Appendix C  Notification of Compliance

Index
Getting Started

This chapter provides an overview of starting your NETGEAR ProSafe M5300 Switch and accessing the user interface. This chapter contains the following sections:

- **Switch Management Interface** on page 9
- **Web Access** on page 9
- **Understanding the User Interfaces** on page 10
- **Interface Naming Convention** on page 17

**Switch Management Interface**

The switches in the NETGEAR ProSafe M5300 family contain an embedded Web server and management software for managing and monitoring switch functions. M5300 Series devices function as simple switches without the management software. However, you can use the management software to configure more advanced features that can improve switch efficiency and overall network performance.

Web-based management lets you monitor, configure, and control your switch remotely using a standard Web browser instead of using expensive and complicated SNMP software products. From your Web browser, you can monitor the performance of your switch and optimize its configuration for your network. You can configure all switch features, such as VLANs, QoS, and ACLs by using the Web-based management interface.

**Web Access**

To access the M5300 Series management interface, open a Web browser and enter the IP address of the switch in the address field.

You must be able to ping the IP address of the M5300 Series management interface from your administrative system for Web access to be available. If you did not change the IP address of the switch from the default value, enter 192.168.1.1 into the address field.
Getting Started

Accessing the switch directly from your Web browser displays the login screen shown below.

Understanding the User Interfaces

ProSafe M5300 software includes a set of comprehensive management functions for configuring and monitoring the system by using one of the following methods:

- Web user interface
- Simple Network Management Protocol (SNMP)
- Command Line Interface (CLI)

Each of the standards-based management methods allows you to configure and monitor the components of the ProSafe M5300 software. The method you use to manage the system depends on your network size and requirements, and on your preference.

The Web Management User Guide Web Management User Guide describes how to use the Web-based interface to manage and monitor the system.

Using the Web Interface

To access the switch by using a Web browser, the browser must meet the following software requirements:

- HTML version 4.0, or later
- HTTP version 1.1, or later
- Java Runtime Environment 1.6 or later
Use the following procedures to log on to the Web interface:

1. Open a Web browser and enter the IP address of the switch in the Web browser address field.
2. The default user name is **admin**, default password is none (no password). Type the user name into the field on the login screen and then click **Login**. User names and passwords are case sensitive.
3. After the system authenticates you, the System Information page displays.

The figure below shows the layout of the Managed Switch Web interface.

**Navigation Tabs, Feature Links, and Page Menu**

The navigation tabs along the top of the Web interface give you quick access to the various switch functions. The tabs are always available and remain constant, regardless of which feature you configure.

When you select a tab, the features for that tab appear as links directly under the tabs. The feature links in the blue bar change according to the navigation tab that is selected.

The configuration pages for each feature are available as links in the page menu on the left side of the page. Some items in the menu expand to reveal multiple configuration pages, as the following figure shows. When you click a menu item that includes multiple configuration pages, the item becomes preceded by a down arrow symbol and expands to display the additional pages.
Configuration and Monitoring Options

The area directly under the feature links and to the right of the page menu displays the configuration information or status for the page you select. On pages that contain configuration options, you can input information into fields or select options from drop-down menus.

Each page contains access to the HTML-based help that explains the fields and configuration options for the page. Each page also contains command buttons.

*Table 1* shows the command buttons that are used throughout the pages in the Web interface:

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD</td>
<td>Clicking ADD adds the new item configured in the heading row of a table.</td>
</tr>
<tr>
<td>APPLY</td>
<td>Clicking APPLY sends the updated configuration to the switch. Configuration changes take effect immediately.</td>
</tr>
<tr>
<td>CANCEL</td>
<td>Clicking CANCEL cancels the configuration on the screen and resets the data on the screen to the latest value of the switch.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Clicking DELETE removes the selected item.</td>
</tr>
<tr>
<td>REFRESH</td>
<td>Clicking REFRESH updates the page with the latest information from the device.</td>
</tr>
<tr>
<td>LOGOUT</td>
<td>Clicking the LOGOUT button ends the session.</td>
</tr>
</tbody>
</table>
Device View

The Device View is a Java® applet that displays the ports on the switch. This graphic provides an alternate way to navigate to configuration and monitoring options. The graphic also provides information about device ports, current configuration and status, table information, and feature components.

The Device View is available from the System > Device View page.

The port coloring indicates whether a port is currently active. Green indicates that the port is enabled, red indicates that an error has occurred on the port or that the link is disabled, and black indicates that the port is not active.

The following figure shows the front-panel Device View of the M5300-52G-POE+ switch.

Stack Unit ID

Open Full Stack View

Stack Navigation

Front/Back View Toggle

Use the stack navigation buttons to view the stack master or the next/previous members in the stack. Click Full Stack View to see the device view for each stack member on a single page. The following figure shows the full stack view for a stack with two members.

To view the back panel of the switch, click the front/back toggle button (B or F, depending on the current view). The following figure shows the back-panel Device View of the M5300-52G-POE+ switch.
**Device View System LEDs**

In addition to the port LEDs, the device view provides a representation of the system LEDs on the left side of the front switch panel.

**Power/Status LED**

The power LED is a bicolor LED that serves as an indicator of power and diagnostic status. The following indications are given by the following LED states:

- A solid green LED indicates that the power is supplied to the switch and operating normally.
- A solid yellow LED indicates that system is in the boot-up stage.
- No lit LED indicates that power is disconnected.

**FAN Status LED**

FAN status is indicated as follows:

- A solid yellow LED indicates that the fan is faulty.
- No lit LED indicates that the fan is operating normally.

**Stack Master LED**

The Stack Master LED is lit if there is an active stack link and the unit is in stack mode.

- A solid green LED indicates that the switch acts as a master unit in a stack of switches.
- No lit LED indicates that the switch acts as a slave member in a stack of switches.

**Module LEDs**

Each switch includes two back-panel XAUI ports that support stacking or Ethernet modules. For the M5300 Series-28G switches, the port numbers are 27 and 28. For M5300 Series-52G switches, the port numbers are 51 and 52. If a back-panel module is present and active, the LED is solid green.

**Seven-Segment LED for the Stacking ID**

A solid green LED displays the stack ID (1–6).
Device View Navigation

Click the port you want to view or configure to see a menu that displays statistics and configuration options. Click the menu option to access the page that contains the configuration or monitoring options.

If you click the graphic, but do not click a specific port, the main menu appears. This menu contains the same option as the navigation tabs at the top of the page.
Help Page Access

Every page contains a link to the online help ☰, which contains information to assist in configuring and managing the switch. The online help pages are context sensitive. For example, if the IP Addressing page is open, the help topic for that page displays if you click Help.

User-Defined Fields

User-defined fields can contain 1 to 159 characters, unless otherwise noted on the configuration Web page. All characters may be used except for the following (unless specifically noted in for that feature):

\ <
/ >|
* |
?

Using SNMP

The ProSafe software supports the configuration of SNMP groups and users that can manage traps that the SNMP agent generates.

ProSafe use both standard public MIBs for standard functionality and private MIBs that support additional switch functionality. All private MIBs begin with a “-” prefix. The main object for interface configuration is in -SWITCHING-MIB, which is a private MIB. Some interface configurations also involve objects in the public MIB, IF-MIB.

SNMP is enabled by default. The System > Management > System Information Web page, which is the page that displays after a successful login, displays the information you need to configure an SNMP manager to access the switch.

Any user can connect to the switch using the SNMPv3 protocol, but for authentication and encryption, the switch supports only one user which is admin; therefore there is only one profile that can be created or modified.

To configure authentication and encryption settings for the SNMPv3 admin profile by using the Web interface:

1. Navigate to the System > SNMP > SNMPv3 > User Configuration page.
2. To enable authentication, select an Authentication Protocol option, which is either MD5 or SHA.
3. To enable encryption, select the DES option in the Encryption Protocol field. Then, enter an encryption code of eight or more alphanumeric characters in the Encryption Key field.
4. Click APPLY.

To access configuration information for SNMPv1 or SNMPv2, click System > SNMP > SNMPv1/v2 and click the page that contains the information to configure.
Interface Naming Convention

The ProSafe support physical and logical interfaces. Interfaces are identified by their type and the interface number. The physical ports are gigabit interfaces and are numbered on the front panel. You configure the logical interfaces by using the software. Table 2 describes the naming convention for all interfaces available on the switch.

Table 2. Naming Conventions for Interfaces

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
</table>
| Physical                         | The physical ports are in unit/slot/port format, where unit is the stack ID of the switch, slot is the slot ID (always 0 for physical ports), and port is the port ID, which starts at 1 and is identified on the front panel of the switch. | 1/0/1: Port 1 on stack member 1  
2/0/23: Port 23 on stack member 2 |
| Link Aggregation Group (LAG)     | LAG interfaces are logical interfaces that are only used for bridging functions. | ch1, ch2, ch3, and so on            |
| CPU Management Interface        | This is the internal switch interface responsible for the switch base MAC address. This interface is not configurable and is always listed in the MAC Address Table. | 5/1                                 |
| Routing VLAN Interfaces          | This is an interface used for routing functionality. The format can be expressed in vlan id format or unit/slot/interface format, where unit is 0, slot is 4, and interface is the logical VLAN interface ID. | 0/4/1, 0/4/2, 0/4/3, and so on  
or vlan 1, vlan 2, vlan 3, and so on |
Configuring System Information

Use the features in the System tab to define the switch’s relationship to its environment. The System tab contains links to the following features:

- **Management** on page 19
- Device View (See Device View on page 12)
- **License** on page 43
- **Services** on page 45
- **Stacking** on page 68
- **PoE (M5300-28G-POE+ and M5300-52G-POE+ Only)** on page 82
- **SNMP** on page 87
- **LLDP** on page 93
- **ISDP** on page 109
- **Timer Schedule** on page 114

Management

This section describes how to display the switch status and specify some basic switch information, such as the management interface IP address, system clock settings, and DNS information. From the Management link, you can access the following pages:

- **System Information** on page 20
- **Switch Statistics** on page 24
- **System CPU Status** on page 26
- **Loopback Interface** on page 29
- **Network Interface** on page 30
- **Time** on page 34
- **DNS** on page 40
- **SDM Template Preference** on page 42
System Information

After a successful login, the System Information page displays. Use this page to configure and view general device information.

To display the System Information page, click System > Management > System Information. A screen similar to the following displays.
The System Information provides various statuses:

**Switch Status**

To define system information:

1. In the **System Name** field, enter the name you want to use to identify this switch. You may use up to 255 alphanumeric characters. The factory default is blank.
2. In the **System Location** field, enter the location of this switch. You may use up to 255 alphanumeric characters. The factory default is blank.
3. In the **System Contact** field, enter the contact person for this switch. You may use up to 25 alphanumeric characters. The factory default is blank.
4. In the **Login Timeout** field, specify how many minutes of inactivity should occur on a serial port connection before the switch closes the connection. Enter a number between 0 and 160: the factory default is 5. Entering 0 disables the timeout.
5. Click **APPLY** to send the updated screen to the switch and cause the changes to take effect on the switch. These changes will not be retained across a power cycle unless a save is performed.

The following table describes the status information the System Page displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Name</td>
<td>The product name of this switch.</td>
</tr>
<tr>
<td>IPv4 Network Interface</td>
<td>The IPv4 address and mask assigned to the network interface.</td>
</tr>
<tr>
<td>IPv6 Network Interface</td>
<td>The IPv6 prefix and prefix length assigned to the network interface.</td>
</tr>
<tr>
<td>IPv4 Loopback Interface</td>
<td>The IPv4 address and mask assigned to the loopback interface.</td>
</tr>
<tr>
<td>IPv6 Loopback Interface</td>
<td>The IPv6 prefix and prefix length assigned to the loopback interface.</td>
</tr>
<tr>
<td>System Date</td>
<td>The current date and time. If the system has not synchronized with an SNTP server, the system time and date is probably incorrect by many years.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>The time in days, hours and minutes since the last switch reboot.</td>
</tr>
<tr>
<td>Current SNTP Sync Status</td>
<td>Indicates whether the system time has synchronized with an SNTP server (Success), or has not attempted or failed to synchronize with an SNTP server (Other).</td>
</tr>
<tr>
<td>System SNMP OID</td>
<td>The base object ID for the switch’s enterprise MIB.</td>
</tr>
<tr>
<td>System Mac Address</td>
<td>Universally assigned network address.</td>
</tr>
<tr>
<td>Supported Java Plugin Version</td>
<td>The supported version of Java plugin.</td>
</tr>
<tr>
<td>Current SNTP Synchronized Time</td>
<td>The current date and time, if the system time has been synchronized with an SNTP server; otherwise, this field is Not Synchronized.</td>
</tr>
</tbody>
</table>
**FAN Status**

The screen shows the status of the fans in all units. These fans remove the heat generated by the power, CPU, and other chipsets, allowing the chipsets to work normally. Fan status has three possible values: OK, Failure, Not Applicable (NA).

The following table describes the Fan Status information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit ID</td>
<td>The stack member unit identifier assigned to the switch which the fan belongs to.</td>
</tr>
<tr>
<td>CPU 1/CPU2</td>
<td>The working status of each CPU fan.</td>
</tr>
<tr>
<td>Power 1/Power 2</td>
<td>The working status of the power supply fan(s). If the status is N/A, the power supply might not be installed or active, or the switch model might support a single power supply.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the system information of the switch.

