-port class of service mappings. If you specify an interface, the command
displays the port trust mode of the interface. If you do not specify an interface, the command displays the most recent global configuration settings.

**Format**

```
show classofservice trust [<unit/slot/port>]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-IP Traffic Class</td>
<td>The traffic class used for non-IP traffic. This is only displayed when the COS trust mode is set to trust IP Precedence or IP DSCP (on platforms that support IP DSCP).</td>
</tr>
<tr>
<td>Untrusted Traffic Class</td>
<td>The traffic class used for all untrusted traffic. This is only displayed when the COS trust mode is set to 'untrusted'.</td>
</tr>
</tbody>
</table>

**show interfaces cos-queue**

This command displays the class-of-service queue configuration for the specified interface. The unit/slot/port parameter is optional and is only valid on platforms that support independent per-port class of service mappings. If specified, the class-of-service queue configuration of the interface is displayed. If omitted, the most recent global configuration settings are displayed.

**Format**

```
show interfaces cos-queue [<unit/slot/port>]
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queue Id</td>
<td>An interface supports n queues numbered 0 to (n-1). The specific n value is platform dependent.</td>
</tr>
<tr>
<td>Minimum Bandwidth</td>
<td>The minimum transmission bandwidth guarantee for the queue, expressed as a percentage. A value of 0 means bandwidth is not guaranteed and the queue operates using best-effort. This is a configured value.</td>
</tr>
<tr>
<td>Scheduler Type</td>
<td>Indicates whether this queue is scheduled for transmission using a strict priority or a weighted scheme. This is a configured value.</td>
</tr>
<tr>
<td>Queue Management Type</td>
<td>The queue depth management technique used for this queue (tail drop).</td>
</tr>
</tbody>
</table>

If you specify the interface, the command also displays the following information.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The unit/slot/port of the interface. If displaying the global configuration, this output line is replaced with a Global Config indication.</td>
</tr>
<tr>
<td>Interface Shaping Rate</td>
<td>The maximum transmission bandwidth limit for the interface as a whole. It is independent of any per-queue maximum bandwidth value(s) in effect for the interface. This is a configured value.</td>
</tr>
</tbody>
</table>
Differentiated Services (DiffServ) Commands

This section describes the commands you use to configure QoS Differentiated Services (DiffServ).

You configure DiffServ in several stages by specifying three DiffServ components:

1. Class
   a. Creating and deleting classes.
   b. Defining match criteria for a class.

2. Policy
   a. Creating and deleting policies
   b. Associating classes with a policy
   c. Defining policy statements for a policy/class combination

3. Service
   a. Adding and removing a policy to/from an inbound or outbound interface

The DiffServ class defines the packet filtering criteria. The attributes of a DiffServ policy define the way the switch processes packets. You can define policy attributes on a per-class instance basis. The switch applies these attributes when a match occurs.

Packet processing begins when the switch tests the match criteria for a packet. The switch applies a policy to a packet when it finds a class match within that policy.

The following rules apply when you create a DiffServ class:

- Each class can contain a maximum of one referenced (nested) class
- Class definitions do not support hierarchical service policies

A given class definition can contain a maximum of one reference to another class. You can combine the reference with other match criteria. The referenced class is truly a reference and not a copy since additions to a referenced class affect all classes that reference it. Changes to any class definition currently referenced by any other class must result in valid class definitions for all derived classes, otherwise the switch rejects the change. You can remove a class reference from a class definition.

The only way to remove an individual match criterion from an existing class definition is to delete the class and re-create it.

Note: The mark possibilities for policing include CoS, IP DSCP, and IP Precedence. While the latter two are only meaningful for IP packet types, CoS marking is allowed for both IP and non-IP packets, since it updates the 802.1p user priority field contained in the VLAN tag of the layer 2 packet header.
**diffserv**

This command sets the DiffServ operational mode to active. While disabled, the DiffServ configuration is retained and can be changed, but it is not activated. When enabled, DiffServ services are activated.

**Format**

```
diffserv
```

**Mode**

Global Config

**no diffserv**

This command sets the DiffServ operational mode to inactive. While disabled, the DiffServ configuration is retained and can be changed, but it is not activated. When enabled, DiffServ services are activated.

**Format**

```
no diffserv
```

**Mode**

Global Config

---

**DiffServ Class Commands**

Use the DiffServ class commands to define traffic classification. To classify traffic, you specify Behavior Aggregate (BA), based on DSCP and Multi-Field (MF) classes of traffic (name, match criteria).

This set of commands consists of class creation/deletion and matching, with the class match commands specifying Layer 3, Layer 2, and general match criteria. The class match criteria are also known as class rules, with a class definition consisting of one or more rules to identify the traffic that belongs to the class.

---

**Note:** Once you create a class match criterion for a class, you cannot change or delete the criterion. To change or delete a class match criterion, you must delete and re-create the entire class.

---

The CLI command root is **class-map**.

**class-map**

This command defines a DiffServ class of type match-all. When used without any match condition, this command enters the class-map mode. The `<class-map-name>` is a case sensitive alphanumeric string from 1 to 31 characters uniquely identifying an existing DiffServ class.
**Note:** The class-map-name `default` is reserved and must not be used.

The class type of **match-all** indicates all of the individual match conditions must be true for a packet to be considered a member of the class. This command may be used without specifying a class type to enter the Class-Map Config mode for an existing DiffServ class.

**Note:** The optional keywords `[[ipv4 | ipv6]]` specify the Layer 3 protocol for this class. If not specified, this parameter defaults to ipv4. This maintains backward compatibility for configurations defined on systems before IPv6 match items were supported.

**Note:** The CLI mode is changed to Class-Map Config or Ipv6-Class-Map Config when this command is successfully executed depending on the `[[ipv4 | ipv6]]` keyword specified.

<table>
<thead>
<tr>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>`class-map match-all &lt;class-map-name&gt; [[ipv4</td>
<td>ipv6]]`</td>
</tr>
</tbody>
</table>

**no class-map**

This command eliminates an existing DiffServ class. The `<class-map-name>` is the name of an existing DiffServ class. (The class name 'default' is reserved and is not allowed here.) This command may be issued at any time; if the class is currently referenced by one or more policies or by any other class, the delete action fails.

<table>
<thead>
<tr>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>no class-map &lt;class-map-name&gt;</code></td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**class-map rename**

This command changes the name of a DiffServ class. The `<class-map-name>` is the name of an existing DiffServ class. The `<new-class-map-name>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the class.

<table>
<thead>
<tr>
<th>Default</th>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td><code>class-map rename &lt;class-map-name&gt; &lt;new-class-map-name&gt;</code></td>
<td>Global Config</td>
</tr>
</tbody>
</table>
**match ethertype**

This command adds to the specified class definition a match condition based on the value of the ethertype. The `<ethertype>` value is specified as one of the following keywords: `appletalk`, `arp`, `ibmsna`, `ipv4`, `ipv6`, `ipx`, `mplsmcast`, `mplsucast`, `netbios`, `novell`, `pppoe`, `rarp` or as a custom ethertype value in the range of 0x0600-0xFFFF.

**Format**

```
match ethertype <keyword> | custom 0x0600-0xFFFF>
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config

**match any**

This command adds to the specified class definition a match condition whereby all packets are considered to belong to the class.

**Default**

`none`

**Format**

```
match any
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config

**match class-map**

This command adds to the specified class definition the set of match conditions defined for another class. The `<refclassname>` is the name of an existing DiffServ class whose match conditions are being referenced by the specified class definition.

**Default**

`none`

**Format**

```
match class-map <refclassname>
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config

Note the following:

- The parameters `<refclassname>` and `<class-map-name>` can not be the same.
- Only one other class may be referenced by a class.
- Any attempts to delete the `<refclassname>` class while the class is still referenced by any `<class-map-name>` fails.
- The combined match criteria of `<class-map-name>` and `<refclassname>` must be an allowed combination based on the class type.
- Any subsequent changes to the `<refclassname>` class match criteria must maintain this validity, or the change attempt fails.
- The total number of class rules formed by the complete reference class chain (including both predecessor and successor classes) must not exceed a platform-specific maximum.
In some cases, each removal of a reclass rule reduces the maximum number of available rules in the class definition by one.

**no match class-map**

This command removes from the specified class definition the set of match conditions defined for another class. The `<refclassname>` is the name of an existing DiffServ class whose match conditions are being referenced by the specified class definition.

**Format**

```
no match class-map <refclassname>
```

**Mode**

Class-Map Config
Ipv6-Class-Map Config

**match cos**

This command adds to the specified class definition a match condition for the Class of Service value (the only tag in a single tagged packet or the first or outer 802.1Q tag of a double VLAN tagged packet). The value may be from 0 to 7.

**Default**

none

**Format**

```
macth cos <0-7>
```

**Mode**

Class-Map Config
Ipv6-Class-Map Config

**match secondary cos**

This command adds to the specified class definition a match condition for the secondary Class of Service value (the only tag in a single tagged packet or the first or outer 802.1Q tag of a double VLAN tagged packet). The value may be from 0 to 7.

**Default**

none

**Format**

```
macth secondary-cos <0-7>
```

**Mode**

Class-Map Config

**match ip6flowlbl**

This command adds to the specified class definition a match condition based on the IP6flowlbl of a packet. The `label` is the value to match in the Flow Label field of the IPv6 header (range 0-1048575).

**Format**

```
macth ip6flowlbl <label>
```

**Mode**

Ipv6-Class-Map Configuration mode
**match destination-address mac**

This command adds to the specified class definition a match condition based on the destination MAC address of a packet. The `<macaddr>` parameter is any layer 2 MAC address formatted as six, two-digit hexadecimal numbers separated by colons (e.g., 00:11:22:dd:ee:ff). The `<macmask>` parameter is a layer 2 MAC address bit mask, which need not be contiguous, and is formatted as six, two-digit hexadecimal numbers separated by colons (e.g., ff:07:23:ff:fe:dc).

**Default**

none

**Format**

```
match destination-address mac <macaddr> <macmask>
```

**Mode**

Class-Map Config
Ipv6-Class-Map Config

**match dstip**

This command adds to the specified class definition a match condition based on the destination IP address of a packet. The `<ipaddr>` parameter specifies an IP address. The `<ipmask>` parameter specifies an IP address bit mask and must consist of a contiguous set of leading 1 bits.

**Default**

none

**Format**

```
match dstip <ipaddr> <ipmask>
```

**Mode**

Class-Map Config

**match dstip6**

This command adds to the specified class definition a match condition based on the destination IPv6 address of a packet.

**Default**

none

**Format**

```
match dstip6 <destination-ipv6-prefix/prefix-length>
```

**Mode**

Ipv6-Class-Map Config

**match dstl4port**

This command adds to the specified class definition a match condition based on the destination layer 4 port of a packet using a single keyword or numeric notation. To specify the match condition as a single keyword, the value for `<portkey>` is one of the supported port name keywords. The currently supported `<portkey>` values are: domain, echo, ftp, ftpdata, http, smtp, snmp, telnet, tftp, www. Each of these translates into its equivalent port number.
To specify the match condition using a numeric notation, one layer 4 port number is required. The port number is an integer from 0 to 65535.

Default: none

Format: `match dstl4port {<portkey> | <0-65535>}

Mode: Class-Map Config, Ipv6-Class-Map Config

**match ip dscp**

This command adds to the specified class definition a match condition based on the value of the IP DiffServ Code Point (DSCP) field in a packet, which is defined as the high-order six bits of the Service Type octet in the IP header (the low-order two bits are not checked).

The `<dscpval>` value is specified as either an integer from 0 to 63, or symbolically through one of the following keywords: af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, be, cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, ef.

**Note:** The ip dscp, ip precedence, and ip tos match conditions are alternative ways to specify a match criterion for the same Service Type field in the IP header, but with a slightly different user notation.

Default: none

Format: `match ip dscp <dscpval>

Mode: Class-Map Config, Ipv6-Class-Map Config

**match ip precedence**

This command adds to the specified class definition a match condition based on the value of the IP Precedence field in a packet, which is defined as the high-order three bits of the Service Type octet in the IP header (the low-order five bits are not checked). The precedence value is an integer from 0 to 7.

**Note:** The IP DSCP, IP Precedence, and IP ToS match conditions are alternative ways to specify a match criterion for the same Service Type field in the IP header, but with a slightly different user notation.
match ip tos

This command adds to the specified class definition a match condition based on the value of the IP TOS field in a packet, which is defined as all eight bits of the Service Type octet in the IP header. The value of `<tosbits>` is a two-digit hexadecimal number from 00 to ff. The value of `<tosmask>` is a two-digit hexadecimal number from 00 to ff. The `<tosmask>` denotes the bit positions in `<tosbits>` that are used for comparison against the IP TOS field in a packet. For example, to check for an IP TOS value having bits 7 and 5 set and bit 1 clear, where bit 7 is most significant, use a `<tosbits>` value of a0 (hex) and a `<tosmask>` of a2 (hex).

**Note:** The IP DSCP, IP Precedence, and IP ToS match conditions are alternative ways to specify a match criterion for the same Service Type field in the IP header, but with a slightly different user notation.

match protocol

This command adds to the specified class definition a match condition based on the value of the IP Protocol field in a packet using a single keyword notation or a numeric value notation.

To specify the match condition using a single keyword notation, the value for `<protocol-name>` is one of the supported protocol name keywords. The currently supported values are: `icmp`, `igmp`, `ip`, `tcp`, `udp`. A value of `ip` matches all protocol number values.

To specify the match condition using a numeric value notation, the protocol number is a standard value assigned by IANA and is interpreted as an integer from 0 to 255.
**Note:** This command does not validate the protocol number value against the current list defined by IANA.

<table>
<thead>
<tr>
<th>Command</th>
<th>Default</th>
<th>Format</th>
<th>Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>match protocol</td>
<td>none</td>
<td>match protocol ( \langle \text{protocol-name} \rangle \mid \langle 0-255 \rangle )</td>
<td>Class-Map Config</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Ipv6-Class-Map Config</td>
</tr>
</tbody>
</table>

`match source-address mac`

This command adds to the specified class definition a match condition based on the source MAC address of a packet. The `<address>` parameter is any layer 2 MAC address formatted as six, two-digit hexadecimal numbers separated by colons (e.g., 00:11:22:dd:ee:ff). The `<macmask>` parameter is a layer 2 MAC address bit mask, which may not be contiguous, and is formatted as six, two-digit hexadecimal numbers separated by colons (e.g., ff:07:23:ff:fe:dc).

<table>
<thead>
<tr>
<th>Default</th>
<th>none</th>
<th>match source-address mac \langle address \rangle \langle macmask \rangle</th>
<th>Class-Map Config</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>Ipv6-Class-Map Config</td>
</tr>
</tbody>
</table>

`match srcip`

This command adds to the specified class definition a match condition based on the source IP address of a packet. The `<ipaddr>` parameter specifies an IP address. The `<ipmask>` parameter specifies an IP address bit mask and must consist of a contiguous set of leading 1 bits.

<table>
<thead>
<tr>
<th>Default</th>
<th>none</th>
<th>match srcip \langle ipaddr \rangle \langle ipmask \rangle</th>
<th>Class-Map Config</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>Ipv6-Class-Map Config</td>
</tr>
</tbody>
</table>

`match srcip6`

This command adds to the specified class definition a match condition based on the source IP address of a packet.

<table>
<thead>
<tr>
<th>Default</th>
<th>none</th>
</tr>
</thead>
</table>
**match srcl4port**

This command adds to the specified class definition a match condition based on the source layer 4 port of a packet using a single keyword or numeric notation. To specify the match condition as a single keyword notation, the value for `<portkey>` is one of the supported port name keywords (listed below). The currently supported `<portkey>` values are: domain, echo, ftp, ftpdata, http, smtp, snmp, telnet, tftp, www. Each of these translates into its equivalent port number, which is used as both the start and end of a port range.

To specify the match condition as a numeric value, one layer 4 port number is required. The port number is an integer from 0 to 65535.

**Default**

```
none
```

**Format**

```
mapping srcl4port {<portkey> | <0-65535>}
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config

**match vlan**

This command adds to the specified class definition a match condition based on the value of the layer 2 VLAN Identifier field (the 802.1Q tag of a VLAN tagged packet). The VLAN is an integer from 0 to 4095.

**Default**

```
none
```

**Format**

```
mapping vlan {<0-4095>}
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config

**match secondary-vlan**

This command adds to the specified class definition a match condition based on the value of the layer 2 secondary VLAN Identifier field (the 802.1Q tag of a double VLAN tagged packet). The VLAN is an integer from 0 to 4095.

**Default**

```
none
```

**Format**

```
mapping secondary-vlan {<0-4095>}
```

**Mode**

- Class-Map Config
- Ipv6-Class-Map Config
DiffServ Policy Commands

Use the DiffServ policy commands to specify traffic conditioning actions, such as policing and
marking, to apply to traffic classes

Use the policy commands to associate a traffic class that you define by using the class
command set with one or more QoS policy attributes. Assign the class/policy association to
an interface to form a service. Specify the policy name when you create the policy.

Each traffic class defines a particular treatment for packets that match the class definition.
You can associate multiple traffic classes with a single policy. When a packet satisfies the
conditions of more than one class, preference is based on the order in which you add the
classes to the policy. The first class you add has the highest precedence.

This set of commands consists of policy creation/deletion, class addition/removal, and
individual policy attributes.

**Note:** The only way to remove an individual policy attribute from a class
instance within a policy is to remove the class instance and re-add it
to the policy. The values associated with an existing policy attribute
can be changed without removing the class instance.

The CLI command root is `policy-map`.

**assign-queue**

This command modifies the queue id to which the associated traffic stream is assigned. The
`queueid` is an integer from 0 to $n-1$, where $n$ is the number of egress queues supported by
the device.

**Format**

`assign-queue <queueid>`

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop

**drop**

This command specifies that all packets for the associated traffic stream are to be dropped at
ingress.

**Format**

`drop`

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Assign Queue, Mark (all forms), Mirror, Police, Redirect
**mirror**

This command specifies that all incoming packets for the associated traffic stream are copied to a specific egress interface (physical port or LAG).

**Format**

```
mirror <unit/slot/port>
```

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop, Redirect

**redirect**

This command specifies that all incoming packets for the associated traffic stream are redirected to a specific egress interface (physical port or port-channel).

**Format**

```
redirect <unit/slot/port>
```

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop, Mirror

**conform-color**

Use this command to enable color-aware traffic policing and define the conform-color class map. Used in conjunction with the police command where the fields for the conform level are specified. The `<class-map-name>` parameter is the name of an existing DiffServ class map.

---

**Note:** This command may only be used after specifying a police command for the policy-class instance.

---

**Format**

```
conform-color <class-map-name>
```

**Mode**

Policy-Class-Map Config

**class**

This command creates an instance of a class definition within the specified policy for the purpose of defining treatment of the traffic class through subsequent policy attribute statements. The `<classname>` is the name of an existing DiffServ class.

---

**Note:** This command causes the specified policy to create a reference to the class definition.
Note: The CLI mode is changed to Policy-Class-Map Config when this command is successfully executed.

**Format**  
```plaintext  
class <classname>  
```

**Mode**  
Policy-Map Config

**no class**

This command deletes the instance of a particular class and its defined treatment from the specified policy. `<classname>` is the names of an existing DiffServ class.

Note: This command removes the reference to the class definition for the specified policy.

**Format**  
```plaintext  
no class <classname>  
```

**Mode**  
Policy-Map Config

**mark cos**

This command marks all packets for the associated traffic stream with the specified class of service value in the priority field of the 802.1p header (the only tag in a single tagged packet or the first or outer 802.1Q tag of a double VLAN tagged packet). If the packet does not already contain this header, one is inserted. The CoS value is an integer from 0 to 7.

**Default**  
1

**Format**  
```plaintext  
mark-cos <0-7>  
```

**Mode**  
Policy-Class-Map Config

**Incompatibilities**
Drop, Mark IP DSCP, IP Precedence, Police

**mark cos-as-sec-cos**

This command marks outer VLAN tag priority bits of all packets as the inner VLAN tag priority, marking CoS as Secondary CoS. This essentially means that the inner VLAN tag CoS is copied to the outer VLAN tag CoS.

**Format**  
```plaintext  
mark-cos-as-sec-cos  
```
**mark ip-dscp**

This command marks all packets for the associated traffic stream with the specified IP DSCP value.

The `<dscpval>` value is specified as either an integer from 0 to 63, or symbolically through one of the following keywords: af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, be, cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, ef.

**Format**

```
mark ip-dscp <dscpval>
```

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop, Mark IP DSCP, IP Precedence, Police

---

**mark ip-precedence**

This command marks all packets for the associated traffic stream with the specified IP Precedence value. The IP Precedence value is an integer from 0 to 7.

**Note:** This command may not be used on IPv6 classes. IPv6 does not have a precedence field.

**Format**

```
mark ip-precedence <0-7>
```

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop, Mark CoS, Mark IP Precedence, Police

**Policy Type**

In

---

**police-simple**

This command is used to establish the traffic policing style for the specified class. The simple form of the police command uses a single data rate and burst size, resulting in two outcomes: conform and violate. The conforming data rate is specified in kilobits-per-second (Kbps) and is an integer from 1 to 4294967295. The conforming burst size is specified in kilobytes (KB) and is an integer from 1 to 128.

For each outcome, the only possible actions are drop, set-cos-transmit, set-dscp-transmit, set-prec-transmit, or transmit. In this simple form of the police command, the conform action defaults to transmit and the violate action defaults to drop.
For set-dscp-transmit, a \(<dscpval>\) value is required and is specified as either an integer from 0 to 63, or symbolically through one of the following keywords: af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, be, cs0, cs1, cs2, cs3, cs4, cs5, cs6, cs7, ef.

For set-prec-transmit, an IP Precedence value is required and is specified as an integer from 0-7.

For set-cos-transmit an 802.1p priority value is required and is specified as an integer from 0-7.

**Format**

```
police-simple {<1-4294967295> <1-128> conform-action {drop | set-prec-transmit <0-7> | set-dscp-transmit <0-63> | set-cos-transmit <0-7> | set-sec-cos-transmit | transmit} [violate-action {drop | set-prec-transmit <0-7> | set-dscp-transmit <0-63> | set-cos-transmit <0-7> | transmit}]}
```

**Mode**

Policy-Class-Map Config

**Incompatibilities**

Drop, Mark (all forms)

**police-two-rate**

This command is the two-rate form of the police command and is used to establish the traffic policing style for the specified class. For each outcome, the only possible actions are drop, set-cos-as-sec-cos, set-cos-transmit, set-sec-cos-transmit, set-dscp-transmit, set-prec-transmit, or transmit. In this two-rate form of the police command, the conform action defaults to send, the exceed action defaults to drop, and the violate action defaults to drop. These actions can be set with this command once the style has been configured.

**Format**

```
```

**Mode**

Policy-Class-Map Config

**policy-map**

This command establishes a new DiffServ policy. The \(<policyname>\) parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the policy. The type of policy is specific to the inbound traffic direction as indicated by the in parameter.

**Note:** The CLI mode is changed to Policy-Map Config when this command is successfully executed.
Quality of Service (QoS) Commands

no policy-map

This command eliminates an existing DiffServ policy. The `<policyname>` parameter is the name of an existing DiffServ policy. This command may be issued at any time. If the policy is currently referenced by one or more interface service attachments, this delete attempt fails.

Format: no policy-map `<policyname>`
Mode: Global Config

policy-map rename

This command changes the name of a DiffServ policy. The `<policyname>` is the name of an existing DiffServ class. The `<newpolicyname>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the policy.

Format: policy-map rename `<policyname>` `<newpolicyname>`
Mode: Global Config

DiffServ Service Commands

Use the DiffServ service commands to assign a DiffServ traffic conditioning policy, which you specified by using the policy commands, to an interface in the incoming direction.

The service commands attach a defined policy to a directional interface. You can assign only one policy at any one time to an interface in the inbound direction. DiffServ is not used in the outbound direction.

This set of commands consists of service addition/removal.

The CLI command root is `service-policy`.

service-policy

This command attaches a policy to an interface in the inbound direction. The `<policyname>` parameter is the name of an existing DiffServ policy. This command causes a service to create a reference to the policy.

**Note:** This command effectively enables DiffServ on an interface in the inbound direction. There is no separate interface administrative 'mode' command for DiffServ.
Quality of Service (QoS) Commands

ProSafe Managed Switch

Note: This command fails if any attributes within the policy definition exceed the capabilities of the interface. Once a policy is successfully attached to an interface, any attempt to change the policy definition, that would result in a violation of the interface capabilities, causes the policy change attempt to fail.

Format: service-policy {in|out} <policymapname>

Modes:
- Global Config
- Interface Config

Note: Each interface can have one policy attached.

no service-policy

This command detaches a policy from an interface in the inbound direction. The <policyname> parameter is the name of an existing DiffServ policy.

Note: This command causes a service to remove its reference to the policy. This command effectively disables DiffServ on an interface in the inbound direction. There is no separate interface administrative 'mode' command for DiffServ.

Format: no service-policy in <policymapname>

Modes:
- Global Config
- Interface Config

DiffServ Show Commands

Use the DiffServ show commands to display configuration and status information for classes, policies, and services. You can display DiffServ information in summary or detailed formats. The status information is only shown when the DiffServ administrative mode is enabled.
**show class-map**

This command displays all configuration information for the specified class. The `<class-name>` is the name of an existing DiffServ class.

**Format**

```
show class-map <class-name>
```

**Modes**

- Privileged EXEC
- User EXEC

If the class-name is specified the following fields are displayed:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class Name</td>
<td>The name of this class.</td>
</tr>
<tr>
<td>Class Type</td>
<td>A class type of 'all' means every match criterion defined for the class is evaluated simultaneously and must all be true to indicate a class match.</td>
</tr>
<tr>
<td>Class Layer3 Protocol</td>
<td>The Layer 3 protocol for this class. Possible values are IPv4 and IPv6.</td>
</tr>
<tr>
<td>Match Criteria</td>
<td>The Match Criteria fields are only displayed if they have been configured. Not all platforms support all match criteria values. They are displayed in the order entered by the user. The fields are evaluated in accordance with the class type. The possible Match Criteria fields are: Destination IP Address, Destination Layer 4 Port, Destination MAC Address, Ethertype, Source MAC Address, VLAN, Class of Service, Every, IP DSCP, IP Precedence, IP TOS, Protocol Keyword, Reference Class, Source IP Address, and Source Layer 4 Port.</td>
</tr>
<tr>
<td>Values</td>
<td>The values of the Match Criteria.</td>
</tr>
</tbody>
</table>

If you do not specify the Class Name, this command displays a list of all defined DiffServ classes. The following fields are displayed:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class Name</td>
<td>The name of this class. (Note that the order in which classes are displayed is not necessarily the same order in which they were created.)</td>
</tr>
<tr>
<td>Class Type</td>
<td>A class type of 'all' means every match criterion defined for the class is evaluated simultaneously and must all be true to indicate a class match.</td>
</tr>
<tr>
<td>Reference Class Name</td>
<td>The name of an existing DiffServ class whose match conditions are being referenced by the specified class definition.</td>
</tr>
</tbody>
</table>

**show diffserv**

This command displays the DiffServ General Status Group information, which includes the current administrative mode setting as well as the current and maximum number of rows in each of the main DiffServ private MIB tables. This command takes no options.

**Format**

```
show diffserv
```

**Mode**

Privileged EXEC
show policy-map

This command displays all configuration information for the specified policy. The <policyname> is the name of an existing DiffServ policy.

Format  show policy-map [policyname]

Mode     Privileged EXEC

If the Policy Name is specified the following fields are displayed:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Name</td>
<td>The name of this policy.</td>
</tr>
<tr>
<td>Policy Type</td>
<td>The policy type (Only inbound policy definitions are supported for this platform.)</td>
</tr>
</tbody>
</table>

The following information is repeated for each class associated with this policy (only those policy attributes actually configured are displayed):

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assign Queue</td>
<td>Directs traffic stream to the specified QoS queue. This allows a traffic classifier to specify which one of the supported hardware queues are used for handling packets belonging to the class.</td>
</tr>
<tr>
<td>Class Name</td>
<td>The name of this class.</td>
</tr>
<tr>
<td>Committed Burst Size (KB)</td>
<td>The committed burst size, used in simple policing.</td>
</tr>
<tr>
<td>Committed Rate (Kbps)</td>
<td>The committed rate, used in simple policing.</td>
</tr>
</tbody>
</table>
If the Policy Name is not specified this command displays a list of all defined DiffServ policies. The following fields are displayed:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Name</td>
<td>The name of this policy. (The order in which the policies are displayed is not necessarily the same order in which they were created.)</td>
</tr>
</tbody>
</table>
Quality of Service (QoS) Commands

ProSafe Managed Switch

show diffserv service

This command displays policy service information for the specified interface and direction. The `<unit/slot/port>` parameter specifies a valid unit/slot/port number for the system.

Format

```
show diffserv service <unit/slot/port> [in | out]
```

Mode

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Type</td>
<td>The policy type (Only inbound is supported).</td>
</tr>
<tr>
<td>Class Members</td>
<td>List of all class names associated with this policy.</td>
</tr>
</tbody>
</table>

show diffserv service brief

This command displays all interfaces in the system to which a DiffServ policy has been attached. The inbound direction parameter is optional.

Format

```
show diffserv service brief [in | out]
```

Mode

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>DiffServ Admin Mode</td>
<td>The current setting of the DiffServ administrative mode. An attached policy is only in effect on an interface while DiffServ is in an enabled mode.</td>
</tr>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Direction</td>
<td>The traffic direction of this interface service.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>The current operational status of this DiffServ service interface.</td>
</tr>
<tr>
<td>Policy Name</td>
<td>The name of the policy attached to the interface in the indicated direction.</td>
</tr>
<tr>
<td>Policy Details</td>
<td>Attached policy details, whose content is identical to that described for the show policy-map &lt;policymapname&gt; command (content not repeated here for brevity).</td>
</tr>
</tbody>
</table>

The following information is repeated for interface and direction (only those interfaces configured with an attached policy are shown):

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Valid slot and port number separated by forward slashes.</td>
</tr>
<tr>
<td>Direction</td>
<td>The traffic direction of this interface service.</td>
</tr>
</tbody>
</table>
show policy-map interface

This command displays policy-oriented statistics information for the specified interface and direction. The `<unit/slot/port>` parameter specifies a valid interface for the system.

**Note:** This command is only allowed while the DiffServ administrative mode is enabled.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>OperStatus</td>
<td>The current operational status of this DiffServ service interface.</td>
</tr>
<tr>
<td>Policy Name</td>
<td>The name of the policy attached to the interface in the indicated direction.</td>
</tr>
</tbody>
</table>

**Format**

```
show policy-map interface <unit/slot/port> [in | out]
```

**Mode**

Privileged EXEC

<tr>
<td>Policy Name</td>
<td>The name of the policy attached to the interface.</td>
</tr>
</tbody>
</table>

**MAC Access Control List (ACL) Commands**

This section describes the commands you use to configure MAC ACL settings. MAC ACLs ensure that only authorized users have access to specific resources and block any unwarranted attempts to reach network resources.

The following rules apply to MAC ACLs:

- The maximum number of ACLs you can create is hardware dependent. The limit applies to all ACLs, regardless of type.
- The system supports only Ethernet II frame types.
- The maximum number of rules per MAC ACL is hardware dependent.

**mac access-list extended**

This command creates a MAC Access Control List (ACL) identified by `<name>`, consisting of classification fields defined for the Layer 2 header of an Ethernet frame. The `<name>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the MAC access list.

If a MAC ACL by this name already exists, this command enters Mac-Access-List config mode to allow updating the existing MAC ACL.

---

**Note:** The CLI mode changes to Mac-Access-List Config mode when you successfully execute this command.

**Format**

```
mac access-list extended <name>
```

**Mode**

Global Config
no mac access-list extended

This command deletes a MAC ACL identified by `<name>` from the system.

Format: `no mac access-list extended <name>`
Mode: Global Config

mac access-list extended rename

This command changes the name of a MAC Access Control List (ACL). The `<name>` parameter is the name of an existing MAC ACL. The `<newname>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the MAC access list.

This command fails if a MAC ACL by the name `<newname>` already exists.

Format: `mac access-list extended rename <name> <newname>`
Mode: Global Config

{deny | permit} (MAC ACL)

This command creates a new rule for the current MAC access list. Each rule is appended to the list of configured rules for the list.

---

**Note:** The 'no' form of this command is not supported, since the rules within a MAC ACL cannot be deleted individually. Rather, the entire MAC ACL must be deleted and re-specified.

---

**Note:** An implicit 'deny all' MAC rule always terminates the access list.

A rule may either deny or permit traffic according to the specified classification fields. At a minimum, the source and destination MAC value must be specified, each of which may be substituted using the keyword any to indicate a match on any value in that field. The remaining command parameters are all optional, but the most frequently used parameters appear in the same relative order as shown in the command format.

The Ethertype may be specified as either a keyword or a four-digit hexadecimal value from 0x0600-0xFFFF. The currently supported `<ethertypekey>` values are: appletalk, arp, ibmsna, ipv4, ipv6, ipx, mplsmdcast, mcluscast, netbios, novell, pppoe, rarp. Each of these translates into its equivalent Ethertype value(s).

The time-range parameter allows imposing time limitation on the MAC ACL rule as defined by the parameter `<time-range-name>`. If a time range with the specified name does not exist and the MAC ACL containing this ACL rule is applied to an interface or bound to a...
VLAN, then the ACL rule is applied immediately. If a time range with specified name exists and the MAC ACL containing this ACL rule is applied to an interface or bound to a VLAN, then the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

<table>
<thead>
<tr>
<th>Ethertype Keyword</th>
<th>Corresponding Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>appletalk</td>
<td>0x809B</td>
</tr>
<tr>
<td>arp</td>
<td>0x0806</td>
</tr>
<tr>
<td>ibmsna</td>
<td>0x80D5</td>
</tr>
<tr>
<td>ipv4</td>
<td>0x0800</td>
</tr>
<tr>
<td>ipv6</td>

</tr>
<tr>
<td>rarp</td>
<td>0x8035</td>
</tr>
</tbody>
</table>

The vlan and cos parameters refer to the VLAN identifier and 802.1p user priority fields, respectively, of the VLAN tag. For packets containing a double VLAN tag, this is the first (or outer) tag.

The assign-queue parameter allows specification of a particular hardware queue for handling traffic that matches this rule. The allowed \{queue-id\} value is 0-(n-1), where n is the number of user configurable queues available for the hardware platform. The assign-queue parameter is valid only for a permit rule.

**Note:** The special command form \{deny \| permit\} any any is used to match all Ethernet layer 2 packets, and is the equivalent of the IP access list “match every” rule.

**Format**

\{deny\|permit\} \{<srcmac> \| any\} \{<dstmac> \| any\} \{<ethertypekey> \| <0x0600-0xFFFF>\} \{vlan \{eq <0-4095>\}\} \{cos <0-7>\} \{[log] \[time-range <time-range-name>][assign-queue <queue-id>]\} \{[mirror | redirect] \<unit/slot/port>\}

**Mode**

Mac-Access-List Config
### mac access-group

This command either attaches a specific MAC Access Control List (ACL) identified by `<name>` to an interface, or associates it with a VLAN ID, in a given direction. The `<name>` parameter must be the name of an existing MAC ACL.

An optional sequence number may be specified to indicate the order of this mac access list relative to other mac access lists already assigned to this interface and direction. A lower number indicates higher precedence order. If a sequence number is already in use for this interface and direction, the specified mac access list replaces the currently attached mac access list using that sequence number. If the sequence number is not specified for this command, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction is used.

This command specified in Interface Config mode only affects a single interface, whereas the Global Config mode setting is applied to all interfaces. The VLAN keyword is only valid in the Global Config mode. The Interface Config mode command is available only on platforms that support independent per-port class of service queue configuration.

An optional `control-plane` is specified to apply the MAC ACL on the CPU port. The control packets, like BPDU, are also dropped because of the implicit deny all rule added to the end of the list. To overcome this, permit rules must be added to allow the control packets.

---

**Note:** The `<out>` option might or might not be available, depending on the platform.

The `control-plane` keyword is available only in Global Config mode.

---

**Format**

```
mac access-group  <name>  {{control-plane|in|out}  vlan  vlan-id
                     {in|out}}  [sequence  <1-4294967295>]}
```

**Modes**

- Global Config
- Interface Config

---

### no mac access-group

This command removes a MAC ACL identified by `<name>` from the interface in a given direction.

**Format**

```
no mac access-group  <name>  {{control-plane|in|out}  vlan  vlan-id
                     {in|out}}
```

**Modes**

- Global Config
- Interface Config
**show mac access-lists**

This command displays a MAC access list and all of the rules that are defined for the MAC ACL. Use the `[name]` parameter to identify a specific MAC ACL to display.

**Format**

`show mac access-lists [name]`

**Mode**

Privileged EXEC

</tbody>
</table>

**IP Access Control List (ACL) Commands**

This section describes the commands you use to configure IP ACL settings. IP ACLs ensure that only authorized users have access to specific resources and block any unwarranted attempts to reach network resources.

The following rules apply to IP ACLs:

- Managed switch software does not support IP ACL configuration for IP packet fragments.
- The maximum number of ACLs you can create is hardware dependent. The limit applies to all ACLs, regardless of type.
- The maximum number of rules per IP ACL is hardware dependent.
- Wildcard masking for ACLs operates differently from a subnet mask. A wildcard mask is in essence the inverse of a subnet mask. With a subnet mask, the mask has ones (1’s) in the bit positions that are used for the network address, and has zeros (0’s) for the bit
positions that are not used. In contrast, a wildcard mask has (0’s) in a bit position that must be checked. A ‘1’ in a bit position of the ACL mask indicates the corresponding bit can be ignored.

**access-list**

This command creates an IP Access Control List (ACL) that is identified by the access list number, which is 1-99 for standard ACLs or 100-199 for extended ACLs.

**IP Standard ACL:**

**Format**

```
access-list <1-99> {deny | permit} {every | <srcip> <srcmask>} [log]
[rate-limit <1-4294967295> <1-128>] [assign-queue <queue-id>]
{[mirror | redirect] <unit/slot/port>}
```

**Mode**

Global Config

**IP Extended ACL:**

**Format**

```
access-list <100-199> {deny | permit} {every | {(icmp | igmp | ip | tcp | udp | <number>} <srcip> <srcmask>[
{eq {<portkey> | <0-65535>}
<dstip> <dstmask> [
{eq {<portkey> | <0-65535>}
[precedence <precedence> | tos <tos> <tosmask> | dscp <dscp>
[log] [rate-limit <1-4294967295> <1-128>] [assign-queue <queue-id>]
{[mirror | redirect] <unit/slot/port>}
```

**Mode**

Global Config

</table>

**no access-list**

This command deletes an IP ACL that is identified by the parameter `<accesslistnumber>` from the system. The range for `<accesslistnumber>` 1-99 for standard access lists and 100-199 for extended access lists.

**Format**

`no access-list <accesslistnumber>`

**Mode**

Global Config

**ip access-list**

This command creates an extended IP Access Control List (ACL) identified by `<name>`, consisting of classification fields defined for the IP header of an IPv4 frame. The `<name>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the IP access list.

If an IP ACL by this name already exists, this command enters IPv4-Access_List config mode to allow updating the existing IP ACL.

**Note:** The CLI mode changes to IPv4-Access-List Config mode when you successfully execute this command.

**Format**

`ip access-list <name>`

**Mode**

Global Config

Quality of Service (QoS) Commands
**no ip access-list**

This command deletes the IP ACL identified by <name> from the system.

**Format**

```
no ip access-list <name>
```

**Mode**

Global Config

**ip access-list rename**

This command changes the name of an IP Access Control List (ACL). The <name> parameter is the names of an existing IP ACL. The <newname> parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the IP access list.

This command fails is an IP ACL by the name <newname> already exists.

**Format**