**Temperature Status**

The screen shows the current operating temperature of the switch. The temperature is instant and can be refreshed when the **REFRESH** button is pressed. The maximum temperature of the switch depends on the actual hardware.

The following table describes the Temperature Status information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit ID</td>
<td>The stack member unit identifier assigned to the switch which the fan belongs to.</td>
</tr>
<tr>
<td>System</td>
<td>The current temperature of the switch.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the system information of the switch.
Device Status

The screen shows the various inventory information for each device.

The following table describes the Device Status information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware Version</td>
<td>The release.version.maintenance.build number of the code currently running on the switch. For example, if the release was 8, the version was 0, the maintenance number was 3, and the build number was 11, the format would be 8.0.3.11.</td>
</tr>
<tr>
<td>Boot Version</td>
<td>The version of the boot code which is in the flash memory to load the firmware into the memory.</td>
</tr>
<tr>
<td>CPLD Version</td>
<td>The version of the software for the Complex Programmable Logic Device (CPLD).</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number of this switch.</td>
</tr>
<tr>
<td>AC</td>
<td>The status of the internal AC power module.</td>
</tr>
</tbody>
</table>
| Remote        | Indicates the status of the Remote Power Supply (RPS). The status has three possible values:  
                  • Not Present: RPS bank not connected  
                  • OK: RPS bank connected.  
                  • FAIL: RPS is present, but power is failed. |
| PoE Version   | Version of the PoE controller firmware image.                              |
| MAX PoE       | Indicates the status of maximum PoE power available on the switch as follows:  
                  • ON: Indicates less than 7W of PoE power available for another device.  
                  • OFF: Indicates at least 7W of PoE power available for another device.  
                  • N/A: Indicates that PoE is not supported by the unit. |

Click **REFRESH** to refresh the system information of the switch.
Switch Statistics

Use this page to display the switch statistics.

To display the Switch Statistics page, click **System > Management > Switch Statistics**. A screen similar to the following displays.

![Switch Statistics Table](image)

The following table describes Switch Statistics information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>This object indicates the ifIndex of the interface table entry associated with the Processor of this switch.</td>
</tr>
<tr>
<td>Octets Received</td>
<td>The total number of octets of data received by the processor (excluding framing bits but including FCS octets).</td>
</tr>
<tr>
<td>Packets Received Without Errors</td>
<td>The total number of packets (including broadcast packets and multicast packets) received by the processor.</td>
</tr>
<tr>
<td>Unicast Packets Received</td>
<td>The number of subnetwork-unicast packets delivered to a higher-layer protocol.</td>
</tr>
<tr>
<td>Multicast Packets Received</td>
<td>The total number of packets received that were directed to a multicast address. Note that this number does not include packets directed to the broadcast address.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of packets received that were directed to the broadcast address. Note that this does not include multicast packets.</td>
</tr>
<tr>
<td>Receive Packets Discarded</td>
<td>The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.</td>
</tr>
<tr>
<td>Octets Transmitted</td>
<td>The total number of octets transmitted out of the interface, including framing characters.</td>
</tr>
<tr>
<td>Packets Transmitted Without Errors</td>
<td>The total number of packets transmitted out of the interface.</td>
</tr>
<tr>
<td>Unicast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Multicast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to a Multicast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Broadcast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to the Broadcast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Transmit Packets Discarded</td>
<td>The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.</td>
</tr>
<tr>
<td>Most Address Entries Ever Used</td>
<td>The highest number of Forwarding Database Address Table entries that have been learned by this switch since the most recent reboot.</td>
</tr>
<tr>
<td>Address Entries in Use</td>
<td>The number of Learned and static entries in the Forwarding Database Address Table for this switch.</td>
</tr>
<tr>
<td>Maximum VLAN Entries</td>
<td>The maximum number of Virtual LANs (VLANs) allowed on this switch.</td>
</tr>
<tr>
<td>Most VLAN Entries Ever Used</td>
<td>The largest number of VLANs that have been active on this switch since the last reboot.</td>
</tr>
<tr>
<td>Static VLAN Entries</td>
<td>The number of presently active VLAN entries on this switch that have been created statically.</td>
</tr>
<tr>
<td>Dynamic VLAN Entries</td>
<td>The number of presently active VLAN entries on this switch that have been created by GVRP registration.</td>
</tr>
<tr>
<td>VLAN Deletes</td>
<td>The number of VLANs on this switch that have been created and then deleted since the last reboot.</td>
</tr>
<tr>
<td>Time Since Counters Last Cleared</td>
<td>The elapsed time, in days, hours, minutes, and seconds, since the statistics for this switch were last cleared.</td>
</tr>
</tbody>
</table>

Click **CLEAR** to clear all the counters, resetting all switch summary and detailed statistics to default values. The discarded packets count cannot be cleared.
System CPU Status

Use this page to display system CPU status and utilization information.

To display the System Resource page, click **System > Management > System CPU Status**. A screen similar to the following displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total System Memory</td>
<td>The total memory of the switch in KBytes.</td>
</tr>
<tr>
<td>Available Memory</td>
<td>The available memory space for the switch in KBytes.</td>
</tr>
</tbody>
</table>

**CPU Utilization Information**

This area displays the CPU Utilization information. It displays the amount of available and allocated memory and lists each system process (task) that is running, along with its CPU utilization over the last 5, 60, and 300 seconds.
Slot Information

Use this page to view information about the cards installed in the switch’s slots. This page also provides information about the cards and switches that are compatible with the device.

To display the Switch Statistics page, click System > Management > Slot Information. A screen similar to the following displays.

**Slot Summary**

The following table describes information in the Slot Summary table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slot</td>
<td>The slot number.</td>
</tr>
<tr>
<td>Status</td>
<td>Indicates whether the slot is empty or full.</td>
</tr>
<tr>
<td>Administrative State</td>
<td>Indicates whether the slot is administratively enabled or disabled.</td>
</tr>
<tr>
<td>Power State</td>
<td>Indicates whether the device is providing power to the slot.</td>
</tr>
<tr>
<td>Configured Card Model ID</td>
<td>The model ID of the card configured for the slot.</td>
</tr>
<tr>
<td>Configured Card Description</td>
<td>The description of the card configured for the slot.</td>
</tr>
<tr>
<td>Inserted Card Model ID</td>
<td>The model ID of the card plugged into the slot.</td>
</tr>
<tr>
<td>Inserted Card Description</td>
<td>The description of the card plugged into the slot.</td>
</tr>
</tbody>
</table>
## Supported Card

The following table describes information in the Supported Card table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Card Model</td>
<td>The model ID of the supported card.</td>
</tr>
<tr>
<td>Card Index</td>
<td>The index assigned to the card type.</td>
</tr>
<tr>
<td>Card Type</td>
<td>The hardware type of the supported card, which is assigned by the manufacturer.</td>
</tr>
<tr>
<td>Card Descriptor</td>
<td>Description of the supported card, which includes the manufacturer's product number and information about number and speed of the supported interfaces.</td>
</tr>
</tbody>
</table>

## Supported Switch

The following table describes information in the Supported Switch table. When preconfiguring a new stack member, the Switch Index identifies the type of switch that is being added to the stack.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch Model ID</td>
<td>The model number of the supported switch.</td>
</tr>
<tr>
<td>Switch Index</td>
<td>The index assigned to the supported switch.</td>
</tr>
</tbody>
</table>
Loopback Interface

Use this page to create, configure, and remove Loopback interfaces. A loopback interface is a logical interface that is considered to be always up.

To display the Loopback Interface page, click System > Management > Loopback Interface. A screen similar to the following displays.

To configure a loopback interface:

1. In the Loopback Interface Type field select whether the interface is an IPv4 or IPv6 loopback interface. The configuration fields vary based on the interface type.
2. For an IPv4 loopback interface, configure the following:
   a. In the Loopback ID field select the loopback ID number
   b. In the Primary Address field, input the primary IPv4 address for this interface in dotted decimal notation.
   c. In the Primary Mask field, input the primary IPv4 subnet mask for this interface in dotted decimal notation.
   d. View the logical status of the interface in the Loopback Interface Status field. A loopback interface is always up.
3. For an IPv6 loopback interface, configure the following:
   a. In the Loopback ID field select the loopback ID number.
   b. Use the IPv6 Mode field to enable IPv6 on this interface using the IPv6 address. This option is only configurable prior to specifying an explicit IPv6 address.
   c. Use the IPv6 Address field to enter the IPv6 address in the format prefix/length.
   d. Use the EUI64 field to optionally specify the 64-bit extended unique identifier (EUI-64).
4. Click ADD to add the configured IPv4 or IPv6 loopback interface.
5. To remove the loopback interface configuration, select the box associated with the interface to remove, and click DELETE.
6. To modify information about a configured interface, select the box associated with the interface to modify, update the configuration information in the appropriate fields, and click APPLY.
Network Interface

From the Network Interface link, you can access the following pages:

- *IPv4 Network Configuration* on page 30
- *IPv6 Network Interface Configuration* on page 32
- *IPv6 Network Interface Neighbor Table* on page 33

**IPv4 Network Configuration**

To display the IPv4 Network Configuration page, click **System > Management > Network Interface > IPv4 Network Configuration**. A screen similar to the following displays.

![IPv4 Network Interface Configuration](image)

The network interface is the logical interface used for in-band connectivity with the switch via any of the switch's front panel ports. The configuration parameters associated with the switch's network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

To access the switch over a network you must first configure it with IP information (IP address, subnet mask, and default gateway). You can configure the IP information using any of the following:

- **BOOTP**
- **DHCP**
- Terminal interface via the EIA-232 port
Once you have established in-band connectivity, you can change the IP information using any of the following:

- Terminal interface via the EIA-232 port
- Terminal interface via telnet
- SNMP-based management
- Web-based management

To configure an IPv4 network interface:

1. Use **Current Network Configuration Protocol** to specify how the device acquires network information on the network interface:
   - None – The switch does not attempt to acquire network information dynamically. Select this option to configure a static IP address, subnet mask, and default gateway.
   - BOOTP – During the next boot cycle, the BOOTP client on the switch broadcasts a BOOTP request in an attempt to acquire information from a BOOTP server on the network.
   - DHCP – During the next boot cycle, the DHCP client on the switch broadcasts a DHCP request in an attempt to acquire information from a DHCP server on the network. After this option is applied, you can use the Refresh icon at the end of the row to renew the IPv4 address learned from DHCP server.

2. If the network configuration protocol is None, use the **IP Address** field to specify the IP address of the interface. The factory default value is 169.254.100.100. For DHCP or BootP configuration protocols, this field shows the IP address the network interface has leased from the DHCP or BootP server.

3. If the network configuration protocol is None, use the **Subnet Mask** field to enter the IP subnet mask for the interface. The factory default value is 255.255.0.0. For DHCP or BootP configuration protocols, this field shows the subnet mask assigned to the network interface has by the DHCP or BootP server.

4. If the network configuration protocol is None, use **Default Gateway** to specify the default gateway for the IP interface. The factory default value is 0.0.0.0. For DHCP or BootP configuration protocols, this field shows the default gateway assigned to the network interface has by the DHCP or BootP server.

5. Use **MAC Address type** to specify whether the burned in or the locally administered MAC address should be used for in-band connectivity.

   If the MAC address type is burned in, the Burned In MAC Address field shows the hardware address assigned to the device by the manufacturer.

6. If the MAC address type is Locally Administered, use **Locally Administered MAC Address** to configure a locally administered MAC address for in-band connectivity instead of using the burned-in universally administered MAC address. Enter the address as twelve hexadecimal digits (6 bytes) with a colon between each byte. Bit 1 of byte 0 must be set to a 1 and bit 0 to a 0, in other words, byte 0 must have a value between x’40’ and x’7F’.

7. Use **DHCP Vendor Class Identifier** to specify whether to set a value for DHCP option 60 in the DHCP requests that the DHCP client on the switch broadcasts to network DHCP servers. Option 60, the Vendor Class Identifier (VCI), can help identify the device to the DHCP server, which allows the server to include additional information in the DHCP response.
8. Use **DHCP Vendor Class Identifier String** to specify the text string to add to DHCP requests as option 60, the VCI option.

9. Use **Management VLAN ID** to specify the management VLAN ID of the switch. It may be configured to any value in the range of 1 - 4093. Some network administrators use a management VLAN to isolate system management traffic from end-user data traffic.

10. Click **APPLY** to update the network interface with the specified values.

11. Click **CANCEL** to abandon the changes.

### IPv6 Network Interface Configuration

To display the IPv6 Network Configuration page, click **System > Management > Network Interface > IPv6 Network Interface Configuration**. A screen similar to the following displays.