```
ip access-list rename <name> <newname>
```

**Mode**

Global Config

**{deny | permit} (IP ACL)**

This command creates a new rule for the current IP access list. Each rule is appended to the list of configured rules for the list.

---

**Note:** The “no” form of this command is not supported, since the rules within an IP ACL cannot be deleted individually. Rather, the entire IP ACL must be deleted and re-specified.

---

**Note:** An implicit “deny all” IP rule always terminates the access list.

---

**Note:** The `mirror` parameter allows traffic matching this rule to be copied to the specified `<unit/slot/port>`, while the `redirect` parameter allows traffic matching this rule to be forwarded to the specified `<unit/slot/port>`. The `assign-queue` and `redirect` parameters are valid only for a `permit` rule.

---

A rule might either deny or permit traffic according to the specified classification fields. At a minimum, either the every keyword or the protocol, source address, and destination address values must be specified. The source and destination IP address fields might be specified using the keyword ‘any’ to indicate a match on any value in that field. The remaining
command parameters are all optional, but the most frequently used parameters appear in the same relative order as shown in the command format.

The assign-queue parameter allows specification of a particular hardware queue for handling traffic that matches this rule. The allowed \(<\text{queue-id}>\) value is 0-(n-1), where n is the number of user configurable queues available for the hardware platform. The \textit{assign-queue} parameter is valid only for a \textit{permit} rule.

The time-range parameter allows imposing time limitation on the IP ACL rule as defined by the parameter \(<\text{time-range-name}>\). If a time range with the specified name does not exist and the IP ACL containing this ACL rule is applied to an interface or bound to a VLAN, then the ACL rule is applied immediately. If a time range with specified name exists and the IP ACL containing this ACL rule is applied to an interface or bound to a VLAN, then the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

The user can specify a simple rate limiter for packets matching an ACL “permit” rule. The user needs to specify the burst size in kbytes and allowed rate of traffic in kbps. The conforming traffic is allowed to transmit, and non-conforming traffic is dropped. This action is ignored for any “deny” rule, since by definition matching packets are dropped.

\textbf{Format} \hspace{1cm} \{deny | permit\} \{every \| \{\{icmp | igmp | ip | tcp | udp \| <number>\} \<srcip> <srcmask>\} \{eq \{<portkey> | <0-65535>\} \<dstip> <dstmask> \{eq \{<portkey> | <0-65535>\}\} \[precedence <precedence> | tos <tos> <tosmask> | dscp <dscp>\] \[log\] \[rate-limit \{<1-4294967295> <1-128>\}\] \[timerange <time-range-name>\] \{assign-queue <queue-id>\} \{[mirror | redirect] \[lag <lag number> | <unit/slot/port>\]\}

\textbf{Mode} \hspace{1cm} Ipv4-Access-List Config

\textit{ip access-group}

This command either attaches a specific IP ACL identified by \(<\text{accesslistnumber}>\) to an interface or associates with a VLAN ID in a given direction. The parameter \(<\text{name}>\) is the name of the Access Control List.

An optional sequence number may be specified to indicate the order of this IP access list relative to other IP access lists already assigned to this interface and direction. A lower number indicates higher precedence order. If a sequence number is already in use for this interface and direction, the specified access list replaces the currently attached IP access list using that sequence number. If the sequence number is not specified for this command, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction is used.

\textbf{Note:} The \(<\text{out}>\) option might not be available, depending on the platform.

IPv6 Access Control List (ACL) Commands

This section describes the commands you use to configure IPv6 ACL settings. IPv6 ACLs ensure that only authorized users have access to specific resources and block any unwarranted attempts to reach network resources.

The following rules apply to IPv6 ACLs:

- The maximum number of ACLs you create is 100, regardless of type.
- The system supports only Ethernet II frame types.
- The maximum number of rules per IPv6 ACL is hardware dependent.

### `ipv6 access-list`

This command creates an IPv6 Access Control List (ACL) identified by `<name>`, consisting of classification fields defined for the IP header of an IPv6 frame. The `<name>` parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the IPv6 access list.

If an IPv6 ACL by this name already exists, this command enters IPv6-Access-List config mode to allow updating the existing IPv6 ACL.

**Note:** The CLI mode changes to IPv6-Access-List Config mode when you successfully execute this command.

### Quality of Service (QoS) Commands
no ipv6 access-list

This command deletes the IPv6 ACL identified by <name> from the system.

Format: no ipv6 access-list <name>
Mode: Global Config

ipv6 access-list rename

This command changes the name of an IPv6 ACL. The <name> parameter is the name of an existing IPv6 ACL. The <newname> parameter is a case-sensitive alphanumeric string from 1 to 31 characters uniquely identifying the IPv6 access list.

This command fails is an IPv6 ACL by the name <newname> already exists.

Format: ipv6 access-list rename <name> <newname>
Mode: Global Config

{deny | permit} (IPv6)

This command creates a new rule for the current IPv6 access list. Each rule is appended to the list of configured rules for the list.

Note: The ‘no’ form of this command is not supported, since the rules within an IPv6 ACL cannot be deleted individually. Rather, the entire IPv6 ACL must be deleted and respecified.

Note: An implicit ‘deny all’ IPv6 rule always terminates the access list.

A rule may either deny or permit traffic according to the specified classification fields. At a minimum, either the ‘every’ keyword or the protocol, source address, and destination address values must be specified. The source and destination IPv6 address fields may be specified using the keyword ‘any’ to indicate a match on any value in that field. The remaining command parameters are all optional, but the most frequently used parameters appear in the same relative order as shown in the command format.

The assign-queue parameter allows specification of a particular hardware queue for handling traffic that matches this rule. The allowed <queue-id> value is 0-(n-1), where n is the number of user configurable queues available for the hardware platform. The assign-queue parameter is valid only for a permit rule.

The mirror parameter allows the traffic matching this rule to be copied to the specified <unit/slot/port>, while the redirect parameter allows the traffic matching this rule to be
forwarded to the specified <unit/slot/port>. The assign-queue and redirect parameters are only valid for a permit rule.

The time-range parameter allows imposing time limitation on the IPv6 ACL rule as defined by the parameter <time-range-name>. If a time range with the specified name does not exist and the IPv6 ACL containing this ACL rule is applied to an interface or bound to a VLAN, then the ACL rule is applied immediately. If a time range with specified name exists and the IPv6 ACL containing this ACL rule is applied to an interface or bound to a VLAN, then the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

Format  
{deny | permit} {every | {{icmp | igmp | ipv6 | tcp | udp |} <number>} [log] [timerange <time-range-name>] [assign-queue <queue-id>] [{mirror | redirect} <unit/slot/port>]

Mode  
IPv6-Access-List Config

ipv6 traffic-filter

This command either attaches a specific IPv6 ACL identified by <name> to an interface or associates with a VLAN ID in a given direction. The <name> parameter must be the name of an existing IPv6 ACL.

An optional sequence number may be specified to indicate the order of this mac access list relative to other IPv6 access lists already assigned to this interface and direction. A lower number indicates higher precedence order. If a sequence number is already in use for this interface and direction, the specified IPv6 access list replaces the currently attached IPv6 access list using that sequence number. If the sequence number is not specified for this command, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction is used.

This command specified in Interface Config mode only affects a single interface, whereas the Global Config mode setting is applied to all interfaces. The vlan keyword is only valid in the Global Config mode. The Interface Config mode command is only available on platforms that support independent per-port class of service queue configuration.

**Note:** You should be aware that the <out> option may or may not be available, depending on the platform.

Format  
ipv6 traffic-filter <name> {{control-plane|in|out}|vlan <vlan-id> [in|out]} [sequence <1-4294967295>]

Modes  
• Global Config
• Interface Config
no ipv6 traffic-filter

This command removes an IPv6 ACL identified by `<name>` from the interface(s) in a given direction.

**Format**

```plaintext
no ipv6 traffic-filter <name> {{control-plane|in|out}|vlan <vlan-id> {in|out}}
```

**Modes**

- Global Config
- Interface Config

**show ipv6 access-lists**

This command displays an IPv6 access list and all of the rules that are defined for the IPv6 ACL. Use the `[name]` parameter to identify a specific IPv6 ACL to display.

**Format**

```plaintext
show ipv6 access-lists [name]
```

**Mode**

- Privileged EXEC

<table>
<thead>
<tr>

</table>
Time Range Commands for Time-Based ACLs

Time-based ACLs allow one or more rules within an ACL to be based on time. Each ACL rule within an ACL, except for the implicit `deny all` rule, can be configured to be active and operational only during a specific time period. The time range commands allow you to define specific times of the day and week to implement time-based ACLs. The time range is identified by a name and can then be referenced by an ACL rule defined within an ACL.

**time-range**

Use this command to create a time range identified by `name`, consisting of one absolute time entry and/or one or more periodic time entries. The `name` parameter is a case-sensitive, alphanumeric string from 1 to 31 characters that uniquely identifies the time range. An alpha-numeric string is defined as consisting of only alphabetic, numeric, dash, underscore, or space characters. If a time range by this name already exists, this command enters Time-Range config mode to allow updating the time range entries.

**Note:** When you successfully execute this command, the CLI mode changes to Time-Range Config mode.

**Format**

time-range <name>

**Mode**

Global Config

**no time-range**

Use this command to delete a time-range identified by `name`.

**Format**

no time-range <name>

**Mode**

Global Config

**absolute**

Use this command to add an absolute time entry to a time range. Only one absolute time entry is allowed per time-range. The `time` parameter is based on the currently configured time zone. The `[start time date]` parameters indicate the time and date at which the configuration that referenced the time range starts going into effect. The time is expressed in a 24-hour clock, in the form of hours:minutes. For example, 8:00 is 8:00 am and 20:00 is 8:00 pm. The date is expressed in the format day month year. If no start time and date are specified, the configuration statement is in effect immediately. The `[end time date]` parameters indicate the time and date at which the configuration that referenced the time range stops going into effect.
range is no longer in effect. The end time and date must be after the start time and date. If no end time and date are specified, the configuration statement is in effect indefinitely.

**Format**

```
absolute {{start time date} [end time date]}
```

**Mode**

Time-Range Config

**no absolute**

Use this command to delete the absolute time entry in the time range.

**Format**

```
no absolute
```

**Mode**

Time-Range Config

**periodic**

Use this command to add a periodic time entry to a time range. The `time` parameter is based off of the currently configured time zone. The first occurrence of the `days-of-the-week` argument is the starting day(s) from which the configuration that referenced the time range starts going into effect. The second occurrence is the ending day or days from which the configuration that referenced the time range is no longer in effect. If the end `days-of-the-week` are the same as the start, they can be omitted. This argument can be any single day or combinations of days: Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday. Other possible values are:

- daily—Monday through Sunday
- weekdays—Monday through Friday
- weekend—Saturday and Sunday

If the ending `days-of-the-week` are the same as the starting `days-of-the-week`, they can be omitted. The first occurrence of the `time` argument is the starting `time` at which the configuration that referenced the time range starts going into effect. The second occurrence is the ending `time` at which the configuration that referenced the time range is no longer in effect. The hours:minutes are expressed in a 24-hour clock. For example, 8:00 is 8:00 am and 20:00 is 8:00 pm.

The frequency is how often this periodic entry will become active. If the value is set to 0, timer schedule will be treated as absolute.

**Format**

```
periodic <frequency> {days-of-the-week time} to {{days-of-the-week time}}
```

**Mode**

Time-Range Config

**no periodic**

Use this command to delete a periodic time entry from a time range.

**Format**

```
no periodic <frequency>{days-of-the-week time} to {{days-of-the-week time}}
```

**Mode**

Time-Range Config
**Quality of Service (QoS) Commands**

**periodic \{start|end\} time**

Use this command to configure the start/end time for the time-range.

**Format**

```
periodic \{start|end\} time
```

**Mode**

Time-Range Config

**show time-range**

Use this command to display a time range and all the absolute/periodic time entries that are defined for the time range. Use the `name` parameter to identify a specific time range to display. When `name` is not specified, all the time ranges defined in the system are displayed.

**Format**

```
show time-range
```

**Mode**

Privileged EXEC

<table>

</table>

**AutoVOIP**

AutoVOIP detects the VoIP streams and put the VoIP streams in the specific VLAN (auto-voip VLAN) and provides higher class of service to the VoIP streams automatically (both data and signaling). It detects the VoIP streams in two modes.

**Protocol-based Auto VoIP**

In a VoIP system, various signaling protocols are used to establish the connection between two VoIP devices. The supported signaling protocols are SIP, H.323, and SCCP.

**OUI-based Auto VoIP**

The OUI-based Auto VoIP feature prioritizes VoIP packets based on the OUI bytes in the source MAC address. A default list of OUIs is maintained. User is also allowed to configure OUIs that need prioritization apart from the default OUI list. Up to 128 OUIs are allowed on the device or system, including the default OUIs.
**Note:** If voice VLAN and Auto-VoIP are enabled at the same time, then one of them is operational. If the connected phone is LLDP-MED capable, then voice VLAN has precedence over the Auto VoIP and Auto VoIP is operational if the phone does not support LLDP-MED.

`auto-voip {protocol-based | oui-based}`

This command is used to configure auto VoIP mode. The supported modes are protocol-based and oui-based. Protocol based auto VoIP prioritizes the voice data based on the layer 4 port used for the voice session. OUI based auto VoIP prioritizes the phone traffic based on the known OUI of the phone.

**Format**

```
auto-voip {protocol-based | oui-based}
```

**Mode**

- Global Config
- Interface Config

**Default**

```
ooi-based
```

`no auto-voip {protocol-based | oui-based}`

This command is used to set default mode.

**Format**

```
no auto-voip {protocol-based | oui-based}
```

**Mode**

- Global Config
- Interface Config

`auto-voip oui`

This command is used to configure an OUI for Auto VoIP. The traffic from the configured OUI will get the highest priority over the other traffic.

**Format**

```
auto-voip oui <oui-prefix> oui-desc <string>
```

**Mode**

- Global Config

**Default**

A list of known OUIs is present

`no auto-voip oui`

This command is to delete already configured OUI.

**Format**

```
no auto-voip oui <oui-prefix>
```

**Mode**

- Global Config
auto-voip vlan

This command is used to configure the global Auto VoIP VLAN id. The VLAN behavior is depend on the configured auto VoIP mode.

Format  auto-voip vlan <vlanid>
Mode     Global Config
Default  None

no auto-voip vlan

This command is used to set the auto-voip VLAN to the default 2.

Format  no auto-voip vlan
Mode     Global Config

auto-voip oui-based priority

This command is used to configure the global OUI based auto VoIP priority. If the phone OUI is matches one of the configured OUI, then the priority of traffic from the phone is changed to OUI priority configured through this command.

Format  auto-voip oui-based priority <priority-value>
Mode     Global Config
Default  Highest available priority

no auto-voip oui-based priority

This command is used to set the priority to the default value.

Format  no auto-voip oui-based priority <priority-value>
Mode     Global Config

auto-voip protocol-based {remark | traffic-class}

This command is used to configure the global protocol based auto-VoIP remarking priority/traffic-class. If the remark priority is configured, the voice data of the session is remarked with the priority configured through this command.
ProSafe Managed Switch

**Note:** The administrator has to enable tagging on auto-VoIP-enabled ports to remark the voice data when it is egressed.

**Format**

```plaintext
auto-voip protocol-based {remark <remark-priority> | traffic-class <tc>}
```

**Mode**

- Global Config
- Interface Config

**Default**

Traffic-class 7

```plaintext
no auto-voip protocol-based {remark | traffic-class}
```

This command is used to set the traffic-class to the default value.

**Format**

```plaintext
no auto-voip protocol-based {remark <remark-priority> | traffic-class <tc>}
```

**Mode**

- Global Config
- Interface Config

**show auto-voip interface**

This command shows the configuration of the auto-voip per port.

**Format**

```plaintext
show auto-voip interface [oui-based|protocol-based]
{<unit/slot/port> | all}
```

**Mode**

- Privileged EXEC
- User EXEC

**Example 1:** If the configured auto-VoIP mode is protocol-based and the traffic-class is configured.

Auto VoIP VLAN: 2

<table>
<thead>
<tr>
<th>Interface Mode</th>
<th>Admin Mode</th>
<th>Auto VoIP Mode</th>
<th>Traffic Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>0/1</td>
<td>Enabled</td>
<td>protocol-based</td>

<td>00:01:01</td>
<td>Configured</td>
<td>VoIP phone</td>
</tr>
</tbody>
</table>

### iSCSI Commands

The tasks involved in providing automated QoS preferential treatment of iSCSI flows can be divided into the following categories:

- Detecting the establishment and termination of iSCSI sessions and connections by snooping packets used in the iSCSI protocol.
- Maintaining a database of currently active iSCSI sessions and connections to store data about the participants. This allows the formulation of classifier rules giving the data packets for the session the desired QoS treatment.
- Installing and removing classifier rule sets as needed for the iSCSI session traffic.
- Monitoring activity in the iSCSI sessions to allow for aging out session entries if the session termination packets are not received.

The means of detecting the establishment and termination of iSCSI sessions is accomplished by installing classifier rules to trap iSCSI protocol packets to the CPU for examination. This protocol uses well-known TCP ports for initiators to contact targets with 3260 and 860. Additional port numbers or “port number/target IP address” can also be configured for monitoring if an installation uses ports other than the well-known ports. The well-known ports are configured as part of the default configuration of the component and can be removed if desired by the user.
**iscsi enable**

The iscsi enable Global Configuration mode command globally enables iSCSI awareness.

<table>
<thead>
<tr>
<th>Format</th>
<th>iscsi enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
<tr>
<td>Default</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**no iscsi enable**

This command is to disable iSCSI awareness use the no form of this command. When User uses this command, iSCSI resources will be released.

<table>
<thead>
<tr>
<th>Format</th>
<th>no iscsi enable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
<tr>
<td>Default</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

**iscsi target port**

This command configures iSCSI port/s, target addresses and names.

---

**Note:** When working with private iSCSI ports (not IANA assigned iSCSI ports 3260/860), it is recommended to specify the target IP address as well, so the switch will only snoop frames with which the TCP destination port is one of the configured TCP ports, AND there destination IP is the target's IP address. This way the CPU is not be falsely loaded by non-iSCSI flows (if by chance other applications also choose to use these {un-reserved} ports).

When a port is already defined and not bound to an IP, and the User wants to bind it to an IP, the User should first remove it by using the no form of the command and then add it again, this time together with the relevant IP.

Target names are only for display when using show iscsi command. These names are not use to match (or for doing any sanity check).
with the iSCSI session information acquired by snooping.

Maximum of 16 TCP ports can be configured either bound to IP or not.

---

**Format**
iscsi target port tcp-port-1 [tcp-port-2… tcp-port-8] [address ip-address] [name targetname]

**Mode**
Global Config

**Default**
3260 and 860, but they can be removed as any other configured target

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcp-port</td>
<td>TCP port number or list of TCP port numbers on which iSCSI target/s listen to requests. Up to 16 TCP ports can be defined in the system in one command or by using multiple commands.</td>
</tr>
<tr>
<td>ip-address</td>
<td>IP address of the iSCSI target. When the no form is used, and the tcp port to be deleted is one bound to a specific IP address, the address field must be present.</td>
</tr>
<tr>
<td>targetname</td>
<td>iSCSI name of the iSCSI target. The name can be statically configured; however, it can be obtained from ISNS or from sendTargets response. The initiator MUST present both its iSCSI Initiator Name and the iSCSI Target Name to which it wishes to connect in the first login request of a new session or connection.</td>
</tr>
</tbody>
</table>

**no iscsi target port**

This command is to delete iSCSI port/s, target, use the no form of this command.

**Format**
no iscsi target port tcp-port-1 [tcp-port-2… tcp-port-8] [address ip-address]

**Mode**
Global Config

**iscsi cos**

The iscsi cos Global Configuration mode command sets the quality of service profile that will be applied to iSCSI flows.

---

**Note:** SCSI flows are assigned by default to the highest VPT/DSCP mapped to the highest queue not used for stack management or voice VLAN. The user should also take care of configuring the relevant Class of Service parameters for the queue in order to complete the setting.

Setting the VPT/DSCP sets the QoS profile which determines the egress queue to which the frame is mapped. The switch default
The setting for egress queues scheduling is Weighted Round Robin (WRR).

The user may complete the QoS setting by configuring the relevant ports to work in other scheduling and queue management modes via the Class of Service settings. Depending on the platform, these choices may include strict priority for the queue used for iSCSI traffic. The downside of strict priority is that, in certain circumstances (under heavy high priority traffic), other lower priority traffic may get starved. In WRR the queue to which the flow is assigned to can be set to get the required percentage.

**Format**

```
iscsi cos traffic-class {vpt <vpt> | dscp <dscp>} [remark]
```

**Mode**

Global Config

**Term**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>traffic-class</td>
<td>The traffic class used for assigning iSCSI traffic to a queue.</td>
</tr>
<tr>
<td>vpt/dscp</td>
<td>The VLAN Priority Tag or DSCP to assign iSCSI session packets.</td>
</tr>
<tr>
<td>remark</td>
<td>Mark the iSCSI frames with the configured VPT/DSCP when egressing the switch.</td>
</tr>
</tbody>
</table>

**no iscsi cos**

This command is to set the quality of service profile of SCSI flows to default.

**Format**

```
no iscsi cos
```

**Mode**

Global Config

**iscsi aging time**

The iscsi aging time Global Configuration mode command sets aging time for iSCSI sessions.

Behavior when changing aging time:

- When aging time is increased - Current sessions will be timed out according to the new value.
- When aging time is decreased - Any sessions that have been dormant for a time exceeding the new setting will be immediately deleted from the table. All other sessions will continue to be monitored against the new time out value.

**Format**

```
iscsi aging time <time>
```

**Mode**

Global Config

**Default**

5 minutes
**Quality of Service (QoS) Commands**

### show iscsi

This command displays the iSCSI settings.

**Format**
```
show iscsi
```

**Mode**
- Privileged EXEC
- User EXEC

**Example:**

The following example displays the iSCSI settings.

```
Console # show iscsi
iSCSI enabled
iSCSI vpt is 5, remark
Session aging time: 60 min
Maximum number of sessions is 256
-----------------------------------------------------------
iSCSI targets and TCP ports:
---------------------------
TCP Port Target IP Address Name
3260 172.16.1.25
```

### show iscsi sessions

The show iscsi sessions Privileged EXEC mode command displays the iSCSI sessions.

**Format**
```
show iscsi sessions [detailed]
```

**Mode**
- Privileged EXEC
- User EXEC

**Default**
If not specified, sessions are displayed in short mode (not detailed)
Example:

The following example displays the iSCSI sessions.

Console # show iscsi sessions
-----------------------------------------------------------
ISID: 11
ISID: 222
-----------------------------------------------------------
storage.tape:sys1.xyz
Session 3:
Session 4:
-----------------------------------------------------------

This chapter contains the following sections:

- About PoE
- PoE Commands

**About PoE**

Power over Ethernet describes a technology to pass electrical power safely along with data on existing Ethernet cabling. The PSE or power supply equipment is the device or switch that delivers electrical power, and the PD or powered device is the end device that powers up through the power delivered along the Ethernet cable.

This technology is governed by two standards:

- IEEE 802.3af-2003. This is the original standard, also known as the low power standard, which mandates delivery of up to 15.4 watts by the PSE. Because of power dissipation, only 12.95 watts is assured to be available at the powered device (PD). The PD needs to be designed so that it can accept power over Ethernet cabling. Category 3 cables can be used to deliver power to the PD. However, with the advent of 802.11n, the newer wireless APs required more power. To account for this, a newer standard was developed in 2009, known as 802.3at.

- IEEE 802.3at-2009. This is the newer standard, also known as PoE+. This is also known as the high-power standard, which mandates delivery of up to 34.2 watts by the PSE. Because of power dissipation, PoE+ provides only a maximum of 25.5 watts at the powered device. Some PSEs can provide up to 51 watts. Before this standard became available in 2009, the industry started using different implementations to allow for more power. All these needed to be brought under the purview of the newer 802.3at standard.
PoE Commands

poe
Use this command to enable the Power over Ethernet (PoE) functionality on a global basis or per interface.

Format  poe
Mode     Global Config
         Interface Config
Default  enabled

no poe
Use this command to disable the Power over Ethernet (PoE) functionality on a global basis or per interface.

Format  no poe
Mode     Global Config
         Interface Config

poe detection
Use this command to configure the detection type on a global basis or per interface. It is used to configure which types of PDs will be detected and powered by the switch. There are three options:

• ieee—Detect resistive-type devices (IEEE standard)
• pre-ieee—Legacy capacitive detection only (non-standard)
• auto—Perform resistive detection first (IEEE standard), and then capacitive detection (pre-IEEE standard)

Format  poe detection { ieee | pre-ieee | auto}
Mode     Global Config
         Interface Config
Default  auto
**no poe detection**

Use this command to set the detection mode to the default on a global basis or per interface.

```
Format     no poe detection
Mode       Global Config
           Interface Config
```

**poe high-power**

Use this command to switch a port from 802.3af mode to high-power mode. This mode is used to power up devices that require more power than the current IEEE 802.3af power (more than 12.95 watts at the PD). There are three options:

- **legacy**—Use this mode if the device can power up (more than 12.95 watts) with higher current and it cannot identify itself as a Class 4 device.
- **Pre-dot3at**—Use this mode if the device cannot identify itself as a Class 4 device and it does not have LLDP support.
- **Dot3at**—Use this mode if the device is a Class 4 device capable of figuring out power requirements through 2-event classification or LLDP.

```
Format     poe high-power {legacy | pre-dot3at | dot3at}
Mode       Interface Config
Default    dot3at
```

**no poe high-power**

Use this command to disable the high-power mode. The port will support only IEEE 902.3af devices.

This command works on a global basis or per interface.

```
Format     no poe high-power
Mode       Interface Config
```

**poe power limit**

Use this command to configure the type of power limit for a port. If the power limit type is “user-defined,” the command also allows you to configure a maximum power limit.

There are three options:

- **class-based**—Allows the port to draw up to the maximum power based on the classification of the device connected.
- **none**—Allows the port to draw up to Class 0 maximum power if it is in low-power mode and up to Class 4 maximum power if it is in high-power mode.
• **user-defined**—Allows you to define the maximum power to the port. This can be a value between 3 and 32 watts.

**Format**
```
poe power limit { class-based | none | user-defined [<3000 - 32000>]
```

**Mode**
- Global Config
- Interface Config

**Default**
User-defined, with a maximum of 30 watts

**no poe power limit**

Use this command to set the power limit type to the default. It also sets the maximum power limit to the default if the power limit type is user-defined.

**Format**
```
no poe power limit [user-defined]
```

**Mode**
- Global Config
- Interface Config

**poe power management**

Use this command to configure the power management mode based on each individual PoE unit or on all PoE units.

Both the power management modes mentioned here will power up a device based on first come, first served. When the available power is less than the power limit defined on a port, no more power will be delivered.

Static and dynamic modes differ in how the available power is calculated, as follows:

**Static Power Management**

Available power = power limit of the source - total allocated power

Where total allocated power is calculated as the power limit configured on the port.

**Dynamic Power Management**

Available power = power limit of the source - total allocated power

Where total allocated power is calculated as the amount of power consumed by the port.

For example:

Assume that the power limit of the source is 300 watts. One port is powered up and is drawing 3 watts of power. The power limit defined on the port is user-defined as 15 watts. In this case, the available power for static and dynamic would be as follows:

**Static Power Management**

Available power = 300 watts - 15 watts = 285 watts
Dynamic Power Management
Available power = 300 watts - 3 watts = 297 watts

Format: poe power management {<unit>|all} {dynamic | static}
Mode: Global Config
Default: dynamic

no poe power management
Use this command to set the power management mode to the default.

Format: no poe power management {<unit>|all}
Mode: Global Config

poe priority
Use this command to configure the priority on a specific port. This is used for power management purposes. The switch might not be able to supply power to all connected devices, so the port priority is used to determine which ports will supply power if adequate power capacity is not available for all enabled ports. For ports that have the same priority level, the lower numbered port will have higher priority. There are three options:

- Crit—Critical priority
- High—High priority
- Low—Low priority

Format: poe priority { Crit | High | Low }
Mode: Global Config
Interface Config
Default: low

no poe priority
Use this command to set the priority to the default.

Format: no poe priority
Mode: Global Config
Interface Config

poe reset
Use this command to reset the PoE state of every port (in global mode) or a specific port (in interface mode). When the PoE port status is shown to be in an error state, this command can be
used to reset the PoE port. The command can also reset the power-delivering ports. Note that this command takes effect only once after it is executed and cannot be saved across power cycles.

**Format**

```
poe reset
```

**Mode**

- Global Config
- Interface Config

### poe timer schedule name

Use this command to allow you to attach a timer schedule to a PoE port.

You can define a time schedule using the existing time range commands. This schedule has start and stop times. When this timer schedule is applied to a PoE-enabled port, the capability of the port to deliver power is affected. At the scheduled start time, the PoE port is disabled such that it cannot deliver any power. At the scheduled stop time, the PoE port is reenabled so that it can deliver power.

**Note:** For information about creating a timer schedule, see *Time Range Commands for Time-Based ACLs* on page 506.

**Format**

```
poe timer schedule <name>
```

**Mode**

Interface Config
no poe timer schedule name

Use this command to detach the schedule from the port.

Format no poe timer schedule
Mode Interface Config

poe usagethreshold

Use this command to set a threshold (as a percentage) for the total amount of power that can be delivered by the switch. For example, if the switch can deliver up to a maximum of 300 watts, a usage threshold of 90% ensures that only 270 watts are used for delivering power to devices. This ensures that more power is not drawn than the switch can provide.

When the usage threshold is set, all the PDs are brought down and then brought back up. If the consumed power is less than the threshold power (in the preceding case, 270 watts), then the devices continue to power up. If the consumed power is 269 watts or less, the next device is powered up. The moment consumed power exceeds the threshold power (270 watts), no other devices can power up.

This command allows you to set the usage threshold based on each individual PoE unit or all PoE units.

Format poe usagethreshold {<unit>|all} <1-99>
Mode Global Config
Default 90

no poe usagethreshold

Use this command to set the usage threshold to a default value.

Format no poe usagethreshold {<unit>|all}
Mode Global Config

poe traps

Use this command to enable logging of specific PoE-related events, such as a PoE port powering a device, the threshold being exceeded, and so on.

Format poe traps
Mode Global Config
Default Enable
**no poe traps**

Use this command to disable logging the PoE traps.

**Format**  
no poe traps

**Mode**  
Global Config

**show poe**

Use this command to get global information regarding the PoE status.

**Format**  
show poe

**Mode**  
Privileged EXEC  
User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware Version</td>
<td>This is the firmware version of the PoE controller on the switch.</td>
</tr>
</tbody>
</table>
| PSE Main Operational Status| This indicates the status of the PoE controller:  
  - ON—Indicates that the PoE controller is actively delivering power.  
  - OFF—Indicates that the PoE controller is not delivering power.  
  - FAULTY—Indicates that the PoE controller is not functioning. |
| Total Power (Main AC)       | This indicates the maximum amount of power that can be delivered by this PoE unit when on system power.                                  |
| Total Power (RPS)           | This indicates the maximum amount of power that can be delivered by this PoE unit when on RPS.                                         |
| Total Power (PD)            | This indicates the maximum amount of power that can be delivered by this PoE unit when on the PD source. This field is applicable only for the GSM5212P. |
| Power Source                | This indicates the power source being used: main AC, RPS, or PD. If PD is used as a source, then “PD <portNo>” is displayed.             |
| Threshold Power             | System can power up one port, if consumed power is less than this power. That is, the consumed power can be between the total power and threshold power values. The threshold power value is effected by changing the system usage threshold. |
| Total Power Consumed        | This indicates the total amount of power being delivered to all the devices plugged into the switch.                                    |
| Usage Threshold             | This indicates the usage threshold level.                                                                                              |
| Power Management Mode       | This indicates the management mode used by the PoE controller.                                                                       |
| Auto Reset Mode             | This indicates whether the PoE ports will be automatically reset in case of an error on a port.                                      |
| Traps                       | This configures the traps.                                                                                                             |
Example:

(switch) #show poe

Utility Commands

This chapter describes the utility commands available in the CLI.

This chapter contains the following sections:

- Auto Install Commands
- Dual Image Commands
- System Information and Statistics Commands
- Logging Commands
- Email Alerting and Mail Server Commands
- System Utility and Clear Commands
- Simple Network Time Protocol (SNTP) Commands
- DHCP Server Commands
- DNS Client Commands
- Packet Capture Commands
- Serviceability Packet Tracing Commands
- Cable Test Command
- sFlow Commands
- Software License Commands
- IP Address Conflict Commands
- Link Local Protocol Filtering Commands
- RMON Stats and History Commands
- UDLD Commands

The commands in this chapter are in four functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
- Copy commands transfer or save configuration and informational files to and from the switch.
- Clear commands clear some or all of the settings to factory defaults.
Auto Install Commands

This section describes the Auto Install Commands. Auto Install is a software feature which provides for the configuration of a switch automatically when the device is initialized and no configuration file is found on the switch. The Auto Install process requires DHCP to be enabled by default in order for it to be completed. The downloaded config file is not automatically saved to startup-config. An administrator must explicitly issue a save request in order to save the configuration. The Auto Install process depends upon the configuration of other devices in the network, including a DHCP or BOOTP server, a TFTP server and, if necessary, a DNS server.

There are three steps to Auto Install:

1. Configuration or assignment of an IP address for the device.
2. Assignment of a TFTP server.
3. Obtain a configuration file for the device from the TFTP server.

show autoinstall

This command displays the current status of the Auto Config process.

Format  show autoinstall

Mode  Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoInstall Mode</td>
<td>The administrator mode is enabled or disabled.</td>
</tr>
<tr>
<td>AutoSave Mode</td>
<td>If this option is enabled, the downloaded config file will be saved.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, administrator must explicitly issue a &quot;copy running-config</td>
</tr>
<tr>
<td></td>
<td>startup-config&quot; command in order to save the configuration.</td>
</tr>
<tr>
<td>AutoInstall Retry Count</td>
<td>the number of attempts to download a configuration.</td>
</tr>
<tr>
<td>AutoInstall State</td>
<td>The status of the AutoInstall.</td>
</tr>
</tbody>
</table>

Example

(switch) #show autoinstall
AutoInstall Mode......................... Stopped
AutoSave Mode............................. Disabled
AutoInstall Persistant Mode............. Enabled
AutoInstall Retry Count.................. 3
AutoInstall State....................... Waiting for boot options
**boot host auto-save**

This command is used to enable automatically saving the downloaded configuration on the switch.

**Default**
- Disabled

**Format**
- `boot host auto-save`

**Mode**
- Privileged EXEC

**no boot host auto-save**

This command is used to disable automatically saving the downloaded configuration on the switch.

**Format**
- `no boot host auto-save`

**Mode**
- Privileged EXEC

**boot autoinstall start**

The command is used to start Auto Install on the switch. Auto Install tries to download a config file from a TFTP server.

**Format**
- `boot autoinstall start`

**Mode**
- Privileged EXEC

**boot autoinstall stop**

The command is used to A user may terminate the Auto Install process at any time prior to the downloading of the config file. This is most optimally done when the switch is disconnected from the network, or if the requisite configuration files have not been configured on TFTP servers. Termination of the Auto Install process ends further periodic requests for a host-specific file.

**Format**
- `boot autoinstall stop`

**Mode**
- Privileged EXEC

**boot host retry-count**

This command is used to set the number of attempts to download a configuration. The valid range is from 1 to 6.

**Default**
- 3

**Format**
- `boot host retry-count <count>`

**Mode**
- Privileged EXEC
**no boot host retry-count**

This command is used to reset the number to the default. The default number is 3.

**Format**

```
no boot host retry-count
```

**Mode**

Privileged EXEC

**boot host dhcp**

This command is used to enable AutoInstall on the switch for the next reboot cycle. The command does not change the current behavior of AutoInstall and saves the command to NVRAM.

**Default**

Enabled

**Format**

```
boot host dhcp
```

**Mode**

Privileged EXEC

**no boot host dhcp**

This command is used to disable AutoInstall on the switch for the next reboot cycle. The command does not change the current behavior of AutoInstall and saves the command to NVRAM.

**Format**

```
no boot host dhcp
```

**Mode**

Privileged EXEC

**erase startup-config**

Use this command to erase the text-based configuration file stored in non-volatile memory. If the switch boots and no startup-config file is found, the AutoInstall process automatically begins.

**Format**

```
erase startup-config
```

**Mode**

Privileged EXEC

**Dual Image Commands**

The software supports a dual image feature that allows the switch to have two software images in the permanent storage. You can specify which image is the active image to be loaded in subsequent reboots. This feature allows reduced down-time when you upgrade or downgrade the software.
**delete**

This command deletes the supplied image file from the permanent storage. The image to be deleted must be a backup image. If this image is the active image, or if this image is activated, an error message displays. The optional `<unit>` parameter is valid only on Stacks. Error will be returned, if this parameter is provided, on Standalone systems. In a stack, the `<unit>` parameter identifies the node on which this command must be executed. When this parameter is not supplied, the command is executed on all nodes in a Stack.

**Format**

```
   delete [unit] {image1 | image2}
```

**Mode**

Privileged EXEC

---

**boot system**

This command activates the specified image. It will be the active-image for subsequent reboots and will be loaded by the boot loader. The current active-image is marked as the backup-image for subsequent reboots. The optional `<unit>` parameter is valid only in Stacking, where the `unit` parameter identifies the node on which this command must be executed. When this parameter is not supplied, the command is executed on all nodes in a Stack.

**Format**

```
   boot system [unit] <image-file-name>
```

**Mode**

Privileged EXEC

---

**show bootvar**

This command displays the version information and the activation status for the current active and backup images on the supplied unit (node) of the Stack. If you do not specify a unit number, the command displays image details for all nodes on the Stack. The command also displays any text description associated with an image. This command, when used on a Standalone system, displays the switch activation status. For a standalone system, the unit parameter is not valid.

**Format**

```
   show bootvar [unit]
```

**Mode**

Privileged EXEC

---

**filedescr**

This command associates a given text description with an image. Any existing description will be replaced. For stacking, the `[unit]` parameter identifies the node on which this command must be executed. When this parameter is not supplied, the command is executed on all nodes in a Stack.

**Format**

```
   filedescr [unit] {image1 | image2} <text-description>
```

**Mode**

Privileged EXEC
**update bootcode**

This command updates the bootcode (boot loader) on the switch. The bootcode is read from the active-image for subsequent reboots. The optional `<unit>` parameter is valid only on Stacks. Error will be returned, if this parameter is provided, on Standalone systems. For Stacking, the `<unit>` parameter identifies the node on which this command must be executed. When this parameter is not supplied, the command is executed on all nodes in a Stack.

**Format**

`update bootcode [<unit>]`

**Mode**

Privileged EXEC

---

**System Information and Statistics Commands**

This section describes the commands you use to view information about system features, components, and configurations.

**show arp switch**

This command displays the contents of the IP stack's Address Resolution Protocol (ARP) table. The IP stack only learns ARP entries associated with the management interfaces - network or service ports. ARP entries associated with routing interfaces are not listed.

**Format**

`show arp switch`

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>IP address of the management interface or another device on the management network.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Hardware MAC address of that device.</td>
</tr>
<tr>
<td>Interface</td>
<td>For a service port the output is <em>Management</em>. For a network port, the output is the unit/slot/port of the physical interface.</td>
</tr>
</tbody>
</table>

**show eventlog**

This command displays the event log, which contains error messages from the system. The event log is not cleared on a system reset. The `<unit>` is the switch identifier.

**Format**

`show eventlog [<unit>]`

**Mode**

Privileged EXEC
### File
The file in which the event originated.

### Line
The line number of the event.

### Task Id
The task ID of the event.

### Code
The event code.

### Time
The time this event occurred.

### Unit
The unit for the event.

**Note:** Event log information is retained across a switch reset.

### show hardware

This command displays inventory information for the switch.

**Note:** The show version command and the show hardware command display the same information. In future releases of the software, the show hardware command will not be available. For a description of the command output, see the command `show version` on page 535.

**Format**  
`show hardware`

**Mode**  
Privileged EXEC

### show version

This command displays inventory information for the switch.

**Note:** The show version command will replace the show hardware command in future releases of the software.

**Format**  
`show version`

**Mode**  
Privileged EXEC
show interface

This command displays a summary of statistics for a specific interface or a count of all CPU traffic based upon the argument.

**Format**  
`show interface <unit/slot/port> | switchport`

**Mode**  
Privileged EXEC

The display parameters, when the argument is `<unit/slot/port>`, are as follows:

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets Received Without Error</td>
<td>The total number of packets (including broadcast packets and multicast packets) received by the processor.</td>
</tr>
<tr>
<td>Packets Received With Error</td>
<td>The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of packets received that were directed to the broadcast address. Note that this does not include multicast packets.</td>
</tr>
<tr>
<td>Packets Transmitted Without Error</td>
<td>The total number of packets transmitted out of the interface.</td>
</tr>
<tr>
<td>Transmit Packets Errors</td>
<td>The number of outbound packets that could not be transmitted because of errors.</td>
</tr>
<tr>
<td>Collisions Frames</td>
<td>The best estimate of the total number of collisions on this Ethernet segment.</td>
</tr>
<tr>
<td>Time Since Counters Last Cleared</td>
<td>The elapsed time, in days, hours, minutes, and seconds since the statistics for this port were last cleared.</td>
</tr>
</tbody>
</table>
The display parameters, when the argument is “switchport” are as follows:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets Received Without Error</td>
<td>The total number of packets (including broadcast packets and multicast packets) received by the processor.</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of packets received that were directed to the broadcast address. Note that this does not include multicast packets.</td>
</tr>
<tr>
<td>Packets Received With Error</td>
<td>The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.</td>
</tr>
<tr>
<td>Packets Transmitted Without Error</td>
<td>The total number of packets transmitted out of the interface.</td>
</tr>
<tr>
<td>Broadcast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested to be transmitted to the Broadcast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>TransmitPacket Errors</td>
<td>The number of outbound packets that could not be transmitted because of errors.</td>
</tr>
<tr>
<td>Address Entries Currently In Use</td>
<td>The total number of Forwarding Database Address Table entries now active on the switch, including learned and static entries.</td>
</tr>
<tr>
<td>VLAN Entries Currently In Use</td>
<td>The number of VLAN entries presently occupying the VLAN table.</td>
</tr>
<tr>
<td>Time Since Counters Last Cleared</td>
<td>The elapsed time, in days, hours, minutes, and seconds since the statistics for this switch were last cleared.</td>
</tr>
</tbody>
</table>

**show interface counters**

This command reports key summary statistics for all ports (physical, CPU, and port-channel).

**Format**

```
show interface counters
```

**Mode**

Privileged EXEC

The following shows example CLI display output for the command.

```
(Routing) #show interface counters

<table>
<thead>
<tr>
<th>Port</th>
<th>InOctets</th>
<th>InUcastPkts</th>
<th>InMcastPkts</th>
<th>InBcastPkts</th>

```
**show interface ethernet**

This command displays detailed statistics for a specific interface or for all CPU traffic based upon the argument.

**Format**

```
show interface ethernet {unit/slot/port | switchport}
```

**Mode**

Privileged EXEC

When you specify a value for `unit/slot/port`, the command displays the following information.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
</table>
| **Packets Received**        | • **Total Packets Received (Octets)** - The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including Frame Check Sequence (FCS) octets). This object can be used as a reasonable estimate of Ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. The result of this equation is the value Utilization which is the percent utilization of the Ethernet segment on a scale of 0 to 100 percent.  
• **Packets Received 64 Octets** - The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).  
• **Packets Received 65–127 Octets** - The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).  
• **Packets Received 128–255 Octets** - The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).  
• **Packets Received 256–511 Octets** - The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).  
• **Packets Received 512–1023 Octets** - The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).  
• **Packets Received 1024–1518 Octets** - The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).  
• **Packets Received > 1518 Octets** - The total number of packets received that were longer than 1522 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.  
• **Packets RX and TX 64 Octets** - The total number of packets (including bad packets) received and transmitted that were 64 octets in length (excluding framing bits but including FCS octets). |

<tbody>
<tr>
<td><strong>Packets Received with MAC Errors</strong></td>
<td>• <strong>Total Packets Received with MAC Errors</strong> - The total number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Jabbers Received</strong> - The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error). Note that this definition of jabber is different than the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fragments/Undersize Received</strong> - The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets).</td>
</tr>
<tr>
<td></td>
<td>• <strong>Alignment Errors</strong> - The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with a non-integral number of octets.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Rx FCS Errors</strong> - The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with an integral number of octets.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Overruns</strong> - The total number of frames discarded as this port was overloaded with incoming packets, and could not keep up with the inflow.</td>
</tr>
<tr>
<td><strong>Received Packets Not Forwarded</strong></td>
<td>• <strong>Total Received Packets Not Forwarded</strong> - A count of valid frames received which were discarded (in other words, filtered) by the forwarding process</td>
</tr>
<tr>
<td></td>
<td>• <strong>Local Traffic Frames</strong> - The total number of frames dropped in the forwarding process because the destination address was located off of this port.</td>
</tr>
<tr>
<td></td>
<td>• <strong>802.3x Pause Frames Received</strong> - A count of MAC Control frames received on this interface with an opcode indicating the PAUSE operation. This counter does not increment when the interface is operating in half-duplex mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unacceptable Frame Type</strong> - The number of frames discarded from this port due to being an unacceptable frame type.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Multicast Tree Viable Discards</strong> - The number of frames discarded when a lookup in the multicast tree for a VLAN occurs while that tree is being modified.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reserved Address Discards</strong> - The number of frames discarded that are destined to an IEEE 802.1 reserved address and are not supported by the system.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Broadcast Storm Recovery</strong> - The number of frames discarded that are destined for FF:FF:FF:FF:FF:FF when Broadcast Storm Recovery is enabled.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CFI Discards</strong> - The number of frames discarded that have CFI bit set and the addresses in RIF are in non-canonical format.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Upstream Threshold</strong> - The number of frames discarded due to lack of cell descriptors available for that packet's priority level.</td>

</table>
| **Packets Transmitted Octets** | - **Total Packets Transmitted (Octets)** - The total number of octets of data (including those in bad packets) received on the network (excluding framing bits but including FCS octets). This object can be used as a reasonable estimate of Ethernet utilization. If greater precision is desired, the etherStatsPkts and etherStatsOctets objects should be sampled before and after a common interval. -----  
- **Packets Transmitted 64 Octets** - The total number of packets (including bad packets) received that were 64 octets in length (excluding framing bits but including FCS octets).  
- **Packets Transmitted 65-127 Octets** - The total number of packets (including bad packets) received that were between 65 and 127 octets in length inclusive (excluding framing bits but including FCS octets).  
- **Packets Transmitted 128-255 Octets** - The total number of packets (including bad packets) received that were between 128 and 255 octets in length inclusive (excluding framing bits but including FCS octets).  
- **Packets Transmitted 256-511 Octets** - The total number of packets (including bad packets) received that were between 256 and 511 octets in length inclusive (excluding framing bits but including FCS octets).  
- **Packets Transmitted 512-1023 Octets** - The total number of packets (including bad packets) received that were between 512 and 1023 octets in length inclusive (excluding framing bits but including FCS octets).  
- **Packets Transmitted 1024-1518 Octets** - The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).  
- **Packets Transmitted > 1518 Octets** - The total number of packets transmitted that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.  
- **Max Frame Size** - The maximum size of the Info (non-MAC) field that this port will receive or transmit. |
| **Packets Transmitted Successfully** | - **Total Packets Transmitted Successfully** - The number of frames that have been transmitted by this port to its segment.  
- **Unicast Packets Transmitted** - The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.  
- **Multicast Packets Transmitted** - The total number of packets that higher-level protocols requested be transmitted to a Multicast address, including those that were discarded or not sent.  
- **Broadcast Packets Transmitted** - The total number of packets that higher-level protocols requested be transmitted to the Broadcast address, including those that were discarded or not sent. |
| **Transmit Packets Discarded** | The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space. |
| **Transmit Errors** | - **Total Transmit Errors** - The sum of Single, Multiple, and Excessive Collisions.  
- **Tx FCS Errors** - The total number of packets transmitted that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with an integral number of octets.  
- **Oversized** - The total number of frames that exceeded the max permitted frame size. This counter has a max increment rate of 815 counts per sec. at 10 Mb/s.  
- **Underrun Errors** - The total number of frames discarded because the transmit FIFO buffer became empty during frame transmission. |

</tbody>
</table>
show mac-addr-table

This command displays the forwarding database entries. These entries are used by the transparent bridging function to determine how to forward a received frame.

Enter all or no parameter to display the entire table. Enter a MAC Address and VLAN ID to display the table entry for the requested MAC address on the specified VLAN. Enter the count parameter to view summary information about the forwarding database table. Use the interface <unit/slot/port> parameter to view MAC addresses on a specific interface. Use the vlan <vlan_id> parameter to display information about MAC addresses on a specified VLAN.

Format  
show mac-addr-table [{<macaddr> <vlan_id> | all | count | interface <unit/slot/port> | vlan <vlan_id>}]  

Mode  
Privileged EXEC

The following information displays if you do not enter a parameter, the keyword all, or the MAC address and VLAN ID. If you enter vlan <vlan_id>, only the Mac Address, Interface, and Status fields appear.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mac Address</td>
<td>A unicast MAC address for which the switch has forwarding and or filtering information. The format is 6 or 8 two-digit hexadecimal numbers that are separated by colons, for example 01:23:45:67:89:AB. In an IVL system the MAC address will be displayed as 8 bytes.</td>
</tr>
<tr>
<td>Interface</td>
<td>The port through which this address was learned.</td>
</tr>
<tr>
<td>Interface Index</td>
<td>This object indicates the ifIndex of the interface table entry associated with this port.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of this entry. The meanings of the values are:</td>
</tr>
<tr>
<td></td>
<td>• Static—The value of the corresponding instance was added by the system or a user when a static MAC filter was defined. It cannot be relearned.</td>
</tr>
<tr>
<td></td>
<td>• Learned—The value of the corresponding instance was learned by observing the source MAC addresses of incoming traffic, and is currently in use.</td>
</tr>
<tr>
<td></td>
<td>• Management—The value of the corresponding instance (system MAC address) is also the value of an existing instance of dot1dStaticAddress. It is identified with interface 0/1, and is currently used when enabling VLANs for routing.</td>
</tr>
<tr>
<td></td>
<td>• Self—The value of the corresponding instance is the address of one of the switch’s physical interfaces (the system’s own MAC address).</td>
</tr>
<tr>
<td></td>
<td>• GMRP Learned—The value of the corresponding was learned via GMRP and applies to Multicast.</td>
</tr>
<tr>
<td></td>
<td>• Other—The value of the corresponding instance does not fall into one of the other categories.</td>
</tr>
</tbody>
</table>

If you enter the interface <unit/slot/port> parameter, in addition to the MAC Address and Status fields, the following field appears:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>The VLAN on which the MAC address was learned.</td>
</tr>
</tbody>
</table>
Utility Commands

The following information displays if you enter the `count` parameter:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dynamic Address count</td>
<td>Number of MAC addresses in the forwarding database that were automatically learned.</td>
</tr>
<tr>
<td>Static Address (User-defined) count</td>
<td>Number of MAC addresses in the forwarding database that were manually entered by a user.</td>
</tr>
<tr>
<td>Total MAC Addresses in use</td>
<td>Number of MAC addresses currently in the forwarding database.</td>
</tr>
<tr>
<td>Total MAC Addresses available</td>
<td>Number of MAC addresses the forwarding database can handle.</td>
</tr>
</tbody>
</table>

**process cpu threshold**

Use this command to configure the CPU utilization thresholds. The Rising and Falling thresholds are specified as a percentage of CPU resources. The utilization monitoring time period can be configured from 5 seconds to 86400 seconds in multiples of 5 seconds. The CPU utilization threshold configuration is saved across a switch reboot. Configuring the falling utilization threshold is optional. If the falling CPU utilization parameters are not configured, then they take the same value as the rising CPU utilization parameters.

**Format**

```
process cpu threshold type total rising <1-100> interval <5-86400> {rising <1-100> interval <5-86400>}
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rising threshold</td>
<td>The percentage of CPU resources that, when exceeded for the configured rising interval, triggers a notification. The range is 1 to 100. The default is 0 (disabled).</td>
</tr>
<tr>
<td>rising interval</td>
<td>The duration of the CPU rising threshold violation, in seconds, that must be met to trigger a notification. The range is 5 to 86400. The default is 0 (disabled).</td>
</tr>
<tr>
<td>falling threshold</td>
<td>The percentage of CPU resources that, when usage falls below this level for the configured interval, triggers a notification. The range is 1 to 100. The default is 0 (disabled). A notification is triggered when the total CPU utilization falls below this level for a configured period of time. The falling utilization threshold notification is made only if a rising threshold notification was previously done. The falling utilization threshold must always be equal or less than the rising threshold value. The CLI does not allow setting the falling threshold to be greater than the rising threshold.</td>
</tr>
<tr>
<td>falling interval</td>
<td>The duration of the CPU falling threshold, in seconds, that must be met to trigger a notification. The range is 5 to 86400. The default is 0 (disabled).</td>
</tr>
</tbody>
</table>

**show process cpu**

This command provides the percentage utilization of the CPU by different tasks.
Note: It is not necessarily the traffic to the CPU, but different tasks that keep the CPU busy.

Format: show process cpu
Mode: Privileged EXEC

The following shows example CLI display output.

(Switch) #show process cpu

Memory Utilization Report
status      bytes
------ ----------
  free  192980480
  alloc   53409968

Task Utilization Report
Task                    Utilization
-----------------------  -----------
  bcmL2X.0                      0.75%
  bcmCNTR.0                     0.20%
  bcmLINK.0                     0.35%
  DHCP snoop                    0.10%
  Dynamic ARP Inspection        0.10%
  dot1s_timer_task              0.10%
  dhcpsPingTask                 0.20%

show mbuf total

This command shows the total system buffer pools status.

Format: show mbuf total
Mode: Privileged EXEC

The following shows an example of CLI display output for the command.

(switch) #show mbuf total

mbufSize           9284 (0x2444)
Current Time       0x1897fa
MbufsFree          150
MbufsRxUsed        0
Total Rx Norm Alloc Attempts   26212
Total Rx Mid2 Alloc Attempts  4087
Total Rx Mid1 Alloc Attempts  188943
Total Rx High Alloc Attempts  384555
Total Tx Alloc Attempts    2478536
Total Rx Norm Alloc Failures 0
Total Rx Mid2 Alloc Failures 0
show running-config

Use this command to display or capture the current setting of different protocol packages supported on the switch. This command displays or captures commands with settings and configurations that differ from the default value. To display or capture the commands with settings and configurations that are equal to the default value, include the [all] option.

**Note:** Show running-config does not display the User Password, even if you set one different from the default.

The output is displayed in script format, which can be used to configure another switch with the same configuration. If the optional <scriptname> is provided with a file name extension of “.scr”, the output is redirected to a script file.

**Note:** If you issue the show running-config command from a serial connection, access to the switch through remote connections (such as Telnet) is suspended while the output is being generated and displayed.

**Note:** If you use a text-based configuration file, the show running-config command will only display configured physical interfaces, i.e. if any interface only contains the default configuration, that interface will be skipped from the show running-config command output. This is true for any configuration mode that contains nothing but default configuration. That is, the command to enter a particular config mode, followed immediately by its ‘exit’ command, are both omitted from the show running-config command output (and hence from the startup-config file when the system configuration is saved.)

If all the flags in a particular group are enabled, then the command displays trapflags <group name> all.
If some, but not all, of the flags in that group are enabled, the command displays `trapflags <groupname> <flag-name>`.

**Format**
```
show running-config [all | <scriptname>]
```

**Mode**
Privileged EXEC

### show running-config interface

This command shows the current configuration on a particular interface. The interface could be a physical port or a virtual port—like a LAG or VLAN. The output captures how the configuration differs from the factory default value.

**Format**
```
show running-config interface {<unit/slot/port>} | VLAN <id> | LAG <id>
```

**Mode**
Interface Config

### show sysinfo

This command displays switch information.

**Format**
```
show sysinfo
```

**Mode**
Privileged EXEC

</tbody>
</table>

### show tech-support

Use this command to display system and configuration information when you contact technical support. The output of this command combines the output of the following commands:

- `show version`
- `show sysinfo`
• show port all
• show isdp neighbors
• show logging
• show event log
• show logging buffered
• show trap log

Format
show tech-support
Mode
Privileged EXEC

**show tech-support techsupport**

This command without the techsupport parameter displays system and configuration information on the console. To generate the information in a file, specify the techsupport parameter.

Format
show tech-support techsupport
Mode
Privileged EXEC

**length**

Use this command to set the pagination length to value number of lines for the sessions specified by configuring on different Line Config modes (telnet, ssh, and console) and is persistent.

Default
24
Format
length <0|5-48>
Mode
Line Config

**no length value**

Use this command to set the pagination length to the default value number of lines.

Format
no length
Mode
Line Config

**terminal length**

Use this command to set the number of lines of output to be displayed on the screen, i.e. pagination, for the show running-config and show running-config all commands. The terminal length size is either zero or a number in the range of 5 to 48. After the user-configured number of lines is displayed in one page, the system prompts the user “--More-- or (q)uit.” Press q or Q to quit, or press any key to display the next set
of <5-48> lines. The command `terminal length 0` disables pagination and, as a result, the output of the `show running-config` command is displayed immediately.

**Default**

24 lines per page

**Format**

`terminal length <0 | 5-48>`

**Mode**

Privileged EXEC

### no terminal length

Use this command to set the terminal length to the default value.

**Format**

`no terminal length`

**Mode**

Privileged EXEC

### show terminal length

Use this command to display the value of the user-configured terminal length size.

**Format**

`show terminal length`

**Mode**

Privileged EXEC

### memory free low-watermark processor

Use this command to get notifications when the CPU free memory falls below the configured threshold. A notification is generated when the free memory falls below the threshold. Another notification is generated once the available free memory rises to 10 percent above the specified threshold. To prevent generation of excessive notifications when the CPU free memory fluctuates around the configured threshold, only one Rising or Falling memory notification is generated over a period of 60 seconds. The threshold is specified in kilobytes. The CPU free memory threshold configuration is saved across a switch reboot.

**Format**

`memory free low-watermark processor <1-1034956>`

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low-watermark</td>
<td>When CPU free memory falls below this threshold, a notification message is triggered. The range is 1 to the maximum available memory on the switch. The default is 0 (disabled).</td>
</tr>
</tbody>
</table>

### Logging Commands

This section describes the commands you use to configure system logging, and to view logs and the logging settings.
**logging buffered**

This command enables logging to an in-memory log that keeps up to 128 logs.

- **Default**: disabled; critical when enabled
- **Format**: logging buffered
- **Mode**: Global Config

**no logging buffered**

This command disables logging to in-memory log.

- **Format**: no logging buffered
- **Mode**: Global Config

**logging buffered wrap**

This command enables wrapping of in-memory logging when the log file reaches full capacity. Otherwise when the log file reaches full capacity, logging stops.

- **Default**: enabled
- **Format**: logging buffered wrap
- **Mode**: Privileged EXEC

**no logging buffered wrap**

This command disables wrapping of in-memory logging and configures logging to stop when the log file capacity is full.

- **Format**: no logging buffered wrap
- **Mode**: Privileged EXEC

**logging cli-command**

This command enables the CLI command logging feature, which enables the 7000 series software to log all CLI commands issued on the system.

- **Default**: enabled
- **Format**: logging cli-command
- **Mode**: Global Config
no logging cli-command

This command disables the CLI command Logging feature.

Format  
no logging cli-command

Mode  
Global Config

logging console

This command enables logging to the console. You can specify the `<severitylevel>` value as either an integer from 0 to 7 or symbolically through one of the following keywords: emergency (0), alert (1), critical (2), error (3), warning (4), notice (5), info (6), or debug (7).

Default  
disabled; critical when enabled

Format  
logging console [severitylevel]

Mode  
Global Config

no logging console

This command disables logging to the console.

Format  
no logging console

Mode  
Global Config

logging host

This command enables logging to a host. You can configure up to eight hosts. The `<ipaddr|hostname>` is the IP address of the logging host. The `<addressstype>` indicates the type of address ipv4 or ipv6 or dns being passed. The `<port>` value is a port number from 1 to 65535. You can specify the `<severitylevel>` value as either an integer from 0 to 7 or symbolically through one of the following keywords: emergency (0), alert (1), critical (2), error (3), warning (4), notice (5), info (6), or debug (7).

The end user can configure either an IPv4 or IPv6 address or a host name for a Syslog collector among the list of servers.

Default  
• port—514
• level—critical (2)

Format  
logging host <ipaddr|hostname> <addressstype>  
[<port>][<severitylevel>]

Mode  
Global Config
**logging host remove**

This command disables logging to host. See *show logging hosts* on page 554 for a list of host indexes.

**Format**

logging host remove <hostindex>

**Mode**

Global Config

**logging syslog**

This command enables syslog logging. The `<portid>` parameter is an integer with a range of 1-65535.

**Default**

disabled

**Format**

logging syslog [port <portid>]

**Mode**

Global Config

**no logging syslog**

This command disables syslog logging.

**Format**

no logging syslog

**Mode**

Global Config

**logging syslog source-interface**

This command configures the syslog source-interface.

**Format**

logging syslog source-interface {<u/s/p> | {loopback <loopback-id>} | {tunnel <tunnel-id>}}

**Mode**

Global Config

**show logging**

This command displays logging configuration information.

**Format**

show logging

**Mode**

Privileged EXEC

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**logging persistent**

Use this command to configure the Persistent logging for the switch. The severity level of logging messages is specified at severity level. Possible values for severity level are (emergency|0, alert|1, critical|2, error|3, warning|4, notice|5, info|6, debug|7).

**Default**

Disable

**Format**

```
logging persistent <severity level>
```

**Mode**

Global Config
no logging persistent

Use this command to disable the persistent logging in the switch.

**Format**

no logging persistent

**Mode**

Global Config

---

**Email Alerting and Mail Server Commands**

**logging email**

This command enables email alerting and sets the lowest severity level for which log messages are emailed. If you specify a severity level, log messages at or above this severity level, but below the urgent severity level, are emailed in a non-urgent manner by collecting them together until the log time expires. You can specify the `severitylevel` value as either an integer from 0 to 7 or symbolically through one of the following keywords: emergency (0), alert (1), critical (2), error (3), warning (4), notice (5), info (6), or debug (7).

**Default**

Disabled; when enabled, log messages at or above severity Warning (4) are emailed

**Format**

logging email [ <severitylevel> ]

**Mode**

Global Config

**no logging email**

This command disables email alerting.

**Format**

no logging email

**Mode**

Global Config

**logging email urgent**

This command sets the lowest severity level at which log messages are emailed immediately in a single email message. Specify the `severitylevel` value as either an integer from 0 to 7 or symbolically through one of the following keywords: emergency (0), alert (1), critical (2), error (3), warning (4), notice (5), info (6), or debug (7). Specify none to indicate that log messages are collected and sent in a batch email at a specified interval.

**Default**

Alert (1) and emergency (0) messages are sent immediately

**Format**

logging email urgent { <severitylevel> | none }

**Mode**

Global Config
**no logging email urgent**

This command resets the urgent severity level to the default value.

**Format**

```
no logging email urgent
```

**Mode**

Global Config

**logging email message-type to-addr**

This command configures the email address to which messages are sent. The message types supported are urgent, non-urgent, and both. For each supported severity level, multiple email addresses can be configured. The `to-email-addr` variable is a standard email address, for example `admin@yourcompany.com`.

**Format**

```
logging email message-type {urgent |non-urgent |both} to-addr <to-email-addr>
```

**Mode**

Global Config

**no logging email message-type to-addr**

This command removes the configured to-addr field of email.

**Format**

```
no logging email message-type {urgent |non-urgent |both} to-addr <to-email-addr>
```

**Mode**

Global Config

**logging email from-addr**

This command configures the email address of the sender (the switch).

**Default**

`switch@netgear.com`

**Format**

```
logging email from-addr <from-email-addr>
```

**Mode**

Global Config

**no logging email from-addr**

This command removes the configured email source address.

**Format**

```
no logging email from-addr <from-email-addr>
```

**Mode**

Global Config
**logging email message-type subject**

This command configures the subject line of the email for the specified type.

**Default**
For urgent messages: Urgent Log Messages
For non-urgent messages: Non Urgent Log Messages

**Format**
logging email message-type {urgent |non-urgent |both} subject

**Mode**
Global Config

**no logging email message-type subject**

This command removes the configured email subject for the specified message type and restores it to the default email subject.

**Format**
no logging email message-type {urgent |non-urgent |both} subject

**Mode**
Global Config

**logging email logtime**

This command configures how frequently non-urgent email messages are sent. Non-urgent messages are collected and sent in a batch email at the specified interval. The valid range is every 30-1440 minutes.

**Default**
30 minutes

**Format**
logging email logtime <minutes>

**Mode**
Global Config

**no logging email logtime**

This command resets the non-urgent log time to the default value.

**Format**
no logging email logtime

**Mode**
Global Config

**logging traps**

This command sets the severity at which SNMP traps are logged and sent in an email. Specify the severity level value as either an integer from 0 to 7 or symbolically through one of the following keywords: emergency (0), alert (1), critical (2), error (3), warning (4), notice (5), info (6), or debug (7).

**Default**
Info (6) messages and higher are logged.

**Format**
logging traps <severity level>

**Mode**
Global Config
no logging traps

This command resets the SNMP trap logging severity level to the default value.

Format: no logging traps
Mode: Global Config

logging email test message-type

This command sends an email to the SMTP server to test the email alerting function.

Format: logging email test message-type {urgent | non-urgent | both} message-body <message-body>
Mode: Global Config

show logging email config

This command displays information about the email alert configuration.

Format: show logging email config
Mode: Privileged EXEC

<table>
<thead>

</tr>
<tr>
<td>Time Since Last Email Sent</td>
<td>The amount of time that has passed since the last email was sent from the switch.</td>
</tr>
</tbody>
</table>

**clear logging email statistics**

This command resets the email alerting statistics.

**Format**  
clear logging email statistics

**Mode**  
Privileged EXEC

**mail-server**

Use this command to configure the SMTP server to which the switch sends email alert messages and change the mode to Mail Server Configuration mode. The server address can be in the IPv4, IPv6, or DNS name format.

**Format**  
mail-server {ip-address | ipv6-address | hostname}

**Mode**  
Global Config

**no mail-server**

Use this command to remove the specified SMTP server from the configuration.

**Format**  
no mail-server {ip-address | ipv6-address | hostname}

**Mode**  
Global Config
security

Use this command to set the email alerting security protocol by enabling the switch to use TLS authentication with the SMTP Server. If the TLS mode is enabled on the switch but the SMTP server does not support TLS mode, no email is sent to the SMTP server.

Default none
Format security {tlsv1 | none}
Mode Mail Server Config

port

Use this command to configure the TCP port to use for communication with the SMTP server. The recommended port for TLSv1 is 465, and for no security (i.e. none) it is 25. However, any nonstandard port in the range 1 to 65535 is also allowed.

Default 25
Format port {465 | 25 | 1–65535}
Mode Mail Server Config

username

Use this command to configure the login ID that the switch uses to authenticate with the SMTP server.

Default admin
Format username name
Mode Mail Server Config

password

Use this command to configure the password that the switch uses to authenticate with the SMTP server.

Format password password
Mode Mail Server Config

show mail-server config

Use this command to display information about the email alert configuration.

Format show mail-server {ip-address | hostname | all } config
Mode Privileged EXEC
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>

<td>Email Alert Security Protocol</td>
<td>The security protocol (TLS or none) the switch uses to authenticate with the SMTP server.</td>
</tr>
<tr>
<td>Email Alert Username</td>
<td>The username the switch uses to authenticate with the SMTP server.</td>
</tr>
<tr>
<td>Email Alert Password</td>
<td>The password the switch uses to authenticate with the SMTP server.</td>
</tr>
</tbody>
</table>

System Utility and Clear Commands

This section describes the commands you use to help troubleshoot connectivity issues and to restore various configurations to their factory defaults.

**traceroute**

Use the `traceroute` command to discover the routes that packets actually take when traveling to their destination through the network on a hop-by-hop basis. Traceroute continues to provide a synchronous response when initiated from the CLI.

**Default**

- count: 3 probes
- interval: 3 seconds
- size: 0 bytes
- port: 33434
- maxTtl: 30 hops
- maxFail: 5 probes
- initTtl: 1 hop

**Format**

```
traceroute <ipaddr|hostname> [initTtl <initTtl>] [maxTtl <maxTtl>] [maxFail <maxFail>] [interval <interval>] [count <count>] [port <port>] [size <size>] [source{ip-address|<unit/slot/port> | loopback <0-7>}]```

**Mode**

Privileged EXEC
Using the options described below, you can specify the initial and maximum time-to-live (TTL) in probe packets, the maximum number of failures before termination, the number of probes sent for each TTL, and the size of each probe.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>hostname</td>
</tr>
<tr>
<td>initTtl</td>
<td>Use initTtl to specify the initial time-to-live (TTL), the maximum number of router hops between the local and remote system. Range is 0 to 255.</td>
</tr>
<tr>
<td>maxTtl</td>
<td>Use maxTtl to specify the maximum TTL. Range is 1 to 255.</td>
</tr>
<tr>
<td>maxFail</td>
<td>Use maxFail to terminate the traceroute after failing to receive a response for this number of consecutive probes. Range is 0 to 255.</td>
</tr>
<tr>
<td>interval</td>
<td>Use interval to specify the time between probes, in seconds. Range is 1 to 60 seconds.</td>
</tr>
<tr>
<td>count</td>
<td>Use the optional count parameter to specify the number of probes to send for each TTL value. Range is 1 to 10 probes.</td>
</tr>
<tr>
<td>port</td>
<td>Use the optional port parameter to specify destination UDP port of the probe. This should be an unused port on the remote destination system. Range is 1 to 65535.</td>
</tr>
<tr>
<td>size</td>
<td>Use the optional size parameter to specify the size, in bytes, of the payload of the Echo Requests sent. Range is 0 to 65507 bytes.</td>
</tr>
<tr>
<td>source</td>
<td>Use the optional source parameter to specify the source IP address or interface for the traceroute.</td>
</tr>
</tbody>
</table>

The following are examples of the CLI command.

**traceroute Success:**

(Switch) # traceroute 10.240.10.115 initTtl 1 maxTtl 4 maxFail 0 interval 1 count 3 port 33434 size 43
Traceroute to 10.240.10.115,4 hops max 43 byte packets:
1 10.240.4.1 708 msec 41 msec 11 msec
2 10.240.10.115 0 msec 0 msec 0 msec

Hop Count = 1 Last TTL = 2 Test attempt = 6 Test Success = 6

**traceroute Failure:**

(Switch) # traceroute 10.40.1.1 initTtl 1 maxFail 0 interval 1 count 3 port 33434 size 43
Traceroute to 10.40.1.1,30 hops max 43 byte packets:
1 10.240.4.1 19 msec 18 msec 9 msec
2 10.240.1.252 0 msec 0 msec 1 msec
3 172.31.0.9 277 msec 276 msec 277 msec
4 10.254.1.1 289 msec 327 msec 282 msec
5 10.254.21.2 287 msec 293 msec 296 msec
6 192.168.76.2 290 msec 291 msec 289 msec
7 0.0.0.0 0 msec *
Hop Count = 6 Last TTL = 7 Test attempt = 19 Test Success = 18

**traceroute ipv6**

Use the `traceroute` command to discover the routes that packets actually take when traveling to their destination through the network on a hop-by-hop basis. The `<ipv6-address|hostname>` parameter must be a valid IPv6 address or hostname. The optional `<port>` parameter is the UDP port used as the destination of packets sent as part of the traceroute. This port should be an unused port on the destination system. The range for `<port>` is zero (0) to 65535. The default value is 33434.

**Default**

port: 33434

**Format**

`traceroute ipv6 <ipv6-address|hostname> [port <port>]`

**Mode**

Privileged EXEC

**clear config**

This command resets the configuration to the factory defaults without powering off the switch. When you issue this command, a prompt appears to confirm that the reset should proceed. When you enter `y`, you automatically reset the current configuration on the switch to the default values. It does not reset the switch.

**Format**

clear config

**Mode**

Privileged EXEC

**clear eventlog**

This command clears all event messages maintained in the switch.

**Format**

clear eventlog

**Mode**

Privileged EXEC

**clear mac-addr-table**

This command clears the dynamically learned MAC addresses of the switch.

**Format**

clear mac-addr-table

**Mode**

Privileged EXEC

**clear logging buffered**

This command clears the messages maintained in the system log.

**Format**

clear logging buffered

**Mode**

Privileged EXEC
clear counters

This command clears the statistics for a specified <unit/slot/port>, for all the ports, or for the entire switch based upon the argument.

Format clear counters {<unit/slot/port> | all}
Mode Privileged EXEC

clear igmpsnooping

This command clears the tables managed by the IGMP Snooping function and attempts to delete these entries from the Multicast Forwarding Database.

Format clear igmpsnooping
Mode Privileged EXEC

clear pass

This command resets all user passwords to the factory defaults without powering off the switch. You are prompted to confirm that the password reset should proceed.

Format clear pass
Mode Privileged EXEC

clear port-channel

This command clears all port-channels (LAGs).

Format clear port-channel
Mode Privileged EXEC

clear traplog

This command clears the trap log.

Format clear traplog
Mode Privileged EXEC

clear vlan

This command resets VLAN configuration parameters to the factory defaults.

Format clear vlan
Mode Privileged EXEC
**enable password**

This command prompts you to change the Privileged EXEC password. Passwords are a maximum of 64 alphanumeric characters. The password is case sensitive. The option [encrypted] allows the administrator to transfer the enable password between devices without having to know the password. In this case, the <password> parameter must be exactly 128 hexadecimal characters.

**Format**

```
enable password <password> [encrypted]
```

**Mode**

Privileged EXEC

**logout**

This command closes the current telnet connection or resets the current serial connection.

---

**Note:** Save configuration changes before logging out.

---

**Format**

```
logout
```

**Modes**

- Privileged EXEC
- User EXEC

**ping**

Use this command to determine whether another computer is on the network. Ping provides a synchronous response when initiated from the CLI and Web interfaces.

**Default**

- The default count is 1.
- The default interval is 3 seconds.
- The default size is 0 bytes.

**Format**

```
ping <ipaddress|hostname> [count <count>] [interval <interval>] [size <size>]
```

**Modes**

- Privileged EXEC
- User EXEC
Using the options described below, you can specify the number and size of Echo Requests and the interval between Echo Requests.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Use the <strong>count</strong> parameter to specify the number of ping packets (ICMP Echo requests) that are sent to the destination address specified by the <code>&lt;ip-address&gt;</code> field. The range for <code>&lt;count&gt;</code> is 1 to 15 requests.</td>
</tr>
<tr>
<td>interval</td>
<td>Use the <strong>interval</strong> parameter to specify the time between Echo Requests, in seconds. Range is 1 to 60 seconds.</td>
</tr>
<tr>
<td>size</td>
<td>Use the <strong>size</strong> parameter to specify the size, in bytes, of the payload of the Echo Requests sent. Range is 0 to 65507 bytes.</td>
</tr>
</tbody>
</table>

The following are examples of the CLI command.

**ping success:**

```plaintext
(Switch) # ping 10.254.2.160 count 3 interval 1 size 255
Pinging 10.254.2.160 with 255 bytes of data:

Received response for icmp_seq = 0. time= 275268 usec
Received response for icmp_seq = 1. time= 274009 usec
Received response for icmp_seq = 2. time= 279459 usec

---10.254.2.160 PING statistics---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip (msec) min/avg/max = 274/279/276
```

**ping failure:**

**In Case of Unreachable Destination:**

```plaintext
(Switch) # ping 192.168.254.222 count 3 interval 1 size 255
Pinging 192.168.254.222 with 255 bytes of data:
Received Response: Unreachable Destination
Received Response :Unreachable Destination
Received Response :Unreachable Destination
---192.168.254.222 PING statistics----
3 packets transmitted, 3 packets received, 0% packet loss
round-trip (msec) min/avg/max = 0/0/0
```

**In Case Of Request TimedOut:**

```plaintext
(Switch) # ping 1.1.1.1 count 1 interval 3
Pinging 1.1.1.1 with 0 bytes of data:

---1.1.1.1 PING statistics----
1 packets transmitted,0 packets received, 100% packet loss
round-trip (msec) min/avg/max = 0/0/0
```

**ping ipv6**

Use this command to determine whether another computer is on the network. Ping provides a synchronous response when initiated from the CLI and Web interfaces. To use the
command, configure the switch for network (in-band) connection. The source and target devices must have the ping utility enabled and running on top of TCP/IP. The switch can be pinged from any IP workstation with which the switch is connected through the default VLAN (VLAN 1), as long as there is a physical path between the switch and the workstation. The terminal interface sends three pings to the target station. Use the \texttt{ipv6-address}\texttt{|hostname} parameter to ping an interface by using the global IPv6 address of the interface. Use the optional \texttt{size} keyword to specify the size of the ping packet. You can utilize the ping or traceroute facilities over the service/network ports when using an IPv6 global address \texttt{ipv6-global-address}\texttt{|hostname}. Any IPv6 global address or gateway assignments to these interfaces will cause IPv6 routes to be installed within the IP stack such that the ping or traceroute request is routed out the service/network port properly. When referencing an IPv6 link-local address, you must also specify the network port interface by using the \texttt{network} parameter.

**Defaults**
- The default count is 1.
- The default interval is 3 seconds.
- The default size is 0 bytes.

**Format**
\texttt{ping ipv6 \{<ipv6-global-address|<hostname>\} [size <datagram-size>]}

**Modes**
- Privileged EXEC
- User EXEC

\textit{ping ipv6 interface}

Use this command to determine whether another computer is on the network. To use the command, configure the switch for network (in-band) connection. The source and target devices must have the ping utility enabled and running on top of TCP/IP. The switch can be pinged from any IP workstation with which the switch is connected through the default VLAN (VLAN 1), as long as there is a physical path between the switch and the workstation. The terminal interface sends three pings to the target station. Use the \texttt{interface} keyword to ping an interface by using the link-local address or the global IPv6 address of the interface. You can use a loopback, network port, or physical interface as the source. Use the optional \texttt{size} keyword to specify the size of the ping packet. The \texttt{ipv6-address} is the link local IPv6 address of the device you want to query.

**Format**
\texttt{ping ipv6 interface \{<unit/slot/port> | loopback <loopback-id> | network\} <link-local-address> [size <datagram-size>]}

**Modes**
- Privileged EXEC
- User EXEC
**quit**

This command closes the current telnet connection or resets the current serial connection. The system asks you whether to save configuration changes before quitting.

**Format** quit

**Modes**
- Privileged EXEC
- User EXEC

**reload**

This command resets the switch without powering it off. Reset means that all network connections are terminated and the boot code executes. The switch uses the stored configuration to initialize the switch. You are prompted to confirm that the reset should proceed. The LEDs on the switch indicate a successful reset.

**Format** reload

**Mode** Privileged EXEC

**save**

This command makes the current configuration changes permanent by writing the configuration changes to system NVRAM.

**Format** save

**Mode** Privileged EXEC

**copy**

The **copy** command uploads and downloads files to and from the switch. You can also use the copy command to manage the dual images (image1 and image2) on the file system. Upload and download files from a server by using TFTP or Xmodem. SFTP and SCP are available as additional transfer methods if the software package supports secure management.

**Format** copy <source> <destination>

**Mode** Privileged EXEC

Replace the **<source>** and **<destination>** parameters with the options in table below. For the **<url>** source or destination, use one of the following values:

{xmodem | tftp://<ipaddr|hostname>/<filename> | sftp://<username>@<ipaddr|ipv6address>/<filepath>/<filename> | sftp://<username>@<ipaddr|ipv6address>/<filename> | scp://<username>@<ipaddr|ipv6address>/<filepath>/<filename> | scp://<username>@<ipaddr|ipv6address>/<filename>}

For TFTP, SFTP and SCP, the **<ipaddr|hostname>** parameter is the IP address or host name of the server, **<filepath>** is the path to the file, and **<filename>** is the name of the file you want to upload or download. For SFTP and SCP, the **<username>** parameter is the username for logging into the remote server via SSH.
**Note:** `<ip6address>` is also a valid parameter for routing packages that support IPv6.

For switches that support a USB device, the copy command can be used to transfer files from and to the USB device. The syntax for the USB file is: `usb://<filename>`. The USB device can be either a source or destination in the `copy` command. It cannot be used as both source and destination in a given `copy` command.

**Note:** Remember to upload the existing Switch CLI.cfg file off the switch prior to loading a new release image in order to make a backup.

Parameters for the `copy` command are listed in the following table:

<table>
<thead>
<tr>
<th>Source</th>
<th>Destination</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvram:backup-config</td>
<td>nvram:startup-config</td>
<td>Copies the backup configuration to the startup configuration.</td>
</tr>
<tr>
<td>nvram:clibanner</td>
<td><code>&lt;url&gt;</code></td>
<td>Copies the CLI banner to a server.</td>
</tr>
<tr>
<td>nvram:errlog</td>
<td><code>&lt;url&gt;</code></td>
<td>Copies the error log file to a server.</td>
</tr>
<tr>
<td>nvram:log</td>
<td><code>&lt;url&gt;</code></td>
<td>Copies the log file to a server.</td>
</tr>
<tr>
<td>nvram:script <code>&lt;scriptname&gt;</code></td>
<td><code>&lt;url&gt;</code></td>
<td>Copies a specified configuration script file to a server.</td>
</tr>
<tr>
<td>nvram:startup-config</td>
<td>nvram:backup-config</td>
<td>Copies the startup configuration to the backup configuration.</td>
</tr>
<tr>
<td>nvram:startup-config</td>
<td><code>&lt;url&gt;</code></td>
<td>Copies the startup configuration to a server.</td>
</tr>

Simple Network Time Protocol (SNTP) Commands

This section describes the commands you use to automatically configure the system time and date by using SNTP.

`sntp broadcast client poll-interval`

This command sets the poll interval for SNTP broadcast clients in seconds as a power of two where `<poll-interval>` can be a value from 6 to 10.

| Default | 6 |
| Format   | `sntp broadcast client poll-interval <poll-interval>` |
| Mode     | Global Config |

`no sntp broadcast client poll-interval`

This command resets the poll interval for SNTP broadcast client back to the default value.

<table>
<thead>
<tr>
<th>Format</th>
<th><code>no sntp broadcast client poll-interval</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

`sntp client mode`

This command enables Simple Network Time Protocol (SNTP) client mode and may set the mode to either broadcast or unicast.

<table>
<thead>
<tr>
<th>Default</th>
<th>disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>`sntp client mode [broadcast</td>
</tr>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>
no sntp client mode

This command disables Simple Network Time Protocol (SNTP) client mode.

**Format**
no sntp client mode

**Mode**
Global Config

sntp client port

This command sets the SNTP client port id to a value from 1-65535.

**Default**
123

**Format**
sntp client port <portid>

**Mode**
Global Config

no sntp client port

This command resets the SNTP client port back to its default value.

**Format**
no sntp client port

**Mode**
Global Config

sntp unicast client poll-interval

This command sets the poll interval for SNTP unicast clients in seconds as a power of two where `<poll-interval>` can be a value from 6 to 10.

**Default**
6

**Format**
sntp unicast client poll-interval <poll-interval>

**Mode**
Global Config

no sntp unicast client poll-interval

This command resets the poll interval for SNTP unicast clients to its default value.

**Format**
no sntp unicast client poll-interval

**Mode**
Global Config

sntp unicast client poll-timeout

This command will set the poll timeout for SNTP unicast clients in seconds to a value from 1-30.

**Default**
5
no sntp unicast client poll-timeout

This command will reset the poll timeout for SNTP unicast clients to its default value.

Format:  no sntp unicast client poll-timeout
Mode:    Global Config

sntp unicast client poll-retry

This command will set the poll retry for SNTP unicast clients to a value from 0 to 10.

Default: 1
Format:  sntp unicast client poll-retry <poll-retry>
Mode:    Global Config

no sntp unicast client poll-retry

This command will reset the poll retry for SNTP unicast clients to its default value.

Format:  no sntp unicast client poll-retry
Mode:    Global Config

sntp server

This command configures an SNTP server (a maximum of three). The optional priority can be a value of 1-3, the version a value of 1-4, and the port id a value of 1-65535.

Format:  sntp server <ipaddress|ipv6address|hostname> [<priority> [<version> [<portid>]]]
Mode:    Global Config

no sntp server

This command deletes an server from the configured SNTP servers.

Format:  no sntp server remove <ipaddress|ipv6address|hostname>
Mode:    Global Config

clock timezone

When using SNTP/NTP time servers to update the switch’s clock, the time data received from the server is based on Coordinated Universal Time (UTC) which is the same as Greenwich
Mean Time (GMT). This may not be the time zone in which the switch is located. Use the `clock timezone` command to configure a time zone specifying the number of hours and optionally the number of minutes difference from UTC. To set the switch clock to UTC, use the `no` form of the command.

**Format**
```
clock timezone zone-name +/-hours-offset [+-/minutes-offset]
```

**Mode**
Global Config

**Default**
```
no clock timezone
```

### | Definition |
---|---|
**zone-name** | A name to associate with the time zone |
**hours-offset** | Number of hours difference with UTC |
**minutes-offset** | Number of minutes difference with UTC |

**no clock timezone**

This command sets the switch to UTC time.

**Format**
```
no clock timezone
```

**Mode**
Global Config

**clock set**

This command sets the system time and date.

**Format**
```
clock set <hh:mm:ss>
clock set <mm/dd/yyyy>
```

**Mode**
Global Config

**clock summer-time recurring**

Use the `clock summer-time recurring` command to set the summertime offset to UTC recursively every year. If the optional parameters are not specified, they are read as either '0' or '0', as appropriate.

Use the following parameters to configure the summer-time.

- USA—the US Daylight saving time setting is used (Start --- March, 2nd sunday 02:00 AM, End --- Nov, 1st sunday, 2:00 AM)
- EU—the European Union Daylight savings time is used (Start --- March, 5th Sunday 02:00 AM, End --- October, 5th Sunday, 3:00 AM)
- week—Week of the month. (Range: 1-5, first, last)
- day—Day of the week. (Range: The first three letters by name; sun, for example.)
- month—Month. (Range: The first three letters by name; jan, for example.)
• **hh:mm**—Time in 24-hour format in hours and minutes. (Range: hh:0-23, mm: 0-59)
• **offset**—Number of minutes to add during the summertime. (Range: 1-1440)
• **acronym**—The acronym for the time zone to be displayed when summertime is in effect. (Range: Up to four characters)

**Format**
clock summer-time recurring {USA | EU | \{week day month hh:mm week day month hh:mm\}} [offset offset] [zone acronym]

**Mode**
Global Config

**For example:**

(Switch)(Config)# clock summer-time recurring 1 sun jan 00:10 2 mon mar 10:00 offset 1 zone ABC

clock summer-time date

Use the clock summer-time date command to set the summertime offset to UTC. If the optional parameters are not specified, they are read as either '0' or '\0', as appropriate.

• **date**—Day of the month. (Range: 1-31)
• **month**—Month. (Range: The first three letters by name; jan, for example.)
• **year**—Year. (Range: 2000-2097)
• **hh:mm**—Time in 24-hour format in hours and minutes. (Range: hh: 0-23, mm: 0-59)
• **offset**—Number of minutes to add during the summertime. (Range: 1-1440)
• **acronym**—The acronym for the time zone to be displayed when summertime is in effect. (Range: Up to four characters)

**Format**
clock summer-time date {date | month} {month | date} year hh:mm {date | month} {month | date} year hh:mm [offset offset] [zone acronym]

**Mode**
Global Config

**For example:**

(Switch)(config)# clock summer-time date 1 Apr 2007 02:00 28 Oct 2007 offset 90 zone EST

or

(Switch) (config)# clock summer-time date Apr 1 2007 02:00 Oct 28 2007 offset 90 zone EST
Utility Commands

no clock summer-time

Use the no clock summer-time command to reset the summertime offset.

Format no clock summer-time
Mode Global Config

For example:

console(config)#no clock summer-time

show sntp

This command is used to display SNTP settings and status.

Format show sntp
Mode Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Update Time</td>
<td>Time of last clock update.</td>
</tr>
<tr>
<td>Last Unicast Attempt Time</td>
<td>Time of last transmit query (in unicast mode).</td>
</tr>
<tr>
<td>Last Attempt Status</td>
<td>Status of the last SNTP request (in unicast mode) or unsolicited message (in broadcast mode).</td>
</tr>
<tr>
<td>Broadcast Count</td>
<td>Current number of unsolicited broadcast messages that have been received and processed by the SNTP client since last reboot.</td>
</tr>
<tr>
<td>Multicast Count</td>
<td>Current number of unsolicited multicast messages that have been received and processed by the SNTP client since last reboot.</td>
</tr>
</tbody>
</table>

show sntp client

This command is used to display SNTP client settings.

Format show sntp client
Mode Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Supported Modes</td>
<td>Supported SNTP Modes (Broadcast, Unicast, or Multicast).</td>
</tr>
<tr>
<td>SNTP Version</td>
<td>The highest SNTP version the client supports.</td>
</tr>
<tr>
<td>Port</td>
<td>SNTP Client Port.</td>
</tr>
<tr>
<td>Client Mode</td>
<td>Configured SNTP Client Mode.</td>
</tr>
</tbody>
</table>
show snntp server

This command is used to display SNTP server settings and configured servers.

Format       show snntp server
Mode         Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Host Address</td>
<td>IP address or hostname of configured SNTP Server.</td>
</tr>
<tr>
<td>Server Type</td>
<td>Address Type of Server.</td>
</tr>
<tr>
<td>Server Stratum</td>
<td>Claimed stratum of the server for the last received valid packet.</td>
</tr>
<tr>
<td>Server Reference ID</td>
<td>Reference clock identifier of the server for the last received valid packet.</td>
</tr>
<tr>
<td>Server Mode</td>
<td>SNTP Server mode.</td>
</tr>
<tr>
<td>Server Maximum Entries</td>
<td>Total number of SNTP Servers allowed.</td>
</tr>
<tr>
<td>Server Current Entries</td>
<td>Total number of SNTP configured.</td>

<td>IP address or hostname of configured SNTP Server.</td>
</tr>
<tr>
<td>Address Type</td>
<td>Address Type of configured SNTP server.</td>
</tr>
<tr>
<td>Priority</td>
<td>IP priority type of the configured server.</td>
</tr>
<tr>
<td>Version</td>
<td>SNTP Version number of the server. The protocol version used to query the</td>
</tr>
<tr>
<td></td>
<td>server in unicast mode.</td>
</tr>
<tr>
<td>Port</td>
<td>Server Port Number.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>Last server attempt time for the specified server.</td>
</tr>
<tr>
<td>Last Update Status</td>
<td>Last server attempt status for the server.</td>
</tr>
<tr>
<td>Total Unicast Requests</td>
<td>Number of requests to the server.</td>
</tr>
<tr>
<td>Failed Unicast Requests</td>
<td>Number of failed requests from server.</td>
</tr>
</tbody>
</table>
show clock

Use the show clock command in Privileged EXEC or User EXEC mode to display the time and date from the system clock. Use the show clock detail command to show the time zone and summertime configuration.

Format: show clock [detail]
Mode: User EXEC, Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>The time provided by the time source.</td>
</tr>
<tr>
<td>Time Source</td>
<td>The time source type.</td>
</tr>
</tbody>
</table>

If option detail is specified, these terms are displayed

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>

<tbody>
<tr>
<td>Time Zone</td>
<td>The time zone configured.</td>
</tr>
<tr>
<td>Summer Time</td>
<td>Indicate if the summer time is enabled.</td>
</tr>
</tbody>
</table>

DHCP Server Commands

This section describes the commands you to configure the DHCP server settings for the switch. DHCP uses UDP as its transport protocol and supports a number of features that facilitate in administration address allocations.

ip dhcp pool

This command configures a DHCP address pool name on a DHCP server and enters DHCP pool configuration mode.

Default: none
Format: ip dhcp pool <name>
Mode: Global Config

no ip dhcp pool

This command removes the DHCP address pool. The name should be previously configured pool name.

Format: no ip dhcp pool <name>
Mode: Global Config
**client-identifier**

This command specifies the unique identifier for a DHCP client. Unique-identifier is a valid notation in hexadecimal format. In some systems, such as Microsoft DHCP clients, the client identifier is required instead of hardware addresses. The unique-identifier is a concatenation of the media type and the MAC address. For example, the Microsoft client identifier for Ethernet address c819.2488.f177 is 01c8.1924.88f1.77 where 01 represents the Ethernet media type. For more information, refer to the "Address Resolution Protocol Parameters" section of RFC 1700, Assigned Numbers for a list of media type codes.

**Default** none

**Format**  
client-identifier <uniqueidentifier>

**Mode**  
DHCP Pool Config

**no client-identifier**

This command deletes the client identifier.

**Format**  
no client-identifier

**Mode**  
DHCP Pool Config

**client-name**

This command specifies the name for a DHCP client. Name is a string consisting of standard ASCII characters.

**Default** none

**Format**  
client-name <name>

**Mode**  
DHCP Pool Config

**no client-name**

This command removes the client name.

**Format**  
no client-name

**Mode**  
DHCP Pool Config

**default-router**

This command specifies the default router list for a DHCP client. \{address1, address2... address8\} are valid IP addresses, each made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid.

**Default** none
Utility Commands

ProSafe Managed Switch

Format: `default-router <address1> [<address2>....<address8>]`
Mode: DHCP Pool Config

no default-router

This command removes the default router list.

Format: `no default-router`
Mode: DHCP Pool Config

dns-server

This command specifies the IP servers available to a DHCP client. Address parameters are valid IP addresses; each made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid.

Default: none

Format: `dns-server <address1> [<address2>....<address8>]`
Mode: DHCP Pool Config

no dns-server

This command removes the DNS Server list.

Format: `no dns-server`
Mode: DHCP Pool Config

hardware-address

This command specifies the hardware address of a DHCP client. Hardware-address is the MAC address of the hardware platform of the client consisting of 6 bytes in dotted hexadecimal format. Type indicates the protocol of the hardware platform. It is 1 for 10 MB Ethernet and 6 for IEEE 802.

Default: ethernet

Format: `hardware-address <hardwareaddress> <type>`
Mode: DHCP Pool Config

no hardware-address

This command removes the hardware address of the DHCP client.

Format: `no hardware-address`
Mode: DHCP Pool Config
host

This command specifies the IP address and network mask for a manual binding to a DHCP client. Address and Mask are valid IP addresses; each made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid. The prefix-length is an integer from 0 to 32.

**Default**

none

**Format**

```
host <address> [{<mask> | <prefix-length>}] 
```

**Mode**

DHCP Pool Config

no host

This command removes the IP address of the DHCP client.

**Format**

```
no host
```

**Mode**

DHCP Pool Config

lease

This command configures the duration of the lease for an IP address that is assigned from a DHCP server to a DHCP client. The overall lease time should be between 1-86400 minutes. If you specify `infinite`, the lease is set for 60 days. You can also specify a lease duration. `Days` is an integer from 0 to 59. `Hours` is an integer from 0 to 23. `Minutes` is an integer from 0 to 59.

**Default**

1 (day)

**Format**

```
lease [{<days> [ехours>] [ехminutes>] | infinite}] 
```

**Mode**

DHCP Pool Config

no lease

This command restores the default value of the lease time for DHCP Server.

**Format**

```
no lease
```

**Mode**

DHCP Pool Config

network (DHCP Pool Config)

Use this command to configure the subnet number and mask for a DHCP address pool on the server. Network-number is a valid IP address, made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid. Mask is the IP subnet mask for the specified address pool. The prefix-length is an integer from 0 to 32.

**Default**

none
Utility Commands

ProSafe Managed Switch

Format  

network <networknumber> [{<mask> | <prefixlength>}]  
Mode  

DHCP Pool Config

no network  

This command removes the subnet number and mask.

Format  

no network  
Mode  

DHCP Pool Config

bootfile  

The command specifies the name of the default boot image for a DHCP client. The<br>
<filename> specifies the boot image file.

Format  

bootfile <filename>  
Mode  

DHCP Pool Config

no bootfile  

This command deletes the boot image name.

Format  

no bootfile  
Mode  

DHCP Pool Config

domain-name  

This command specifies the domain name for a DHCP client. The <domain> specifies the<br>
domain name string of the client.

Default  

none

Format  

domain-name <domain>  
Mode  

DHCP Pool Config

no domain-name  

This command removes the domain name.

Format  

no domain-name  
Mode  

DHCP Pool Config

netbios-name-server  

This command configures NetBIOS Windows Internet Naming Service (WINS) name servers<br>
that are available to DHCP clients.
One IP address is required, although one can specify up to eight addresses in one command line. Servers are listed in order of preference (address1 is the most preferred server, address2 is the next most preferred server, and so on).

**Default** none

**Format** netbios-name-server <address> [<address2>...<address8>]

**Mode** DHCP Pool Config

**no netbios-name-server**

This command removes the NetBIOS name server list.

**Format** no netbios-name-server

**Mode** DHCP Pool Config

**netbios-node-type**

The command configures the NetBIOS node type for Microsoft Dynamic Host Configuration Protocol (DHCP) clients. type specifies the NetBIOS node type. Valid types are:

- b-node—Broadcast
- p-node—Peer-to-peer
- m-node—Mixed
- h-node—Hybrid (recommended)

**Default** none

**Format** netbios-node-type <type>

**Mode** DHCP Pool Config

**no netbios-node-type**

This command removes the NetBIOS node Type.

**Format** no netbios-node-type

**Mode** DHCP Pool Config

**next-server**

This command configures the next server in the boot process of a DHCP client. The <address> parameter is the IP address of the next server in the boot process, which is typically a TFTP server.

**Default** inbound interface helper addresses
Utility Commands

ProSafe Managed Switch

Format  next-server  <address>
Mode   DHCP Pool Config

**no next-server**

This command removes the boot server list.

Format     no next-server
Mode       DHCP Pool Config

**option**

The `option` command configures DHCP Server options. The `<code>` parameter specifies the DHCP option code and ranges from 1-254. The `<ascii string>` parameter specifies an NVT ASCII character string. ASCII character strings that contain white space must be delimited by quotation marks. The `hex <string>` parameter specifies hexadecimal data. In hexadecimal, character strings are two hexadecimal digits. You can separate each byte by a period (for example, a3.4f.22.0c), colon (for example, a3:4f:22:0c), or white space (for example, a3 4f 22 0c).

Default  none
Format    option  <code>  {ascii string | hex <string1> [ <string2>...<string8>] | ip <address1> [ <address2>...<address8>]} 
Mode     DHCP Pool Config

**no option**

This command removes the DHCP Server options. The `<code>` parameter specifies the DHCP option code.

Format    no option  <code>
Mode       DHCP Pool Config

**ip dhcp excluded-address**

This command specifies the IP addresses that a DHCP server should not assign to DHCP clients. Low-address and high-address are valid IP addresses; each made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid.

Default  none
Format    ip dhcp excluded-address  <lowaddress>  [highaddress]
Mode      Global Config
**no ip dhcp excluded-address**

This command removes the excluded IP addresses for a DHCP client. Low-address and high-address are valid IP addresses; each made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid.

**Format**

`no ip dhcp excluded-address <lowaddress> [highaddress]`

**Mode**

Global Config

**ip dhcp ping packets**

Use this command to specify the number, in a range from 2-10, of packets a DHCP server sends to a pool address as part of a ping operation. By default the number of packets sent to a pool address is 2, which is the smallest allowed number when sending packets. Setting the number of packets to 0 disables this command.

**Default**

2

**Format**

`ip dhcp ping packets <0,2-10>`

**Mode**

Global Config

**no ip dhcp ping packets**

This command prevents the server from pinging pool addresses and sets the number of packets to 0.

**Default**

0

**Format**

`no ip dhcp ping packets`

**Mode**

Global Config

**service dhcp**

This command enables the DHCP server.

**Default**

disabled

**Format**

`service dhcp`

**Mode**

Global Config

**no service dhcp**

This command disables the DHCP server.

**Format**

`no service dhcp`

**Mode**

Global Config
**ip dhcp bootp automatic**

This command enables the allocation of the addresses to the bootp client. The addresses are from the automatic address pool.

**Default**

disabled

**Format**

ip dhcp bootp automatic

**Mode**

Global Config

**no ip dhcp bootp automatic**

This command disables the allocation of the addresses to the bootp client. The addresses are from the automatic address pool.

**Format**

no ip dhcp bootp automatic

**Mode**

Global Config

**ip dhcp conflict logging**

This command enables conflict logging on DHCP server.

**Default**

enabled

**Format**

ip dhcp conflict logging

**Mode**

Global Config

**no ip dhcp conflict logging**

This command disables conflict logging on DHCP server.

**Format**

no ip dhcp conflict logging

**Mode**

Global Config

**clear ip dhcp binding**

This command deletes an automatic address binding from the DHCP server database. If "*" is specified, the bindings corresponding to all the addresses are deleted. `<address>` is a valid IP address made up of four decimal bytes ranging from 0 to 255. IP address 0.0.0.0 is invalid.

**Format**

clear ip dhcp binding {<address> | *}

**Mode**

Privileged EXEC
clear ip dhcp server statistics

This command clears DHCP server statistics counters.

Format    clear ip dhcp server statistics
Mode      Privileged EXEC

clear ip dhcp conflict

The command is used to clear an address conflict from the DHCP Server database. The server detects conflicts using a ping. DHCP server clears all conflicts if the asterisk (*) character is used as the address parameter.

Default   none
Format    clear ip dhcp conflict {<address> | *}
Mode      Privileged EXEC

show ip dhcp binding

This command displays address bindings for the specific IP address on the DHCP server. If no IP address is specified, the bindings corresponding to all the addresses are displayed.

Format    show ip dhcp binding [<address>]
Modes     • Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>The IP address of the client.</td>
</tr>
<tr>
<td>Hardware Address</td>
<td>The MAC Address or the client identifier.</td>
</tr>
<tr>
<td>Lease expiration</td>
<td>The lease expiration time of the IP address assigned to the client.</td>
</tr>
<tr>
<td>Type</td>
<td>The manner in which IP address was assigned to the client.</td>
</tr>
</tbody>
</table>

show ip dhcp global configuration

This command displays address bindings for the specific IP address on the DHCP server. If no IP address is specified, the bindings corresponding to all the addresses are displayed.

Format    show ip dhcp global configuration
Modes     • Privileged EXEC
• User EXEC
Service DHCP | The field to display the status of dhcp protocol.
---|---
Number of Ping Packets | The maximum number of Ping Packets that will be sent to verify that an ip address id not already assigned.
Conflict Logging | Shows whether conflict logging is enabled or disabled.
BootP Automatic | Shows whether BootP for dynamic pools is enabled or disabled.

**show ip dhcp pool configuration**

This command displays pool configuration. If all is specified, configuration for all the pools is displayed.

**Format**

```
show ip dhcp pool configuration {<name> | all}
```

**Modes**

- Privileged EXEC
- User EXEC

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Name</td>
<td>The name of the configured pool.</td>
</tr>
<tr>
<td>Pool Type</td>
<td>The pool type.</td>

</thead>
<tbody>
<tr>
<td>DHCP OFFER</td>
<td>The number of DHCPOFFER messages the server sent.</td>
</tr>
<tr>
<td>DHCP ACK</td>
<td>The number of DHCPACK messages the server sent.</td>
</tr>
<tr>
<td>DHCP NACK</td>
<td>The number of DHCPNACK messages the server sent.</td>
</tr>
</tbody>
</table>

**show ip dhcp conflict**

This command displays address conflicts logged by the DHCP Server. If no IP address is specified, all the conflicting addresses are displayed.

**Format**

```
show ip dhcp conflict [<ip-address>]
```

**Modes**

- Privileged EXEC
- User EXEC
IP address | The IP address of the host as recorded on the DHCP server.
---|---
Reporting Host Hardware Address | The hardware address of the host that reported the conflict.
Detection Method | The manner in which the IP address of the hosts were found on the DHCP Server.
Detection time | The time when the conflict was found.

**DNS Client Commands**

These commands are used in the Domain Name System (DNS), an Internet directory service. DNS is how domain names are translated into IP addresses. When enabled, the DNS client provides a hostname lookup service to other components.

**ip domain lookup**

Use this command to enable the DNS client.

- **Default**: enabled
- **Format**: `ip domain lookup`
- **Mode**: Global Config

**no ip domain lookup**

Use this command to disable the DNS client.

- **Format**: `no ip domain lookup`
- **Mode**: Global Config

**ip domain name**

Use this command to define a default domain name that the software uses to complete unqualified host names (names with a domain name). By default, no default domain name is configured in the system. `<name>` may not be longer than 255 characters and should not include an initial period. This `<name>` should be used only when the default domain name list, configured using the `ip domain list` command, is empty.

- **Default**: none
- **Format**: `ip domain name <name>`
- **Mode**: Global Config

Example: The CLI command `ip domain name yahoo.com` will configure yahoo.com as a default domain name. For an unqualified hostname xxx, a DNS query is made to find the IP address corresponding to xxx.yahoo.com.

---

**Utility Commands**

591
no ip domain name

Use this command to remove the default domain name configured using the `ip domain name` command.

**Format**

`no ip domain name`

**Mode**

Global Config

---

ip domain list

Use this command to define a list of default domain names to complete unqualified names. By default, the list is empty. Each name must be no more than 256 characters, and should not include an initial period. The default domain name, configured using the `ip domain name` command, is used only when the default domain name list is empty. A maximum of 32 names can be entered in to this list.

**Default**

none

**Format**

`ip domain list <name>`

**Mode**

Global Config

---

no ip domain list

Use this command to delete a name from a list.

**Format**

`no ip domain list <name>`

**Mode**

Global Config

---

ip name server

Use this command to configure the available name servers. Up to eight servers can be defined in one command or by using multiple commands. The parameter `<server-address>` is a valid IPv4 or IPv6 address of the server. The preference of the servers is determined by the order they were entered.

**Format**

`ip name-server <server-address1> [server-address2...server-address8]`

**Mode**

Global Config

---

no ip name server

Use this command to remove a name server.

**Format**

`no ip name-server [server-address1...server-address8]`

**Mode**

Global Config
**ip host**

Use this command to define static host name-to-address mapping in the host cache. `<name>` is host name. `<ip address>` is the IP address of the host.

Default none

Format `ip host <name> <ipaddress>`

Mode Global Config

**no ip host**

Use this command to remove the name-to-address mapping.

Format `no ip host <name>`

Mode Global Config

**ipv6 host**

Use this command to define static host name-to-IPv6 address mapping in the host cache. `<name>` is host name. `<v6 address>` is the IPv6 address of the host.

Default none

Format `ipv6 host <name> <v6 address>`

Mode Global Config

**no ipv6 host**

Use this command to remove the static host name-to-IPv6 address mapping in the host cache.

Format `no ipv6 host <name>`

Mode Global Config

**ip domain retry**

Use this command to specify the number of times to retry sending Domain Name System (DNS) queries. The parameter `<number>` indicates the number of times to retry sending a DNS query to the DNS server. This number ranges from 0 to 100.

Default 2

Format `ip domain retry <number>`

Mode Global Config
no ip domain retry

Use this command to return to the default.

Format  no ip domain retry <number>
Mode    Global Config

ip domain timeout

Use this command to specify the amount of time to wait for a response to a DNS query. The parameter <seconds> specifies the time, in seconds, to wait for a response to a DNS query. <seconds> ranges from 0 to 3600.

Default  3
Format    ip domain timeout <seconds>
Mode      Global Config

no ip domain timeout

Use this command to return to the default setting.

Format  no ip domain timeout <seconds>
Mode    Global Config

clear host

Use this command to delete entries from the host name-to-address cache. This command clears the entries from the DNS cache maintained by the software. This command clears both IPv4 and IPv6 entries.

Format    clear host {<name> | all}
Mode       Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A particular host entry to remove. &lt;name&gt; ranges from 1-255 characters.</td>
</tr>
<tr>
<td>all</td>
<td>Removes all entries.</td>
</tr>
</tbody>
</table>
**show hosts**

Use this command to display the default domain name, a list of name server hosts, the static and the cached list of host names and addresses <name> ranges from 1-255 characters. This command displays both IPv4 and IPv6 entries.

**Format**

```
show hosts [name]
```

**Mode**

User EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Name</td>
<td>Domain host name.</td>
</tr>
<tr>
<td>Default Domain</td>
<td>Default domain name.</td>
</tr>
<tr>
<td>Default Domain List</td>
<td>Default domain list.</td>
</tr>
<tr>
<td>Domain Name Lookup</td>
<td>DNS client enabled/disabled.</td>
</tr>
<tr>
<td>Number of Retries</td>
<td>Number of time to retry sending Domain Name System (DNS) queries.</td>
</tr>
<tr>
<td>Retry Timeout Period</td>
<td>Amount of time to wait for a response to a DNS query.</td>
</tr>
<tr>
<td>Name Servers</td>
<td>Configured name servers.</td>
</tr>
</tbody>
</table>

**Example:** The following shows example CLI display output for the command.

```
<Switch> show hosts

Host name................................. Device
Default domain......................... gm.com
Default domain list..................... yahoo.com, Stanford.edu, rediff.com
Domain Name lookup...................... Enabled
Number of retries....................... 5
Retry timeout period................. 1500
Name servers (Preference order)... 176.16.1.18 176.16.1.19

Configured host name-to-address mapping:

<table>
<thead>
<tr>
<th>Host</th>
<th>Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>accounting.gm.com</td>
<td>176.16.8.8</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Host</th>
<th>Total</th>
<th>Elapsed</th>
<th>Type</th>
<th>Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.stanford.edu">www.stanford.edu</a></td>
<td>72</td>
<td>3</td>
<td>IP</td>
<td>171.64.14.203</td>
</tr>
</tbody>
</table>
```

**Packet Capture Commands**

Packet capture commands assist in troubleshooting protocol-related problems with the management CPU. The packets to and from the management CPU can be captured in an
internally allocated buffer area for export to a PC host for protocol analysis. Public domain packet analysis tools like Ethereal can be used to decode and review the packets in detail. Capturing can be performed in a variety of modes, either transmit-side only, receive-side only, or both. The number of packets captured will depend on the size of the captured packets.

capture {start|stop}

Use the command `capture start` to manually start capturing CPU packets for packet trace. Capturing packets is stopped automatically when 128 packets are captured and have not yet been displayed during a capture session. It is guaranteed that packets not displayed and not saved will not be lost when capturing is in progress. Use the command `capture stop` to manually stop capturing CPU packets for packet trace before the moment when 128 packets are captured and capturing packets is stopped automatically. The packet capture operates in three modes:

- Capture file
- Remote capture
- Capture line

The command is not persistent across a reboot cycle.

Format: capture {start|stop} {transmit|receive|all}

Mode: Privileged EXEC

capture {file|remote|line}

Use this command to configure file capture options. The command is persistent across a reboot cycle.

Default: Remote

Format: capture {file|remote|line}

Mode: Global Config
Use this command to reset the capture mode to remote mode.

Format
no capture
Mode
Global Config

capture remote port

Use this command to configure file capture options. The command is persistent across a reboot cycle.

Default
2002
Format
capture remote port <port-id>
Mode
Global Config

no capture remote port

Use this command to reset the remote port to the default (2002).

Format
no capture report port
Mode
Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>In capture file mode, the captured packets are stored in a file on NVRAM. The maximum file size defaults to 524288 bytes. The switch can transfer the file to a TFTP server via TFTP, SFTP, SCP via CLI, Web and SNMP. The file is formatted in pcap format, is named cpuPktCapture.pcap, and can be examined using network analyzer tools such as Wireshark® by Ethereal®. Starting a file capture automatically terminates any remote capture sessions and line capturing. After the packet capture is activated, the capture proceeds until the capture file reaches its maximum size, or until the capture is stopped manually using the CLI command capture stop.</td>
</tr>
<tr>
<td>remote</td>
<td>In remote capture mode, the captured packets are redirected in real time to an external PC running the Wireshark tool for Microsoft® Windows®. A packet capture server runs on the switch side and sends the captured packets via a TCP connection to the Wireshark tool. The remote capture can be enabled or disabled using the CLI. There should be a Windows PC with the Wireshark tool to display the captured file. When using the remote capture mode, the switch does not store any captured data locally on its file system. You can configure the IP port number for connecting Wireshark to the switch. The default port number is 2002. If a firewall is installed between the Wireshark PC and the switch, then these ports must be allowed to pass through the firewall. You must configure the firewall to allow the Wireshark PC to initiate TCP connections to the switch. If the socket connection to Wireshark has been established, then the captured CPU packets are written to the data socket. Wireshark receives the packets and processes it to display. This continues until the session is terminated by either end. Starting a remote capture session automatically terminates the file capture and line capturing.</td>
</tr>
<tr>
<td>line</td>
<td>In capture line mode, the captured packets are saved in real time mode into the RAM and can be displayed on the CLI. Starting a line capture automatically terminates any remote capture session and capturing into a file.</td>
</tr>
</tbody>
</table>
**capture file size**

Use this command to configure file capture options. The command is persistent across a reboot cycle. The range is from 2 to 512 Kbytes.

**Default**
512Kbytes

**Format**
capture file size <file-size>

**Mode**
Global Config

**no capture file size**

Use this command to reset the file size to the default (512Kbytes).

**Format**
no capture file size

**Mode**
Global Config

**capture line wrap**

There are two methods to configure capturing CPU packets into RAM: capture line wrap and no capture line wrap. Use the capture line wrap command to stop automatically capturing packets when 128 packets are saved and have not yet been displayed during the capturing session. When capturing is in progress, unsaved, not-yet-displayed packets will not be lost.

**Default**
Disabled

**Format**
capture line wrap

**Mode**
Global Config

**no capture line wrap**

Use this command to disable the capture line wrap mode.

**Format**
no capture line wrap

**Mode**
Global Config

**Serviceability Packet Tracing Commands**

These commands improve the capability of network engineers to diagnose conditions affecting their managed switch product.

⚠️ **CAUTION:**
The output of the debug commands can be long and may adversely affect system performance.
**debug arp**

Use this command to enable ARP debug protocol messages.

- **Default**: disabled
- **Format**: debug arp
- **Mode**: Privileged EXEC

**no debug arp**

Use this command to disable ARP debug protocol messages.

- **Format**: no debug arp
- **Mode**: Privileged EXEC

**debug auto-voip**

Use this command to enable Auto VOIP debug messages. Use the optional parameters to trace H323, SCCP, or SIP packets respectively.

- **Default**: disabled
- **Format**: debug auto-voip [H323|SCCP|SIP]
- **Mode**: Privileged EXEC

**no debug auto-voip**

Use this command to disable Auto VOIP debug messages.

- **Format**: no debug auto-voip
- **Mode**: Privileged EXEC

**debug clear**

This command disables all previously enabled “debug” traces.

- **Default**: disabled
- **Format**: debug clear
- **Mode**: Privileged EXEC

**debug console**

This command enables the display of “debug” trace output on the login session in which it is executed. Debug console display must be enabled in order to view any trace output. The output of debug trace commands will appear on all login sessions for which debug console
has been enabled. The configuration of this command remains in effect for the life of the login session. The effect of this command is not persistent across resets.

Default        disabled
Format         debug console
Mode           Privileged EXEC

no debug console

This command disables the display of “debug” trace output on the login session in which it is executed.

Format         no debug console
Mode           Privileged EXEC

debug dhcp packet

Use this command to display “debug” information about DHCPv4 client activities and trace DHCPv4 packets to and from the local DHCPv4 client.

Default        disabled
Format         debug dhcp packet [transmit | receive]
Mode           Privileged EXEC

no debug dhcp

Use this command to disable the display of “debug” trace output for DHCPv4 client activity.

Format         no debug dhcp packet [transmit | receive]
Mode           Privileged EXEC

debug dot1x packet

Use this command to enable dot1x packet debug trace.

Default        disabled
Format         debug dot1x
Mode           Privileged EXEC
**no debug dot1x packet**

Use this command to disable dot1x packet debug trace.

**Format**

```
no debug dot1x
```

**Mode**

Privileged EXEC

**debug igmpsnooping packet**

This command enables tracing of IGMP Snooping packets received and transmitted by the switch.

**Default**

disabled

**Format**

```
debug igmpsnooping packet
```

**Mode**

Privileged EXEC

**no debug igmpsnooping packet**

This command disables tracing of IGMP Snooping packets.

**Format**

```
no debug igmpsnooping packet
```

**Mode**

Privileged EXEC

**debug igmpsnooping packet transmit**

This command enables tracing of IGMP Snooping packets transmitted by the switch. Snooping should be enabled on the device and the interface in order to monitor packets for a particular interface.

**Default**

disabled

**Format**

```
debug igmpsnooping packet transmit
```

**Mode**

Privileged EXEC

A sample output of the trace message is shown below.