![IPv6 Network Interface Configuration](image)

The IPv6 network interface is the logical interface used for in-band connectivity with the switch via any of the switch’s front panel ports. The configuration parameters associated with the switch’s network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

To access the switch over an IPv6 network you must first configure it with IPv6 information (IPv6 prefix, prefix length, and default gateway). You can configure the IP information using any of the following:

- IPv6 Auto Configuration
- DHCPv6
- Terminal interface via the EIA-232 port

Once you have established in-band connectivity, you can change the IPv6 information using any of the following:

- Terminal interface via the EIA-232 port
- Terminal interface via telnet
- SNMP-based management
- Web-based management
To configure an IPv6 network interface:

1. Use **Admin Mode** to enable or disable the IPv6 network interface on the switch. The default value is enable.

2. Use **IPv6 Address Auto Configuration Mode** to set the IPv6 address for the IPv6 network interface in auto configuration mode if this option is enabled. The default value is disable. Auto configuration can be enabled only when IPv6 Auto config or DHCPv6 are not enabled on any of the management interfaces.

3. Use **Current Network Configuration Protocol** to configure the IPv6 address for the IPv6 network interface by DHCPv6 protocol if this option is enabled. The default value is None. DHCPv6 can be enabled only when IPv6 Auto config or DHCPv6 are not enabled on any of the management interfaces.

4. Use **DHCPv6 Client DUID** to specify an Identifier used to identify the client's unique DUID value. This option only displays when DHCPv6 is enabled.

5. Use **IPv6 Gateway** to specify the gateway for the IPv6 network interface. The gateway address is in IPv6 global or link-local address format.

6. Use **IPv6 Prefix/Prefix Length** to add the IPv6 prefix and prefix length to the IPv6 network interface. The address is in global address format.

7. Use **EUI64** to specify whether to format the IPv6 address in EUI-64 format. Default value is false.

8. Click **ADD** to add a new IPv6 address in global format.

9. Click **DELETE** to delete a selected IPv6 address.

**IPv6 Network Interface Neighbor Table**

Use this page to view information about IPv6 neighbors the device has discovered through the network interface by using the Neighbor Discovery Protocol (NDP).

To display the IPv6 Network Neighbor page, click **System > Management > Network Interface > IPv6 Network Interface Neighbor Table**. A screen similar to the following displays.

The following table displays IPv6 Network Interface Neighbor Table information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 address</td>
<td>The IPv6 Address of a neighbor switch visible to the network interface.</td>
</tr>
<tr>
<td>MAC address</td>
<td>The MAC address of a neighbor switch.</td>
</tr>
</tbody>
</table>
ProSafe M5300 Switch

Time

ProSafe software supports the Simple Network Time Protocol (SNTP). SNTP assures accurate network device clock time synchronization up to the millisecond. Time synchronization is performed by a network SNTP server. ProSafe software operates only as an SNTP client and cannot provide time services to other systems.

Time sources are established by Stratum. Stratum define the accuracy of the reference clock. The higher the stratum (where zero is the highest), the more accurate the clock. The device receives time from stratum 1 and above since it is itself a stratum 2 device.

The following is an example of stratum:

- **Stratum 0**: A real-time clock is used as the time source, for example, a GPS system.
- **Stratum 1**: A server that is directly linked to a Stratum 0 time source is used. Stratum 1 time servers provide primary network time standards.
- **Stratum 2**: The time source is distanced from the Stratum 1 server over a network path. For example, a Stratum 2 server receives the time over a network link, via NTP, from a Stratum 1 server.

Information received from SNTP servers is evaluated based on the time level and server type.

SNTP time definitions are assessed and determined by the following time levels:

- **T1**: Time at which the original request was sent by the client.
- **T2**: Time at which the original request was received by the server.
- **T3**: Time at which the server sent a reply.
- **T4**: Time at which the client received the server's reply.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IsRtr</td>
<td>True(1) if the neighbor machine is a router, false(2) otherwise.</td>
</tr>
</tbody>
</table>
| Neighbor State | The state of the neighboring switch:  
|               | • reachable(1) - The neighbor is reachable by this switch.  
|               | • stale(2) - Information about the neighbor is scheduled for deletion.  
|               | • delay(3) - No information has been received from neighbor during delay period.  
|               | • probe(4) - Switch is attempting to probe for this neighbor.  
|               | • unknown(6) - Unknown status. |
| Last Updated   | The last sysUpTime that this neighbor has been updated. |
The device can poll Unicast server types for the server time.

Polling for Unicast information is used for polling a server for which the IP address is known. SNTP servers that have been configured on the device are the only ones that are polled for synchronization information. T1 through T4 are used to determine server time. This is the preferred method for synchronizing device time because it is the most secure method. If this method is selected, SNTP information is accepted only from SNTP servers defined on the device using the SNTP Server Configuration page.

The device retrieves synchronization information, either by actively requesting information or at every poll interval.

**SNTP Global Configuration**

Use the SNTP Global Configuration page to enable the SNTP client on the device and to configure the SNTP client settings. Enabling and configuring the SNTP client allows the device to synchronize the system time with a valid SNTP server on the network.

To display the SNTP Global Configuration page, click **System > Management > Time > SNTP Global Configuration**.
SNTP Global Configuration

SNTP stands for Simple Network Time Protocol. As its name suggests, it is a less complicated version of Network Time Protocol, which is a system for synchronizing the clocks of networked computer systems, primarily when data transfer is handled via the Internet.

1. Use **Client Mode** to specify the mode of operation of SNTP Client. An SNTP client may operate in one of the following modes.
   - **Disable** - SNTP is not operational. No SNTP requests are sent from the client nor are any received SNTP messages processed.
   - **Unicast** - SNTP operates in a point to point fashion. A unicast client sends a request to a designated server at its unicast address and expects a reply from which it can determine the time and, optionally the round-trip delay and local clock offset relative to the server.
   - **Broadcast** - SNTP operates in the same manner as multicast mode but uses a local broadcast address instead of a multicast address. The broadcast address has a single subnet scope while a multicast address has Internet wide scope.

   Default value is Disable.

2. Use **Port** to specify the local UDP port to listen for responses/broadcasts. Allowed range is 1 to 65535. Default value is 123.

3. Use **Unicast Poll Interval** to specify the number of seconds between unicast poll requests expressed as a power of two when configured in unicast mode. Allowed range is (6 to 10). Default value is 6.

4. Use **Broadcast Poll Interval** to specify the number of seconds between broadcast poll requests expressed as a power of two when configured in broadcast mode. Broadcasts received prior to the expiry of this interval are discarded. Allowed range is (6 to 10). Default value is 6.

5. Use **Unicast Poll Timeout** to specify the number of seconds to wait for an SNTP response when configured in unicast mode. Allowed range is (1 to 30). Default value is 5.

6. Use **Unicast Poll Retry** to specify the number of times to retry a request to an SNTP server after the first time-out before attempting to use the next configured server when configured in unicast mode. Allowed range is (0 to 10). Default value is 1.

7. When using SNTP/NTP time servers to update the switch's clock, the time data received from the server is based on Coordinated Universal Time (UTC) which is the same as Greenwich Mean Time (GMT). This may not be the time zone in which the switch is located.

   Use **Time Zone Name** to configure a timezone specifying the number of hours and optionally the number of minutes difference from UTC with **Offset Hours** and **Offset Minutes**. The time zone can affect the display of the current system time. The default value is UTC.

8. Use **Offset Hours** to specify the number of hours difference from UTC. See Time Zone Name (Step 7 previous) for more information. Allowed range is (-24 to 24). The default value is 0.

9. Use **Offset Minutes** to specify the number of Minutes difference from UTC. See Time Zone Name (Step 7 previous) for more information. Allowed range is 0 to 59. The default value is 0.
ProSafe M5300 Switch

SNTP Global Status

The following table displays SNTP Global Status information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>Specifies the SNTP Version the client supports.</td>
</tr>
<tr>
<td>Supported Mode</td>
<td>Specifies the SNTP modes the client supports. Multiple modes may be supported by a client.</td>
</tr>
<tr>
<td>Last Update Time</td>
<td>Specifies the local date and time (UTC) the SNTP client last updated the system clock.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>Specifies the local date and time (UTC) of the last SNTP request or receipt of an unsolicited message.</td>
</tr>
<tr>
<td>Last Attempt Status</td>
<td>Specifies the status of the last SNTP request or unsolicited message for both unicast and broadcast modes. If no message has been received from a server, a status of Other is displayed. These values are appropriate for all operational modes.</td>
</tr>
<tr>
<td></td>
<td>• Other - None of the following enumeration values.</td>
</tr>
<tr>
<td></td>
<td>• Success - The SNTP operation was successful and the system time was updated.</td>
</tr>
<tr>
<td></td>
<td>• Request Timed Out - A directed SNTP request timed out without receiving a response from the SNTP server.</td>
</tr>
<tr>
<td></td>
<td>• Bad Date Encoded - The time provided by the SNTP server is not valid.</td>
</tr>
<tr>
<td></td>
<td>• Version Not Supported - The SNTP version supported by the server is not compatible with the version supported by the client.</td>
</tr>
<tr>
<td></td>
<td>• Server Unsynchronized - The SNTP server is not synchronized with its peers. This is indicated via the 'leap indicator' field on the SNTP message.</td>
</tr>
<tr>
<td></td>
<td>• Server Kiss Of Death - The SNTP server indicated that no further queries were to be sent to this server. This is indicated by a stratum field equal to 0 in a message received from a server.</td>
</tr>
<tr>
<td>Server IP Address</td>
<td>Specifies the IP address of the server for the last received valid packet. If no message has been received from any server, an empty string is shown.</td>
</tr>
<tr>
<td>Address Type</td>
<td>Specifies the address type of the SNTP Server address for the last received valid packet.</td>
</tr>
<tr>
<td>Server Stratum</td>
<td>Specifies the claimed stratum of the server for the last received valid packet.</td>
</tr>
<tr>
<td>Reference Clock Id</td>
<td>Specifies the reference clock identifier of the server for the last received valid packet.</td>
</tr>
<tr>
<td>Server Mode</td>
<td>Specifies the mode of the server for the last received valid packet.</td>
</tr>
<tr>
<td>Unicast Server Max Entries</td>
<td>Specifies the maximum number of unicast server entries that can be configured on this client.</td>
</tr>
</tbody>
</table>
SNTP Server Configuration

Use the SNTP Server Configuration page to view and modify information for adding and modifying Simple Network Time Protocol SNTP servers.

To display the SNTP Server Configuration page, click **System > Management > Time > SNTP Server Configuration**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unicast Server Current Entries</td>
<td>Specifies the number of current valid unicast server entries configured for this client.</td>
</tr>
<tr>
<td>Broadcast Count</td>
<td>Specifies the number of unsolicited broadcast SNTP messages that have been received and processed by the SNTP client since last reboot.</td>
</tr>
</tbody>
</table>

To configure a new SNTP Server:

1. Enter the appropriate SNTP server information in the available fields:
   - **Server Type** - Specifies whether the address for the SNTP server is an IP address (IPv4) or hostname (DNS).
   - **Address** - Specify the address or host name of an SNTP server the device can use to synchronize the system time. If this address is a DNS hostname, then that hostname should be resolved into an IP address each time a SNTP request is sent to it.
   - **Port** - Enter a port number on the SNTP server to which SNTP requests are sent. The valid range is 1–65535. The default is 123.
   - **Priority** - Specify the priority of this server entry in determining the sequence of servers to which SNTP requests will be sent. The client continues sending requests to different servers until a successful response is received or all servers are exhausted. This object indicates the order in which to query the servers. A server entry with a precedence of 1 will be queried before a server with a priority of 2, and so forth. If more than one server has the same priority then the requesting order will follow the lexicographical ordering of the entries in this table. Allowed range is (1 to 3). Default value is 1.
   - **Version** - Enter the NTP version running on the server. (Range: 1–4, default: 4).
2. Click **ADD**.

3. Repeat the previous steps to add additional SNTP servers. You can configure up to three SNTP servers.

4. To removing an SNTP server, select the check box next to the configured server to remove, and then click **DELETE**. The entry is removed, and the device is updated.

5. To change the settings for an existing SNTP server, select the check box next to the configured server and enter new values in the available fields, and then click **APPLY**. Configuration changes take effect immediately.

6. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

7. Click **REFRESH** to refresh the page with the most current data from the switch.

**SNTP Server Status**

The SNTP Server Status table displays status information about the SNTP servers configured on your switch. The following table describes the SNTP Global Status fields.