```
<15> JAN 01 02:45:06 192.168.17.29-1 IGMPSNOOP[185429992]: igmp_snooping_debug.c(116)
908 % Pkt TX - Intf: 1/0/20(20), Vlan_Id:1 Src_Mac: 00:03:0e:00:00:00 Dest_Mac:
01:00:5e:00:00:01 Src_IP: 9.1.1.1 Dest_IP: 225.0.0.1 Type: V2_Membership_Report Group:
225.0.0.1
```

The following parameters are displayed in the trace message:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>TX</td>
<td>A packet transmitted by the device.</td>
</tr>
<tr>
<td>Intf</td>
<td>The interface that the packet went out on. Format used is unit/slot/port (internal interface number). Unit is always shown as 1 for interfaces on a non-stacking device.</td>
</tr>
</tbody>
</table>
no debug igmpsnooping transmit

This command disables tracing of transmitted IGMP snooping packets.

Format: no debug igmpsnooping transmit
Mode: Privileged EXEC

dbg igmpsnooping packet receive

This command enables tracing of IGMP Snooping packets received by the switch. Snooping should be enabled on the device and the interface in order to monitor packets for a particular interface.

Default: disabled
Format: debug igmpsnooping packet receive
Mode: Privileged EXEC

A sample output of the trace message is shown below.

<15> JAN 01 02:45:06 192.168.17.29-1 IGMSNOOP[185429992]: igmp_snooping_debug.c(116) 908 % Pkt RX - Intf: 1/0/20(20), Vlan_Id:1 Src_Mac: 00:03:0e:00:00:10 Dest_Mac: 01:00:5e:00:00:05 Src_IP: 11.1.1.1 Dest_IP: 225.0.0.5 Type: Membership_Query Group: 225.0.0.5

The following parameters are displayed in the trace message:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX</td>
<td>A packet received by the device.</td>
</tr>
<tr>
<td>Intf</td>
<td>The interface that the packet went out on. Format used is unit/slot/port (internal interface number). Unit is always shown as 1 for interfaces on a non-stacking device.</td>
</tr>

</table>
| **Type** | The type of IGMP packet. Type can be one of the following:  
  • Membership_Query – IGMP Membership Query  
  • V1_Membership_Report – IGMP Version 1 Membership Report  
  • V2_Membership_Report – IGMP Version 2 Membership Report  
  • V3_Membership_Report – IGMP Version 3 Membership Report  
  • V2_Leave_Group – IGMP Version 2 Leave Group |
| **Group** | Multicast group address in the IGMP header. |

**no debug igmpsnooping receive**

This command disables tracing of received IGMP Snooping packets.

**Format**

no debug igmpsnooping receive

**Mode**

Privileged EXEC

**debug ip acl**

Use this command to enable debug of IP Protocol packets matching the ACL criteria.

**Default**

disabled

**Format**

debug ip acl <acl Number>

**Mode**

Privileged EXEC

**no debug ip acl**

Use this command to disable debug of IP Protocol packets matching the ACL criteria.

**Format**

no debug ip acl <acl Number>

**Mode**

Privileged EXEC

**debug ip dvmrp packet**

Use this command to trace DVMRP packet reception and transmission. **receive** traces only received DVMRP packets and **transmit** traces only transmitted DVMRP packets. When neither keyword is used in the command, then all DVMRP packet traces are dumped. Vital
information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default disabled
Format debug ip dvmrp packet [receive|transmit]
Mode Privileged EXEC

no debug ip dvmrp packet

Use this command to disable debug tracing of DVMRP packet reception and transmission.

Format no debug ip dvmrp packet [receive|transmit]
Mode Privileged EXEC

debug ip igmp packet

Use this command to trace IGMP packet reception and transmission. receive traces only received IGMP packets and transmit traces only transmitted IGMP packets. When neither keyword is used in the command, then all IGMP packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default disabled
Format debug ip igmp packet [receive|transmit]
Mode Privileged EXEC

no debug ip igmp packet

Use this command to disable debug tracing of IGMP packet reception and transmission.

Format no debug ip igmp packet [receive|transmit]
Mode Privileged EXEC

debug ip mcache packet

Use this command for tracing MDATA packet reception and transmission. receive traces only received data packets and transmit traces only transmitted data packets. When neither keyword is used in the command, then all data packet traces are dumped. Vital information such as source address, destination address, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default disabled
Format debug ip mcache packet [receive|transmit]
Mode Privileged EXEC
Utility Commands

no debug ip mcache packet

Use this command to disable debug tracing of MDATA packet reception and transmission.

Format  no debug ip mcache packet [receive|transmit]
Mode    Privileged EXEC

default ip pimdm packet

Use this command to trace PIMDM packet reception and transmission. receive traces only received PIMDM packets and transmit traces only transmitted PIMDM packets. When neither keyword is used in the command, then all PIMDM packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default  disabled
Format    debug ip pimdm packet [receive|transmit]
Mode      Privileged EXEC

no debug ip pimdm packet

Use this command to disable debug tracing of PIMDM packet reception and transmission.

Format  no debug ip pimdm packet [receive|transmit]
Mode    Privileged EXEC

default ip pimsm packet

Use this command to trace PIMSM packet reception and transmission. receive traces only received PIMSM packets and transmit traces only transmitted PIMSM packets. When neither keyword is used in the command, then all PIMSM packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default  disabled
Format    debug ip pimsm packet [receive|transmit]
Mode      Privileged EXEC

no debug ip pimsm packet

Use this command to disable debug tracing of PIMSM packet reception and transmission.

Format  no debug ip pimsm packet [receive|transmit]
Mode    Privileged EXEC
**debug ip vrrp**

Use this command to enable VRRP debug protocol messages.

Default: disabled

Format: `debug ip vrrp`

Mode: Privileged EXEC

**no debug ip vrrp**

Use this command to disable VRRP debug protocol messages.

Format: `no debug ip vrrp`

Mode: Privileged EXEC

**debug ipv6 dhcp**

Use this command to display “debug” information about DHCPv6 client activities and trace DHCPv6 packets to and from the local DHCPv6 client.

Default: disabled

Format: `debug ipv6 dhcp`

Mode: Privileged EXEC

**no ipv6 debug dhcp**

Use this command to disable the display of “debug” trace output for DHCPv6 client activity.

Format: `no debug ipv6 dhcp`

Mode: Privileged EXEC

**debug ipv6 mcache packet**

Use this command for tracing MDATAv6 packet reception and transmission. `receive` traces only received data packets and `transmit` traces only transmitted data packets. When neither keyword is used in the command, then all data packet traces are dumped. Vital information such as source address, destination address, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default: disabled

Format: `debug ipv6 mcache packet [receive|transmit]`

Mode: Privileged EXEC
**no debug ipv6 mcache packet**

Use this command to disable debug tracing of MDATAv6 packet reception and transmission.

**Format**

no debug ipv6 mcache packet [receive|transmit]

**Mode**

Privileged EXEC

**debug ipv6 mld packet**

Use this command to trace MLDv6 packet reception and transmission. *receive* traces only received MLDv6 packets and *transmit* traces only transmitted MLDv6 packets. When neither keyword is used in the command, then all MLDv6 packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

**Default**

disabled

**Format**

debug ipv6 mld packet [receive|transmit]

**Mode**

Privileged EXEC

**no debug ipv6 mld packet**

Use this command to disable debug tracing of MLDv6 packet reception and transmission.

**Format**

no debug ipv6 mld packet [receive|transmit]

**Mode**

Privileged EXEC

**debug ipv6 pimdm packet**

Use this command to trace PIMDMv6 packet reception and transmission. *receive* traces only received PIMDMv6 packets and *transmit* traces only transmitted PIMDMv6 packets. When neither keyword is used in the command, then all PIMDMv6 packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

**Default**

disabled

**Format**

debug ipv6 pimdm packet [receive|transmit]

**Mode**

Privileged EXEC

**no debug ipv6 pimdm packet**

Use this command to disable debug tracing of PIMDMv6 packet reception and transmission.

**debug ipv6 pimsm packet**

Use this command to trace PIMSMv6 packet reception and transmission. *receive* traces only received PIMSMv6 packets and *transmit* traces only transmitted PIMSMv6 packets. When
neither keyword is used in the command, then all PIMSMv6 packet traces are dumped. Vital information such as source address, destination address, control packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

```
Default disabled
Format debug ipv6 pimsm packet [receive|transmit]
Mode Privileged EXEC
```

**no debug ipv6 pimsm packet**

Use this command to disable debug tracing of PIMSMv6 packet reception and transmission.

```
Format no debug ipv6 pimsm packet [receive|transmit]
Mode Privileged EXEC
```

**debug lacp packet**

This command enables tracing of LACP packets received and transmitted by the switch.

```
Default disabled
Format debug lacp packet
Mode Privileged EXEC
```

A sample output of the trace message is shown below.

```
<15> JAN 01 14:04:51 10.254.24.31-1 DOT3AD[183697744]: dot3ad_debug.c(385) 58 %%
Pkt TX - Intf: 1/0/1(1), Type: LACP, Sys: 00:11:88:14:62:e1, State: 0x47, Key: 0x36
```

**no debug lacp packet**

This command disables tracing of LACP packets.

```
Format no debug lacp packet
Mode Privileged EXEC
```

**debug mldsnooping packet**

Use this command to trace MLD snooping packet reception and transmission. **receive** traces only received MLD snooping packets and **transmit** traces only transmitted MLD snooping packets. When neither keyword is used in the command, then all MLD snooping packet traces are dumped. Vital information such as source address, destination address, control
packet type, packet length, and the interface on which the packet is received or transmitted is displayed on the console.

Default: disabled
Format: debug mldsnooping packet [receive|transmit]
Mode: Privileged EXEC

**no debug mldsnooping packet**

Use this command to disable debug tracing of MLD snooping packet reception and transmission.

**debug ospf packet**

This command enables tracing of OSPF packets received and transmitted by the switch.

Default: disabled
Format: debug ospf packet
Mode: Privileged EXEC

Sample outputs of the trace messages are shown below.

<15> JAN 02 11:03:31 10.50.50.1-2 OSPF[46300472]: ospf_debug.c(297) 25430 % Pkt RX -

**no debug rip packet**

This command disables tracing of RIP requests and responses.

**Format**

no debug rip packet

**Mode**

Privileged EXEC

**debug sflow packet**

Use this command to enable sFlow debug packet trace.

**Default**

disabled

**Format**

debug sflow packet

**Mode**

Privileged EXEC
no debug sflow packet

Use this command to disable sFlow debug packet trace.

Format: `no debug sflow packet`
Mode: Privileged EXEC

debug spanning-tree bpdu

This command enables tracing of spanning tree BPDUs received and transmitted by the switch.

Default: disabled
Format: `debug spanning-tree bpdu`
Mode: Privileged EXEC

no debug spanning-tree bpdu

This command disables tracing of spanning tree BPDUs.

Format: `no debug spanning-tree bpdu`
Mode: Privileged EXEC

debu8 spanning-tree bpdu receive

This command enables tracing of spanning tree BPDUs received by the switch. Spanning tree should be enabled on the device and on the interface in order to monitor packets for a particular interface.

Default: disabled
Format: `debug spanning-tree bpdu receive`
Mode: Privileged EXEC

A sample output of the trace message is shown below.

```
<15> JAN 01 01:02:04 192.168.17.29-1 DOT1S[191096896]: dot1s_debug.c(1249) 101 % Pkt RX - Intf: 1/0/9(9), Source_Mac: 00:11:88:4e:c2:10 Version: 3, Root Mac: 00:11:88:4e:c2:00, Root Priority: 0x8000 Path Cost: 0

Cable Test Command

The cable test feature enables you to determine the cable connection status on a selected port.

**Note:** The cable test feature is supported only for copper cable. It is not supported for optical fiber cable. If the port has an active link while the cable test is run, the link can go down for the duration of the test.

### cablestatus

This command returns the status of the specified port.

**Format**

```
cablestatus <unit/slot/port>
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

sFlow Commands

sFlow® is the standard for monitoring high-speed switched and routed networks. sFlow technology is built into network equipment and gives complete visibility into network activity, enabling effective management and control of network resources.
**sflow receiver**

Use this command to configure the sFlow collector parameters (owner string, receiver timeout, max datagram size, IP address, and port).

**Format**

```
sflow receiver <rcvr_idx> owner <owner-string> [timeout <rcvr_timeout> | notimeout] max datagram <size> ip/ipv6 <ip> port <port>
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Owner</td>
<td>The identity string for the receiver, the entity making use of this sFlowRcvrTable entry. The range is 127 characters. The default is a null string. The empty string indicates that the entry is currently unclaimed and the receiver configuration is reset to the default values. An entity wishing to claim an sFlowRcvrTable entry must ensure that the entry is unclaimed before trying to claim it. The entry is claimed by setting the owner string to a non-null value. The entry must be claimed before assigning a receiver to a sampler or poller.</td>
</tr>
<tr>
<td>Receiver Timeout</td>
<td>The time, in seconds, remaining before the sampler or poller is released and stops sending samples to receiver. A management entity wanting to maintain control of the sampler is responsible for setting a new value before the old one expires. The allowed range is 0-4294967295 seconds. The default is zero (0).</td>
</tr>
<tr>
<td>Receiver Datagram Size</td>
<td>The maximum number of data bytes that can be sent in a single sample datagram. The management entity should set this value to avoid fragmentation of the sFlow datagrams. The allowed range is 200 to 9116. The default is 1400.</td>
</tr>
<tr>
<td>Receiver IP</td>
<td>The sFlow receiver IP address. If set to 0.0.0.0, no sFlow datagrams will be sent. The default is 0.0.0.0.</td>
</tr>
<tr>
<td>Receiver Port</td>
<td>The destination Layer4 UDP port for sFlow datagrams. The range is 1-65535. The default is 6343.</td>
</tr>
</tbody>
</table>

**no sflow receiver**

Use this command to set the sFlow collector parameters back to the defaults.

**Format**

```
no sflow receiver <idx> {ip <ip-address> | maxdatagram <size> | owner <string> timeout <interval> | port <14-port>}
```

**Mode**

Global Config
**sflow sampler**

A data source configured to collect flow samples is called a poller. Use this command to configure a new sFlow sampler instance for this data source if `<rcvr_idx>` is valid.

**Format**

```plaintext
sflow sampler {<rcvr-index> | rate <sampling-rate> | maxheadersize <size>}
```

**Mode**

Interface Config

**Field**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Index</td>
<td>The sFlow Receiver for this sFlow sampler to which flow samples are to be sent. A value of zero (0) means that no receiver is configured, no packets will be sampled. Only active receivers can be set. If a receiver expires, then all samplers associated with the receiver will also expire. Possible values are 1-8. The default is 0.</td>
</tr>
<tr>
<td>Maxheadersize</td>
<td>The maximum number of bytes that should be copied from the sampler packet. The range is 20-256. The default is 128. When set to zero (0), all the sampler parameters are set to their corresponding default value.</td>
</tr>
<tr>
<td>Sampling Rate</td>
<td>The statistical sampling rate for packet sampling from this source. A sampling rate of 1 counts all packets. A value of zero (0) disables sampling. A value of N means that out of N incoming packets, 1 packet will be sampled. The range is 1024-65536 and 0. The default is 0.</td>
</tr>
</tbody>
</table>

**no sflow sampler**

Use this command to reset the sFlow sampler instance to the default settings.

**Format**

```plaintext
no sflow sampler {<rcvr-index> | rate <sampling-rate> | maxheadersize <size>}
```

**Mode**

Interface Config

**sflow poller**

A data source configured to collect counter samples is called a poller. Use this command to enable a new sFlow poller instance for this data source if `<rcvr_idx>` is valid.

**Format**

```plaintext
sflow poller {<rcvr-index> | interval <poll-interval>}
```

**Mode**

Interface Config
no sflow poller

Use this command to reset the sFlow poller instance to the default settings.

Format  

```
no sflow poller {<rcvr-indx> | interval <poll-interval>}
```

Mode  

Interface Config

show sflow agent

The sFlow agent collects time-based sampling of network interface statistics and flow-based samples. These are sent to the configured sFlow receivers. Use this command to display the sFlow agent information.

Format  

```
show sflow agent
```

Mode  

Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Index</td>
<td>Enter the sFlow Receiver associated with the sampler/poller. A value of zero (0) means that no receiver is configured. The range is 1-8. The default is 0.</td>
</tr>
<tr>
<td>Poll Interval</td>
<td>Enter the sFlow instance polling interval. A poll interval of zero (0) disables counter sampling. When set to zero (0), all the poller parameters are set to their corresponding default value. The range is 0-86400. The default is 0. A value of N means once in N seconds a counter sample is generated.</td>
</tr>
</tbody>
</table>

Field  |
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>sFlow Version</td>
</tr>
<tr>
<td>IP Address</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command.

```
(switch) #show sflow agent
sFlow Version.................................. 1.3;Netgear;1.0
IP Address.................................... 10.131.12.66
```
show sflow pollers

Use this command to display the sFlow polling instances created on the switch. Use "-" for range.

Format  show sflow pollers
Mode     Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Poller DataSource</td>
<td>The sFlowDataSource (slot/port) for this sFlow sampler. This agent will support Physical ports only.</td>
</tr>
<tr>
<td>Receiver Index</td>
<td>The sFlowReceiver associated with this sFlow counter poller.</td>
</tr>
<tr>
<td>Poller Interval</td>
<td>The number of seconds between successive samples of the counters associated with this data source.</td>
</tr>
</tbody>
</table>

show sflow receivers

Use this command to display configuration information related to the sFlow receivers.

Format  show sflow receivers [<index>]
Mode     Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Index</td>
<td>The sFlow Receiver associated with the sampler/poller.</td>
</tr>
<tr>
<td>Owner String</td>
<td>The identity string for receiver, the entity making use of this sFlowRcvrTable entry.</td>
</tr>
<tr>
<td>Time Out</td>
<td>The time (in seconds) remaining before the receiver is released and stops sending samples to sFlow receiver.</td>
</tr>
<tr>
<td>Max Datagram Size</td>
<td>The maximum number of bytes that can be sent in a single sFlow datagram.</td>
</tr>
<tr>
<td>Port</td>
<td>The destination Layer4 UDP port for sFlow datagrams.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The sFlow receiver IP address.</td>
</tr>
<tr>
<td>Address Type</td>
<td>The sFlow receiver IP address type. For an IPv4 address, the value is 1 and for an IPv6 address, the value is 2.</td>
</tr>
<tr>
<td>Datagram Version</td>
<td>The sFlow protocol version to be used while sending samples to sFlow receiver.</td>
</tr>
</tbody>
</table>

Example: The following shows example CLI display output for the command.

(switch) #show sflow receivers 1
Receiver Index.............................................. 1
Owner String................................................ 0
show sflow samplers

Use this command to display the sFlow sampling instances created on the switch.

**Format**

```
show sflow samplers
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sampler Data Source</td>
<td>The sFlowDataSource (slot/port) for this sFlow sampler. This agent will support Physical ports only.</td>

<tr>
<td>Receiver Index</td>
<td>The sFlowReceiver configured for this sFlow sampler.</td>
</tr>
<tr>
<td>Packet Sampling Rate</td>
<td>The statistical sampling rate for packet sampling from this source.</td>
</tr>
<tr>
<td>Max Header Size</td>
<td>The maximum number of bytes that should be copied from a sampled packet to form a flow sample.</td>
</tr>
</tbody>
</table>

**Software License Commands**

License commands allow you to configure advanced features on some layer2 managed switches. The following table lists the software license matrix for the layer2 managed switches. For details, see *Licensing and Command Support* on page 8.

<table>
<thead>
<tr>
<th>Switch</th>
<th>IPv4 Routing</th>
<th>IPv6 Routing</th>
<th>IP Multicast</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Switches</td>
<td>Licensed</td>
<td>Licensed</td>
<td>Licensed</td>
</tr>
</tbody>
</table>

**Note:** The software license allows the user to download a license file only on the Master unit. The file cannot be downloaded on a Slave unit.

There are two options to download the license file to the switch:

- Use the **Copy** command to download the license file through the CLI.
- Go to the **Maintenance > Download** page to download the licence file through the GUI.
show license

This command displays the license status.

License Date indicates the date of the license. License Status indicates whether license is active or inactive.

Format: show license
Mode: Privileged EXEC

Example: The following shows example CLI display output for the command.

(Managed Switches) #show license
License date : Apr-9-2010
License copy : 1
License Status: Active
Description : License key is active.
(Managed Switches) #

show license features

This command displays the features that are licensed on the switch.

Format: show license features
Mode: Privileged EXEC

Example: The following shows example CLI display output for the command.

(Managed Switches) #show license features
IGMP
MCAST
PIMDM
DVMRP
PIMSM
OSPFV3
IPV6

IP Address Conflict Commands

ip address-conflict-detect run

This command triggers the switch to run active address conflict detection by sending gratuitous ARP packets for IPv4 addresses on the switch.
**ProSafe Managed Switch**

---

**Note:** This command takes effect only once after it is executed and cannot be saved across power cycles.

**Format**

ip address-conflict-detect run

**Mode**

Global Config

---

**show ip address-conflict**

This command displays the status information corresponding to the last detected address conflict.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Conflict Detection Status</td>
<td>Identifies whether the switch has detected an address conflict on any IP address.</td>
</tr>
<tr>
<td>Last Conflicting IP Address</td>
<td>The IP Address that was last detected as conflicting on any interface.</td>
</tr>
<tr>
<td>Last Conflicting MAC Address</td>
<td>The MAC Address of the conflicting host that was last detected on any interface.</td>
</tr>
<tr>
<td>Time Since Conflict Detected</td>
<td>The time in days, hours, minutes and seconds since the last address conflict was detected.</td>
</tr>
</tbody>
</table>

**clear ip address-conflict-detect**

This command clears the detected address conflict status information.

**Format**

clear ip address-conflict-detect

**Mode**

Privileged EXEC

---

**Link Local Protocol Filtering Commands**

Link Local Protocol Filtering (LLPF) allows the switch to filter out multiple proprietary protocol PDUs, such as Port Aggregation Protocol (PAgP), if the problems occur with proprietary protocols running on standards-based switches. If certain protocol PDUs cause unexpected results, LLPF can be enabled to prevent those protocol PDUs from being processed by the switch.

**llpf blockall**

Use this command to block LLPF protocol(s) on a port. Use `blockall` to filter all PDUs with a DMAC of 01:00:00:0C:CC:CX on the interface. Use `blockisdp` to filter the ISDP packets on the interface. Use `blockvtp` to filter the VTP packets on the interface. Use `blockdtp` to filter...
the DTP packets on the interface. Use `blockudld` to filter the UDLD packets on the interface. Use `blockpagp` to filter the PAGP packets on the interface. Use `blocksstp` to filter the SSTP packets on the interface.

### Format

```
llpf {blockisdp | blockvtp | blockdtp | blockudld | blockpagp | blocksstp | blockall }
```

### Mode

`Interface Config`

### Default

`Disable`

### no llpf

Use this command to unblock LLPF protocol(s) on a port.

### show llpf interface all

Use this command to display the status of LLPF rules configured on a particular port or on all ports.

### Format

```
show llpf interface [all | unit/slot/port]
```

### Mode

`Privileged EXEC`

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block ISDP</td>
<td>Shows whether the port blocks ISDP PDUs.</td>
</tr>
<tr>
<td>Block VTP</td>
<td>Shows whether the port blocks VTP PDUs.</td>
</tr>
<tr>
<td>Block DTP</td>
<td>Shows whether the port blocks DTP PDUs.</td>
</tr>
<tr>
<td>Block UDLD</td>
<td>Shows whether the port blocks UDLD PDUs.</td>
</tr>
<tr>
<td>Block PAGP</td>
<td>Shows whether the port blocks PAGP PDUs.</td>
</tr>
<tr>
<td>Block SSTP</td>
<td>Shows whether the port blocks SSTP PDUs.</td>
</tr>
<tr>
<td>Block All</td>
<td>Shows whether the port blocks all proprietary PDUs available for the LLDP feature.</td>
</tr>
</tbody>
</table>

### RMON Stats and History Commands

The various MIBs within RFC 2819, 3273, and 3434 are arranged into groups. The managed switch supports some of the groups in these RFCs but not all. The managed switch complies with `MODULE-COMPLIANCE` and `OBJECT-GROUP` definitions within these RFCs for supporting individual groups.

The managed switch supports the following groups:
RFC 2819

- Group 1 - Statistics
  Contains cumulative traffic and error statistics.

- Group 2 - History
  Generates reports from periodic traffic sampling that are useful for analyzing trends. This group includes History Control Group and Ethernet History Group.

- Group 3 - Alarm
  Enables the definition and setting of thresholds for various counters. Thresholds can be passed in either a rising or falling direction on existing MIB objects, primarily those in the Statistics group. An alarm is triggered when a threshold is crossed and the alarm is passed to the Event group. The Alarm requires the Event Group.

- Group 9 - Event
  Controls the actions that are taken when an event occurs. RMON events occur when:
  - A threshold (alarm) is exceeded
  - There is a match on certain filters.

RFC 3273

- Group 1 - Media Independent Group
  Contains media-independent statistics that provide information for full and/or half-duplex links as well as high capacity links.

- Group 2 - Ether Stats High Capacity Group
  Contains the High Capacity RMON extensions to RMON-1 etherStatsTable (RFC 2819 Group 1).

- Group 3 - Ether History High Capacity Group
  Contains the High Capacity RMON extensions to RMON-1 etherHistoryTable (RFC 2819 Group 2).

RFC 3434

- Group 1 - High Capacity Alarm Control Group
  Controls the configuration of alarms for high capacity MIB object instances.

- Group 2 - High Capacity Alarm Capabilities Group
  Describes the high capacity alarm capabilities provided by the agent.

- Group 3 - High Capacity Alarm Notifications Group
  Provides new rising and falling threshold notifications for high capacity objects.
**rmon alarm**

This command sets the RMON alarm entry in the RMON alarm MIB group.

**Format**

```
 rmon alarm <alarm number> variable sample interval sampling type rising-threshold value falling-threshold value startup rising/falling/rising-falling owner string
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

<tr>
<td>Owner String</td>
<td>High capacity alarm owner. The owner string associated with the entry.</td>
</tr>
</tbody>
</table>

**no rmon hcalarm**

This command deletes the rmon hcalarm entry.

**Format**

`no rmon hcalarm <alarm number>`

**Mode**

Global Config

**rmon event**

This command sets the rmon event entry in the RMON event mib group.

**Format**

`rmon event <event number> [description|log|owner|trap]`

**Mode**

Global Config
### no rmon event

This command deletes the rmon event entry.

**Format**

```
no rmon event <event number>
```

**Mode**

Global Config

### rmon collection history

This command sets the history control parameters of the RMON historyControl mib group.

**Format**

```
rmon collection history <index number> [buckets <1-65535> | interval <1-3600> | owner <owner>]
```

**Mode**

Interface Config

### no rmon collection history

This command deletes the history control group entry with the specified index number.

**Format**

```
no rmon collection history <index number>
```

**Mode**

Interface Config

### show rmon

This command displays the entries in the RMON alarm table.

**Format**

```
show rmon {alarms | alarm <alarm-index>}
```

**Mode**

Privileged Exec

### show rmon collection history

This command displays the entries in the RMON history control table.

**Format**

```
show rmon collection history
```

**Mode**

Privileged Exec
**show rmon events**

This command displays the entries in the RMON event table.

**Format**
show rmon events

**Mode**
Privileged Exec

**Example:**
(Switch) # show rmon events

<table>
<thead>
<tr>
<th>Index</th>
<th>Description</th>
<th>Type</th>
<th>Community</th>
<th>Owner</th>
<th>Last time sent</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>test</td>
<td>log</td>
<td>public</td>
<td>MIB</td>
<td>0 days 0 h:0 m:0 s</td>
</tr>
</tbody>
</table>

**show rmon history**

This command displays the specified entry in the RMON history table.

**Format**
show rmon history <index> {errors|other|throughput}

**Mode**
Privileged Exec

**Example:**
(Switch) # show rmon history 1 throughput

Sample set: 1
Maximum table size: 270

<table>
<thead>
<tr>
<th>Time</th>
<th>Octets</th>
<th>Packets</th>
<th>Broadcast</th>
<th>Multicast</th>
<th>Util</th>
</tr>

<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**show rmon log**

This command displays the entries in the RMON log table.

**Format**
show rmon log

**Mode**
Privileged Exec

**Example:**
(Switch) # show rmon log

Maximum table size: 100

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**show rmon statistics interface**

This command displays the RMON statistics for the given interface.

**Format**

```
show rmon statistics interface <unit/slot/port>
```

**Mode**

Privileged Exec

**Example:**

```
(switch) # show rmon statistics interface 1/0/1
Interface: 1/0/1
Dropped: 0
Octets: 0  Packets: 0
Broadcast: 0  Multicast: 0
CRC Align Errors: 0  Collisions: 0
Undersize Pkts: 0  Oversize Pkts: 0
Fragments: 0  Jabbers: 0
64 Octets: 0  65 - 127 Octets: 0
128 - 255 Octets: 0  256 - 511 Octets: 0
512 - 1023 Octets: 0  1024 - 1518 Octets: 0
```

**show rmon {hcalarms | hcalarm <alarm index>**

This command displays the entries in the RMON hcAlarmTable.

**Format**

```
show rmon {hcalarms | hcalarm <alarm index>}
```

**Mode**

Privileged Exec

---

**UDLD Commands**

The UDLD feature detects unidirectional links physical ports. A unidirectional link is a forwarding anomaly in a Layer 2 communication channel in which a bi-directional link stops passing traffic in one direction. UDLD must be enabled on both sides of the link in order to detect a unidirectional link. The UDLD protocol operates by exchanging packets containing information about neighboring devices.

**udld enable**

This command enables UDLD globally on the switch.

**Default**

disabled

**Format**

```
udld enable
```

**Mode**

Global Config
no udld enable

This command disables udld globally on the switch.

**Format**
no udld enable

**Mode**
Global Config

**udld message time**

This command configures the interval between UDLD probe messages on ports that are in the advertisement phase. The range is from 7 to 90 seconds.

**Default**
15

**Format**
udld message time <interval>

**Mode**
Global Config

**udld timeout interval**

This command configures the time interval after which UDLD link is considered to be unidirectional. The range is from 5 to 60 seconds.

**Default**
5

**Format**
udld timeout interval <interval>

**Mode**
Global Config

**udld enable**

This command enables UDLD on the specified interface.

**Default**
disabled

**Format**
udld enable

**Mode**
Interface Config

no udld enable

This command disables udld on the specified interface.

**Format**
no udld enable

**Mode**
Interface Config
**udld port**

This command selects the UDLD mode operating on this interface. If the keyword “aggressive” is not entered, the port operates in normal mode.

**Default** normal

**Format** `udld port [aggressive]`

**Mode** Interface Config

**udld reset**

This command resets all interfaces that have been shutdown by UDLD.

**Format** `udld reset`

**Mode** Privileged EXEC

**show udld**

This command displays the global settings of UDLD.

**Format** `show udld`

**Mode** Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Mode</td>
<td>The global administrative mode of UDLD.</td>
</tr>
<tr>
<td>Message Interval</td>
<td>The time period (in seconds) between the transmission of UDLD probe packets.</td>
</tr>
<tr>
<td>Timeout Interval</td>
<td>The time period (in seconds) before making decision that link is unidirectional.</td>
</tr>
</tbody>
</table>

**show udld <slot/port>**

This command displays the UDLD settings for the specified <slot/port>. If the “all” keyword is entered, it displays information for all ports.

**Format** `show udld {< unit/slot/port> | all }

**Mode**
- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit/Slot/Port</td>
<td>The identifying &lt;unit/slot/port&gt; of the interface.</td>

</tr>
</tbody>
</table>
| UDLD Status      | The status of the link as determined by UDLD. The options are:  
|                  |   • “Undetermined” - UDLD has not collected enough information to determine the state of the port  
|                  |   • “Not applicable” - UDLD is disabled, either globally or on the port  
|                  |   • “Shutdown” - UDLD has detected a unidirectional link and shutdown the port, That is, the port is in an errDisabled state.  
|                  |   • “Bidirectional” - UDLD has detected a bidirectional link.  
|                  |   • “Undetermined(Link Down)” - The port would transition into this state when the port link physically goes down due to any reasons other than the port been put into D-Disable mode by UDLD protocol on the switch.                                                                                                         |
This chapter describes the management commands available in the managed switch CLI.

This chapter contains the following sections:

- Configuring the Switch Management CPU
- Network Interface Commands
- Console Port Access Commands
- Telnet Commands
- Secure Shell (SSH) Commands
- Management Security Commands
- Hypertext Transfer Protocol (HTTP) Commands
- Access Commands
- User Account Commands
- SNMP Commands
- RADIUS Commands
- TACACS+ Commands
- Configuration Scripting Commands
- Pre-Login Banner and System Prompt Commands
- Switch Database Management (SDM) Templates
- IPv6 Management Commands

The commands in this chapter are in three functional groups:

- Show commands display switch settings, statistics, and other information.
- Configuration commands configure features and options of the switch. For every configuration command, there is a show command that displays the configuration setting.
- Clear commands clear some or all of the settings to factory defaults.
Configuring the Switch Management CPU

To manage the switch via the web GUI or telnet, an IP address needs to be assigned to the switch management CPU. Whereas there are CLI commands that can be used to do this, ezconfig simplifies the task. The tool is applicable to all NETGEAR 7000-series managed switches, and allows you to configure the following parameters:

1. The administrator’s user password and administrator-enable password
2. Management CPU IP address and network mask
3. System name and location information

The tool is interactive and uses questions to guide you through the steps required to perform its task. At the end of the session, it will ask you if you want to save the changed information. To see exactly what has been changed by ezconfig at the end of the session, use the `show running-config` command.

To perform any switch configuration other than the items listed above, use other CLI commands or the Web GUI.

**ezconfig**

This command sets the IP address, subnet mask and gateway of the device. The IP address and the gateway must be on the same subnet.

**Format**

`ezconfig`

**Mode**

Privileged EXEC
The following is an example of an `ezconfig` session.

```
NETGEAR EZ Configuration Utility
------------------------------
Hello and Welcome!

This utility will walk you thru assigning the IP address for the switch management CPU. It will allow you to save the changes at the end. After the session, simply use the newly assigned IP address to access the Web GUI using any public domain Web browser.

Admin password not defined. Do you want to change the password? (Y/N/Q)  y
Enter new password:********
Confirm new password:********
Password Changed!

The 'enable' password required for switch configuration via the command line interface is currently not configured. Do you wish to change it (Y/N/Q)?  y
Enter new password:********
Confirm new password:********
Password Changed!

Assigning an IP address to your switch management

Current IP Address Configuration
-------------------------------
IP address: 0.0.0.0
Subnet mask: 0.0.0.0
Gateway address: 0.0.0.0

Would you like to assign an IP address now (Y/N/Q)?  y
IP Address: 10.10.10.1
Subnet mask: 255.255.255.0
Gateway address: 10.10.10.10

Do you want to assign switch name and location information (Y/N/Q)?  y
System Name: testunit1
System Location: testlab
System Contact: Bud Lightyear

The configuration changes have been saved successfully. Please enter 'show running-config' to see the final configuration.

Thanks for using EzConfig!
```
Network Interface Commands

This section describes the commands you use to configure a logical interface for management access. To configure the management VLAN, see step on page 65.

**enable (Privileged EXEC access)**

Use this command to access the Privileged EXEC mode. From the Privileged EXEC mode, you can configure the network interface.

**Format**

```
enable
```

**Mode**

User EXEC

**network parms**

Use this command to set the IP address, subnet mask and gateway of the device. The IP address and the gateway must be on the same subnet.

**Format**

```
network parms <ipaddr> <netmask> [gateway]
```

**Mode**

Privileged EXEC

**network protocol**

Use this command to specify the network configuration protocol to be used. If you modify this value, change is effective immediately. If you use the bootp parameter, the switch periodically sends requests to a BootP server until a response is received. If you use the dhcp parameter, the switch periodically sends requests to a DHCP server until a response is received. If you use the none parameter, you must configure the network information for the switch manually.

**Default**

```
none
```

**Format**

```
network protocol {none | bootp | dhcp}
```

**Mode**

Privileged EXEC

**network mac-address**

Use this command to set locally administered MAC addresses. The following rules apply:

- Bit 6 of byte 0 (called the U/L bit) indicates whether the address is universally administered (b’0’) or locally administered (b’1’).
- Bit 7 of byte 0 (called the I/G bit) indicates whether the destination address is an individual address (b’0’) or a group address (b’1’).
- The second character, of the twelve character macaddr, must be 2, 6, A or E.
A locally administered address must have bit 6 On (b'1') and bit 7 Off (b'0').

**Format**  
`network mac-address <macaddr>`

**Mode**  
Privileged EXEC

**network mac-type**

Use this command to specify whether the switch uses the burned in MAC address or the locally-administered MAC address.

**Default**  
burnedin

**Format**  
`network mac-type {local | burnedin}`

**Mode**  
Privileged EXEC

**no network mac-type**

Use this command to reset the value of MAC address to its default.

**Format**  
`no network mac-type`

**Mode**  
Privileged EXEC

**network javamode**

Use this command to specify whether or not the switch should allow access to the Java applet in the header frame of the Web interface. When access is enabled, the Java applet can be viewed from the Web interface. When access is disabled, the user cannot view the Java applet.

**Default**  
enabled

**Format**  
`network javamode`

**Mode**  
Privileged EXEC

**no network javamode**

Use this command to disallow access to the Java applet in the header frame of the Web interface. When access is disabled, the user cannot view the Java applet.

**Format**  
`no network javamode`

**Mode**  
Privileged EXEC

**show network**

Use this command to display configuration settings associated with the switch’s network interface. The network interface is the logical interface used for in-band connectivity with the switch via any of the switch's front panel ports. The configuration parameters associated with
the switch’s network interface do not affect the configuration of the front panel ports through which traffic is switched or routed. The network interface is always considered to be up, whether or not any member ports are up; therefore, the show network command will always show “Interface Status” as “Up”.

Format
show network

Modes
• Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Status</td>
<td>The network interface status; it is always considered to be “up”.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address of the interface. The factory default value is 0.0.0.0.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>The IP subnet mask for this interface. The factory default value is 0.0.0.0.</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>The default gateway for this IP interface. The factory default value is 0.0.0.0.</td>
</tr>
<tr>
<td>IPv6 Administrative Mode</td>
<td>Whether enabled or disabled.</td>
</tr>
<tr>
<td>IPv6 Address/Length</td>
<td>The IPv6 address and length.</td>
</tr>
<tr>
<td>IPv6 Default Router</td>
<td>The IPv6 default router address.</td>
</tr>
<tr>
<td>Burned In MAC Address</td>
<td>The burned in MAC address used for in-band connectivity.</td>
</tr>
<tr>
<td>Locally Administered MAC Address</td>
<td>If desired, a locally administered MAC address can be configured for in-band connectivity. To take effect, 'MAC Address Type' must be set to 'Locally Administered'. Enter the address as twelve hexadecimal digits (6 bytes) with a colon between each byte. Bit 1 of byte 0 must be set to a 1 and bit 0 to a 0, i.e. byte 0 should have the following mask 'xxxx xx10'. The MAC address used by this bridge when it must be referred to in a unique fashion. It is recommended that this be the numerically smallest MAC address of all ports that belong to this bridge. However it is only required to be unique. When concatenated with dot1dStpPriority a unique BridgeIdentifier is formed which is used in the Spanning Tree Protocol.</td>
</tr>
<tr>
<td>MAC Address Type</td>
<td>The MAC address which should be used for in-band connectivity. The choices are the burned in or the Locally Administered address. The factory default is to use the burned in MAC address.</td>
</tr>
</tbody>
</table>

The following shows example CLI display output for the network port.

(Netgear Switch) #show network

<table>
<thead>
<tr>
<th>Term</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Status</td>
<td>Always Up</td>
</tr>
<tr>
<td>IP Address</td>
<td>10.250.3.1</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>10.250.3.3</td>
</tr>
<tr>
<td>IPv6 Administrative Mode</td>
<td>Enabled</td>
</tr>
<tr>
<td>IPv6 Address/Length</td>
<td>FE80::210:18FF:FE82:337/64</td>
</tr>
<tr>
<td>IPv6 Address/Length</td>
<td>3099::1/64</td>
</tr>
</tbody>
</table>
IPv6 Address/Length is 3099::210:18FF:FE82:337/64
IPv6 Default Router is FE80::204:76FF:FE73:423A
Burned In MAC Address 00:10:18:82:03:37
Locally Administered MAC Address 00:00:00:00:00:00
MAC Address Type Burned In
Network Configuration Protocol Current None
Management VLAN ID 1
Web Mode Enable
Java Mode Enable

Console Port Access Commands

This section describes the commands you use to configure the console port. You can use a serial cable to connect a management host directly to the console port of the switch.

configuration

Use this command to access Global Config mode. From Global Config mode, you can configure a variety of system settings, including user accounts. You can also enter other command modes, including Line Config mode.

Format configuration

Mode Privileged EXEC

line

Use this command to access Line Config mode, which allows you to configure various Telnet settings, ssh settings, and the console port.

Format line {console | telnet | ssh}

Mode Global Config

serial baudrate

Use this command to specify the communication rate of the terminal interface. The supported rates are 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200.

Default 115200

Format serial baudrate {1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600 | 115200}

Mode Line Config
**no serial baudrate**

Use this command to set the communication rate of the terminal interface.

**Format**

```
no serial baudrate
```

**Mode**

Line Config

**serial timeout**

Use this command to specify the maximum connect time (in minutes) without console activity. A value of 0 indicates that a console can be connected indefinitely. The time range is 0 to 160.

**Default**

5

**Format**

```
serial timeout <0-160>
```

**Mode**

Line Config

**no serial timeout**

Use this command to set the maximum connect time (in minutes) without console activity.

**Format**

```
no serial timeout
```

**Mode**

Line Config

**login authentication**

Use this command in line configuration mode to specify a login authentication method list for remote telnet or console.

**Format**

```
login authentication {default | list-name}
```

**Mode**

Line Config

**no login authentication**

Use this command to return to the default specified by the login authentication command.

**Format**

```
no login authentication {default | list-name}
```

**Mode**

Line Config
**enable authentication**

Use this command in line configuration mode to specify an authentication method list when the user accesses a higher privilege level in remote telnet or console.

**Format**

```
enable authentication {default | list-name}
```

**Mode**

Line Config

**no enable authentication**

Use this command to return to the default specified by the `enable authentication` command.

**Format**

```
no enable authentication {default | list-name}
```

**Mode**

Line Config

**show serial**

Use this command to display serial communication settings for the switch.

**Format**

```
show serial
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial Port Login Timeout</td>
<td>The time, in minutes, of inactivity on a Serial port connection, after which the Switch will close the connection. Any numeric value between 0 and 160 is allowed, the factory default is 5. A value of 0 disables the timeout.</td>
</tr>
<tr>
<td>Login Timeout (minutes)</td>
<td>The default baud rate at which the serial port will try to connect. The available values are 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200 baud. The factory default is 9600 baud.</td>
</tr>
<tr>
<td>Baud Rate (bps)</td>
<td>The number of bits in a character. The number of bits is always 8.</td>
</tr>
<tr>
<td>Character Size (bits)</td>
<td>Whether Hardware Flow-Control is enabled or disabled. Hardware Flow Control is always disabled.</td>
</tr>
<tr>
<td>Flow Control</td>
<td>The number of Stop bits per character. The number of Stop bits is always 1.</td>
</tr>
<tr>
<td>Stop Bits</td>
<td>The Parity Method used on the Serial Port. The Parity Method is always None.</td>
</tr>
<tr>
<td>Parity Type</td>
<td></td>
</tr>
</tbody>
</table>

**Telnet Commands**

This section describes the commands you use to configure and view Telnet settings. You can use Telnet to manage the device from a remote management host.
ip telnet server enable

Use this command to enable Telnet connections to the system and to enable the Telnet Server Admin Mode. This command opens the Telnet listening port.

Default: enabled
Format: ip telnet server enable
Mode: Privileged EXEC

no ip telnet server enable

Use this command to disable Telnet access to the system and to disable the Telnet Server Admin Mode. This command closes the Telnet listening port and disconnects all open Telnet sessions.

Format: no ip telnet server enable
Mode: Privileged EXEC

telnet

Use this command to establish a new outbound Telnet connection to a remote host. The host value must be a valid IP address or host name. Valid values for port should be a valid decimal integer in the range of 0 to 65535, where the default value is 23. If [debug] is used, the current Telnet options enabled is displayed. The optional line parameter sets the outbound Telnet operational mode as 'linemode' where, by default, the operational mode is 'character mode'. The noecho option disables local echo.

Format: telnet <ip-address|hostname> <port> [debug] [line] [noecho]
Modes:
- Privileged EXEC
- User EXEC

transport input telnet

Use this command to regulate new Telnet sessions. If enabled, new Telnet sessions can be established until there are no more sessions available. An established session remains active until the session is ended or an abnormal network error ends the session.

Note: If the Telnet Server Admin Mode is disabled, Telnet sessions cannot be established. Use the ip telnet server enable command to enable Telnet Server Admin Mode.
no transport input telnet

Use this command to prevent new Telnet sessions from being established.

Format
no transport input telnet

Mode
Line Config

transport output telnet

Use this command to regulate new outbound Telnet connections. If enabled, new outbound Telnet sessions can be established until the system reaches the maximum number of simultaneous outbound Telnet sessions allowed. An established session remains active until the session is ended or an abnormal network error ends it.

Default
enabled

Format
transport output telnet

Mode
Line Config

no transport output telnet

Use this command to prevent new outbound Telnet connection from being established.

Format
no transport output telnet

Mode
Line Config

session-limit

Use this command to specify the maximum number of simultaneous outbound Telnet sessions. A value of 0 indicates that no outbound Telnet session can be established.

Default
5

Format
session-limit <0-5>

Mode
Line Config
no session-limit

Use this command to set the maximum number of simultaneous outbound Telnet sessions to the default value.

Format: `no session-limit`
Mode: Line Config

session-timeout

Use this command to set the Telnet session timeout value. The timeout value unit of time is minutes.

Default: 5

Format: `session-timeout <1-160>
Mode: Line Config

no session-timeout

Use this command to set the Telnet session timeout value to the default. The timeout value unit of time is minutes.

Format: `no session-timeout`
Mode: Line Config

telnetcon maxsessions

Use this command to specify the maximum number of Telnet connection sessions that can be established. A value of 0 indicates that no Telnet connection can be established. The range is 0-5.

Default: 4

Format: `telnetcon maxsessions <0-4>
Mode: Privileged EXEC

no telnetcon maxsessions

Use this command to set the maximum number of Telnet connection sessions that can be established to the default value.

Format: `no telnetcon maxsessions`
Mode: Privileged EXEC
**telnetcon timeout**

Use this command to set the Telnet connection session timeout value, in minutes. A session is active as long as the session has not been idle for the value set. The time is a decimal value from 1 to 160.

**Note:** When you change the timeout value, the new value is applied to all active and inactive sessions immediately. Any sessions that have been idle longer than the new timeout value are disconnected immediately.

<table>
<thead>
<tr>
<th>Default</th>
<th>5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>telnetcon timeout &lt;1-160&gt;</td>
</tr>
<tr>
<td>Mode</td>
<td>Privileged EXEC</td>
</tr>
</tbody>
</table>

**no telnetcon timeout**

Use this command to set the Telnet connection session timeout value to the default.

**Note:** Changing the timeout value for active sessions does not become effective until the session is reaccessed. Also, any keystroke activates the new timeout duration.

<table>
<thead>
<tr>
<th>Format</th>
<th>no telnetcon timeout</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Privileged EXEC</td>
</tr>
</tbody>
</table>

**show telnet**

Use this command to display the current outbound Telnet settings. In other words, these settings apply to Telnet connections initiated from the switch to a remote system.

<table>
<thead>
<tr>
<th>Format</th>
<th>show telnet</th>
</tr>
</thead>
</table>
| Modes  | • Privileged EXEC  
          • User EXEC   |
### Outbound Telnet Login

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Outbound Telnet Login Timeout</td>
<td>The number of minutes an outbound Telnet session is allowed to remain inactive before being logged off.</td>
</tr>
<tr>
<td>Maximum Number of Outbound Telnet Sessions</td>
<td>The number of simultaneous outbound Telnet connections allowed.</td>
</tr>
<tr>
<td>Allow New Outbound Telnet Sessions</td>
<td>Indicates whether outbound Telnet sessions will be allowed.</td>
</tr>
</tbody>
</table>

### Management Commands

**show telnetcon**

Use this command to display the current inbound Telnet settings. In other words, these settings apply to Telnet connections initiated from a remote system to the switch.

**Format**

```
show telnetcon
```

**Modes**

- Privileged EXEC
- User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remote Connection Login Timeout (minutes)</td>
<td>This object indicates the number of minutes a remote connection session is allowed to remain inactive before being logged off. May be specified as a number from 1 to 160. The factory default is 5.</td>
</tr>
<tr>
<td>Maximum Number of Remote Connection Sessions</td>
<td>This object indicates the number of simultaneous remote connection sessions allowed. The factory default is 5.</td>
</tr>
<tr>
<td>Allow New Telnet Sessions</td>
<td>New Telnet sessions will not be allowed when this field is set to no. The factory default value is yes.</td>
</tr>
</tbody>
</table>

### Secure Shell (SSH) Commands

This section describes the commands you use to configure SSH access to the switch. Use SSH to access the switch from a remote management host.

**Note:** The system allows a maximum of 5 SSH sessions.
**ip ssh**

Use this command to enable SSH access to the system. (This command is the short form of the *ip ssh server enable* command.)

**Default**
disabled

**Format**
`ip ssh`

**Mode**
Privileged EXEC

**ip ssh protocol**

Use this command to set or remove protocol levels (or versions) for SSH. Either SSH1 (1), SSH2 (2), or both SSH 1 and SSH 2 (1 and 2) can be set.

**Default**
1 and 2

**Format**
`ip ssh protocol [1] [2]`

**Mode**
Privileged EXEC

**ip ssh server enable**

Use this command to enable the IP secure shell server.

**Default**
disabled

**Format**
`ip ssh server enable`

**Mode**
Privileged EXEC

**no ip ssh server enable**

Use this command to disable the IP secure shell server.

**Format**
`no ip ssh server enable`

**Mode**
Privileged EXEC

**sshcon maxsessions**

Use this command to specify the maximum number of SSH connection sessions that can be established. A value of 0 indicates that no ssh connection can be established. The range is 0 to 5.

**Default**
5

**Format**
`sshcon maxsessions <0-5>`

**Mode**
Privileged EXEC
no sshcon maxsessions

Use this command to set the maximum number of allowed SSH connection sessions to the default value.

Format  no sshcon maxsessions
Mode     Privileged EXEC

sshcon timeout

Use this command to set the SSH connection session timeout value, in minutes. A session is active as long as the session has been idle for the value set. The time is a decimal value from 1 to 160.

Changing the timeout value for active sessions does not become effective until the session is re accessed. Also, any keystroke activates the new timeout duration.

Default   5
Format    sshcon timeout <1-160>
Mode      Privileged EXEC

no sshcon timeout

Use this command to set the SSH connection session timeout value, in minutes, to the default.

Changing the timeout value for active sessions does not become effective until the session is re accessed. Also, any keystroke activates the new timeout duration.

Format    no sshcon timeout
Mode      Privileged EXEC

show ip ssh

Use this command to display the ssh settings.

Format    show ip ssh
Mode      Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Mode</td>
<td>This field indicates whether the administrative mode of SSH is enabled or disabled.</td>
</tr>
<tr>
<td>Protocol Level</td>
<td>The protocol level may have the values of version 1, version 2 or both versions 1 and version 2.</td>
</tr>
<tr>
<td>SSH Sessions Currently Active</td>
<td>The number of SSH sessions currently active.</td>
</tr>
</tbody>
</table>
Management Security Commands

This section describes commands you use to generate keys and certificates, which you can do in addition to loading them as before.

**crypto certificate generate**

Use this command to generate self-signed certificate for HTTPS. The generate RSA key for SSL has a length of 1024 bits. The resulting certificate is generated with a common name equal to the lowest IP address of the device and a duration of 365 days.

**Format**

crypto certificate generate

**Mode**

Global Config

**no crypto certificate generate**

Use this command to delete the HTTPS certificate files from the device, regardless of whether they are self-signed or downloaded from an outside source.

**Format**

no crypto certificate generate

**Mode**

Global Config

**crypto key generate rsa**

Use this command to generate an RSA key pair for SSH. The new key files will overwrite any existing generated or downloaded RSA key files.

**Format**

crypto key generate rsa

**Mode**

Global Config
no crypto key generate rsa

Use this command to delete the RSA key files from the device.

Format: `no crypto key generate rsa`
Mode: Global Config

crypto key generate dsa

Use this command to generate a DSA key pair for SSH. The new key files will overwrite any existing generated or downloaded DSA key files.

Format: `crypto key generate dsa`
Mode: Global Config

no crypto key generate dsa

Use this command to delete the DSA key files from the device.

Format: `no crypto key generate dsa`
Mode: Global Config

Hypertext Transfer Protocol (HTTP) Commands

This section describes the commands you use to configure HTTP and secure HTTP access to the switch. Access to the switch by using a Web browser is enabled by default. Everything you can view and configure by using the CLI is also available by using the Web.

**ip http server**

Use this command to enable access to the switch through the Web interface. When access is enabled, the user can login to the switch from the Web interface. When access is disabled, the user cannot login to the switch’s Web server. Disabling the Web interface takes effect immediately. All interfaces are affected.

Default: enabled
Format: `ip http server`
Mode: Privileged EXEC
no ip http server

Use this command to disable access to the switch through the Web interface. When access is disabled, the user cannot login to the switch’s Web server.

Format    no ip http server
Mode      Privileged EXEC

ip http secure-server

Use this command to enable the secure socket layer for secure HTTP.

Default    disabled
Format      ip http secure-server
Mode        Privileged EXEC

no ip http secure-server

Use this command to disable the secure socket layer for secure HTTP.

Format      no ip http secure-server
Mode        Privileged EXEC

ip http java

Use this command to enable the Web Java mode. The Java mode applies to both secure and un-secure Web connections.

Default    Enabled
Format      ip http java
Mode        Privileged EXEC

no ip http java

Use this command to disable the Web Java mode. The Java mode applies to both secure and un-secure Web connections.

Format      no ip http java
Mode        Privileged EXEC

ip http session hard-timeout

Use this command to configure the hard timeout for un-secure HTTP sessions in hours. Configuring this value to zero will give an infinite hard-timeout. When this timeout expires, the
user will be forced to re-authenticate. This timer begins on initiation of the web session and is
unaffected by the activity level of the connection.

Default 24
Format ip http session hard-timeout <0-168>
Mode Privileged EXEC

no ip http session hard-timeout

Use this command to restore the hard timeout for un-secure HTTP sessions to the default
value.

Format no ip http session hard-timeout
Mode Privileged EXEC

ip http authentication

Use this command to specify the authentication methods for http server users. The additional
methods of authentication are used only if the previous method returns an error, not if it fails.
To ensure that the authentication succeeds even if all methods return an error, specify none
as the final method in the command line. For example If none specified as an authentication
method after radius, no authentication is used if the radius server is down.

Format ip http authentication method1 [method2 ...]
Mode Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>Uses the local username database for authentication.</td>
</tr>
<tr>
<td>Radius</td>
<td>Uses the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td>Tacacs</td>
<td>Uses the list of all TACACS servers for authentication.</td>
</tr>
<tr>
<td>None</td>
<td>Uses no authentication.</td>
</tr>
</tbody>
</table>

no ip http authentication

Use this command to restore the authentication methods to the default.

Format no ip http authentication method1 [method2 ...]
Mode Global Config
**ip http session maxsessions**

Use this command to limit the number of allowable un-secure HTTP sessions. Zero is the configurable minimum.

Default: 16  
Format: `ip http session maxsessions <0-16>`  
Mode: Privileged EXEC

**no ip http session maxsessions**

Use this command to restore the number of allowable un-secure HTTP sessions to the default value.

Format: `no ip http session maxsessions`  
Mode: Privileged EXEC

**ip http session soft-timeout**

Use this command to configure the soft timeout for un-secure HTTP sessions in minutes. Configuring this value to zero will give an infinite soft-timeout. When this timeout expires the user will be forced to re-authenticate. This timer begins on initiation of the Web session and is re-started with each access to the switch.

Default: 5  
Format: `ip http session soft-timeout <0-60>`  
Mode: Privileged EXEC

**no ip http session soft-timeout**

Use this command to reset the soft timeout for un-secure HTTP sessions to the default value.

Format: `no ip http session soft-timeout`  
Mode: Privileged EXEC

**ip http secure-session maxsessions**

Use this command to limit the number of secure HTTP sessions. Zero is the configurable minimum.

Default: 16  
Format: `ip http secure-session maxsessions <0-16>`  
Mode: Privileged EXEC
no ip http secure-session maxsessions

Use this command to restore the number of allowable secure HTTP sessions to the default value.

Format  no ip http secure-session maxsessions
Mode    Privileged EXEC

ip http secure-session soft-timeout

Use this command to configure the soft timeout for secure HTTP sessions in minutes. Configuring this value to zero will give an infinite soft-timeout. When this timeout expires, you are forced to re-authenticate. This timer begins on initiation of the Web session and is re-started with each access to the switch. The secure-session soft-timeout can not be set to zero (infinite).

Default  5
Format    ip http secure-session soft-timeout <1-60>
Mode      Privileged EXEC

no ip http secure-session soft-timeout

Use this command to restore the soft timeout for secure HTTP sessions to the default value.

Format  no ip http secure-session soft-timeout
Mode    Privileged EXEC

ip http secure-session hard-timeout

Use this command to configure the hard timeout for secure HTTP sessions in hours. When the timeout expires, the user is forced to re-authenticate. This timer begins on initiation of the Web session and is unaffected by the activity level of the connection. The secure-session hard-timeout can not be set to zero (infinite).

Default  24
Format    ip http secure-session hard-timeout <1-168>
Mode      Privileged EXEC

no ip http secure-session hard-timeout

Use this command to reset the hard timeout for secure HTTP sessions to the default value.

Format  no ip http secure-session hard-timeout
Mode    Privileged EXEC
**ip https authentication**

Use this command to specify the authentication methods for http server users. The additional methods of authentication are used only if the previous method returns an error, not if it fails. To ensure that the authentication succeeds even if all methods return an error, specify `none` as the final method in the command line. If `none` is specified as an authentication method after `radius`, no authentication is used if the radius server is down.

**Format**

```
ip https authentication method1 [method2 ...]
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>Uses the local username database for authentication.</td>
</tr>
<tr>
<td>Radius</td>
<td>Uses the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td>Tacacs</td>
<td>Uses the list of all TACACS servers for authentication.</td>
</tr>
<tr>
<td>None</td>
<td>Uses no authentication.</td>
</tr>
</tbody>
</table>

**no ip https authentication**

Use this command to restore the authentication methods to the default for http server users.

**Format**

```
no ip https authentication method1 [method2 ...]
```

**Mode**

Global Config

**ip http secure-port**

Use this command to set the SSL port where port can be 1-65535 and the default is port 443.

**Default**

443

**Format**

```
ip http secure-port <portid>
```

**Mode**

Privileged EXEC

**no ip http secure-port**

Use this command to reset the SSL port to the default value.

**Format**

```
no ip http secure-port
```

**Mode**

Privileged EXEC
ip http secure-protocol

Use this command to set protocol levels (versions). The protocol level can be set to TLS1, SSL3 or to both TLS1 and SSL3.

**Default**
SSL3 and TLS1

**Format**
ip http secure-protocol [SSL3] [TLS1]

**Mode**
Privileged EXEC

**show ip http**

Use this command to display the http settings for the switch.

**Format**
show ip http

**Mode**

Access Commands

Use the commands in this section to close remote connections or to view information about connections to the system.

disconnect

Use the disconnect command to close HTTP, HTTPS, Telnet or SSH sessions. Use all to close all active sessions, or use <session-id> to specify the session ID to close. To view the possible values for <session-id>, use the show loginsession command.

Format
disconnect {<session_id> | all}

Mode
Privileged EXEC

show loginsession

Use this command to display current Telnet and serial port connections to the switch.

Format
show loginsession

Mode
Privileged EXEC

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

User Account Commands

This section describes the commands you use to add, manage, and delete system users. The 7000 series software has two default users: admin and guest. The admin user can view and configure system settings, and the guest user can view settings.

Note: You cannot delete the admin user. There is only one user allowed with read/write privileges. You can configure up to five read-only users on the system.
**username**

Use this command to add a new user to the local user database. The default privilege level is 1. Using the encrypted keyword allows the administrator to transfer local user passwords between devices without having to know the passwords. When the password parameter is used along with encrypted parameter, the password must be exactly 128 hexadecimal characters in length. If the password strength feature is enabled, this command checks for password strength and returns an appropriate error if it fails to meet the password strength criteria. Giving the optional parameter override-complexity-check disables the validation of the password strength.

**Format**

```
username name {password password [encrypted
[override-complexity-check] | level level [encrypted
[override-complexity-check]] | override-complexity-check]} | [level level [override-complexity-check] password}
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the user, up to 32 characters.</td>
</tr>
<tr>
<td>Password</td>
<td>The password for the users 8-64 characters. This value can be zero if the no passwords min-length command has been executed. The special characters allowed in the password include: ! # $ % ` ( ) * + , . / : ; = &gt; @ [ ] _ ^ {</td>
</tr>
<tr>
<td>level</td>
<td>Specifies the user level. If not specified, the privilege level is 1. Level 0 can be assigned by a level 15 user to another user to suspend that user's access. Range 0-15. Enter access level 1 for Read Access or 15 for Read/Write Access.</td>
</tr>
<tr>
<td>encrypted</td>
<td>Encrypted password you enter, copied from another device configuration.</td>
</tr>
<tr>
<td>override-complexity-check</td>
<td>Disables the validation of the password strength.</td>
</tr>
</tbody>
</table>

**no username**

Use this command to remove a user account.

**Format**

```
no username <username>
```

**Mode**

Global Config

**Note:** You cannot delete the “admin” user account.
**username name nopassword**

Use this command to remove an existing user’s password (NULL password).

**Format**  
`username name nopassword [Level Level]`

**Mode**  
Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the user. Range: 1-32 characters.</td>
</tr>
<tr>
<td>password</td>
<td>The authentication password for the user. Range 8-64 characters.</td>
</tr>
<tr>
<td>level</td>
<td>The user level. Level 0 can be assigned by a level 15 user to another user to suspend that user’s access. Range 0-15.</td>
</tr>
</tbody>
</table>

**username <username> unlock**

Use this command to unlock a user’s account. Only a user with read/write access can re-activate a locked user account.

**Format**  
`username <username> unlock`

**Mode**  
Global Config

**username snmpv3 accessmode**

Use this command to specify the snmpv3 access privileges for the specified login user. The valid accessmode values are `readonly` or `readwrite`. The `<username>` is the login user name for which the specified access mode applies. The default is `readwrite` for the “admin” user and `readonly` for all other users. You must enter the `<username>` in the same case you used when you added the user. To see the case of the `<username>`, enter the `show users` command.

**Defaults**

- admin - readwrite
- other - readonly

**Format**  
`username snmpv3 accessmode <username> {readonly | readwrite}`

**Mode**  
Global Config

**no username snmpv3 accessmode**

Use this command to set the snmpv3 access privileges for the specified user as `readwrite` for the “admin” user and `readonly` for all other users. The `<username>` value is the user name for which the specified access mode will apply.

**Format**  
`no username snmpv3 accessmode <username>`

**Mode**  
Global Config
**username snmpv3 authentication**

Use this command to specify the authentication protocol to be used for the specified user. The valid authentication protocols are **none**, **md5** or **sha**. If you specify **md5** or **sha**, the login password is also used as the snmpv3 authentication password and therefore must be at least eight characters in length. The `<username>` is the user name associated with the authentication protocol. You must enter the `<username>` in the same case you used when you added the user. To see the case of the `<username>`, enter the `show users` command.

**Default**

no authentication

**Format**

```
username snmpv3 authentication <username> {none | md5 | sha}
```

**Mode**

Global Config

**no username snmpv3 authentication**

Use this command to set the authentication protocol to be used for the specified user to **none**. The `<username>` is the user name for which the specified authentication protocol is used.

**Format**

```
no username snmpv3 authentication <username>
```

**Mode**

Global Config

**username snmpv3 encryption**

Use this command to specify the encryption protocol used for the specified user. The valid encryption protocols are **des** or **none**.

If you select **des**, you can specify the required key on the command line. The encryption key must be 8 to 64 characters long. If you select the **des** protocol but do not provide a key, the user is prompted for the key. When you use the **des** protocol, the login password is also used as the snmpv3 encryption password, so it must be a minimum of eight characters. If you select **none**, you do not need to provide a key.

The `<username>` value is the login user name associated with the specified encryption. You must enter the `<username>` in the same case you used when you added the user. To see the case of the `<username>`, enter the `show users` command.

**Default**

no encryption

**Format**

```
username snmpv3 encryption <username> {none | des[key]}
```

**Mode**

Global Config
no username snmpv3 encryption

Use this command to set the encryption protocol to none. The <username> is the login user name for which the specified encryption protocol will be used.

Format    no username snmpv3 encryption <username>
Mode      Global Config

show users

Use this command to display the configured user names and their settings. This command is only available for users with Read/Write privileges. The SNMPv3 fields will only be displayed if SNMP is available on the system.

Format    show users
Mode      Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>The name the user enters to login using the serial port, Telnet or Web.</td>
</tr>
<tr>
<td>Access Mode</td>
<td>Shows whether the user is able to change parameters on the switch (Read/Write) or is only able to view them (Read Only). As a factory default, the “admin” user has Read/Write access and the “guest” has Read Only access. There can only be one Read/Write user and up to five Read Only users.</td>
</tr>
<tr>
<td>SNMPv3 Access Mode</td>
<td>The SNMPv3 Access Mode. If the value is set to <strong>ReadWrite</strong>, the SNMPv3 user is able to set and retrieve parameters on the system. If the value is set to <strong>ReadOnly</strong>, the SNMPv3 user is only able to retrieve parameter information. The SNMPv3 access mode may be different than the CLI and Web access mode.</td>

</table>
ProSafe Managed Switch

### show users accounts detail

This command displays the local user status with respect to user account lockout and password aging. It also includes information about Password strength and complexity.

**Format**

```
show users accounts detail
```

**Mode**

Privileged EXEC

```
(Switch) #show users accounts detail
UserName....................................... admin
Privilege...................................... 15
Password Aging................................. ---
Password Expiry............................... ---
Lockout........................................ False
Override Complexity Check...................... Disable
Password Strength.............................. ---
UserName....................................... guest
Privilege...................................... 1
Password Aging................................... ---
Password Expiry............................... ---
Lockout........................................ False
Override Complexity Check...................... Disable
Password Strength.............................. ---
```

### show users long

Use this command to display the user's full name.

**Format**

```
show users long
```

**Mode**

Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Name</td>
<td>The full name of the user.</td>
</tr>
</tbody>
</table>

### show users login-history

Use this command to display the users who have logged in previously.

**Format**

```
show users login-history [{user name}]
```

**Mode**

Privileged EXEC
### Term | Definition
--- | ---
Login Time | The time at which the user logged in.
Username | The user name used to login.
Protocol | The protocol that the user used to login.
Location | The location of the user.

**passwords min-length**

Use this command to enforce a minimum password length for local users. The value also applies to the enable password. The valid range is 0-64.

**Default** 8  
**Format** `passwords min-length <0-64>`  
**Mode** Global Config

**no passwords min-length**

Use this command to set the minimum password length to the default value.

**Format** `no passwords min-length`  
**Mode** Global Config

**passwords history**

Use this command to set the number of previous passwords that shall be stored for each user account. When a local user changes his or her password, the user will not be able to reuse any password stored in password history. This ensures that users don't reuse their passwords often. The valid range is 0-10.

**Default** 0  
**Format** `passwords history <0-10>`  
**Mode** Global Config

**no passwords history**

Use this command to set the password history to the default value.

**Format** `no passwords history`  
**Mode** Global Config
**passwords aging**

Use this command to implement aging on passwords for local users. When a user’s password expires, the user will be prompted to change it before logging in again. The valid range is 1-365. The default is 0, or no aging.

**Default**

0

**Format**

passwords aging <1-365>

**Mode**

Global Config

**no passwords aging**

Use this command to set the password aging to the default value.

**Format**

no passwords aging

**Mode**

Global Config

**passwords lock-out**

Use this command to strengthen the security of the switch by locking user accounts that have failed login due to wrong passwords. When a lockout count is configured, a user that is logged in must enter the correct password within that count. Otherwise the user will be locked out from further switch access. Only a user with read/write access can re-activate a locked user account. Password lockout does not apply to logins from the serial console. The valid range is 1-5. The default is 0, or no lockout count enforced.

**Format**

passwords lock-out <1-5>

**Mode**

Global Config

**Default**

0

**no passwords lock-out**

Use this command to set the password lock-out count to the default value.

**Format**

no passwords lock-out

**Mode**

Global Config

**passwords strength-check**

Use this command to enable the password strength feature. It is used to verify the strength of a password during configuration.

**Format**

passwords strength-check
no passwords strength-check

Use this command to disable the password strength-check.

Format: `no passwords strength-check`
Mode: Global Config

passwords strength minimum uppercase-letters

Use this command to enforce a minimum number of uppercase letters that a password should contain. The valid range is 0-16. The default is 2. Minimum of 0 means no restriction on that set of characters.

Format: `passwords strength minimum uppercase-letters`
Mode: Global Config
Default: 2

no passwords strength minimum uppercase-letters

Use this command to reset the minimum number of uppercase letters to the default value.

Format: `no passwords strength minimum uppercase-characters`
Mode: Global Config

passwords strength minimum lowercase-letters

Use this command to enforce a minimum number of lowercase letters that a password should contain. The valid range is 0-16. The default is 2. Minimum of 0 means no restriction on that set of characters.

Format: `passwords strength minimum lowercase-letters`
Mode: Global Config
Default: 2

no passwords strength minimum lowercase-letters

Use this command to reset the minimum number of lowercase letters to the default value.

Format: `no passwords strength minimum lowercase-characters`
Mode: Global Config
**passwords strength minimum numeric-characters**

Use this command to enforce a minimum number of numeric characters that a password should contain. The valid range is 0-16. The default is 2. Minimum of 0 means no restriction on that set of characters.

**Format**
```
passwords strength minimum numeric-characters
```

**Mode**
Global Config

**Default**
2

**no passwords strength minimum numeric-characters**

Use this command to reset the minimum number of numeric characters to the default value.

**Format**
```
no passwords strength minimum numeric-characters
```

**Mode**
Global Config

**passwords strength minimum special-characters**

Use this command to enforce a minimum number of special characters that a password should contain. The valid range is 0-16. The default is 2. Minimum of 0 means no restriction on that set of characters.

**Format**
```
passwords strength minimum special-characters
```

**Mode**
Global Config

**Default**
2

**no passwords strength minimum special-characters**

Use this command to reset the minimum number of special letters to the default value.

**Format**
```
no passwords strength minimum special-characters
```

**Mode**
Global Config

**passwords strength maximum consecutive-characters**

Use this command to enforce a maximum number of consecutive characters that a password should contain. An example of consecutive characters is abcd. The valid range is 0-16. If a password has consecutive characters more than the configured limit, it fails to configure. The default is 0. A maximum of 0 means no restriction on that set of characters.

**Format**
```
passwords strength maximum consecutive-characters
```

**Mode**
Global Config

**Default**
0
no passwords strength maximum consecutive-characters

Use this command to reset the maximum number of consecutive characters to the default value.

Format: no passwords strength maximum consecutive-characters
Mode: Global Config

passwords strength maximum repeated-characters

Use this command to enforce a maximum number of repeated characters that a password should contain. An example of repeated characters is aaaa. The valid range is 0-16. If a password has a repetition of characters more than the configured limit, it fails to configure. The default is 0. A maximum of 0 means no restriction on that set of characters.

Format: passwords strength maximum repeated-characters
Mode: Global Config
Default: 0

no passwords strength maximum repeated-characters

Use this command to reset the maximum number of repeated-characters to the default value.

Format: no passwords strength maximum repeated-characters
Mode: Global Config

passwords strength minimum character-classes

Use this command to enforce a minimum number of characters classes that a password should contain. Character classes are uppercase letters, lowercase letters, numeric characters and special characters. The valid range is 0-4. The default is 4.

Format: passwords strength minimum character-classes
Mode: Global Config
Default: 4

no passwords strength minimum character-classes

Use this command to reset the minimum number of character classes to the default value.

Format: no passwords strength minimum character-classes
Mode: Global Config
**passwords strength exclude-keyword**

Use this command to exclude the specified keyword while configuring the password. The password does not accept the keyword in any form (in between the string, case insensitive and reverse) as a substring. User can configure up to a maximum of 3 keywords.

*Format:* `passwords strength exclude-keyword keyword`  
*Mode:* Global Config

**no passwords strength exclude-keyword**

Use this command to remove the exclude-keyword.

*Format:* `no passwords strength exclude-keyword`  
*Mode:* Global Config

**show passwords configuration**

Use this command to display the configured password management settings.

*Format:* `show passwords configuration`  
*Mode:* Privileged EXEC

<tr>
<td>Last Password Set Result</td>
<td>Shows whether the attempt to set a password was successful. If the attempt</td>
</tr>
<tr>
<td></td>
<td>failed, the reason for the failure is included.</td>
</tr>
</tbody>
</table>

### aaa authentication login

Use this command to set authentication at login. The default and optional list names that you create with the `aaa authentication login` command are used with the `login authentication` command. Create a list by entering the `aaa authentication login list-name method` command for a particular protocol, where `list-name` is any character string used to name this list. The `method` argument identifies the list of methods that the authentication algorithm tries, in the given sequence. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

An example of a method that returns an error is if a RADIUS server is not present, and an example of a method failing is when a RADIUS server cannot authenticate the client. If 'local' method is listed first, since local authentication is always available, it only has the fail condition, not error. As such, if 'local' method is the first in the list, no other method will be tried.

To ensure that the authentication succeeds even if all methods return an error, specify `none` as the final method in the command line. For example if `none` is specified as an authentication method after `radius`, no authentication is used if the radius server is down.

**Format**  
aaa authentication login {default | list-name} method1 [method2...]

**Mode**  
Global Config

**Default**  
Uses the listed authentication methods that follow this argument as the default list of methods when a user logs in.
list-name  Character string used to name the list of authentication methods activated when a user logs in. Up to 12 characters.

method1 [method2...]  At least one from the following table:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Uses the enable password for authentication.</td>
</tr>
<tr>
<td>line</td>
<td>Uses the line password for authentication.</td>
</tr>
<tr>
<td>local</td>
<td>Uses the local username database for authentication.</td>
</tr>
<tr>
<td>none</td>
<td>Uses no authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Uses the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td>tacacs</td>
<td>Uses the list of all TACACS servers for authentication.</td>
</tr>
</tbody>
</table>

**Note:** The local user database is checked. This has the same effect as the following command: `aaa authentication login local`

no aaa authentication login

Use this command to remove authentication at login.

**Format**  no aaa authentication login {default | list-name}

**Mode**  Global Config

aaa authentication enable

Use this command to set authentication when the user access higher privilege level, use the `aaa authentication enable default` command in global configuration mode. The default and optional list names that you create with the `aaa authentication enable` command are used with the `enable authentication` command.

Create a list by entering the `aaa authentication enable list-name method` command where `list-name` is any character string used to name this list. The `method` argument identifies the list of methods that the authentication algorithm tries, in the given sequence. The additional methods of authentication are used only if the previous method returns an error, not if it fails. To ensure that the authentication succeeds even if all methods return an error, specify `none` as the final method in the command line. For example, if `none` is specified as an authentication method after `radius`, no authentication is used if the radius server is down. All `aaa authentication enable default` requests sent by the switch to a RADIUS or TACACS server include the username "$enabx.$", where $x$ is the requested privilege level.

**Format**  aaa authentication enable {default | list-name} method1 [method2...]

**Mode**  Global Config
**Default**  Uses the listed authentication methods that follow this argument as the default list of methods when a user accesses a higher privilege level.

**list-name**  Character string used to name the list of authentication methods activated when a user accesses a higher privilege level. Up to 12 characters.

**method1 [method2...]**  At least one from the following table:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Use to deny access.</td>
</tr>
<tr>
<td>enable</td>
<td>Uses the enable password for authentication.</td>
</tr>
<tr>
<td>line</td>
<td>Uses the line password for authentication.</td>
</tr>
<tr>
<td>none</td>
<td>Uses no authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Uses the list of all RADIUS servers for authentication. Uses username &quot;$enabx$&quot;. where x is the privilege level.</td>
</tr>
<tr>
<td>tacacs</td>
<td>Uses the list of all TACACS servers for authentication. Uses username &quot;$enabx$&quot;. where x is the privilege level.</td>
</tr>
</tbody>
</table>

**Note:** If the default list is not set, only the enable password is checked. This has the same effect as the following command:

```
aaa authentication enable default enable
```

On the console, the enable password is used if it exists. If no password is set, the process will succeed anyway. This has the same effect as the following command:

```
 aaa authentication enable default enable none
```

---

**no aaa authentication enable**

Use this command to remove the authentication method.

**Format**

```
no aaa authentication enable {default | list-name} method1 [method2...]
```

**Mode**

Global Config

**aaa authentication dot1x**

Use this command to set authentication for dot1x users. The method argument identifies the list of methods that the authentication algorithm tries, in the given sequence. The additional methods of authentication are used only if the previous method returns an error, not if there is an authentication failure. To ensure that the authentication succeeds even if all methods return an error, specify `none` as the final method in the command line. For example if `none` is
specified as an authentication method after radius, no authentication is used if the radius
server is down.

Format: `aaa authentication dot1x default method1`

Mode: Global Config

_method1_: At least one from the following table:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local</td>
<td>Uses the local username database for authentication.</td>
</tr>
<tr>
<td>none</td>
<td>Uses no authentication.</td>
</tr>
<tr>
<td>radius</td>
<td>Uses the list of all RADIUS servers for authentication.</td>
</tr>
<tr>
<td>ias</td>
<td>Uses the internal authentication server users database for authentication.</td>
</tr>
</tbody>
</table>

_no aaa authentication dot1x_

Use this command to remove the authentication at login.

Format: `no aaa authentication dot1x default`

Mode: Global Config

_**aaa accounting**_

The command creates an accounting method list. This list is identified by “default” or a
user-specified “list_name.” Accounting records, when enabled for a line-mode, can be sent at
both the beginning and at the end (start-stop), or only at the end (stop-only). If “none” is
specified, then accounting is disabled for the specified list. If “tacacs” is specified as the
Accounting method, Accounting records are notified to a TACACS+ server. If “radius” is the
specified Accounting method, Accounting records are notified to a RADIUS server.

For the same set of accounting type and list name, the administrator can change the record
type or the methods list without having to first delete the previous configuration.

Note the following:

- A maximum of 5 Accounting Method Lists can be created for each exec and commands
type.
- The same list-name can be used for both exec and commands Accounting type.
- AAA Accounting for commands with RADIUS as the Accounting method is not supported.

Format: `aaa accounting {exec | commands } {default | list_name} {start-stop
| stop-only | none} method1 [method2...]

Mode: Global Config
### Management Commands

### no aaa accounting

This command deletes the accounting method list.

**Format**

```
no aaa accounting {exec | commands} {list_name default}
```

**Mode**

Global Config

### accounting (Console/Telnet/SSH)

This command applies the accounting method list to a line config (console/telnet/ssh). Apply this command in Line Config mode.

**Format**

```
accounting {exec | commands} [default | list_name]
```

**Mode**

Line Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>exec</td>
<td>This causes accounting for an EXEC session.</td>
</tr>
<tr>
<td>commands</td>
<td>This causes accounting for each command execution attempt. If a user is enabling accounting for exec mode for the current line-configuration type, he will be logged out.</td>
</tr>
</tbody>
</table>

### no accounting (Console/Telnet/SSH)

This command is used to remove accounting from a line config mode.

**Format**

```
no accounting { exec | commands }
```

**Mode**

Line Config
ip http/https accounting

This command applies user exec accounting list to the line methods HTTP and HTTPs methods.

**Format**

```
ip {http| https} accounting exec {default| <listname>}
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP/HTTPS</td>
<td>Line method for which the list needs to be applied.</td>
</tr>
<tr>

<td>The default list of methods for authorization services.</td>
</tr>
<tr>
<td>list-name</td>
<td>Alphanumeric character string used to name the list of authorization methods.</td>
</tr>
</tbody>
</table>

no ip http/https accounting exec

This command deletes the authorization method list.

**Format**

```
no ip {http| https} accounting exec {default| <listname>}
```

**Mode**

Global Config

**show accounting methods**

This command displays the configured accounting method lists.

**Format**

```
show accounting methods
```

**Mode**

Privileged EXEC

**Example:**

```
(switch) #
(switch) #show accounting methods

<table>
<thead>
<tr>
<th>Acct Type</th>
<th>Method Name</th>
<th>Record Type</th>
<th>Method Type</th>

</tr>
<tr>
<td>HTTPS</td>
<td>none</td>
<td>none</td>
</tr>
<tr>
<td>HTTP</td>
<td>none</td>
<td>none</td>
</tr>
</tbody>
</table>
```
aaa authorization

This command creates an authorization method list. This list is identified by “default” or a user-specified “list_name.” If “tacacs” is specified as the Authorization method, Authorization commands are notified to a TACACS+ server. If “none” is specified as the Authorization method, command authorization is not applicable. A maximum of 5 Authorization Method Lists can be created for “commands” type.

**Note:** Local method is not supported for command Authorization. Also note that command authorization with RADIUS works if and only if the applied authentication method is also radius.

**Format**
```plaintext
aaa authorization {commands | exec } {default | <list_name>}
method1[method2]
```

**Mode**
- Global Config

**Term** | **Definition**
--- | ---
commands | Alphanumeric character string used to name the list of authorization methods.
Exec | The default list of methods for authorization services.
default | The default list of methods for authorization services.
list-name | Alphanumeric character string used to name the list of authorization methods.
method | TACACS+/RADIUS/Local and none are supported.

**no aaa authorization**

This command deletes the authorization method list.

**Format**
```plaintext
no aaa authorization {commands | exec } {default | <list_name>}
method1[method2]
```

**Mode**
- Global Config

**authorization(console/telnet/ssh)**

To apply the command authorization method list to an access method (console/telnet/ssh). Apply this command in the line configuration mode.

**Format**
```plaintext
authorization {commands | exec }[default |<list_name>]
```

**Mode**
- Line console
- Line telnet
- Line SSH
no authorization(console/telnet/ssh)

This command is used to remove command authorization from a line config mode.

**Format**

```
no authorization {commands| exec}
```

**Mode**

- Line console
- Line telnet
- Line SSH

**show authorization methods**

This command displays the configured authorization method lists.

**Format**

```
show authorization methods
```

**Mode**

Privileged EXEC

**Example:**

(Switch) #show authorization methods

<table>
<thead>
<tr>
<th>Command Authorization List</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>dfltCmdAuthList</td>
<td>none undefined undefined undefined undefined</td>

</tbody>
</table>

domain-name

Managed switch supports authentication based on domain name in addition to the username and password. This command allows the switch to be configured in a domain. Users can enable or disable domain functionality.

Following are the two cases

- Domain enabled: In this case, when the user enters only the username, then the managed switch sends the username as the domain-name (configured on switch)\username to the RADIUS server. If the user enters the domain name and
username, then the managed switch sends the username input as the domain-name(as entered by the user)\username to the RADIUS server.

- Domain disabled: In this case, the domain name is not included when the user-name is sent to the RADIUS server.