The following table displays SNTP Server Status information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Specifies all the existing Server Addresses. If no Server configuration exists, a message saying &quot;No SNTP server exists&quot; flashes on the screen.</td>
</tr>
<tr>
<td>Last Update Time</td>
<td>Specifies the local date and time (UTC) that the response from this server was used to update the system clock.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>Specifies the local date and time (UTC) that this SNTP server was last queried.</td>
</tr>
<tr>
<td>Last Attempt Status</td>
<td>Specifies the status of the last SNTP request to this server. If no packet has been received from this server, a status of Other is displayed.</td>
</tr>
<tr>
<td></td>
<td>• Other - None of the following enumeration values.</td>
</tr>
<tr>
<td></td>
<td>• Success - The SNTP operation was successful and the system time was updated.</td>
</tr>
<tr>
<td></td>
<td>• Request Timed Out - A directed SNTP request timed out without receiving a response from the SNTP server.</td>
</tr>
<tr>
<td></td>
<td>• Bad Date Encoded - The time provided by the SNTP server is not valid.</td>
</tr>
<tr>
<td></td>
<td>• Version Not Supported - The SNTP version supported by the server is not compatible with the version supported by the client.</td>
</tr>
<tr>
<td></td>
<td>• Server Unsynchronized - The SNTP server is not synchronized with its peers. This is indicated via the 'leap indicator' field on the SNTP message.</td>
</tr>

<td></td>
<td>• Server Kiss Of Death - The SNTP server indicated that no further queries were to be sent to this server. This is indicated by a stratum field equal to 0 in a message received from a server.</td>
</tr>
<tr>
<td>Requests</td>
<td>Specifies the number of SNTP requests made to this server since last agent reboot.</td>
</tr>
<tr>
<td>Failed Requests</td>
<td>Specifies the number of failed SNTP requests made to this server since last reboot.</td>
</tr>
</tbody>
</table>
DNS

You can use these pages to configure information about DNS servers the network uses and how the switch operates as a DNS client.

DNS Configuration

Use this page to configure global DNS settings and DNS server information.

To access this page, click System > Management > DNS > DNS Configuration.

To configure the global DNS settings:

1. Specify whether to enable or disable the administrative status of the DNS Client.
   - Enable - Allow the switch to send DNS queries to a DNS server to resolve a DNS domain name. Default value is Enable.
   - Disable - Prevent the switch from sending DNS queries.

2. Enter the DNS default domain name to include in DNS queries. When the system is performing a lookup on an unqualified hostname, this field is provided as the domain name (for example, if default domain name is netgear.com and the user enters test, then test is changed to test.netgear.com to resolve the name). The length of the name should not be longer than 255 characters.

3. Use Retry Number to specify the number of times to retry sending DNS queries to DNS server. This number ranges from 0 to 100. The default value is 2.

4. Use Response Timeout (secs) to specify the amount of time, in seconds, to wait for a response to a DNS query. This timeout ranges from 0 to 3600. The default value is 3.

5. To specify the DNS server to which the switch sends DNS queries, enter an IP address in standard IPv4 dot notation in the DNS Server field and click ADD. The server appears in the list below. You can specify up to eight DNS servers. The precedence is set in the order created.

6. To remove a DNS server from the list, select the check box next to the server you want to remove and click DELETE. If no DNS server is specified, the check box is global and will delete all the DNS servers listed.
7. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

8. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**DNS Server Configuration**

The following table displays DNS Server Configuration information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial No</td>
<td>The sequence number of the DNS server.</td>
</tr>
<tr>
<td>Preference</td>
<td>Shows the preference of the DNS Server. The preference is determined by the order they were entered.</td>
</tr>
</tbody>
</table>

**Host Configuration**

Use this page to manually map host names to IP addresses or to view dynamic DNS mappings.

To access this page, click **System > Management > DNS > Host Configuration**.

To add a static entry to the local DNS table:

1. Specify the static host name to add. Its length can not exceed 255 characters and it is a mandatory field for the user.
2. Specify the IP address in standard IPv4 dot notation to associate with the hostname.
3. Click **ADD**. The entry appears in the list below.
4. To remove an entry from the static DNS table, select the check box next to the entry and click **DELETE**.
5. To change the hostname or IP address in an entry, select the check box next to the entry and enter the new information in the appropriate field, and then click **APPLY**.
6. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
The Dynamic Host Mapping table shows host name-to-IP address entries that the switch has learned. The following table describes the dynamic host fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>Lists the host name you assign to the specified IP address.</td>
</tr>
<tr>
<td>Total</td>
<td>Amount of time since the dynamic entry was first added to the table.</td>
</tr>
<tr>
<td>Elapsed</td>
<td>Amount of time since the dynamic entry was last updated.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the dynamic entry.</td>
</tr>
<tr>
<td>Addresses</td>
<td>Lists the IP address associated with the host name.</td>
</tr>
</tbody>
</table>

**SDM Template Preference**

You can use this page to configure the Switch Database Management (SDM) template that is active after the next reboot. An SDM template is a description of the maximum resources the device can use for various features. Different SDM templates allow different combinations of scaling factors, enabling different allocations of resources depending on how the device is used. In other words, SDM templates enable you to reallocate system resources to support a different mix of features based on your network requirements.

To access this page, click **System > Management > DNS > SDM Template Preference**.

To configure the SDM Template Preference settings:

1. Use **SDM Current Template ID** to view the SDM template the switch is currently using.
2. Use **SDM Next Template ID** to configure the next active template. It will be active only after the next reboot. To revert to the default template after the next reboot, use the Default option. Possible values are:
   - Default
   - Dual IPv4 and IPv6
   - IPv4-routing Default
   - IPv4 Data Center
The following table displays Summary information, which describes the maximum resources each template supports for various features.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SDM Template</td>
<td>Identifies the Template. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Dual IPv4 and IPv6</td>
</tr>
<tr>
<td></td>
<td>• IPv4-routing Default</td>
</tr>
<tr>
<td></td>
<td>• IPv4 Data Center</td>
</tr>
<tr>
<td>ARP Entries</td>
<td>The maximum number of entries in the IPv4 Address Resolution Protocol (ARP) cache for routing interfaces.</td>
</tr>
<tr>
<td>IPv4 Unicast Routes</td>
<td>The maximum number of IPv4 unicast forwarding table entries.</td>
</tr>
<tr>
<td>IPv6 NDP Entries</td>
<td>The maximum number of IPv6 Neighbor Discovery Protocol (NDP) cache entries.</td>
</tr>
<tr>
<td>IPv6 Unicast Routes</td>
<td>The maximum number of IPv6 unicast forwarding table entries.</td>
</tr>
<tr>
<td>ECMP Next Hops</td>
<td>The maximum number of next hops that can be installed in the IPv4 and IPv6 unicast forwarding tables.</td>
</tr>
<tr>
<td>IPv4 Multicast Routes</td>
<td>The maximum number of IPv4 multicast forwarding table entries.</td>
</tr>
<tr>
<td>IPv6 Multicast Routes</td>
<td>The maximum number of IPv6 multicast forwarding table entries.</td>
</tr>
</tbody>
</table>

**License**

From the License link under the System tab, you can view information about the switch license.

---

**Note:** The Licence feature is not available on all switch models.

The License link provides access to the following pages:

- *License Key* on page 43
- *License Features* on page 44

**License Key**

Use the License Key page to view information about the license(s) on the device. Some features might require a special license in order to be active. If a license is not active, the feature associated with the license is not available and cannot be configured.

To display the License Key page, click **System > License > License Key**. A screen similar to the following displays.
The following table describes the non-configurable fields on the License Key page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License Date</td>
<td>The date the license is purchased.</td>
</tr>
<tr>
<td>License Copy</td>
<td>The number of licenses that exist on the switch.</td>
</tr>
<tr>
<td>License Status</td>
<td>Indicates whether the license is active or inactive. If a license is inactive, a license should be purchased and downloaded to the switch. The license is not activated until the switch reboots.</td>
</tr>
<tr>
<td>Description</td>
<td>A description of the license key status. If the license is inactive, this field provides information about why it is inactive.</td>
</tr>
</tbody>
</table>

**License Features**

Use the License Features page to view information about the features on the device that require an active license.

To display the License Features page, click **System > License > License Features**. A screen similar to the following displays.
Services

From the Services link, you can access the following pages:

- **DHCP Server** on page 45
- **DHCP Relay** on page 53
- **DHCP L2 Relay** on page 54
- **UDP Relay** on page 57
- **DHCPv6 Server** on page 59
- **DHCPv6 Relay** on page 66

DHCP Server

DHCP is generally used between clients and servers for the purpose of assigning IP addresses, gateways, and other network settings such as DNS and SNTP server information.

From the DHCP Server link, you can access the following pages:

- **DHCP Server Configuration** on page 45
- **DHCP Pool Configuration** on page 47
- **DHCP Pool Options** on page 49
- **DHCP Server Statistics** on page 50
- **DHCP Bindings Information** on page 51
- **DHCP Conflicts Information** on page 52

**DHCP Server Configuration**

To display the DHCP Server Configuration page, click System > Services > DHCP Server > DHCP Server Configuration. A screen similar to the following displays.
To enable or disable DHCP service:

1. Use **Admin Mode** to specify whether the DHCP Service is to be Enabled or Disabled. Default value is Disable.
2. Use **Ping Packet Count** to specify the number of packets a server sends to a Pool address to check for duplication as part of a ping operation. Default value is 2. Valid Range is (0, 2 to 10). Setting the value to 0 will disable the function.
3. Use **Conflict Logging Mode** to specify whether conflict logging on a DHCP Server is to be Enabled or Disabled. Default value is Enable.
4. Use **Bootp Automatic Mode** to specify whether Bootp for dynamic pools is to be Enabled or Disabled. Default value is Disable.
5. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.
6. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**Excluded Address Configuration**

To configure addresses that cannot be assigned to DHCP clients:

1. Use the **IP Range From** field to specify the low address if you want to exclude a range of addresses. Specify the address to be excluded in case you want to exclude a single address.
2. Use the **IP Range To** field to specify the high address if you want to exclude a range of addresses. To exclude a single address, enter the same IP address as specified in IP range from or leave as 0.0.0.0.
3. Click **ADD** to add the exclude addresses configured on the screen to the switch.
4. Click **DELETE** to delete the exclude address from the switch.
DHCP Pool Configuration

To display the DHCP Pool Configuration page, click System > Services > DHCP Server > DHCP Pool Configuration. A screen similar to the following displays.

![DHCP Pool Configuration](image)

To configure a DHCP pool:

1. Select an existing DHCP pool to update or select Create from the Pool Name field and configure the DHCP information the following table describes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Name*</td>
<td>For a user with read/write permission, this field would show names of all the existing pools along with an additional option “Create”. When the user selects “Create” another text box “Pool Name” appears where the user may enter name for the Pool to be created. For a user with read only permission, this field would show names of the existing pools only.</td>
</tr>
<tr>
<td>Pool Name</td>
<td>This field appears when the user with read-write permission has selected “Create” in the Drop Down list against Pool Name*. Specifies the Name of the Pool to be created. Pool Name can be up to 31 characters in length.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type of Binding</td>
<td>Specifies the type of binding for the pool.</td>
</tr>
<tr>
<td></td>
<td>• Unallocated</td>
</tr>
<tr>
<td></td>
<td>• Dynamic</td>
</tr>
<tr>
<td></td>
<td>• Manual</td>
</tr>
<tr>
<td>Network Address</td>
<td>Specifies the subnet address for a DHCP address of a dynamic pool.</td>
</tr>
<tr>
<td>Network Mask</td>
<td>Specifies the subnet number for a DHCP address of a dynamic pool. Either Network Mask or Prefix Length can be configured to specify the subnet mask but not both.</td>
</tr>
<tr>
<td>Network Prefix Length</td>
<td>Specifies the subnet number for a DHCP address of a dynamic pool. Either Network Mask or Prefix Length can be configured to specify the subnet mask but not both. Valid Range is (0 to 32)</td>
</tr>
<tr>
<td>Client Name</td>
<td>Specifies the Client Name for DHCP manual Pool.</td>
</tr>
<tr>
<td>Hardware Address</td>
<td>Specifies the MAC address of the hardware platform of the DHCP client.</td>
</tr>
<tr>
<td>Hardware Address Type</td>
<td>Specifies the protocol of the hardware platform of the DHCP client. Valid types are ethernet and ieee802. Default value is ethernet.</td>
</tr>
<tr>
<td>Client ID</td>
<td>Specifies the Client Identifier for DHCP manual Pool.</td>
</tr>
<tr>
<td>Host Number</td>
<td>Specifies the IP address for a manual binding to a DHCP client. Host can be set only if at least one among of Client Identifier or Hardware Address is specified. Deleting Host would delete Client Name, Client ID, Hardware Address for the Manual Pool and set the Pool Type to Unallocated.</td>
</tr>
<tr>
<td>Host Mask</td>
<td>Specifies the subnet mask for a manual binding to a DHCP client. Either Host Mask or Prefix Length can be configured to specify the subnet mask but not both.</td>
</tr>
<tr>
<td>Host Prefix Length</td>
<td>Specifies the subnet mask for a manual binding to a DHCP client. Either Host Mask or Prefix Length can be configured to specify the subnet mask but not both. Valid Range is (0 to 32)</td>
</tr>
<tr>
<td>Lease Time</td>
<td>Can be selected as “Infinite” to specify lease time as Infinite or “Specified Duration” to enter a specific lease period. In case of dynamic binding infinite implies a lease period of 60 days and In case of manual binding infinite implies indefinite lease period. Default Value is “Specified Duration”.</td>
</tr>
<tr>
<td>Days</td>
<td>Specifies the Number of Days of Lease Period. This field appears only if the user has specified “Specified Duration” as the Lease time. Default Value is 1. Valid Range is (0 to 59)</td>
</tr>
<tr>
<td>Hours</td>
<td>Specifies the Number of Hours of Lease Period. This field appears only if the user has specified “Specified Duration” as the Lease time. Valid Range is (0 to 22)</td>
</tr>
<tr>
<td>Minutes</td>
<td>Specifies the Number of Minutes of Lease Period. This field appears only if the user has specified “Specified Duration” as the Lease time. Valid Range is (0 to 86399)</td>
</tr>
<tr>
<td>Default Router Addresses</td>
<td>Specifies the list of Default Router Addresses for the pool. The user may specify up to 8 Default Router Addresses in order of preference.</td>
</tr>
</tbody>
</table>
Configuring System Information

2. Use ADD to create the Pool Configuration.
3. Use APPLY to change the Pool Configuration. Sends the updated configuration to the switch. Configuration changes take effect immediately.
4. Use DELETE to delete the Pool. This field is not visible to a user with read only permission.