**Note:** If the user domain is already provided by the user/supplicant, the domain name is assumed to reach the managed switch along with the username in the following format: "Domainname \username"

---

**Format**

```plaintext
domain-name <name>
```

**Mode**

Global Config

**no domain-name**

This command is used to disable the domain-name in the managed switch.

**Format**

```plaintext
no domain-name
```

**Mode**

Global Config

**domain-name enable**

This command enables the domain name functionality.

**Format**

```plaintext
domain-name enable
```

**Mode**

Global Config

**no domain-name enable**

This command disables the domain name functionality.

**Format**

```plaintext
no domain-name enable
```

**Mode**

Global Config

**mac address-table multicast forbidden-unregistered vlan**

Use this command to forbid forwarding unregistered multicast addresses (in other words, unknown multicast traffic) on a given VLAN ID.

**Default**

Disabled
no mac address-table multicast forbidden-unregistered vlan

Use this command to restore the default.

Format: no mac address-table multicast forbidden-unregistered vlan
Mode: Global Config

mac address-table multicast forward-unregistered vlan

Use this command to enable forwarding unregistered multicast address (in other words, unknown multicast traffic) on a given VLAN ID.

Format: mac address-table multicast forward-unregistered vlan <1-4093>
Mode: Global Config

mac address-table multicast forward-all vlan

Use this command to enable forwarding of all multicast packets on a given VLAN ID.

Format: mac address-table multicast forward-all vlan <1-4093>
Mode: Global Config

no mac address-table multicast forward-all vlan

Use this command to restore the system default.

Format: no mac address-table multicast forward-all vlan
Mode: Global Config

set igmp report-suppression

Use this command to suppress the IGMP reports on a given VLAN ID. In order to optimize the number of reports traversing the network with no added benefits, a Report Suppression mechanism is implemented. When more than one client responds to an MGMD query for the
same Multicast Group address within the max-response-time, only the first response is forwarded to the query and others are suppressed at the switch.

**Default**  
Disabled

**Format**  
set igmp report-suppression <1-4093>

**Mode**  
VLAN Config

**no set igmp report-suppression**

Use this command to restore the system default.

**Format**  
no set igmp report-suppression

**Mode**  
VLAN Config

**show mac address-table multicast filtering**

Use this command to display the multicast filtering details for a given VLAN.

**Format**  
show mac address-table multicast filtering

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan-id</td>
<td>A valid VLAN ID</td>
</tr>
<tr>
<td>mode</td>
<td>The filtering mode</td>
</tr>
</tbody>
</table>

The following shows example CLI display output for the command.

```
(netgear switch) #show mac address-table multicast filtering 1
VLAN-ID...... 1
Mode......... Forward-Forbidden-Unregistered
```

**show domain-name**

This command displays the configured domain-name.

**Format**  
show domain-name

**Mode**  
Privileged EXEC

**Example:**

```
(switch) #
(switch) #show domain-name
Domain     : Enable
Domain-name : abc
```
aaa ias-user username
The Internal Authentication Server (IAS) database is a dedicated internal database used for local authentication of users for network access through the IEEE 802.1X feature. Use this command to add the specified user to the internal user database. This command also changes the mode to AAA User Config mode.

Format    aaa ias-username <user>
Mode       Global Config

no aaa ias-user username
Use this command to remove an ias user.

Format    no aaa ias-username <user>
Mode       Global Config

aaa session-id
This global aaa command specifies whether the same session-id is used for Authentication, Authorization, and Accounting service type within a session.

Default    common
Format      aaa session-id [common | unique]
Mode        Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>common</td>
<td>Use the same session-id for all AAA Service types.</td>
</tr>
<tr>
<td>unique</td>
<td>Use a unique session-id for AAA Service types.</td>
</tr>
</tbody>
</table>

no aaa session-id
This command resets the aaa session-id behavior to default.

Format    no aaa session-id [unique]
Mode       Global Config

password (AAA IAS User Configuration)
Use this command to specify a password for a user in the IAS database.

Format    password <password> [encrypted]
Mode       AAA IAS User Config
### no password (AAA IAS User Configuration)

Use this command to remove a password for a user in the IAS database.

**Format**

```
no password
```

**Mode**

AAA IAS User Config

### clear aaa ias-users

Use this command to remove all users from the IAS database.

**Format**

```
clear aaa ias-users
```

**Mode**

Privileged EXEC

### show aaa ias-users

Use this command to display configured IAS users and their attributes. Passwords configured are not shown in the show command output.

**Format**

```
show aaa ias-users
```

**Mode**

Privileged EXEC

### SNMP Commands

This section describes the commands you use to configure Simple Network Management Protocol (SNMP) on the switch. You can configure the switch to act as an SNMP agent so that it can communicate with SNMP managers on your network.

#### snmp-server

Use this command to set the name and the physical location of the switch and the organization responsible for the network. The range for `<name>`, `<loc>` and `<con>` is from 1 to 31 alphanumeric characters.

**Default**

none

**Format**

```
snmp-server {sysname <name> | location <loc> | contact <con>}
```

**Mode**

Global Config
snmp-server community

Use this command to add (and name) a new SNMP community. A community <name> is a name associated with the switch and with a set of SNMP managers that manage it with a specified privileged level. The length of <name> can be up to 16 case-sensitive characters.

**Note:** Community names in the SNMP Community Table must be unique. When making multiple entries using the same community name, the first entry is kept and processed and all duplicate entries are ignored.

Default
- Public and private, which you can rename.
- Default values for the remaining four community names are blank.

Format
```
snmp-server community <name>
```

Mode
Global Config

no snmp-server community

Use this command to remove this community name from the table. The <name> is the community name to be deleted.

Format
```
no snmp-server community <name>
```

Mode
Global Config

snmp-server community ipaddr

Use this command to set a client IP address for an SNMP community. The address is the associated community SNMP packet sending address and is used along with the client IP mask value to denote a range of IP addresses from which SNMP clients may use that community to access the device. A value of 0.0.0.0 allows access from any IP address. Otherwise, this value is ANDed with the mask to determine the range of allowed client IP addresses. The name is the applicable community name.

Default
0.0.0.0

Format
```
snmp-server community ipaddr <ipaddr> <name>
```

Mode
Global Config
**no snmp-server community ipaddr**

Use this command to set a client IP address for an SNMP community to 0.0.0.0. The name is the applicable community name.

**Format**

```
nosnmp-servercommunityipaddr
```

**Mode**

Global Config

**snmp-server community ipmask**

Use this command to set a client IP mask for an SNMP community. The address is the associated community SNMP packet sending address and is used along with the client IP address value to denote a range of IP addresses from which SNMP clients may use that community to access the device. A value of 255.255.255.255 will allow access from only one station, and will use that machine's IP address for the client IP address. A value of 0.0.0.0 will allow access from any IP address. The name is the applicable community name.

**Default**

```
0.0.0.0
```

**Format**

```
snmp-servercommunityipmask
```

**Mode**

Global Config

**no snmp-server community ipmask**

Use this command to set a client IP mask for an SNMP community to 0.0.0.0. The name is the applicable community name. The community name may be up to 16 alphanumeric characters.

**Format**

```
nosnmp-servercommunityipmask
```

**Mode**

Global Config

**snmp-server community mode**

Use this command to activate an SNMP community. If a community is enabled, an SNMP manager associated with this community manages the switch according to its access right. If the community is disabled, no SNMP requests using this community are accepted. In this case the SNMP manager associated with this community cannot manage the switch until the Status is changed back to Enable.

**Default**

- private and public communities - enabled
- other four - disabled

**Format**

```
snmp-servercommunitymode
```

**Mode**

Global Config
no snmp-server community mode

Use this command to deactivate an SNMP community. If the community is disabled, no SNMP requests using this community are accepted. In this case the SNMP manager associated with this community cannot manage the switch until the Status is changed back to Enable.

**Format**
no snmp-server community mode <name>

**Mode**
Global Config

snmp-server community ro

Use this command to restrict access to switch information. The access mode is read-only (also called public).

**Format**
snmp-server community ro <name>

**Mode**
Global Config

snmp-server community rw

Use this command to restrict access to switch information. The access mode is read/write (also called private).

**Format**
snmp-server community rw <name>

**Mode**
Global Config

snmp-server enable traps violation

Use this command to enable sending new violation traps designating when a packet with a disallowed MAC address is received on a locked port.

**Note:** For other port security commands, see *Protected Ports Commands* on page 82.

**Default**
disabled

**Format**
snmp-server enable traps violation

**Mode**
Interface Config

---

Management Commands

686
no snmp-server enable traps violation

Use this command to disable sending new violation traps.

Format: no snmp-server enable traps violation
Mode: Interface Config

snmp-server enable traps

Use this command to enable the Authentication Flag.

Default: enabled
Format: snmp-server enable traps
Mode: Global Config

no snmp-server enable traps

Use this command to disable the Authentication Flag.

Format: no snmp-server enable traps
Mode: Global Config

---

**Note:** This command may not be available on all platforms.

snmp-server enable traps linkmode

Use this command to enable Link Up/Down traps for the entire switch. When enabled, link traps are sent only if the Link Trap flag setting associated with the port is enabled. For more information, see `snmp trap link-status` on page 690

Default: enabled
Format: snmp-server enable traps linkmode
Mode: Global Config

no snmp-server enable traps linkmode

Use this command to disable Link Up/Down traps for the entire switch.

Format: no snmp-server enable traps linkmode
Mode: Global Config
**snmp-server enable traps multiusers**

Use this command to enable Multiple User traps. When the traps are enabled, a Multiple User Trap is sent when a user logs in to the terminal interface (EIA 232 or Telnet) and there is an existing terminal interface session.

- **Default**: enabled
- **Format**: `snmp-server enable traps multiusers`
- **Mode**: Global Config

**no snmp-server enable traps multiusers**

Use this command to disable Multiple User traps.

- **Format**: `no snmp-server enable traps multiusers`
- **Mode**: Global Config

**snmp-server enable traps stpmode**

Use this command to enable sending new root traps and topology change notification traps.

- **Default**: enabled
- **Format**: `snmp-server enable traps stpmode`
- **Mode**: Global Config

**no snmp-server enable traps stpmode**

Use this command to disable sending new root traps and topology change notification traps.

- **Format**: `no snmp-server enable traps stpmode`
- **Mode**: Global Config

**snmptrap**

Use this command to add an SNMP trap receiver. The maximum length of `<name>` is 16 case-sensitive alphanumeric characters. The `<snmpversion>` is the version of SNMP. The version parameter options are snmpv1 or snmpv2. The SNMP trap address can be set using both an IPv4 address format as well as an IPv6 global address format.

The following shows an example of the CLI command.

```
(Netgear Switch)# snmptrap mytrap ip6addr 3099::2
```
Note: The <name> parameter does not need to be unique, however; the <name> and <ipaddr | hostname> pair must be unique. Multiple entries can exist with the same <name>, as long as they are associated with a different <ipaddr | hostname>. The reverse scenario is also acceptable. The <name> is the community name used when sending the trap to the receiver, but the <name> is not directly associated with the SNMP Community Table, See “snmp-server community” on page 39.

**no snmptrap**

Use this command to delete trap receivers for a community.

**Format**
```
no snmptrap <name> {ipaddr <ipaddr|hostname> | ip6addr <ip6addr|hostname>}
```

**Mode**
Global Config

**snmptrap snmpversion**

Use this command to modify the SNMP version of a trap. The maximum length of <name> is 16 case-sensitive alphanumeric characters. The <snmpversion> parameter options are snmpv1 or snmpv2.

Note: This command does not support a “no” form.

**Default**
snmpv2

**Format**
```
snmptrap snmpversion <name> {<ipaddr | hostname> |<ip6addr|hostname>} {snmpv1|snmpv2}
```

**Mode**
Global Config
**snmptrap ipaddr**

Use this command to assign an IP address to a specified community name. The maximum length of name is 16 case-sensitive alphanumeric characters.

**Note:** IP addresses in the SNMP trap receiver table must be unique. If you make multiple entries using the same IP address, the first entry is retained and processed. All duplicate entries are ignored.

**Format**
```
snmptrap ipaddr <name> <ipaddrold> <ipaddrnew | hostnamenew>
```

**Mode**
Global Config

**snmptrap mode**

Use this command to activate or deactivate an SNMP trap. Enabled trap receivers are active (able to receive traps). Disabled trap receivers are inactive (not able to receive traps).

**Format**
```
snmptrap mode <name> { <ipaddr | hostname> | <ip6addr | hostname> }
```

**Mode**
Global Config

**no snmptrap mode**

Use this command to deactivate an SNMP trap. Disabled trap receivers are unable to receive traps.

**Format**
```
no snmptrap mode <name> { <ipaddr | hostname> | <ip6addr | hostname> }
```

**Mode**
Global Config

**snmptrap link-status**

Use this command to enable link status traps by interface.

**Note:** This command is valid only when the Link Up/Down Flag is enabled. For more information, see `snmp-server enable traps linkmode` on page 687.

**Format**
```
snmp trap link-status
```

**Mode**
Interface Config
**no snmp trap link-status**

Use this command to disable link status traps by interface.

**Note:** This command is valid only when the Link Up/Down Flag is enabled.

**Format**

```
no snmp trap link-status
```

**Mode**

Interface Config

**snmp trap link-status all**

Use this command to enable link status traps for all interfaces.

**Note:** This command is valid only when the Link Up/Down Flag is enabled. For more information, see `snmp-server enable traps linkmode` on page 687.

**Format**

```
snmp trap link-status all
```

**Mode**

Global Config

---

**no snmp trap link-status all**

Use this command to disable link status traps for all interfaces.

**Note:** This command is valid only when the Link Up/Down Flag is enabled. For more information, see `snmp-server enable traps linkmode` on page 687.

**Format**

```
no snmp trap link-status all
```

**Mode**

Global Config

---

**show snmpcommunity**

Use this command to display SNMP community information. Six communities are supported. You can add, change, or delete communities. The switch does not have to be reset for changes to take effect.
The SNMP agent of the switch complies with SNMP Versions 1, 2 or 3. For more information about the SNMP specification, see the SNMP RFCs. The SNMP agent sends traps through TCP/IP to an external SNMP manager based on the SNMP configuration (the trap receiver and other SNMP community parameters).

**Format**  
show snmpcommunity

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP Community Name</td>
<td>The community string to which this entry grants access. A valid entry is a case-sensitive alphanumeric string of up to 16 characters. Each row of this table must contain a unique community name.</td>
</tr>
<tr>
<td>Client IP Address</td>
<td>An IP address (or portion thereof) from which this device will accept SNMP packets with the associated community. The requesting entity's IP address is ANDed with the Subnet Mask before being compared to the IP address. Note: If the Subnet Mask is set to 0.0.0.0, an IP address of 0.0.0.0 matches all IP addresses. The default value is 0.0.0.0.</td>
</tr>
<tr>
<td>Client IP Mask</td>
<td>A mask to be ANDed with the requesting entity's IP address before comparison with IP address. If the result matches with IP address then the address is an authenticated IP address. For example, if the IP address = 9.47.128.0 and the corresponding Subnet Mask = 255.255.255.0 a range of incoming IP addresses would match, i.e. the incoming IP address could equal 9.47.128.0 - 9.47.128.255. The default value is 0.0.0.0.</td>
</tr>
<tr>
<td>Access Mode</td>
<td>The access level for this community string.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of this community access entry.</td>
</tr>
</tbody>
</table>

**show snmptrap**

Use this command to display SNMP trap receivers. Trap messages are sent across a network to an SNMP Network Manager. These messages alert the manager to events occurring within the switch or on the network. Six trap receivers are simultaneously supported.

**Format**  
show snmptrap

**Mode**  
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP Trap Name</td>
<td>The community string of the SNMP trap packet sent to the trap manager. The string is case sensitive and can be up to 16 alphanumeric characters.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IPv4 address to receive SNMP traps from this device.</td>
</tr>
<tr>
<td>IPv6 Address</td>
<td>The IPv6 address to receive SNMP traps from this device.</td>
</tr>
<tr>
<td>SNMP Version</td>
<td>SNMPv2</td>
</tr>
<tr>
<td>Status</td>
<td>The receiver's status (enabled or disabled).</td>
</tr>
</tbody>
</table>

The following shows an example of the CLI command.
show snmptrap

Format: show snmptrap
Mode: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Flag</td>
<td>Can be enabled or disabled. The factory default is enabled. Indicates whether authentication failure traps will be sent.</td>
</tr>
<tr>
<td>Link Up/Down Flag</td>
<td>Can be enabled or disabled. The factory default is enabled. Indicates whether link status traps will be sent.</td>
</tr>
<tr>
<td>Multiple Users Flag</td>
<td>Can be enabled or disabled. The factory default is enabled. Indicates whether a trap will be sent when the same user ID is logged into the switch more than once at the same time (either through Telnet or the serial port).</td>
</tr>
<tr>
<td>Spanning Tree Flag</td>
<td>Can be enabled or disabled. The factory default is enabled. Indicates whether spanning tree traps are sent.</td>
</tr>
<tr>
<td>ACL Traps</td>
<td>May be enabled or disabled. The factory default is disabled. Indicates whether ACL traps are sent.</td>
</tr>
<tr>
<td>DVMRP Traps</td>
<td>Can be enabled or disabled. The factory default is disabled. Indicates whether DVMRP traps are sent.</td>
</tr>
<tr>
<td>OSPFv2 Traps</td>
<td>Can be enabled or disabled. The factory default is disabled. Indicates whether OSPF traps are sent. If any of the OSPF trap flags are not enabled, then the command displays disabled. Otherwise, the command shows all the enabled OSPF traps' information.</td>
</tr>
<tr>
<td>OSPFv3 Traps</td>
<td>Can be enabled or disabled. The factory default is disabled. Indicates whether OSPF traps are sent. If any of the OSPFv3 trap flags are not enabled, then the command displays disabled. Otherwise, the command shows all the enabled OSPFv3 traps' information.</td>
</tr>
<tr>
<td>PIM Traps</td>
<td>Can be enabled or disabled. The factory default is disabled. Indicates whether PIM traps are sent.</td>
</tr>
</tbody>
</table>
RADIUS Commands

This section describes the commands you use to configure the switch to use a Remote Authentication Dial-In User Service (RADIUS) server on your network for authentication and accounting.

authorization network radius

Use this command to enable the switch to accept VLAN assignment by the radius server.

Default: disable
Format: authorization network radius
Mode: Global Config

no authorization network radius

Use this command to disable the switch to accept VLAN assignment by the radius server.

Format: no authorization network radius
Mode: Global Config

radius accounting mode

Use this command to enable the RADIUS accounting function.

Default: disabled
Format: radius accounting mode
Mode: Global Config

no radius accounting mode

Use this command to set the RADIUS accounting function to the default value (disabled).

Format: no radius accounting mode
Mode: Global Config

radius server attribute

Use this command to specify the RADIUS client to use the NAS-IP Address attribute in the RADIUS requests. If the specific IP address is configured while enabling this attribute, the
Management Commands

ProSafe Managed Switch

RADIUS client uses that IP address while sending NAS-IP-Address attribute in RADIUS communication.

**Format**

```
radius server attribute <4> [<ipaddr>]
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>NAS-IP-Address attribute to be used in RADIUS requests.</td>
</tr>
<tr>
<td>ipaddr</td>
<td>The IP address of the server.</td>
</tr>
</tbody>
</table>

**no radius server attribute**

Use the `no` version of this command to disable the NAS-IP-Address attribute global parameter for RADIUS client. When this parameter is disabled, the RADIUS client does not send the NAS-IP-Address attribute in RADIUS requests.

**Format**

```
no radius server attribute <4> [<ipaddr>]
```

**Mode**

Global Config

The following shows an example of the command.

```
(Switch) (Config) #radius server attribute 4 192.168.37.60
(Switch) (Config) #radius server attribute 4
```

**radius server host**

Use this command to configure the IP address or DNS name to use for communicating with the RADIUS server of a selected server type. While configuring the IP address or DNS name for the authenticating or accounting servers, you can also configure the port number and server name. If the authenticating and accounting servers are configured without a name, the command uses the ‘Default_RADIUS_Auth_Server’ and ‘Default_RADIUS_Acct_Server’ as the default names, respectively. The same name can be configured for more than one authenticating servers and the name should be unique for accounting servers. The RADIUS client allows the configuration of a maximum 32 authenticating and accounting servers.

If you use the `<auth>` parameter, the command configures the IP address or hostname to use to connect to a RADIUS authentication server. You can configure up to 3 servers per RADIUS client. If the maximum number of configured servers is reached, the command fails until you remove one of the servers by issuing the “no” form of the command. If you use the optional `<port>` parameter, the command configures the UDP port number to use when connecting to the configured RADIUS server. The `<port>` number range is 1 - 65535, with 1812 being the default value.
Note: To re-configure a RADIUS authentication server to use the default UDP <port>, set the <port> parameter to 1812.

If you use the <acct> token, the command configures the IP address or hostname to use for the RADIUS accounting server. You can only configure one accounting server. If an accounting server is currently configured, use the “no” form of the command to remove it from the configuration. The IP address or hostname you specify must match that of a previously configured accounting server. If you use the optional <port> parameter, the command configures the UDP port to use when connecting to the RADIUS accounting server. If a <port> is already configured for the accounting server, the new <port> replaces the previously configured <port>. The <port> must be a value in the range 0 - 65535, with 1813 being the default.

Note: To re-configure a RADIUS accounting server to use the default UDP <port>, set the <port> parameter to 1813.

Format       radius server host {auth | acct} {<ipaddr|dnsname>} [name <servername>] [port <0-65535>] [server-type]

Mode         Global Config

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>The IP address of the server.</td>
</tr>
<tr>
<td>dnsname</td>
<td>The DNS name of the server.</td>
</tr>
<tr>
<td>0-65535</td>
<td>The port number to use to connect to the specified RADIUS server.</td>
</tr>
<tr>
<td>servername</td>
<td>The alias name to identify the server.</td>
</tr>
</tbody>
</table>

no radius server host

Use the no version of this command to delete the configured server entry from the list of configured RADIUS servers. If the RADIUS authenticating server being removed is the active server in the servers that are identified by the same server name, then the RADIUS client selects another server for making RADIUS transactions. If the ‘auth’ token is used, the previously configured RADIUS authentication server is removed from the configuration. Similarly, if the ‘acct’ token is used, the previously configured RADIUS accounting server is removed from the configuration. The <ipaddr|dnsname> parameter must match the IP
address or dns name of the previously configured RADIUS authentication / accounting server.

**Format**

```
no radius server host {auth | acct} {<ipaddr|dnsname}>
```

**Mode**

Global Config

The following shows an example of the command.

```
(Switch) (Config) #radius server host acct 192.168.37.60
(Switch) (Config) #radius server host acct 192.168.37.60 port 1813
(Switch) (Config) #radius server host auth 192.168.37.60 name Network1_RADIUS_Auth_Server port 1813

(Switch) (Config) #radius server host acct 192.168.37.60 name Network2_RADIUS_Auth_Server
(Switch) (Config) #no radius server host acct 192.168.37.60
```

**radius server key**

Use this command to configure the key to be used in RADIUS client communication with the specified server. Depending on whether the 'auth' or 'acct' token is used, the shared secret is configured for the RADIUS authentication or RADIUS accounting server. The IP address or hostname provided must match a previously configured server. When this command is executed, the secret is prompted.

Text-based configuration supports Radius server’s secrets in encrypted and non-encrypted format. When you save the configuration, these secret keys are stored in encrypted format only. If you want to enter the key in encrypted format, enter the key along with the encrypted keyword. In the show running config command’s display, these secret keys are displayed in encrypted format. You cannot show these keys in plain text format.

**Note:** The secret must be an alphanumeric value not exceeding 16 characters.

**Format**

```
radius server key {auth | acct} {<ipaddr|dnsname}> encrypted <password>
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>The IP address of the server.</td>
</tr>
<tr>
<td>dnsname</td>
<td>The DNS name of the server.</td>
</tr>
<tr>
<td>password</td>
<td>The password in encrypted format.</td>
</tr>
</tbody>
</table>
The following shows an example of the CLI command.

```
radius server key acct 10.240.4.10 encrypted <encrypt-string>
```

**radius server msgauth**

Use this command to enable the message authenticator attribute to be used for the specified RADIUS Authenticating server.

**Format**

```
radius server msgauth <ipaddr|dnsname>
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip addr</td>
<td>The IP address of the server.</td>
</tr>
<tr>
<td>dnsname</td>
<td>The DNS name of the server.</td>
</tr>
</tbody>
</table>

**no radius server msgauth**

Use the `no` version of this command to disable the message authenticator attribute to be used for the specified RADIUS Authenticating server.

**Format**

```
no radius server msgauth <ipaddr|dnsname>
```

**Mode**

Global Config

**radius server primary**

Use this command to designate a configured server as the primary server in the group of servers that have the same server name. Multiple primary servers can be configured for each number of servers that have the same name. When the RADIUS client has to perform transactions with an authenticating RADIUS server of specified name, the client uses the primary server that has the specified server name by default. If the RADIUS client fails to communicate with the primary server for any reason, the client uses the backup servers configured with the same server name. These backup servers are identified as the ‘Secondary’ type.

**Format**

```
radius server primary {<ipaddr|dnsname>}
```

**Mode**

Global Config

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip addr</td>
<td>The IP address of the RADIUS Authenticating server.</td>
</tr>
<tr>
<td>dnsname</td>
<td>The DNS name of the server.</td>
</tr>
</tbody>
</table>
**radius server retransmit**

Use this command to configure the global parameter for the RADIUS client that specifies the number of transmissions of the messages to be made before attempting the fall back server upon unsuccessful communication with the current RADIUS authenticating server. When the maximum number of retries are exhausted for the RADIUS accounting server and no response is received, the client does not communicate with any other server.

<table>
<thead>
<tr>
<th>Default</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td><code>radius server retransmit &lt;retries&gt;</code></td>
</tr>
<tr>

TACACS+ Commands

TACACS+ provides access control for networked devices via one or more centralized servers. Similar to RADIUS, this protocol simplifies authentication by making use of a single database that can be shared by many clients on a large network. TACACS+ is based on the TACACS protocol (described in RFC1492) but additionally provides for separate authentication, authorization, and accounting services. The original protocol was UDP based with messages passed in clear text over the network; TACACS+ uses TCP to ensure reliable...
delivery and a shared key configured on the client and daemon server to encrypt all messages.

**debug tacacs packet**

Use the `debug tacacs packet` command to turn on TACACS+ packet debug.

<table>
<thead>
<tr>
<th>Default</th>
<th>Disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format</td>
<td>`debug tacacs packet [receive</td>
</tr>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**no debug tacacs packet**

Use this command to turn off TACACS+ packet debug.

<table>
<thead>
<tr>
<th>Format</th>
<th><code>no debug tacacs packet</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Config</td>
</tr>
</tbody>
</table>

**tacacs-server host**

Use the `tacacs-server host` command in Global Configuration mode to configure a TACACS+ server. This command enters into the TACACS+ configuration mode. The `<ip-address|hostname>` parameter is the IP address or hostname of the TACACS+ server. To specify multiple hosts, multiple `tacacs-server host` commands can be used.

| Format | `tacacs-server host <ip-address|hostname>` |
|--------|-----------------------------------------|
| Mode   | Global Config                           |

**no tacacs-server host**

Use the `no tacacs-server host` command to delete the specified hostname or IP address. The `<ip-address|hostname>` parameter is the IP address of the TACACS+ server.

| Format | `no tacacs-server host <ip-address|hostname>` |
|--------|-----------------------------------------|
| Mode   | Global Config                           |

**tacacs-server key**

Use the `tacacs-server key` command to set the authentication and encryption key for all TACACS+ communications between the switch and the TACACS+ daemon. The `<key-string>` parameter has a range of 0 - 128 characters and specifies the authentication and encryption key for all TACACS communications between the switch and the TACACS+ server. This key must match the key used on the TACACS+ daemon.

Text-based configuration supports TACACS server’s secrets in encrypted and non-encrypted format. When you save the configuration, these secret keys are stored in encrypted format.
only. If you want to enter the key in encrypted format, enter the key along with the encrypted keyword. In the show running config command’s display, these secret keys are displayed in encrypted format. You cannot show these keys in plain text format.

**Format**
```
tacacs-server key [<key-string> | encrypted <key-string>]
```

**Mode**
Global Config

**no tacacs-server key**

Use the `no tacacs-server key` command to disable the authentication and encryption key for all TACACS+ communications between the switch and the TACACS+ daemon. The `<key-string>` parameter has a range of 0 - 128 characters. This key must match the key used on the TACACS+ daemon.

**Format**
```
no tacacs-server key <key-string>
```

**Mode**
Global Config

**tacacs-server keystring**

Use this command to set the global authentication encryption key used for all TACACS+ communications between the TACACS+ server and the client.

**Format**
```
tacacs-server keystring
```

**Mode**
Global Config

**tacacs-server source interface**

Use this command in Global Configuration mode to configure the global source interface (Source IP selection) for all TACACS+ communications between the TACACS+ client and the server.

**Format**
```
tacacs-server source-interface {<unit/slot/port> | loopback <loopback-id> | VLAN <vlan-id>}
```

**Mode**
Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit/slot/port</td>
<td>The unit identifier assigned to the switch.</td>
</tr>
<tr>
<td>loopback-id</td>
<td>The loopback interface. The range of the loopback ID is 0 to 7.</td>
</tr>
<tr>
<td>vlan-id</td>
<td>The vlan id. The range of the vlan ID is 1 to 4093.</td>
</tr>
</tbody>
</table>
no tacacs-server source interface

Use this command in Global Configuration mode to remove the global source interface (Source IP selection) for all TACACS+ communications between the TACACS+ client and the server.

Format: `no tacacs-server source-interface`

Mode: Privileged Exec

**tacacs-server timeout**

Use the `tacacs-server timeout` command to set the timeout value for communication with the TACACS+ servers. The `<timeout>` parameter has a range of 1-30 and is the timeout value in seconds.

Default: 5

Format: `tacacs-server timeout <timeout>`

Mode: Global Config

no tacacs-server timeout

Use the `no tacacs-server timeout` command to restore the default timeout value for all TACACS servers.

Format: `no tacacs-server timeout`

Mode: Global Config

**key**

Use the `key` command in TACACS Configuration mode to specify the authentication and encryption key for all TACACS communications between the device and the TACACS server. This key must match the key used on the TACACS daemon. The `<key-string>` parameter specifies the key name. For an empty string use “ ”. (Range: 0 - 128 characters).

Text-based configuration supports TACACS server’s secrets in encrypted and non-encrypted format. When you save the configuration, these secret keys are stored in encrypted format only. If you want to enter the key in encrypted format, enter the key along with the encrypted keyword. In the show running config command’s display, these secret keys are displayed in encrypted format. You cannot show these keys in plain text format.

Format: `key [<key-string> | encrypted <key-string>]`

Mode: TACACS Config
**port**

Use the `port` command in TACACS Configuration mode to specify a server port number. The server `<port-number>` range is 0 - 65535.

- **Default**: 49
- **Format**: `port <port-number>`
- **Mode**: TACACS Config

**priority**

Use the `priority` command in TACACS Configuration mode to specify the order in which servers are used, where 0 (zero) is the highest priority. The `<priority>` parameter specifies the priority for servers. The highest priority is 0 (zero), and the range is 0 - 65535.

- **Default**: 0
- **Format**: `priority <priority>`
- **Mode**: TACACS Config

**timeout**

Use the `timeout` command in TACACS Configuration mode to specify the timeout value in seconds. If no timeout value is specified, the global value is used. The `<timeout>` parameter has a range of 1-30 and is the timeout value in seconds.

- **Format**: `timeout <timeout>`
- **Mode**: TACACS Config

**show tacacs**

Use the `show tacacs` command to display the configuration and statistics of a TACACS+ server.

- **Format**: `show tacacs [<ip-address|hostname>]`
- **Mode**: Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Address</td>
<td>The IP address or hostname of the configured TACACS+ server.</td>
</tr>
<tr>
<td>Port</td>
<td>The configured TACACS+ server port number.</td>
</tr>
<tr>
<td>TimeOut</td>
<td>The timeout in seconds for establishing a TCP connection.</td>
</tr>
<tr>
<td>Priority</td>
<td>The preference order in which TACACS+ servers are contacted. If a server connection fails, the next highest priority server is contacted.</td>
</tr>
</tbody>
</table>
Configuration Scripting Commands

Configuration Scripting allows you to generate text-formatted script files representing the current configuration of a system. You can upload these configuration script files to a PC or UNIX system and edit them. Then, you can download the edited files to the system and apply the new configuration. You can apply configuration scripts to one or more switches with no or minor modifications.

Use the `show running-config` command (see show running-config on page 547) to capture the running configuration into a script. Use the `copy` command (see copy on page 569) to transfer the configuration script to or from the switch.

You should use scripts on systems with default configuration; however, you are not prevented from applying scripts on systems with non-default configurations.

Scripts must conform to the following rules:

- Script files are not distributed across the stack, and only live in the unit that is the master unit at the time of the file download.
- The file extension must be “.scr”.
- A maximum of ten scripts are allowed on the switch.
- The combined size of all script files on the switch shall not exceed 2048 KB.
- The maximum number of configuration file command lines is 2000.

You can type single-line annotations at the command prompt to use when you write test or configuration scripts to improve script readability. The exclamation point (!) character flags the beginning of a comment. The comment flag character can begin a word anywhere on the command line, and all input following this character is ignored. Any command line that begins with the “!” character is recognized as a comment line and ignored by the parser.

The following lines show an example of a script:

```plaintext
! Script file for displaying management access
show telnet !Displays the information about remote connections
! Display information about direct connections
show serial
! End of the script file!
```

**Note:** To specify a blank password for a user in the configuration script, you must specify it as a space within quotes. For example, to change the password for user `jane` from a blank password to `hello`, the script entry is as follows:

```plaintext
users passwd jane " "
```
**script apply**

Use this command to apply the commands in the script to the switch. The `<scriptname>` parameter is the name of the script to apply.

**Format**
```
script apply <scriptname>
```

**Mode**
Privileged EXEC

**script delete**

Use this command to delete a specified script, where the `<scriptname>` parameter is the name of the script to delete. The `<all>` option deletes all the scripts present on the switch.

**Format**
```
script delete {<scriptname> | all}
```

**Mode**
Privileged EXEC

**script list**

Use this command to list all scripts present on the switch as well as the remaining available space.

**Format**
```
script list
```

**Mode**
Global Config

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Script</td>
<td>Name of the script.</td>
</tr>
<tr>
<td>Size</td>
<td>Privileged EXEC</td>
</tr>
</tbody>
</table>

**script show**

Use this command to display the contents of a script file, which is named `<scriptname>`.

**Format**
```
script show <scriptname>
```

**Mode**
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Format</td>
<td>line &lt;number&gt;: &lt;line contents&gt;</td>
</tr>
</tbody>
</table>
**script validate**

Use this command to validate a script file by parsing each line in the script file, where `<scriptname>` is the name of the script to validate. The validate option is intended to be used as a tool for script development. Validation identifies potential problems. It might not identify all problems with a given script on any given device.

**Format**

```
script validate <scriptname>
```

**Mode**

Privileged EXEC

---

**Pre-Login Banner and System Prompt Commands**

This section describes the commands you use to configure the pre-login banner and the system prompt. The pre-login banner is the text that displays before you login at the `User:` prompt.

**copy (pre-login banner)**

Use a `copy` command option to upload or download the CLI Banner to or from the switch. You can specify local URLs by using TFTP, Xmodem, Ymodem, or Zmodem.

**Note:** `<ip6address>` is also a valid parameter for routing packages that support IPv6.

**Format**

```
copy <url> nvram:clibanner
copy nvram:clibanner <url>
```

**Mode**

Privileged EXEC

---

**set prompt**

Use this command to change the name of the prompt. The length of name may be up to 64 alphanumeric characters.

**Format**

```
set prompt <prompt_string>
```

**Mode**

Privileged EXEC
**set clibanner**

Use this command to add the CLI Banner. The banner message supports up to 2000 characters.

**Format**

```
set clibanner <line>
```

**Mode**

Global Config

**no set clibanner**

Use this command to remove the CLI Banner downloaded through TFTP.

**Format**