**DHCP Pool Options**

DHCP options are collections of data with type codes that indicate how the options should be used. Options can specify information that is required for the DHCP protocol, IP stack configuration parameters for the client, information allowing the client to rendezvous with DHCP servers, and so on.

To display the DHCP Pool Options page, click **System > Services > DHCP Server > DHCP Pool Options**. If at least one DHCP pool has been created, a screen similar to the following displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS Server Addresses</td>
<td>Specifies the list of DNS Server Addresses for the pool. The user may specify up to 8 DNS Server Addresses in order of preference.</td>
</tr>
<tr>
<td>NetBIOS Name Server Addresses</td>
<td>Specifies the list of NetBIOS Name Server Addresses for the pool. The user may specify up to 8 NetBIOS Name Server Addresses in order of preference.</td>
</tr>
<tr>
<td>NetBIOS Node Type</td>
<td>Specifies the NetBIOS node type for DHCP clients:</td>
</tr>
<tr>
<td></td>
<td>• b-node Broadcast</td>
</tr>
<tr>
<td></td>
<td>• p-node Peer-to-Peer</td>
</tr>
<tr>
<td></td>
<td>• m-node Mixed</td>
</tr>
<tr>
<td></td>
<td>• h-node Hybrid</td>
</tr>
<tr>
<td>Next Server Address</td>
<td>Specifies the Next Server Address for the pool.</td>
</tr>
<tr>
<td>Domain Name</td>
<td>Specifies the domain name for a DHCP client. Domain Name can be up to 255 characters in length.</td>
</tr>
<tr>
<td>Bootfile</td>
<td>Specifies the name of the default boot image for a DHCP client. File Name can be up to 128 characters in length.</td>
</tr>
</tbody>
</table>

To configure DHCP options for an existing pool:

1. Use **Pool Name** to select the Pool Name.
2. **Option Code** specifies the Option Code configured for the selected Pool.
3. Use **Option Type** to specify the Option Type against the Option Code configured for the selected pool:
   - ASCII
   - Hex
   - IP Address

4. **Option Value** specifies the Value against the Option Code configured for the selected pool.

5. Click **ADD** to add a new Option Code for the selected pool.

6. Click **DELETE** to delete the Option Code for the selected pool.

### DHCP Server Statistics

To display the DHCP Server Statistics page, click **System > Services > DHCP Server > DHCP Server Statistics**. A screen similar to the following displays.

![DHCP Server Statistics](image)

The following table describes the DHCP Server Statistics fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic Bindings</td>
<td>Specifies the number of Automatic Bindings on the DHCP Server.</td>
</tr>
<tr>
<td>Expired Bindings</td>
<td>Specifies the number of Expired Bindings on the DHCP Server.</td>
</tr>
<tr>
<td>Malformed Messages</td>
<td>Specifies the number of the malformed messages.</td>
</tr>
<tr>
<td>DHCPDISCOVER</td>
<td>Specifies the number of DHCPDISCOVER messages received by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPREQUEST</td>
<td>Specifies the number of DHCPREQUEST messages received by the DHCP Server.</td>
</tr>
</tbody>
</table>
Configuring System Information

ProSafe M5300 Switch

DHCP Bindings Information

To display the DHCP Bindings Information page, click **System > Services > DHCP Server > DHCP Bindings Information**. A screen similar to the following displays.

1. Choose:
   - **All Dynamic Bindings** to specify all dynamic bindings to be deleted.
   - **Specific Dynamic Binding** to specify specific dynamic binding to be deleted.

The following table describes the DHCP Bindings Information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPDECLINE</td>
<td>Specifies the number of DHCPDECLINE messages received by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPRELEASE</td>
<td>Specifies the number of DHCPRELEASE messages received by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPINFORM</td>
<td>Specifies the number of DHCPINFORM messages received by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPOFFER</td>
<td>Specifies the number of DHCPOFFER messages sent by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPACK</td>
<td>Specifies the number of DHCPACK messages sent by the DHCP Server.</td>
</tr>
<tr>
<td>DHCPNAK</td>
<td>Specifies the number of DHCPNAK messages sent by the DHCP Server.</td>
</tr>
</tbody>
</table>
**DHCP Conflicts Information**

To display the DHCP Conflicts Information page, click **System > Services > DHCP Server > DHCP Conflicts Information**. A screen similar to the following displays.

1. Choose:
   - **All Address Conflicts** to specify all address conflicts to be deleted.
   - **Specific Address Conflict** to specify a specific dynamic binding to be deleted.

The following table describes the DHCP Conflicts Information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Specifies the IP Address of the host as recorded on the DHCP server.</td>
</tr>
<tr>
<td>Detection Method</td>
<td>Specifies the manner in which the IP address of the hosts were found on the DHCP Server.</td>
</tr>
<tr>
<td>Detection Time</td>
<td>Specifies the time when the conflict was detected in N days NNh:NNm:NNs format with respect to the system up time.</td>
</tr>
</tbody>
</table>
DHCP Relay

If the switch is functioning as a Layer 3 device, the Layer 3 DHCP Relay Agent can relay DHCP messages between DHCP clients and DHCP servers that are located in different IP subnets.

To display the DHCP Relay page, click System > Services> DHCP Relay. A screen similar to the following displays.

**DHCP Relay Configuration**

To configure the DHCP Relay information:

1. Use **Maximum Hop Count** to enter the maximum number of hops a client request can take before being discarded. The range is (1 to 16). The default value is 4.

2. Use **Admin Mode** to select enable or disable radio button. When you select 'enable' DHCP requests will be forwarded to the IP address you entered in the 'Server Address' field.

3. Use **Minimum Wait Time** to enter a Minimum Wait Time in seconds. This value will be compared to the time stamp in the client's request packets, which should represent the time since the client was powered up. Packets will only be forwarded when the time stamp exceeds the minimum wait time. The range is (0 to 100).

4. Use **Circuit ID Option Mode** to enable or disable Circuit ID Option mode. If you select 'enable' Relay Agent options will be added to requests before they are forwarded to the server and removed from replies before they are forwarded to clients.
DHCP Relay Status

The following table describes the DHCP Relay Status fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requests Received</td>
<td>The total number of DHCP requests received from all clients since the last</td>
</tr>
<tr>
<td></td>
<td>time the switch was reset.</td>
</tr>
<tr>
<td>Requests Relayed</td>
<td>The total number of DHCP requests forwarded to the server since the last</td>
</tr>
<tr>
<td></td>
<td>time the switch was reset.</td>
</tr>
<tr>
<td>Packets Discarded</td>
<td>The total number of DHCP packets discarded by this Relay Agent since the</td>
</tr>
<tr>
<td></td>
<td>last time the switch was reset.</td>
</tr>
</tbody>
</table>

DHCP L2 Relay

The DHCP Layer 2 Relay feature permits Layer 3 Relay agent functionality in Layer 2 switched networks.

From the DHCP L2 Relay link, you can access the following pages:

- [DHCP L2 Relay Global Configuration](#) on page 54
- [DHCP L2 Relay Interface Configuration](#) on page 55
- [DHCP L2 Relay Interface Statistics](#) on page 56

DHCP L2 Relay Global Configuration

To display the DHCP L2 Relay Global Configuration page, click System > Services > DHCP L2 Relay> DHCP L2 Relay Global Configuration. A screen similar to the following displays.

To configure the administrative mode of DHCP L2 Relay on the device, use **Admin Mode** to enable or disable the DHCP L2 Relay on the switch. The default is Disable.
To configure the DHCP L2 Relay VLAN information:

1. **VLAN ID** shows the VLAN ID configured on the switch.
2. Use **Admin Mode** to enable or disable the DHCP L2 Relay on the selected VLAN.
3. Use **Circuit ID Mode** to enable or disable the Circuit ID suboption of DHCP Option-82.
4. Use **Remote ID String** to specify the Remote ID when Remote ID mode is enabled.

**DHCP L2 Relay Interface Configuration**

To display the DHCP L2 Relay Interface Configuration page, click **System > Services > DHCP L2 Relay > DHCP L2 Relay Interface Configuration**. A screen similar to the following displays.

To configure one or more interfaces for DHCP L2 relay:

1. Select the check box associated with each interface to configure, or select the check box in the heading row to apply the same settings to all interfaces.
2. Use **Admin Mode** to enable or disable the DHCP L2 Relay on the selected interface. Default is disable.
3. Use **82 Option Trust Mode** to enable or disable an interface to be trusted for DHCP L2 Relay (Option-82) received.
DHCP L2 Relay Interface Statistics

To display the DHCP L2 Relay Interface Statistics page, click **System > Services > DHCP L2 Relay > DHCP L2 Relay Interface Statistics**. A screen similar to the following displays.

The following table describes the DHCP L2 Relay Interface Statistics fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Shows the interface from which the DHCP message is received.</td>
</tr>
<tr>
<td>UntrustedServerMsgsWithOpt82</td>
<td>Shows the number of DHCP message with option82 received from an untrusted server.</td>
</tr>
<tr>
<td>UntrustedClientMsgsWithOpt82</td>
<td>Shows the number of DHCP message with option82 received from an untrusted client.</td>
</tr>
<tr>
<td>TrustedServerMsgsWithoutOpt82</td>
<td>Shows the number of DHCP message without option82 received from a trusted server.</td>
</tr>
<tr>
<td>TrustedClientMsgsWithoutOpt82</td>
<td>Shows the number of DHCP message without option82 received from a trusted client.</td>
</tr>
</tbody>
</table>
UDP Relay

The UDP Relay feature provides the ability for a router to forward configured UDP broadcast packets to a particular IP address. This allows applications to reach servers on non-local subnets. This is possible even when the application is designed to assume a server is always on a local subnet or when the application uses broadcast packets to reach the server (with the limited broadcast address 255.255.255.255, or a network directed broadcast address).

From the UDP Relay link, you can access the following pages:

- UDP Relay Global Configuration on page 57
- UDP Relay Interface Configuration on page 58

UDP Relay Global Configuration

To display the UDP Relay Global Configuration page, click System > Services > UDP Relay> UDP Relay Global Configuration. A screen similar to the following displays.

To configure UDP relay:

1. Use Admin Mode to enable or disable the UDP Relay on the switch. The default value is disable.
2. Use Server Address to specify the UDP Relay Server Address in x.x.x.x format.
3. Use UDP Port to specify the UDP Destination Port. These ports are supported:
   - DefaultSet - Relay UDP port 0 packets. This is specified if no UDP port is selected when creating the Relay server.
   - dhcp - Relay DHCP (UDP port 67) packets.
   - domain - Relay DNS (UDP port 53) packets.
   - isakmp - Relay ISAKMP (UDP port 500) packets.
   - mobile-ip - Relay Mobile IP (UDP port 434) packets.
   - nameserver - Relay IEN-116 Name Service (UDP port 42) packets
   - netbios-dgm - Relay NetBIOS Datagram Server (UDP port 138) packets
   - netbios-ns - Relay NetBIOS Name Server (UDP port 137) packets
   - ntp - Relay network time protocol (UDP port 123) packets.
   - pim-auto-rp - Relay PIM auto RP (UDP port 496) packets.
• rip - Relay RIP (UDP port 520) packets
• tacacs - Relay TACACS (UDP port 49) packet
• tftp - Relay TFTP (UDP port 69) packets
• time - Relay time service (UDP port 37) packets
• Other - If this option is selected, the UDP Port Other Value is enabled. This option permits a user to enter their own UDP port in UDP Port Other Value.

4. Use UDP Port Other Value to specify a UDP Destination Port that lies between 0 and 65535.

5. Click ADD to create an entry in UDP Relay Table with the specified configuration.

6. Click DELETE to remove all entries or a specified one from UDP Relay Table.

The following table describes the UDP Relay Global Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hit Count</td>
<td>Show the number of UDP packets hitting the UDP port</td>
</tr>
</tbody>
</table>

**UDP Relay Interface Configuration**

To display the UDP Relay Interface Configuration page, click System > Services > UDP Relay > UDP Relay Interface Configuration. A screen similar to the following displays.