```
no set clibanner
```

**Mode**

Global Config

---

**Switch Database Management (SDM) Templates**

You can use SDM templates to configure system resources in the switch and optimize support for specific features depending on how the switch is used in the network. You can select a template to provide the maximum system usage for a specific function. For example, you could use a routing template to optimize resources for IPv4 routing if the network environment does not use IPv6 routing.

Note the following:

- If you configure an SDM template, you must reload the switch for the configuration to take effect.
- If you try to configure IPv6 routing without first selecting the dual IPv4-IPv6 routing template, a warning message appears.

**sdm prefer**

Use this command to specify the SDM template to use on the switch.

**Note**: This command is not supported on the following legacy switches: GSM7328S V2H1, GSM7352 V2H1, GSM7228PS V1H1, and GSM7228PS V1H1.
no sdm prefer

Use this command to return to the default template.

Format: no sdm prefer
Mode: Global Config

sdm prefer (Mixed Stacking)

Use this command to specify the SDM template to stack with the following switches.
GSM7328S V2H1, GSM7352S V2H1, GSM7228PS V1H1, GSM7228PS V1H1.

Format: sdm prefer {ipv4-routing smb | dual-ipv4-and-ipv6 { smb | data-center-smb}}
Mode: Global Config

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4-routing</td>
<td>Supports IPv4 routing only.</td>
</tr>
<tr>
<td>-data-center smb</td>
<td>Supports more ECMP next hops in IPv4 routes.</td>
</tr>
<tr>
<td>-data-center plus-enterprise smb</td>
<td>Same as data-center except with more IPv4 routes and ARP entries in enterprise mode.</td>
</tr>
<tr>
<td>-enterprise smb</td>
<td>Supports both IPv4 and IPv6 routing.</td>
</tr>
<tr>
<td>-enterprise</td>
<td>This option is visible only when the switch supports IPv6 and IPv4 routing.</td>
</tr>
<tr>
<td>-data-center-enterprise smb</td>
<td>Support both IPv4 and IPv6 with more ECMP next hops.</td>
</tr>
<tr>
<td>-enterprise</td>
<td>Supports both IPv4 and IPv6 routing.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

<tr>
<td>-smb</td>
<td>This option is visible only when the switch supports IPv6 and IPv4 routing.</td>
</tr>
<tr>
<td>-data-center-smb</td>
<td>Supports both IPv4 and IPv6 with more ECMP next hops.</td>
</tr>
<tr>
<td>-enterprise</td>
<td>Support both IPv4 and IPv6 routing.</td>
</tr>
</tbody>
</table>

show sdm prefer

Use this command to view the currently active SDM template and its scaling parameters, or to view the scaling parameters for an inactive template. When used with no optional keywords, this command lists the currently active template and the template that will become active on the next reboot, if it is different from the currently active template. If the system boots with a non-default template and you clear the template configuration either using no sdm prefer or by deleting the startup configuration, show sdm prefer lists the default template as the next active template.
Use the optional keywords to list the scaling parameters of a specific template.

**Format**
```
show sdm prefer [dual-ipv4-and-ipv6 default | ipv4-routing {default | data-center} ]
```

**Mode**
Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARP Entries</td>
<td>The maximum number of entries in the IPv4 Address Resolution Protocol (ARP) cache for routing interfaces.</td>
</tr>
<tr>
<td>IPv4 Unicast Routes</td>
<td>The maximum number of IPv4 unicast forwarding table entries.</td>
</tr>
<tr>
<td>IPv6 NDP Entries</td>
<td>The maximum number of IPv6 Neighbor Discovery Protocol (NDP) cache entries.</td>
</tr>
<tr>
<td>IPv6 Unicast Routes</td>
<td>The maximum number of IPv6 unicast forwarding table entries.</td>

<tr>
<td>ECMP Next Hops</td>
<td>The maximum number of next hops that can be installed in the IPv4 and IPv6 unicast forwarding tables.</td>
</tr>
<tr>
<td>IPv4 Multicast Routes</td>
<td>The maximum number of IPv4 multicast forwarding table entries.</td>
</tr>
<tr>
<td>IPv6 Multicast Routes</td>
<td>The maximum number of IPv6 multicast forwarding table entries.</td>
</tr>
</tbody>
</table>

**Example:**
```
#show sdm prefer
Current template: Dual IPv4 and IPv6
ARP Entries................................. 4096
IPv4 Unicast Routes.......................... 6112
IPv6 NDP Entries.............................. 2048
IPv6 Unicast Routes........................... 3072
ECMP Next Hops................... 4 I
IPv4 Multicast Routes.................. 256
IPv6 Multicast Routes.................. 256
```

**IPv6 Management Commands**

IPv6 Management commands allow a device to be managed via an IPv6 address in a switch or IPv4 routing (that is, independent from the IPv6 Routing package). For Routing/IPv6 builds of Switch CLI dual IPv4/IPv6 operation over the service port is enabled. Switch CLI has capabilities such as:

- Static assignment of IPv6 addresses and gateways for the network ports.
- The ability to ping an IPv6 link-local address over the network port.
- Using IPv6 Management commands, you can send SNMP traps and queries via the network port.
- The user can manage a device via the network port (in addition to a routing interface).
**network ipv6 enable**

Use this command to enable IPv6 operation on the network port.

**Default**  enabled

**Format**  network ipv6 enable

**Mode**  Privileged EXEC

**no network ipv6 enable**

Use this command to disable IPv6 operation on the network port.

**Format**  no network ipv6 enable

**Mode**  Privileged EXEC

**network ipv6 address**

Use this command to configure an IPv6 global address, enable or disable stateless global address autoconfiguration, and enable or disable dhcpv6 client protocol information for the network port. You can configure multiple IPv6 addresses on the network port.

**Format**  network ipv6 address {address/prefix-length [eui64] | autoconfig | dhcp}

**Mode**  Privileged EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>IPv6 prefix in IPv6 global address format.</td>
</tr>
<tr>
<td>prefix-length</td>
<td>IPv6 prefix length value.</td>
</tr>
<tr>
<td>eui64</td>
<td>Formulate IPv6 address in eui64 format.</td>
</tr>
<tr>
<td>autoconfig</td>
<td>Configure stateless global address autoconfiguration capability.</td>
</tr>
<tr>
<td>dhcp</td>
<td>Configure dhcpv6 client protocol.</td>
</tr>
</tbody>
</table>

**no network ipv6 address**

Use this command to:

- Remove the manually configured IPv6 global address on the network port interface (with the address option).
- Disable the stateless global address autoconfiguration on the network port (with the autoconfig option).
• Disable the dhcpv6 client protocol on the network port (with the dhcp option).

Format: no network ipv6 address {address/prefix-length [eui64] | autoconfig | dhcp}
Mode: Privileged EXEC

**network ipv6 gateway**

Use this command to configure IPv6 gateway (default routers) information for the network port. The gateway address is in IPv6 global or link-local address format.

Format: network ipv6 gateway <gateway-address>
Mode: Privileged EXEC

**no network ipv6 gateway**

Use this command to remove IPv6 gateways on the network port interface.

Format: no network ipv6 gateway
Mode: Privileged EXEC

**show network ndp**

Use this command to display NDP cache information for the network port.

Default: enabled
Format: show network ndp
Mode: • Privileged EXEC
• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Address</td>
<td>The IPv6 address of the interface.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC Address used.</td>
</tr>
<tr>
<td>isRtr</td>
<td>Specifies the router flag.</td>
</tr>
<tr>
<td>Neighbor State</td>
<td>The state of the neighbor cache entry. Possible values are: Reachable, Delay.</td>
</tr>
<tr>
<td>Age Updated</td>
<td>The time in seconds that has elapsed since an entry was added to the cache.</td>
</tr>
</tbody>
</table>

The following shows sample CLI display output for the command:

(switch) #show network ndp

<table>
<thead>
<tr>
<th>IPv6 Address</th>
<th>MAC Address</th>
<th>isRtr</th>
<th>Neighbor State</th>
<th>Age Updated</th>
</tr>
</thead>
<tbody>
<tr>
<td>3017::204:76FF:FE73:423A</td>
<td>00:04:76:73:42:3a</td>
<td>-</td>
<td>Reachable</td>
<td>447535</td>
</tr>
</tbody>
</table>
show network ipv6 dhcp statistics

Use this command to display the statistics of the DHCPv6 client running on the network management interface.

**Format**: show network ipv6 dhcp statistics

**Mode**: • Privileged EXEC

• User EXEC

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPv6 Advertisement Packets Received</td>
<td>The number of DHCPv6 Advertisement packets received on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Reply Packets Received</td>
<td>The number of DHCPv6 Reply packets received on the network interface.</td>
</tr>
<tr>
<td>Received DHCPv6 Advertisement Packets Discarded</td>
<td>The number of DHCPv6 Advertisement packets discarded on the network interface.</td>
</tr>
<tr>
<td>Received DHCPv6 Reply Packets Discarded</td>
<td>The number of DHCPv6 Reply packets discarded on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Malformed Packets Received</td>
<td>The number of DHCPv6 packets that are received malformed on the network interface.</td>
</tr>
<tr>
<td>Total DHCPv6 Packets Received</td>
<td>The total number of DHCPv6 packets received on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Solicit Packets Transmitted</td>
<td>The number of DHCPv6 Solicit packets transmitted on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Request Packets Transmitted</td>
<td>The number of DHCPv6 Request packets transmitted on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Renew Packets Transmitted</td>
<td>The number of DHCPv6 Renew packets transmitted on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Rebind Packets Transmitted</td>
<td>The number of DHCPv6 Rebind packets transmitted on the network interface.</td>
</tr>
<tr>
<td>DHCPv6 Release Packets Transmitted</td>
<td>The number of DHCPv6 Release packets transmitted on the network interface.</td>
</tr>
<tr>
<td>Total DHCPv6 Packets Transmitted</td>
<td>The total number of DHCPv6 packets transmitted on the network interface.</td>
</tr>
</tbody>
</table>

The following example shows CLI display output for the command:

```
(switch)#show network ipv6 dhcp statistics
DHCPv6 Client Statistics
-----------------------------------------------
DHCPv6 Advertisement Packets Received........... 0
DHCPv6 Reply Packets Received..................... 0
Received DHCPv6 Advertisement Packets Discarded.... 0
Received DHCPv6 Reply Packets Discarded........... 0
DHCPv6 Malformed Packets Received................ 0
```

Management Commands

719
clear network ipv6 dhcp statistics

Use this command to clear the DHCPv6 statistics on the network management interface.

**Format**
```
clear network ipv6 dhcp statistics
```

**Mode**
Privileged EXEC
This chapter lists common log messages, along with information regarding the cause of each message. There is no specific action that can be taken per message. When there is a problem being diagnosed, a set of these messages in the event log, along with an understanding of the system configuration and details of the problem will assist NETGEAR, Inc. in determining the root cause of such a problem.

**Note:** This chapter does not contain a complete list of all syslog messages.

This chapter contains the following sections:

- Core
- Utilities
- Management
- Switching
- QoS
- Routing/IPv6 Routing
- Multicast
- Stacking
- Technologies
- O/S Support

</tr>
<tr>
<td>OSPFv2</td>
<td>LSA Checksum error in LsUpdate, dropping LSID 1.2.3.4 checksum 0x1234.</td>
<td>OSPFv2 ignored a received link state advertisement (LSA) whose checksum was incorrect.</td>
</tr>
</tbody>
</table>

Table 41. OSPFv3 Log Messages

<table>
<thead>
<tr>
<th>Component</th>
<th>Message</th>
<th>Cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSPFv3</td>
<td>Best route client deregistration failed for OSPFv3 Redist</td>
<td>OSPFv3 registers with the IPv6 routing table manager (&quot;RTO6&quot;) to be notified of best route changes. There are cases where OSPFv3 deregisters more than once, causing the second deregistration to fail. The failure is harmless.</td>
</tr>
<tr>
<td>OSPFv3</td>
<td>Warning: OSPF LSDB is 90% full (15292 LSAs).</td>
<td>OSPFv3 limits the number of Link State Advertisements (LSAs) that can be stored in the link state database (LSDB). When the database becomes 90 or 95 percent full, OSPFv3 logs this warning. The warning includes the current size of the database.</td>
</tr>
<tr>
<td>OSPFv3</td>
<td>The number of LSAs, 16992, in the OSPF LSDB has exceeded the LSDB memory allocation.</td>
<td>When the OSPFv3 LSDB becomes full, OSPFv3 logs this message. OSPFv3 reoriginates its router LSAs with the R-bit clear indicating that OSPFv3 is overloaded.</td>
</tr>
<tr>
<td>OSPFv3</td>
<td>LSA Checksum error detected for LSID 1.2.3.4 checksum 0x34f5.</td>
<td>OSPFv3 periodically verifies the checksum of each LSA in memory. OSPFv3 logs this</td>
</tr>
</tbody>
</table>

</tbody>
</table>
The Captive Portal feature is a software implementation that blocks clients from accessing the network until user verification has been established. Verification can be configured to allow access for both guest and authenticated users. Authenticated users must be validated against a database of authorized Captive Portal users before access is granted.

The Authentication server supports both HTTP and HTTPS web connections. In addition, Captive Portal can be configured to use an optional HTTP port (in support of HTTP Proxy networks). If configured, this additional port is then used exclusively by Captive Portal. Note that this optional port is in addition to the standard HTTP port 80 which is currently being used for all other web traffic.

This chapter contains the following sections:

- Captive Portal Global Commands
- Captive Portal Configuration Commands
- Captive Portal Status Commands
- Captive Portal Client Connection Commands
- Captive Portal Interface Commands
- Captive Portal Local User Commands
- Captive Portal User Group Commands

**Captive Portal Global Commands**

The commands in this section are related to Captive Portal Global configurations.

`captive-portal`

Use this command to enter the captive portal configuration mode.

<table>
<thead>
<tr>
<th>Format</th>
<th>captive-portal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Global Configuration mode</td>
</tr>
</tbody>
</table>
**enable**

Use this command to globally enable captive portal.

**Default**

disabled

**Format**

enable

**Mode**

Captive Portal Configuration mode

**no enable**

Use this command to globally disable captive portal.

**Default**

disabled

**Format**

no enable

**Mode**

Captive Portal Configuration mode

**http port**

Use this command to configure an additional HTTP port for captive portal to monitor. The valid range is from 0 to 65535.

**Default**

80

**Format**

http port  <0-65535>

**Mode**

Captive Portal Configuration mode

**no http port**

Use this command to reset the HTTP port to the default number 80.

**Format**

no http port

**Mode**

Captive Portal Configuration mode

**https port**

Use this command to configure an additional HTTPS port for captive portal to monitor. The valid range is from 0 to 65535.

**Default**

443

**Format**

https port  <0-65535>

**Mode**

Captive Portal Configuration mode
no https port

Use this command to reset the HTTPs port to the default HTTPS port 443.

Format: no https port
Mode: Captive Portal Configuration mode

authentication timeout

Use this command to configure the authentication timeout. If the user does not enter valid credentials within this time limit, the authentication page needs to be served again in order for the client to gain access to the network.

Default: 300
Format: authentication timeout <60-600>
Mode: Captive Portal Configuration mode

no authentication timeout

Use this command to reset the authentication timeout to the default.

Default: 300
Format: no authentication timeout
Mode: Captive Portal Configuration mode

show captive-portal

Use this command to display the status of the captive portal feature.

Format: show captive-portal
Mode: Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative Mode</td>
<td>The administrative mode is enabled or disabled.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>The Operational status is enabled or disabled.</td>

```
Captive Portal Configuration Commands

The commands in this section are related to captive portal configurations.

configuration (Captive Portal)

Use this command to enter the captive portal instance mode. The captive portal configuration identified by CP ID 1 is the default CP configuration. The system supports a total of ten CP configurations.

Format
configuration <1-10>
Mode Captive Portal Configuration mode

no configuration

Use this command to delete a CP configuration. The default configuration cannot be deleted.

Format
no configuration <1-10>
Mode Captive Portal Configuration mode

enable (Instance)

Use this command to enable a captive portal configuration.

Default enable
Format enable
Mode Captive Portal Instance mode

no enable

Use this command to disable a configuration.

Default enable
Format no enable
Mode Captive Portal Instance mode

name

Use this command to configure the name for a captive portal configuration. The cp-name can be up to 32 alphanumeric characters in length.

Default Configuration 1 has the name "Default" by default. All other configurations have no name by default.
no name

Use this command to remove a configuration name.

Format
no name

Mode
Captive Portal Instance mode

protocol

Use this command to configure the protocol mode for a captive portal configuration. The default protocol is http.

Default
http

Format
protocol { http | https }

Mode
Captive Portal Instance mode

verification

Use this command to configure the verification mode for a captive portal configuration. User verification can be configured to allow access for guest users; users that do not have assigned user names and passwords. User verification can also be configured to allow access for authenticated users. Authenticated users are required to enter a valid user name and password that must first be validated against the local database or a RADIUS server. Network access is granted once user verification has been confirmed.

Default
guest

Format
verification { guest | local | radius }

Mode
Captive Portal Instance mode

group

Use this command to configure a group ID for this captive portal configuration. If a group number is configured, the user entry (Local or RADIUS) must be configured with the same name and the group to authenticate to this captive portal instance. The group ID must be assigned first. If it isn’t, use the user group <1-10> command to create the group ID. The default group ID is 1 for a captive portal configuration.

Default
1

Format
group <1-10>

Mode
Captive Portal Instance mode
no group

Use this command to reset the group number to the default.

Default 1
Format no group <1-10>
Mode Captive Portal Instance mode

redirect (Captive Portal)

Use this command to enable the redirect mode for a captive portal configuration. Use the “no” form of this command to disable redirect mode.

Default disable
Format redirect
Mode Captive Portal Instance mode

no redirect

Use this command to disable redirect mode.

Format no redirect
Mode Captive Portal Instance mode

redirect-url

Use this command to configure the redirect URL for a captive portal configuration. The url is the URL for redirection which can be up to 512 characters in length.

Format redirect-url url
Mode Captive Portal Instance mode

max-bandwidth-down

Use this command configures the maximum rate at which a client can receive data from the network. The rate is in bits per seconds. 0 indicates limit not enforced.

Default 0
Format max-bandwidth-down <0-536870911>
Mode Captive Portal Instance mode
**no max-bandwidth-down**

Use this command to reset the maximum rate to the default.

**Format**

```
no max-bandwidth-down
```

**Mode**

Captive Portal Instance mode

**max-bandwidth-up**

Use this command to configure the maximum rate at which a client can send data into the network. The rate is in bits per seconds. 0 indicates limit not enforced.

**Default**

```
0
```

**Format**

```
max-bandwidth-up <0-536870911>
```

**Mode**

Captive Portal Instance mode

**no max-bandwidth-up**

Use this command to reset the maximum rate to the default.

**Format**

```
no max-bandwidth-up
```

**Mode**

Captive Portal Instance mode

**max-input-octets**

Use this command to configure the maximum number of octets the user is allowed to transmit. After this limit has been reached the user will be disconnected. The number of octets is in bytes. 0 indicates limit not enforced.

**Default**

```
0
```

**Format**

```
max-input-octets <0-4294967295>
```

**Mode**

Captive Portal Instance mode

**no max-input-octets**

Use this command to reset the limit to the default.

**Format**

```
no max-input-octets
```

**Mode**

Captive Portal Instance mode

**max-output-octets**

Use this command to configure the maximum number of octets the user is allowed to receive. After this limit has been reached the user will be disconnected. The number of octets is in bytes. 0 indicates limit not enforced Use the "no".

Default 0

Format `max-output-octets <0-4294967295>`

Mode Captive Portal Instance mode

**no max-output-octets**

Use this command to reset the limit to the default.

Format `no max-output-octets`

Mode Captive Portal Instance mode

**max-total-octets**

Use this command to configure the maximum number of octets the user is allowed to transfer; that is, the sum of octets transmitted and received. After this limit has been reached the user will be disconnected. The number of total octets is in bytes. 0 indicates limit not enforced. Use the "no" form of this command to reset the limit to the default.

Default 0

Format `max-total-octets <0-4294967295>`

Mode Captive Portal Instance mode

**no max-total-octets**

Use this command to reset the limit to the default.

Default 0

Format `max-total-octets <0-4294967295>`

Mode Captive Portal Instance mode

**session-timeout (Captive Portal)**

Use this command to configure the session timeout for a captive portal configuration. After this limit has been reached, the user will be disconnected. Timeout is time in seconds. 0 indicates timeout not enforced.

Default 0

Format `session-timeout <0-86400>`

Mode Captive Portal Instance mode
no session-timeout

Use this command to reset the session timeout to the default.

Format: session-timeout <0-86400>
Mode: Captive Portal Instance mode

idle-timeout

Use this command to configure the idle timeout for a captive portal configuration. 0 indicates timeout not enforced. After an idle session has been reached this, the user will be disconnected.

Default: 0
Format: idle-timeout <0-900>
Mode: Captive Portal Instance mode

no idle-timeout

Use this command to reset the idle timeout to the default.

Format: no idle-timeout
Mode: Captive Portal Instance mode

locale

This command is not intended to be a user command. The administrator must use the WEB UI to create and customize captive portal web content. This command is primarily used by the show running-config command and process as it provides the ability to save and restore configurations using a text based format.

Default: 1
Format: locale <1-5>
Mode: Captive Portal Instance mode

no locale

This command is intended to delete a locale. The default locale cannot be deleted.

Format: no locale <1-5>
Mode: Captive Portal Instance mode
**interface (Captive Portal)**

Use this command to associate an interface with a captive portal configuration.

**Format**

interface <unit/slot/port>

**Mode**

Captive Portal Instance Config mode

**no interface**

Use this command to remove an association with a captive portal configuration.

**Format**

no interface <unit/slot/port>

**Mode**

Captive Portal Instance Config mode

**block**

Use this command to block all traffic for a captive portal configuration. The administrator can block access to a captive portal configuration. When an instance is blocked no client traffic is allowed through any interfaces associated with that captive portal configuration. Blocking a captive portal instance is a temporary command executed by the administrator and not saved in the configuration.

**Default**

no block

**Format**

block

**Mode**

Captive Portal Instance mode

**no block**

Use this command to unblock traffic.

**Format**

no block

**Mode**

Captive Portal Instance mode

---

**Captive Portal Status Commands**

This section describes commands that return captive portal status.

**show captive-portal configuration**

Use this command to display the operational status of each captive portal configuration.

**Format**

show captive-portal configuration <1-10>

**Mode**

Privileged EXEC mode
Captive Portal Commands

### ProSafe Managed Switch

#### Example

```
(show captive-portal configuration 1
CP ID..................................... 1
CP Name................................... cp1
Operational Status........................ Disabled
Disable Reason............................ Administrator Disabled
Blocked Status............................ Not Blocked
Authenticated Users....................... 0
```

#### show captive-portal configuration interface

Use this command to display information about all interfaces assigned to a captive portal configuration or about a specific interface assigned to a captive portal configuration. The `<1-10>` is the captive portal ID. If you do not specify an interface number, all the interfaces assigned to the captive portal configuration will be displayed.

**Format**

```
show captive-portal configuration <1-10> interface [ <unit/slot/port> ]
```

**Mode**

Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal ID</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal instance name</td>
</tr>
<tr>
<td>Operational Status</td>
<td>The operational status is enabled or disabled.</td>
</tr>
<tr>
<td>Disable Reason</td>
<td>If the operational status is disabled, this field shows the reason.</td>
</tr>
<tr>
<td>Blocked Status</td>
<td>Blocked status shows if this captive portal instance block all traffic.</td>
</tr>
<tr>
<td>Authenticated Users</td>
<td>The authenticated users by this captive portal instance.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal ID</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal name</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface associated with the CP ID</td>
</tr>
<tr>
<td>Interface Description</td>
<td>The interface description</td>
</tr>
<tr>
<td>Operational Status</td>
<td>The operational status is enabled or disabled.</td>
</tr>
<tr>
<td>Disable Reason</td>
<td>The reason if the operational status is disabled.</td>
</tr>
<tr>
<td>Block Status</td>
<td>It shows this captive portal instance block all traffic or not.</td>
</tr>
</tbody>
</table>
If the interface is specified. The following term will be displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authenticated users</td>
<td>The number of authenticated users associated with the CP ID.</td>
</tr>
</tbody>
</table>

Example

(Switch)#show captive-portal configuration 1 interface
CP ID..................................... 1
CP Name................................... cp1

<table>
<thead>
<tr>
<th>Interface</th>
<th>Interface Description</th>
<th>Status</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit:1 Slot:0 Port:1</td>
<td>Disabled</td>
<td></td>
<td>Blocked</td>
</tr>
</tbody>
</table>

(Switch)#show captive-portal configuration 1 interface 1/0/1
CP ID..................................... 1
CP Name................................... cp1
Interface.................................. 1/0/1
Interface Description..................... Unit: 1 Slot: 0 Port: 1 Gigab
Operational Status....................... Disabled
Disable Reason............................ Interface Not Attached
Block Status.............................. Not Blocked
Authenticated Users....................... 0

**show captive-portal configuration status**

Use this command to display information about all configured captive portal configurations or about a specific captive portal configuration. The <1-10> is captive portal ID. If <1-10> is not entered, all the configurations are displayed.

**Format**

show captive-portal configuration [ <1-10> ] status

**Mode**

Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal instance ID</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal instance name</td>

<tr>
<td>Mode</td>
<td>The operational mode is enabled or disabled.</td>
</tr>
<tr>
<td>Protocol Mode</td>
<td>The protocol mode is https or http.</td>
</tr>
<tr>
<td>Verification Mode</td>
<td>The user verification mode has three modes: guest, local and radius. The default is guest mode.</td>
</tr>
</tbody>
</table>
If the interface is specified, the following terms are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>The name of the group associated with this captive portal instance.</td>
</tr>
<tr>
<td>Redirect URL Mode</td>
<td>The redirect mode for this captive portal instance</td>
</tr>
<tr>
<td>Redirect URL</td>
<td>The redirect URL is up to 512 characters.</td>
</tr>
<tr>
<td>Session Timeout</td>
<td>Logout once session timeout is reached (seconds).</td>
</tr>
<tr>
<td>Idle Timeout</td>
<td>Logout once idle timeout is reached (seconds).</td>
</tr>
<tr>
<td>Max Bandwidth Up</td>
<td>Maximum client transmit rate (b/s). Limits the bandwidth at which the client can send data into the network.</td>
</tr>
<tr>
<td>Max Bandwidth Down</td>
<td>Maximum client receive rate (b/s). Limits the bandwidth at which the client can receive data from the network.</td>
</tr>
<tr>
<td>Max Input Octets</td>
<td>Maximum number of octets the user is allowed to transmit. After this limit has been reached the user will be disconnected.</td>
</tr>
<tr>
<td>Max Output Octets</td>
<td>Maximum number of octets the user is allowed to receive. After this limit has been reached the user will be disconnected.</td>
</tr>
<tr>
<td>Max Total Octets</td>
<td>Maximum number of octets the user is allowed to transfer (sum of octets transmitted and received). After this limit has been reached the user will be disconnected.</td>
</tr>
</tbody>
</table>

Example

```plaintext
(switch)#show captive-portal configuration status
CP ID     CP Name        Mode     Protocol    Verification
-----    ----------    --------   --------    ------------
1          cp1          Enable     https       Guest
2          cp2          Enable     http        Local
3          cp3          Disable    https       Guest

(switch)#show captive-portal configuration 1 status
CP ID.......................................... 1
CP Name........................................ cp1
Mode........................................... Enabled
Protocol Mode.................................. https
Verification Mode.............................. Guest
Group Name..................................... group123
Redirect URL Mode.............................. Enabled
Redirect URL................................... www.cnn.com
Session Timeout (seconds)...................... 86400
Idle Timeout (seconds)......................... 600
Max Bandwidth Up (bytes/sec)................... 0
Max Bandwidth Down (bytes/sec)................. 0
Max Input Octets (bytes)....................... 0
Max Output Octets (bytes)...................... 0
Max Total Octets (bytes)....................... 0
```
show captive-portal configuration locales

Use this command to display locales associated with a specific captive portal configuration. <1-10> is captive port ID.

Format          show captive-portal configuration <1-10> locales
Mode            Privileged EXEC mode

Example

(switch)#show captive-portal configuration 1 locales
Locale Code
---------------
En

show captive-portal trapflags

Use this command to display which captive portal traps are enabled.

Format          show captive-portal trapflags
Mode            Privileged EXEC mode

Example

(switch)#show captive-portal trapflags
Client Authentication Failure Traps............ Disable
Client Connection Traps........................ Disable
Client Database Full Traps..................... Disable
Client Disconnection Traps..................... Disable

Captive Portal Client Connection Commands

This section describes captive portal client connection commands.

show captive-portal client status

Use this command to display client connection details or a connection summary for connected captive portal users. macaddr is Client MAC address. If no macaddr is entered, all the client status will be displayed.

Format          show captive-portal client [ macaddr ] status
Mode            Privileged EXEC mode
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client MAC Address</td>
<td>The MAC address of the authenticated user</td>
</tr>
<tr>
<td>Client IP Address</td>
<td>The IP address of the authenticated user</td>
</tr>
<tr>
<td>Protocol</td>
<td>The protocol the user is using to access the network.</td>
</tr>
<tr>
<td>Verification</td>
<td>The verification mode for this client.</td>
</tr>
<tr>
<td>Session Time</td>
<td>The current session time since the client is authenticated.</td>
</tr>
</tbody>
</table>

If the macaddr is specified, the following terms are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal ID associated with the client</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal name associated with the client</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface on which the client authenticated.</td>
</tr>
<tr>
<td>Interface Description</td>
<td>The interface description</td>
</tr>
<tr>
<td>User Name</td>
<td>The name of the client who is authenticated.</td>
</tr>
</tbody>
</table>

Example

```
(switch)#show captive-portal client status
Client MAC Address   Client IP Address  Protocol  Verification  Session Time
-----------------   ----------------   --------  ------------   -----  
0002.BC00.1290      10.254.96.47     https     Local       0d:00:01:20
0002.BC00.1291      10.254.96.48     https     Local       0d:00:05:20
0002.BC00.1292      10.254.96.49     https     Radius      0d:00:00:20

(switch)#show captive-portal client 0002.BC00.1290 status
Client MAC Address........................ 0002.BC00.1290
Client IP Address......................... 10.254.96.47
Protocol Mode............................. https
Verification Mode......................... Local
CP ID..................................... 1
CP Name................................... cp1
Interface................................. 1/0/1
Interface Description..................... Unit: 1 Slot: 0 Port: 1 Gigabit - Level
User Name.................................. user123
Session Time.............................. 0d:00:00:13
```
**show captive-portal client statistics**

Use this command to display the statistics for a specific captive portal client. The macaddr is client MAC address.

**Format**

```
show captive-portal client <macaddr> statistics
```

**Mode**

Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client MAC address</td>
<td>The MAC address of the authenticated client</td>
</tr>
<tr>
<td>Bytes Received</td>
<td>The number of bytes received from the client</td>
</tr>
<tr>
<td>Bytes Transmitted</td>
<td>The number of bytes transmitted to the client</td>
</tr>
<tr>
<td>Packets Received</td>
<td>The number of packets received from the client</td>
</tr>
<tr>
<td>Packets Transmitted</td>
<td>The number of packets transmitted from the client</td>
</tr>
</tbody>
</table>

**Example**

```
(switch)#show captive-portal client 0102.0304.0506 statistics
Client MAC Address....................... 0002.bc00.1290
Bytes Received.......................... 0
Bytes Transmitted....................... 0
Packets Received........................ 0
Packets Transmitted..................... 0
```

**show captive-portal interface client status**

Use this command to display information about clients authenticated on all interfaces or a specific interface.

**Format**

```
show captive-portal interface [<unit/slot/port>] client status
```

**Mode**

Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Intf</td>
<td>Interface on which the clients are authenticated.</td>
</tr>
<tr>
<td>Client Intf Description</td>
<td>The interface description</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address of the authenticated user.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address of the authenticated user.</td>
</tr>
</tbody>
</table>
If the interface is specified, the following terms are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The ID of the captive portal associated with the client</td>
</tr>
<tr>
<td>CP Name</td>
<td>The name of the captive portal associated with the client</td>
</tr>
<tr>
<td>Protocol</td>
<td>The protocol the client is using</td>
</tr>
<tr>
<td>Verification</td>
<td>The user verification mode</td>
</tr>
</tbody>
</table>

**Example**

(Switch)#show captive-portal interface client status

<table>
<thead>
<tr>
<th>Client</th>
<th>Client</th>
<th>Intf</th>
<th>Intf Description</th>
<th>MAC Address</th>
<th>IP Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>------</td>
<td>------</td>
<td>----------</td>
<td>----------------------</td>
<td>---------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>1/0/1</td>
<td>Unit: 1 Slot: 0 Port: 1 Gigabit</td>
<td>0002.BC00.1290</td>
<td>10.254.96.47</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1/0/2</td>
<td>Unit: 1 Slot: 0 Port: 2 Gigabit</td>
<td>0002.BC00.1292</td>
<td>10.254.96.49</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1/0/3</td>
<td>Unit: 1 Slot: 0 Port: 3 Gigabit</td>
<td>0002.BC00.1293</td>
<td>10.254.96.50</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(Switch)#show captive-portal interface 1/0/1 client status

Interface........................................ 1/0/1

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>IP Address</th>
<th>CP ID</th>
<th>CP Name</th>
<th>Protocol</th>
<th>Verification</th>
</tr>
</thead>
<tbody>
<tr>
<td>0002.BC00.1290</td>
<td>10.254.96.47</td>
<td>1</td>
<td>cp1</td>
<td>http</td>
<td>local</td>
</tr>
<tr>
<td>0002.BC00.1291</td>
<td>10.254.96.48</td>
<td>2</td>
<td>cp2</td>
<td>http</td>
<td>local</td>
</tr>
</tbody>
</table>

**show captive-portal configuration client status**

Use this command to display the clients authenticated to all captive portal configurations or a specific configuration. <1-10> is the captive portal ID.

**Format**

show captive-portal configuration [ <1-10> ] client status

**Mode**

Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal ID</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal name</td>
</tr>
<tr>
<td>Client MAC Address</td>
<td>The MAC address of the client associated with the captive portal instance.</td>
</tr>
<tr>
<td>Client IP Address</td>
<td>The IP address of the client associated with the captive portal instance</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface on which the client is authenticated.</td>
</tr>
</tbody>
</table>
If the CP ID is specified, the following terms are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The description of the interface</td>
</tr>
</tbody>
</table>

**Example**

```
(switch)#show captive-portal configuration client status
CP ID  CP Name  Client MAC Address    Client IP Address   Interface
-----  -------  ------------------    -----------------  ---------
1      cp1     0002.BC00.1290       10.254.96.47        1/0/1
2      cp2     0002.BC00.1292       10.254.96.49        1/0/3
3      cp3     0002.BC00.1293       10.254.96.50        1/0/4

(switch)#show captive-portal configuration 1 client status
CP ID..................................... 1
CP Name................................... cp1
Client            Client
MAC Address      IP Address     Interface    Interface Description
--------------   -------------  ---------    ----------------------
0002.BC00.1290   10.254.96.47    1/0/1   Unit:1 Slot:0 Port:1 Gigabit
0002.BC00.1291   10.254.96.48    1/0/2   Unit:1 Slot:0 Port:2 Gigabit
```

captive-portal client deauthenticate

Use this command to deauthenticate a specific captive portal client. The `macaddr` is the Client MAC address.

**Format**
captive-portal client deauthenticate [macaddr]|<1-10>|

**Mode**
Privileged EXEC mode

**Captive Portal Interface Commands**

The following section describes captive portal interface commands.

**show captive-portal interface configuration status**

Use this command to display the interface to configuration assignments for all captive portal configurations or for a specific configuration. `<1-10>` is the captive portal ID.

**Format**
show captive-portal interface configuration [ <1-10>] status

**Mode**
Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP ID</td>
<td>The captive portal ID</td>
</tr>
<tr>
<td>CP Name</td>
<td>The captive portal name</td>
</tr>
</tbody>
</table>
Example

(switch)#show captive-portal interface configuration status
CP ID   CP Name      Interface    Interface Description              Type
----- ------------   --------- ----------------------------         --------
1       Default       1/0/1      Unit: 1 Slot: 0 Port: 1 Gigabit     Physical

(switch)#show captive-portal interface configuration 1 status
CP ID..................................... 1
CP Name................................... cp1
Interface      Interface Description                Type
---------      --------------------------------- --------
1/0/1          Unit: 1 Slot: 0 Port: 1 Gigabit    Physical

Captive Portal Local User Commands

The following section describes captive portal local user commands.

user password

Use this command to create a local user or change the password for an existing user. The
user-id is user ID in the range of 1-128. The password is the user password in the range of
8-64 characters. You can also enter encrypted password using the parameter encrypted.

Format  user user-id password { password | encrypted enc-password }
Mode    Captive Portal Configuration mode

no user

Use this command to delete a user from the local user database. If the user has an existing
session, it is disconnected.

Format  no user user-id <1-128>
Mode    Captive Portal Configuration mode
**user name**

Use this command to modify the user name for a local captive portal user. `<1-128>` is the user ID and the name is the user name in the range of 1-32 characters. The local user must exist before you use this command. You can create the local user using user password first.

**Format**

```
user <1-128> name name
```

**Mode**

Captive Portal Configuration mode

**user group**

Use this command to associate a group with a captive portal user. A user must be associated with at least one group so the last group cannot be dis-associated. `<1-128>` is the user ID and `<1-10>` is the group ID.

**Default**

1

**Format**

```
user <1-128> group <1-10>
```

**Mode**

Captive Portal Configuration mode

**no user group**

Use this command to dis-associate a group and user.

**Format**

```
no user <1-128> group <1-10>
```

**Mode**

Captive Portal Configuration mode

**user session-timeout**

Use this command to set the session timeout value for a captive portal user. Use the “no” form of this command to reset the session timeout to the default. The range of session timeout is 0-86400. 0 indicates use global configuration.

**Default**

0

**Format**

```
user <1-128> session-timeout timeout
```

**Mode**

Captive Portal Configuration mode

**no user session-timeout**

Use this command to reset the session timeout to the default.

**Format**

```
no user <1-128> session-timeout
```

**Mode**

Captive Portal Configuration mode
**user idle-timeout**

Use this command to set the session idle timeout value for a captive portal user. <1-128> is the user ID. The range of idle timeout is 0-900 seconds. 0 indicates use global configuration.

Default 0

Format `user <1-128> idle-timeout timeout`

Mode Captive Portal Configuration mode

**no user idle-timeout**

Use this command to reset the idle timeout to the default value.

Format `no user <1-128> idle-timeout timeout`

Mode Captive Portal Configuration mode

**user max-bandwidth-down**

Use this command to configure the bandwidth at which the client can receive data from the network. <1-128> is the user ID. The range of bps is <0-536870911> bps. 0 indicates use global configuration.

Default 0

Format `user <1-128> max-bandwidth-down bps`

Mode Captive Portal Configuration mode

**no user max-bandwidth-down**

Use this command to reset the limit to the default.

Format `no user <1-128> max-bandwidth-down`

Mode Captive Portal Configuration mode

**user max-bandwidth-up**

Use this command to configure the bandwidth at which the client can send data into the network. <1-128> is the user ID. The range of bps is <0-536870911> bps. 0 indicates use global configuration.

Default 0

Format `user <1-128> max-bandwidth-up bps`

Mode Captive Portal Configuration mode
**no user max-bandwidth-up**

Use this command to reset the limit to the default.

**Format**

`no user <1-128> max-bandwidth-up`

**Mode**

Captive Portal Configuration mode

**user max-input-octets**

Use this command to limit the number of octets the user is allowed to transmit. After this limit has been reached the user will be disconnected. `<1-128>` is the user ID. The range of `octets` is 0-4294967295. 0 indicates to use the global limit.

**Default**

0

**Format**

`user <1-128> max-input-octets octets`

**Mode**

Captive Portal Configuration mode

**no user max-input-octets**

Use this command to reset the limit to the default.

**Format**

`no user <1-128> max-input-octets`

**Mode**

Captive Portal Configuration mode

**user max-output-octets**

Use this command to limit the number of octets the user is allowed to receive. After this limit has been reached the user will be disconnected. The `<1-128>` is the user ID. The range of the `octets` is 0 – 4294967295. 0 indicates to use the global limit.

**Default**

0

**Format**

`user <1-128> max-output-octets octets`

**Mode**

Captive Portal Configuration mode

**no user max-output-octets**

Use this command to reset the limit to the default.

**Default**

0

**Format**

`no user <1-128> max-output-octets`

**Mode**

Captive Portal Configuration mode

**user max-total-octets**

Use this command to limit the number of bytes the user is allowed to transmit and receive. The maximum number of octets is the sum of octets transmitted and received. After this limit
has been reached the user will be disconnected. <1-128> is the user ID. The range of octets is 0-4294967295. 0 indicates to use the global limit. Use the “no” form of this command to reset the limit to the default.

Default: 0
Format: user <1-128> max-total-octets octets
Mode: Captive Portal Configuration mode

**no user max-total-octets**

Use this command to reset the limit to the default.

Format: no user <1-128> max-total-octets
Mode: Captive Portal Configuration mode

**show captive-portal user**

Use this command to display all configured users or a specific user in the captive portal local user database.

Format: show captive-portal user [ <1-128> ]
Mode: Privileged EXEC mode

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID</td>
<td>The user ID</td>
</tr>
<tr>
<td>User Name</td>
<td>The user name</td>
</tr>
<tr>
<td>Session Timeout</td>
<td>Logout once session timeout is reached (seconds). If the value is 0 then use the value configured for the captive portal.</td>
</tr>
<tr>
<td>Idle Timeout</td>
<td>Logout once idle timeout is reached (seconds). If the attribute is 0 then use the value configured for the captive portal.</td>
</tr>
<tr>
<td>Group ID</td>
<td>The group ID associated with the user</td>
</tr>
<tr>
<td>Group Name</td>
<td>The group name</td>
</tr>
</tbody>
</table>

If the user ID is specified, the following terms are displayed.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Password Configured</td>
<td>If the password is configured.</td>
</tr>
<tr>
<td>Max Bandwidth Up</td>
<td>Maximum client transmit rate (b/s). Limits the bandwidth at which the client can send data into the network. If the value is 0 then use the value configured for the captive portal.</td>
</tr>
</tbody>
</table>
**Captive Portal Commands**

---

### ProSafe Managed Switch

#### Example

```
(switch)#show captive-portal user

<table>
<thead>
<tr>
<th>User ID</th>
<th>User Name</th>
<th>Session</th>
<th>Idle</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------</td>
<td>--------</td>
<td>-------</td>
<td>------</td>
</tr>
<tr>
<td>1</td>
<td>user123</td>
<td>10</td>
<td>13</td>
</tr>
<tr>
<td>2</td>
<td>user234</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

User ID:................. 1
User Name:.................. user123
Password Configured:........ Yes
Session Timeout:............. 0
Idle Timeout:................. 0
Max Bandwidth Up (bytes/sec):........ 0
Max Bandwidth Down (bytes/sec):........ 0
Max Input Octets (bytes):........ 0
Max Output Octets (bytes):........ 0
Max Total Octets (bytes):........ 0
Group ID | Group Name
---------|------------
1        | Default
2        | group2
```

---

### clear captive-portal users

Use this command to delete all captive portal user entries.

**Format**

```
clear captive-portal users
```

**Mode**

Privileged EXEC mode
Captive Portal User Group Commands

The following section describes captive portal user group commands.

**user group (Create)**

Use this command to create a user group. User group 1 is created by default and cannot be deleted.

- **Default**: 1
- **Format**: `user group <1-10>`
- **Mode**: Captive Portal Configuration mode

**no user group**

Use this command to delete a user group. The default user group (1) cannot be deleted.

- **Format**: `user group <1-10>`
- **Mode**: Captive Portal Configuration mode

**user group name**

Use this command to configure a group name. `<1-10>` is the user group ID. The name can be a string up to 32 characters.

- **Format**: `user group <1-10> name name`
- **Mode**: Captive Portal Configuration mode

**user group rename**

Use this command to change a group’s ID to a different group ID.

- **Format**: `user group group-id rename new-group-id`
- **Mode**: Captive Portal Configuration mode