1. Use Interface to select an Interface to be enabled for the UDP Relay.
2. Use Server Address to specify the UDP Relay Server Address in x.x.x.x format.
3. Use UDP Port to specify UDP Destination Port. The following ports are supported:
   • DefaultSet - Relay UDP port 0 packets. This is specified if no UDP port is selected when creating a Relay server.
   • dhcp - Relay DHCP (UDP port 67) packets.
   • domain - Relay DNS (UDP port 53) packets.
   • isakmp - Relay ISAKMP (UDP port 500) packets.
   • mobile-ip - Relay Mobile IP (UDP port 434) packets
   • nameserver - Relay IEN-116 Name Service (UDP port 42) packets
   • netbios-dgm - Relay NetBIOS Datagram Server (UDP port 138) packets
   • netbios-ns - Relay NetBIOS Name Server (UDP port 137) packets
• **ntp** - Relay network time protocol (UDP port 123) packets.
• **pim-auto-rp** - Relay PIM auto RP (UDP port 496) packets.
• **rip** - Relay RIP (UDP port 520) packets
• **tacacs** - Relay TACACS (UDP port 49) packet
• **tftp** - Relay TFTP (UDP port 69) packets
• **time** - Relay time service (UDP port 37) packets
• **Other** - If this option is selected, the UDP Port Other Value is enabled. This option permits the user to enter their own UDP port in UDP Port Other Value.

4. Use **UDP Port Other Value** to specify UDP Destination Port that lies between 0 and 65535.

5. Use **Discard** to enable/disable dropping of matched packets. Enable can be chosen only when a user enters 0.0.0.0 IP address. Discard mode can be set to Disable when user adds a new entry with a non-zero IP address.

6. Click **ADD** to create an entry in UDP Relay Table with the specified configuration.

7. Click **DELETE** to remove all entries or a specified one from UDP Relay Interface Configuration Table.

The following table describes the UDP Relay Interface Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hit Count</td>
<td>Show the number of UDP packets hitting the UDP port.</td>
</tr>
</tbody>
</table>

**DHCPv6 Server**

IPv6 natively provides IP address autoconfiguration through IPv6 Neighbor Discovery Protocol (NDP) and through the use of Router Advertisement messages. Thus, the role of DHCPv6 within the network is different than that of DHCPv4 because DHCPv6 is not the primary source for IP address assignment.

From the DHCP Server link, you can access the following pages:

• **DHCPv6 Server Configuration** on page 60
• **DHCPv6 Pool Configuration** on page 60
• **DHCPv6 Prefix Delegation Configuration** on page 62
• **DHCPv6 Interface Configuration** on page 63
• **DHCPv6 Bindings Information** on page 64
• **DHCPv6 Server Statistics** on page 65
DHCPv6 Server Configuration

To display the DHCP Server Configuration page, click System > Services > DHCPv6 Server > DHCP Server Configuration. A screen similar to the following displays.

To configure global DHCPv6 server settings:

1. Use Admin Mode to specify whether the DHCPv6 Service is to be Enabled or Disabled. Default value is Disable.
2. In the DHCPv6 Server DUID field, view the client identifier used by the DHCPv6 client (if enabled) when sending messages to the DHCPv6 server.
3. Click CANCEL to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.
4. Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.

DHCPv6 Pool Configuration

Use the DHCPv6 Pool Configuration page to set up a pool of DHCPv6 parameters for DHCPv6 clients. The pool is identified with a pool name and contains IPv6 addresses and domain names of DNS servers.

To display the DHCPv6 Pool Configuration page, click System > Services > DHCPv6 Server > DHCPv6 Pool Configuration. After expanding the DNS Server Addresses and Domain Name fields, a screen similar to the following displays.

</table>
To configure a DHCPv6 Pool:

1. From the **Pool Name** field, select Create and enter name for the Pool to be created. To modify information for an existing DHCPv6 pool, select the name of the pool to configure.

2. If you are configuring a new DHCPv6 pool, specify a unique name for the pool in the **Pool Name** field.

3. Click the **DNS Server Addresses** field to expand the field, and enter the IPv6 address for one or more DNS servers.

4. Click the **Domain Name** field to expand the field, and specify one or more DNS domain server names for the pool. Each name may contain up to 255 alphanumeric characters.

5. Use **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

6. Use **DELETE** to delete the pool selected in the **Pool Name** field.

### DHCPv6 Prefix Delegation Configuration

With the larger address space inherent to IPv6, addresses within a network can be allocated more effectively in a hierarchical fashion. DHCPv6 introduces the notion of prefix delegation as described in RFC 3633 as a way for routers to centralize and delegate IP address assignment.

DHCPv6 clients may request multiple IPv6 prefixes. Also, DHCPv6 clients may request specific IPv6 prefixes. If the configured DHCPv6 pool contains the specific prefix that a DHCPv6 client requests, then that prefix will be delegated to the client. Otherwise, the first available IPv6 prefix within the configured pool will be delegated to the client.

Use the Prefix Delegation Configuration page to configure a delegated prefix for a pool. At least one pool must be created using DHCPv6 Pool Configuration before a delegated prefix can be configured.

To display the DHCPv6 Prefix Delegation Configuration page, click **System > Services > DHCPv6 Server > DHCPv6 Prefix Delegation Configuration**. A screen similar to the following displays.

To configure the Prefix Delegation information:

1. Use **Pool Name** to select the Pool Name.
2. Specify the **Prefix** and **Prefix Length** of the delegated IPv6 prefix in the appropriate fields.
3. In the **DUID** field, specify the client's unique DUID value.
4. In the **Client Name** field, specify the client's name, which is useful for logging or tracing only. It may be up to 31 alphanumeric characters.
5. In the **Valid Lifetime** field, specify the valid lifetime, in seconds, for the delegated prefix. The values allowed are between 0 to 4294967295.

6. In the **Prefer Lifetime** field, specify the preferred lifetime, in seconds, for the delegated prefix. The values allowed are between 0 to 4294967295.

7. Click **ADD** to add a new delegated prefix for the selected pool.

8. Select the check box associated with a prefix delegation and click **DELETE** to remove the delegated prefix.

9. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

10. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

### DHCPv6 Interface Configuration

Use the DHCPv6 Interface Configuration page to configure a DHCPv6 interface.

To display the DHCPv6 Interface Configuration page, click **System > Services > DHCPv6 Server > DHCPv6 Interface Configuration**. A screen similar to the following displays.

To configure the DHCPv6 Interface Configuration information:

1. Select the check box associated with each interface to configure, or select the check box in the heading row to apply the same configuration to all interfaces.

2. In the **Admin Mode** field, specify the DHCPv6 mode to configure server functionality on the selected interface(s). DHCPv6 server and DHCPv6 relay functions are mutually exclusive.

3. In the **Pool Name** field, specify the DHCPv6 pool containing stateless and/or prefix delegation parameters.

4. (Optional) In the **Rapid Commit** field, select Enable to allow abbreviated exchange between the client and server.
5. In the **Preferences** field, specify the preference value used by clients to determine preference between multiple DHCPv6 servers. The values allowed are between 0 to 4294967295. The default value is 0.

6. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

7. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

**DHCPv6 Bindings Information**

To display the DHCPv6 Bindings Information page, click **System > Services > DHCPv6 Server > DHCPv6 Bindings Information**. A screen similar to the following displays.

The following table describes the DHCPv6 Bindings Information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Address</td>
<td>The Client's IPv6 address.</td>
</tr>
<tr>
<td>Client Interface</td>
<td>The interface number where the client binding occurred.</td>
</tr>
<tr>
<td>Client DUID</td>
<td>The client's DHCPv6 unique identifier.</td>
</tr>
<tr>
<td>Prefix</td>
<td>The IPv6 address leased to the client</td>
</tr>
<tr>
<td>Prefix Length</td>
<td>The IPv6 mask length.</td>
</tr>
<tr>
<td>Prefix Type</td>
<td>The type of prefix associated with this binding: Dynamic / Manual.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>The number of seconds until the prefix associated with a binding will expire.</td>
</tr>
<tr>
<td>Valid Lifetime</td>
<td>The valid lifetime value in seconds of the prefix associated with a binding.</td>
</tr>
<tr>
<td>Prefer Lifetime</td>
<td>The preferred lifetime value in seconds of the prefix associated with a binding.</td>
</tr>
</tbody>
</table>
**DHCPv6 Server Statistics**

To display the DHCP Server Statistics page, click **System > Services > DHCPv6 Server > DHCPv6 Server Statistics**. A screen similar to the following displays.

The following table describes the DHCPv6 Server Statistics fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Select the interface with the statistics to view.</td>
</tr>
<tr>
<td>Messages Received</td>
<td>Specifies the aggregate of all interface level statistics for received messages.</td>
</tr>
<tr>
<td>Total DHCPv6 Packets Received</td>
<td>Specifies the total number of Packets Received.</td>
</tr>
<tr>
<td>DHCPv6 Solicit Packets Received</td>
<td>Specifies the number of Solicits.</td>
</tr>
<tr>
<td>DHCPv6 Request Packets Received</td>
<td>Specifies the number of Requests.</td>
</tr>
<tr>
<td>DHCPv6 Confirm Packets Received</td>
<td>Specifies the number of Confirms.</td>
</tr>
<tr>
<td>DHCPv6 Renew Packets Received</td>
<td>Specifies the number of Renews.</td>
</tr>
<tr>
<td>DHCPv6 Rebind Packets Received</td>
<td>Specifies the number of Rebinds.</td>
</tr>
</tbody>
</table>
DHCPv6 Relay

The DHCPv6 Relay Agent allows for various sub-options to be attached to messages that are being relayed by the local switch to a DHCPv6 server. The DHCPv6 server may in turn use this information in determining an address to assign to a DHCPv6 client.

To display the DHCPv6 Relay Configuration page, click **System > Services > DHCPv6 Relay**. A screen similar to the following displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DHCPv6 Release Packets Received</td>
<td>Specifies the number of Releases.</td>
</tr>
<tr>
<td>DHCPv6 Decline Packets Received</td>
<td>Specifies the number of Declines.</td>
</tr>
<tr>
<td>DHCPv6 Inform Packets Received</td>
<td>Specifies the number of Informs.</td>
</tr>
<tr>
<td>DHCPv6 Relay-forward Packets Received</td>
<td>Specifies the number of Relay forwards.</td>
</tr>
<tr>
<td>DHCPv6 Relay-reply Packets Received</td>
<td>Specifies the number of Relay Replies.</td>
</tr>
<tr>
<td>DHCPv6 Malformed Packets Received</td>
<td>Specifies the number of Malformed Packets.</td>
</tr>
<tr>
<td>Received DHCPv6 Packets Discarded</td>
<td>Specifies the number of Packets Discarded.</td>
</tr>
<tr>
<td>Messages Sent</td>
<td>The aggregate of all interface level statistics for messages sent.</td>
</tr>
<tr>
<td>Total DHCPv6 Packets Sent</td>
<td>Specifies the total number of Packets Transmitted.</td>
</tr>
<tr>
<td>DHCPv6 Advertisement Packets Transmitted</td>
<td>Specifies the number of Advertisements.</td>
</tr>
<tr>
<td>DHCPv6 Reply Packets Transmitted</td>
<td>Specifies the number of Replies.</td>
</tr>
<tr>
<td>DHCPv6 Reconfig Packets Transmitted</td>
<td>Specifies the number of Reconfigurations.</td>
</tr>
<tr>
<td>DHCPv6 Relay-forward Packets Transmitted</td>
<td>Specifies the number of Relay forwards.</td>
</tr>
<tr>
<td>DHCPv6 Relay-reply Packets Transmitted</td>
<td>Specifies the number of Relay Replies.</td>
</tr>
</tbody>
</table>
To configure the DHCPv6 Relay information for one or more interfaces:

1. Select the check box associated with each interface to configure, or select the check box in the heading row to apply the same configuration to all interfaces.
2. In the **Admin Mode** field, specify the DHCPv6 mode to configure DHCPv6 Relay functionality. DHCPv6 server and DHCPv6 relay functions are mutually exclusive.
3. In the **Relay Interface** field, specify an interface to reach a relay server.
4. In the **Destination IP Address** field, specify an IPv6 Address to reach a relay server.
5. In the **Remote ID** field, specify the relay agent information option. The remote ID needs to be derived from the DHCPv6 server DUID and the relay interface number, or it can be specified as a user-defined string.
6. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.
7. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
Stacking

A stackable switch is a switch that is fully functional operating as a stand-alone unit but can also be set-up to operate together with up to seven other switches. This group of switches shows the characteristics of a single switch while having the port capacity of the sum of the combined switches.

From the Stacking link under the System tab, you can access the following pages:

- **Stack Configuration** on page 72
- **Stack Port Configuration** on page 74
- **Stack Port Diagnostics** on page 76
- **Stack Firmware Synchronization** on page 77

One of the switches in the stack controls the operation of the stack. This switch is called the stack *master*. The remaining switches in the stack are stack *members*. The stack members use stacking technology to behave and work together as a unified system. Layer 2 and higher protocols present the entire switch stack as a single entity to the network.

The stack master is the single point of stack-wide management. From the stack master, you configure the following:

- System-level (global) features that apply to all stack members
- Interface-level features for all interfaces on any stack member

A switch stack is identified in the network by its network IP address. The network IP address is assigned according to the MAC address of the stack master. Every stack member is uniquely identified by its own stack member number, which is from 1–6. The stack master can be any number within that range.

**Stack Features**

Stacking on the ProSafe M5300 switches supports the following:

- Up to eight switches per stack, which can be any combination of the following switch models:
  - M5300 Series (all models)
  - GSM7328S
  - GSM7352S
  - GSM7328FS
  - GSM7328Sv2
  - GSM7352Sv2
  - GSM7228PS
  - GSM7252PS.
• Single IP address management through a web browser, the CLI, or SNMP.
• Master-slave configuration.
  • The master retains configuration for entire stack.
  • Automatic detection of new members, with synchronization of firmware (upgrade or downgrade as needed).
• Configuration updates across the stack through a single operation.
• Automatic master fail-over. Fully resilient stack with chain and ring topology.
• Hot swapping (insertion and removal) of stack members.

Firmware Synchronization and Upgrade

All stack members must run the same software version to ensure compatibility within the stack. By default, if a unit is added to the stack and its software version is not the same as the stack master, that unit is not allowed to join the stack. You can enable the Stack Firmware Auto Upgrade feature, which will automatically synchronize the firmware version on the new unit with the version running on the stack master. The synchronization operation may result in either upgrade or downgrade of firmware on the mismatched stack member.

Upgrading the firmware on a stack of switches is the same as upgrading the firmware on a single switch. After you download a new image by using the File Download page or SCC, the downloaded image is distributed to all the connected units of the stack.

Note: It is recommended to set the active image for all stack members the same as the active image of the stack master. In other words, if image1 is the active image on the stack master, all units should have image1 as the active image. For information about configuring the active image, see Dual Image Configuration on page 289.

Configuration Maintenance

The stack master stores and maintains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for all stack members. Each stack member retains a copy of the saved file for backup purposes. If the master is removed from the stack or becomes unavailable, another member will be elected master, and will then run from that saved configuration.

The switch master copies its running configuration to the stack member configured as the standby unit whenever it changes (subject to some restrictions to reduce overhead). This enables the standby unit to take over the stack operation with minimal interruption if the stack master becomes unavailable. The running-config synchronization also occurs when the running configuration is auto-saved on the stack master or when the standby unit changes.
Stack Master Election

All stack members are eligible stack masters. If the stack master becomes unavailable, the remaining stack members participate in electing a new stack master from among themselves. The following factors determine which switch is elected the stack master:

- The switch that is master always has priority to retain the role of master
- Assigned priority
- MAC address

When the stack is powered up and completes the boot process or the original stack master becomes unavailable, the stack master is determined through an election process.

The rules for stack master Election are as follows:

- If a unit had previously been elected stack master, then it will remain the stack master and other units will simply be stack members.
- If no units were stack masters, or more than one unit was a stack master, then the unit with the highest management preference is elected stack master. The management preference can be assigned by the administrator. However, if all units have the same management preference, then the unit with the highest MAC address is assigned as the stack master.

Factory Defaults Reset Behavior

If the stack master is reset to the factory default settings (see Factory Default on page 281), the stack master applies the default settings to all the stack members and resets the stack, including all participating stack members. When the stack boots, the stack master election process begins.

A switch can be described in terms of three semi-independent functions called the forwarding plane, the control plane, and the management plane. The forwarding plane forwards data packets. The forwarding plane is implemented in hardware. The control plane is the set of protocols that determine how the forwarding plane should forward packets, deciding which data packets are allowed to be forwarded and where they should go. Application software on the management unit acts as the control plane. The management plane is application software running on the management unit that provides interfaces allowing a network administrator to configure and monitor the device.
Nonstop Forwarding

Nonstop forwarding (NSF) allows the forwarding plane of stack units to continue to forward packets while the control and management planes restart as a result of a power failure, hardware failure, or software fault on the management unit. A nonstop forwarding failover can also be manually initiated by clicking the Initiate Failover button on the NSF Summary page. Traffic flows that enter and exit the stack through physical ports on a unit other than the management continue with at most sub-second interruption when the management unit fails.

To prepare the backup management unit in case of a failover, applications on the management unit continuously checkpoint some state information to the backup unit. Changes to the running configuration are automatically copied to the backup unit. MAC addresses stay the same across a nonstop forwarding failover so that neighbors do not have to relearn them.

When a nonstop forwarding failover occurs, the control plane on the backup unit starts from a partially-initialized state and applies the checkpointed state information. While the control plane is initializing, the stack cannot react to external changes, such as network topology changes. Once the control plane is fully operational on the new management unit, the control plane ensures that the hardware state is updated as necessary. Control plane failover time depends on the size of the stack, the complexity of the configuration, and the speed of the CPU.

The management plane restarts when a failover occurs. Management connections must be reestablished.

For NSF to be effective, adjacent networking devices must not reroute traffic around the restarting device. The switch uses three techniques to prevent traffic from being rerouted:

1. A protocol may distribute a part of its control plane to stack units so that the protocol can give the appearance that it is still functional during the restart. Spanning tree and port channels use this technique.

2. A protocol may enlist the cooperation of its neighbors through a technique known as graceful restart. OSPF uses graceful restart if it is enabled.

3. A protocol may simply restart after the failover if neighbors react slowly enough that they will not normally detect the outage. The IP multicast routing protocols are a good example of this behavior.

To take full advantage of nonstop forwarding, layer 2 connections to neighbors should be via port channels that span two or more stack units, and layer 3 routes should be ECMP routes with next hops via physical ports on two or more units. The hardware can quickly move traffic flows from port channel members or ECMP paths on a failed unit to a surviving unit.
Stack Configuration

From this page, you can preconfigure stack members before adding them to the stack, change the unit number assigned to a stack member, and to select a new stack master or give management preference to one or more units. If you change the unit ID on a stack member, the member reloads. A stack move causes all routes and layer 2 addresses to be lost. The administrator is prompted to confirm the management move.

To display the Stack Configuration page, click **System > Stacking > Basic > Stack Configuration.** A screen similar to the following is displayed.

To select a new stack master:

1. In the **Management Unit Selected** menu, select the unit ID of the stack member to become the stack master.
2. A message indicating that moving stack management will unconfigure entire stack including all interfaces.
3. Click OK to confirm the selection and reload the stack. The stack will be unavailable until the boot process completes.

To configure a stack member before adding it to the stack:

1. Select the **Unit ID** of the stack member to add.
2. Optionally, specify the **Switch Priority** to select whether you want this unit to become a management unit in preference to another unit. The default value for this setting is undefined. If the preference level is set to zero, then the device cannot become a management unit. A higher value indicates a higher priority, the maximum value is 15.
3. Use the **Management Status** field to indicate whether the selected switch is the stack master, a normal stacking member, or the standby unit. A standby unit takes over the stack master responsibilities if the stack master becomes unavailable.
4. Click **Add** to add the preconfigured unit to the stack.
To change the settings for an existing stack member:

1. Select the check box next to the stack member to configure.
2. If desired, specify a new unit ID for the stack member in the **Change to Switch ID** field. The renumbering process causes the unit to reload.
3. Specify the switch type, priority, or management status from the available fields.
4. Click **Apply** to save the changes to the stack member.

   **Note:** If you configured a new unit number for an existing stack member, you are asked to confirm the change. Click **OK** to continue or **Cancel** to retain the original settings.

5. Click **Delete** to remove the selected unit from the stack.
6. Click **Refresh** to update the page with the latest information from the switch.
7. Click **Cancel** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

The following table describes the non-configurable Stack Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware Management</td>
<td>The hardware management preference of the switch. The hardware management preference can be disabled or unassigned.</td>
</tr>
<tr>
<td>Preference</td>
<td></td>
</tr>
<tr>
<td>Standby Status</td>
<td>Identifies the switch that is configured as the Standby Unit. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Cfg Standby - Indicates that the unit is configured as the Standby Unit. The unit configured as the Standby switch becomes the stack manager if the current manager fails.</td>
</tr>
<tr>
<td></td>
<td>• Opr Standby - Indicates that this unit is operating as the Standby Unit and the configured Standby Unit is not part of the stack.</td>
</tr>
<tr>
<td></td>
<td>• None - The switch is not configured as the Standby Unit.</td>
</tr>
<tr>
<td>Switch Status</td>
<td>Displays the status of the selected unit. The possible values are:  \</td>
</tr>

<td>This field indicates the detected version of code on this unit.</td>
</tr>
<tr>
<td>Detected Code Version in Flash</td>
<td>The displays the Release number and version number of the code stored in flash.</td>
</tr>
<tr>
<td>SFS Last Attempt Status</td>
<td>This displays the status of last tried stack firmware synchronisation. “None” is the default value if SFS has not been tried.</td>
</tr>
</tbody>
</table>

**Stack Port Configuration**

By default, the stack ports on each switch are configured for stacking. However, you can use these ports as standard Ethernet ports. Use the Stack Port configuration page to configure the mode of the stack ports and to view information about the ports.

To display the Stack Port Configuration page, click **System > Stacking > Advanced > Stack Port Configuration**. A screen similar to the following is displayed (the page is shown in two parts).
To configure the mode of the stack ports:

1. Select the check box associated with the unit and port to configure:

2. From the **Configured Stack Mode** field, select the operating mode:
   - **Stack.** The port connects to the stack port on another stack member. This is the default value.
   - **Ethernet.** The port operates as a standard switch port that receives and transmits network traffic

3. Click **Apply** to apply the new settings to the system.

4. Click **Cancel** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

5. Click **Refresh** to update the screen with the current information.

The following table describes Stack Port Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit ID</td>
<td>Displays the unit.</td>
</tr>
<tr>

</tbody>
</table>
Configuring System Information

ProSafe M5300 Switch

Stack Port Diagnostics

This page displays the diagnostics for all the stackable interfaces in the given stack.

To display the Stack Port Diagnostics page, click **System > Stacking > Advanced > Stack Port Diagnostics**. A screen similar to the following is displayed.

The following table describes the Stack Port Diagnostics fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit ID</td>
<td>Displays the unit.</td>
</tr>
<tr>
<td>Port</td>
<td>Displays the stackable interface on the given unit.</td>
</tr>
<tr>
<td>Port Diagnostics Info</td>
<td>Displays three text fields (80 character strings) populated by the driver containing debug and status information.</td>
</tr>
</tbody>
</table>
Stack Firmware Synchronization

To display the stack firmware synchronization configurations from the Stack Firmware Synchronization page, click **System > Stacking > Advanced > Stack Firmware Synchronization**. A screen similar to the following is displayed.

![Stack Firmware Synchronization](image)

To configure the Stack Firmware Synchronization features:

1. Specify whether **Stack Firmware Auto Upgrade** is enabled or disabled. This feature determines what to do when a new member attempts to join the stack, and its firmware does not match the version running on the master.
   - **Enable**. The stack master upgrades the version on the new member to match the version running on the rest of the stack.
   - **Disable**. The new member is not allowed to join.

2. Use the **Traps** field to enable or disable sending of traps during Stack Firmware Synchronization Start, Failure, or Finish.

3. Use the **Allow Downgrade** field to determine whether the stack master should downgrade the firmware version on a new member that attempts to join the stack if the new member has a firmware version that is more recent than the stack.

4. Click **Refresh** to update the page with the latest information from the switch.

5. Click **Apply** to apply the new settings to the switch. Configuration changes take effect immediately.
NSF

Use the NSF Summary page to enable nonstop forwarding feature on the stack, view operational status information, and to initiate a warm restart of the management unit.

When nonstop forwarding is enabled, if the management unit of a stack fails, the backup unit takes over as the master without clearing the hardware tables of any of the surviving units. Data traffic continues to be forwarded in hardware while the management functions initialize on the backup unit.

NSF is enabled by default on platforms that support it. The administrator may wish to disable NSF in order to redirect the CPU resources consumed by data checkpointing. To display the NSF Summary page, click **System > Stacking > Advanced > NSF > NSF Summary**. A screen similar to the following is displayed.

To configure NSF:

1. To enable or disable NSF on the switch, select the desired option from the **Admin Mode** field. When enabled, the stack selects a backup unit to receive checkpointed data from applications on the management unit.

2. Click **INITIATE FAILOVER** to start a warm restart. On a warm restart, the backup unit becomes the management unit without clearing its hardware tables (on a cold restart, hardware tables are cleared). Applications apply checkpointed data from the former management unit to the backup unit as the original management unit reboots. If the system is not ready for a warm restart, for example because no backup unit has been elected or one or more members of the stack do not support nonstop forwarding, the command fails with a warning message.

3. Click **APPLY** if you have updated the NSF Admin Status. If you want the switch to retain the new setting across a power cycle, you must perform a save.
4. Click **CANCEL** to abandon the changes.
5. Click **RESET** to redisplay the page with the latest status values from the switch.

The NSF Summary page includes the following non-configurable information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operation Status</td>
<td>Indicates whether NSF is operational on the stack, which may differ from the Admin Status setting. If a unit that does not support NSF is connected to the stack, then NSF is disabled on all stack members. When a unit that does not support NSF is disconnected from the stack and all other units support NSF, and NSF is administratively enabled, then NSF operation resumes.</td>
</tr>
</tbody>
</table>
| Last Startup Reason       | The type of activation that caused the software to start the last time. The possible values are:  
  - Power On — The switch rebooted, caused by a power cycle or an administrative “Reload” command.  
  - Administrative Move — The administrator issued a command for the stand-by manager to take over.  
  - Warm Admin Move — The administrator issued a command for the backup manager to take over.  
  - Warm — The primary management card restarted due to a failure, and the system executed a nonstop forwarding failover to a backup management unit.  
  - Auto Cold — The system switched from the active manager to the backup manager and was unable to maintain user data traffic. This is usually caused by multiple failures occurring close together. |
| Time Since Last Restart   | Time since the current management card became the active management card. For the backup management unit, the value is set to 0d 00:00:00.                                                                               |
| Restart In Progress       | Indicates whether a restart is in progress. A restart is not considered complete until all hardware tables have been fully reconciled.                                                                    |
| Warm Restart Ready        | Indicates whether the initial full checkpoint has finished.                                                                                                                                              |
| Backup Configuration Age  | Indicates the time since the running configuration was last copied to the backup unit.                                                                                                                 |
Checkpoint Statistics

Use the Checkpoint Statistics page to display information about the protocol and routing data that the management unit shares with the backup unit.

To display the Checkpoint Statistics page, click **System > Stacking > Advanced > NSF > Checkpoint Statistics**. A screen similar to the following is displayed.

<table>
<thead>
<tr>
<th>Checkpoint Statistics</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Messages Checkpointed</td>
<td>40</td>
</tr>
<tr>
<td>Bytes Checkpointed</td>
<td>11924</td>
</tr>
<tr>
<td>Time Since Counters Cleared</td>
<td>2 days 1 hrs 55 mins 8 secs</td>
</tr>
<tr>
<td>Checkpoint Message Rate</td>
<td>0.000 msg/sec</td>
</tr>
<tr>
<td>Last 10-second Message Rate</td>
<td>0.0 msg/sec</td>
</tr>
<tr>
<td>Highest 10-second Message Rate</td>
<td>1.3 msg/sec</td>
</tr>
</tbody>
</table>
The following table describes the fields on the Checkpoint Statistics page:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messages Checkpointed</td>
<td>The number of messages sent from master unit to backup unit.</td>
</tr>
<tr>
<td>Bytes Checkpointed</td>
<td>How much data has been sent from master unit to the backup unit.</td>
</tr>
<tr>
<td>Time Since Counters Cleared</td>
<td>The amount of time since the counters have been reset.</td>
</tr>
<tr>
<td>Message Rate Interval</td>
<td>The number of seconds between measurements.</td>
</tr>
<tr>
<td>Message Rate</td>
<td>The number of messages sent in the last measurement interval.</td>
</tr>
<tr>
<td>Highest Message Rate</td>
<td>The highest number of messages that have been sent in a measurement interval.</td>
</tr>
</tbody>
</table>
PoE (M5300-28G-POE+ and M5300-52G-POE+ Only)

Copper Ethernet ports 1–24 on the M5300-28G-POE+ and copper Ethernet ports 1–48 on the M5300-52G-POE+ are PoE+ (IEEE 802.3at) compliant ports. Each port is capable of delivering up to 30W of reliable, uninterrupted power to connected PoE-powered devices (PD).

The GS728TPS can provide a total of 192W of power to all connected devices. The GS752TPS can provide a total of 384W of power to all connected devices. You can configure per-port priority settings, timers, and power limits to manage the power supplied to the connected PDs and to ensure that the power budget for each switch is used effectively.

From the PoE link, you can access the following pages:

- Basic PoE Configuration on page 83
- PoE Port Configuration on page 84
Basic PoE Configuration

Use the PoE Configuration page to view global PoE power information and to configure PoE settings.

To display the Basic PoE Configuration page, click System > Services > PoE > Basic > PoE Configuration. A screen similar to the following displays.

![PoE Configuration Table](image)

To configure PoE trap settings:

1. If you are managing a stack of switches, select the ID of the stack member to configure from the Unit menu.
2. Specify the percentage of the threshold power that must be consumed before a trap is sent.
3. Select the power management algorithm the switch uses to deliver power to the requesting PDs.
   - **Static.** The Power allocated for each port depends on the type of power threshold configured on the port.
   - **Dynamic.** The power consumption of each port is measured and calculated in real-time.
4. Select the appropriate radio button to enable or disable SNMP traps for PoE.
5. Click APPLY to apply the new settings to the system.
6. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
7. Click REFRESH to update the screen with the current information.
The PoE Configuration page also provides the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware Version</td>
<td>Version of the PoE controller's FW image.</td>
</tr>
<tr>
<td>Power Status</td>
<td>Indicates whether the PoE capability is on or off.</td>
</tr>
<tr>
<td>Nominal Power</td>
<td>Indicates the nominal amount of power the switch can provide to all ports.</td>
</tr>
<tr>
<td>Threshold Power</td>
<td>Shows the amount of power the system can consume before the system will not provide power to an additional port.</td>
</tr>
<tr>
<td>Consumed Power</td>
<td>Shows the total amount of power currently being delivered to all ports.</td>
</tr>
</tbody>
</table>

**PoE Port Configuration**

Use the PoE Port Configuration page to configure per-port PoE settings.

To display the Advanced PoE Configuration page, click **System > Services > PoE > Advanced > PoE Configuration**. A screen similar to the following displays (the screens have been edited to show all fields).
To configure PoE Port settings:

1. Select the check box next to the port to configure. Select multiple check boxes to apply the same settings to each selected port. Select the check box in the heading row to apply the same settings to all ports.

2. Configure or view the settings:
   - **Admin Mode.** Enable or disable the ability of the port to deliver power.
   - **High Power.** Indicates whether the port supports High Power Mode.
   - **Max Power.** Shows the maximum power, in Watts, the port can provide.
   - **Port Priority.** Determine which ports can deliver power if the total power delivered by the switch crosses a certain threshold. The switch may not be able to supply power to all connected devices. Priority is used to determine which ports can supply power. When ports have the same priority, the lower numbered port is given a higher priority. The possible priority levels are Critical (highest priority), High, and Low.
   - **High Power Mode.** Select the power-up mode for the port
     - **Disable:** A port is powered in the IEEE 802.3af mode. (Default)
     - **Legacy:** A port is powered using high-inrush current, which is used by legacy powered devices (PDs) with a power requirement greater than 15W from power up.
     - **Pre-802.3at:** A port is powered in the IEEE 802.3af mode initially and switched to the high-power IEEE 802.3at mode before 75 msec. Use this mode if the PD is not performing Layer 2 classification, or if the switch is performing two-event Layer 1 classification.
     - **802.3at:** A port is powered in IEEE 802.3at mode. If the PD class detected by the switch is not Class 4 (type 2), the port will power up the PD, but only Class 4 PDs can be powered up in the IEEE 802.3at mode.
   - **Power Limit Type.** Select the type of power limit to use on the port, which is one of the following:
     - **Class:** Select this option to base the power limit on the detected class value. When this value is selected, the user-configured value configured in the Power Limit field is ignored.
     - **User:** Select this option to base the power limit on the value configured in the Power Limit field.
     - **None:** Select this option to indicate that no power limit type is used on the port.
   - **Power Limit.** Set the maximum amount of power that can be delivered by a port when the Power Limit Type is **User.**
   - **Detection Type.** Select the PD detection mode the PSE port uses to detect an attached device. The detection mode can be one of the following modes:
     - **Auto.** The port performs four-point resistive detection (802.3af4point) followed by legacy detection.
     - **Pre-ieee.** The port performs legacy detection.
     - **IEEE.** The port performs four-point resistive detection (802.3af4point).
• **Class.** View the class of the PD connected to the port. The class defines the range of power a PD is drawing from the system. The class is defined as:
  - 0: 0.44–12.95W
  - 1: 0.44–3.83W
  - 2: 3.84–6.48W
  - 3: 6.49–12.95W
  - 4: 12.95–25.50W (802.3at Type 2 devices only)

• **Timer Schedule.** Select the timer schedule to use for the port. By default, no timer schedules are configured. To create a timer schedule, use the Timer Schedule Global Configuration page.

• **Output Voltage.** Shows the current voltage being delivered to device in Volts.

• **Output Current.** Shows the current being delivered to device in mA.

• **Output Power.** Shows the current power being delivered to device in Watts.

• **Temperature.** The temperature measured at this port of the PoE Controller. It is measured in degrees celsius.

• **Status.** View the operational status of the port PD detection.
  - **Disabled.** Indicates no power is being delivered.
  - **DeliveringPower.** Indicates power is being drawn by a connected device.
  - **Fault.** Indicates a problem with the port.
  - **Test.** Indicates the port is in test mode.
  - **OtherFault.** Indicates the port is idle due to an error condition.
  - **Searching.** Indicates the port is not in one of the above states.
  - **Requesting Power.** Indicates that a valid PD has been detected, but the device is not able to deliver power to the PD due to a power management decision.

• **Fault Status.** Describes the error description when the PSE port is in fault status, which can be one of the following:
  - **No Error.** Specifies that the PSE port is not in any error state.
  - **MPS Absent.** Specifies that the PSE port has detected an absence of main power supply.
  - **Short.** Specifies that the PSE port has detected a short circuit condition.
  - **Overload.** Specifies that the PD connected to the PSE port had tried to provide more power than it is permissible by the hardware.
  - **Power Denied.** Specifies that the PSE port has been denied power because of shortage of power or due to administrative action.

3. Click **APPLY** to apply the new settings to the system.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

5. Click **RESET** to forcibly reset the selected port(s).
From SNMP link under the System tab, you can configure SNMP settings for SNMP V1/V2 and SNMPv3.

From the SNMP link, you can access the following pages:

- SNMPV1/V2 on page 87
- SNMP V3 User Configuration on page 92

**SNMPV1/V2**

The pages under the SNMPV1/V2 menu allow you to configure SNMP community information, traps, and trap flags.

From the SNMP V1/V2 link, you can access the following pages:

- Community Configuration on page 87
- Trap Configuration on page 89
- Trap Flags on page 90
- Supported MIBs on page 91

**Community Configuration**

By default, two SNMP Communities exist:

- Private, with Read/Write privileges and status set to **Enable**.
- Public, with Read Only privileges and status set to **Enable**.

These are well-known communities. Use this page to change the defaults or to add other communities. Only the communities that you define using this page will have access to the switch using the SNMPv1 and SNMPv2c protocols. Only those communities with read/write level access can be used to change the configuration using SNMP.

Use this page when you are using the SNMPv1 and SNMPv2c protocol. If you want to use SNMP v3 you should use the User Accounts menu.

To display this page, click **System > SNMP > SNMP V1/V2 > Community Configuration**. A screen similar to the following displays.
To configure SNMPv1/v2 communities:

1. Use **Community Name** to reconfigure an existing community, or to create a new one. Use this pull-down menu to select one of the existing community names, or select 'Create' to add a new one. A valid entry is a case-sensitive string of up to 16 characters.

2. **Client Address** - Taken together, the Client Address and Client IP Mask denote a range of IP addresses from which SNMP clients may use that community to access this device. If either (Client Address or IP Mask) value is 0.0.0.0, access is allowed from any IP address. Otherwise, every client's address is ANDem with the mask, as is the Client Address, and, if the values are equal, access is allowed. For example, if the Client Address and Client IP Mask parameters are 192.168.1.0/255.255.255.0, then any client whose address is 192.168.1.0 through 192.168.1.255 (inclusive) will be allowed access. To allow access from only one station, use a Client IP Mask value of 255.255.255.255, and use that machine's IP address for Client Address.

3. **Client IP Mask** - Taken together, the Client Address and Client IP Mask denote a range of IP addresses from which SNMP clients may use that community to access this device. If either (Client Address or IP Mask) value is 0.0.0.0, access is allowed from any IP address. Otherwise, every client's address is ANDem with the mask, as is the Client Address, and, if the values are equal, access is allowed. For example, if the Client Address and Client IP Mask parameters are 192.168.1.0/255.255.255.0, then any client whose IP address is 192.168.1.0 through 192.168.1.255 (inclusive) will be allowed access. To allow access from only one station, use a Client IP Mask value of 255.255.255.255, and use that machine's IP address for Client Address.

4. Use **Access Mode** to specify the access level for this community by selecting Read/Write or Read Only from the pull-down menu.

5. Use **Status** to specify the status of this community by selecting Enable or Disable from the pull-down menu. If you select enable, the Community Name must be unique among all valid Community Names or the set request will be rejected. If you select disable, the Community Name will become invalid.

6. Click **ADD** to add the currently selected community to the switch.

7. Click **DELETE** to delete the currently selected Community Name.
Trap Configuration

This page displays an entry for every active Trap Receiver. To access this page, click System > SNMP > SNMP V1/V2 > Trap Configuration.

<table>
<thead>
<tr>
<th>Community Name</th>
<th>Version</th>
<th>Protocol</th>
<th>Address</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>SNMP v1</td>
<td>IPv4</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To configure SNMPv1/v2 traps:

1. To add a host that will receive SNMP traps, enter trap configuration information in the available fields described below, and then click **ADD**.
   a. **Community Name** - Enter the community string for the SNMP trap packet to be sent to the trap manager. This may be up to 16 characters and is case sensitive.
   b. **Version** - Select the trap version to be used by the receiver from the pull down menu:
      - **SNMP v1** - Uses SNMP v1 to send traps to the receiver.
      - **SNMP v2** - Uses SNMP v2 to send traps to the receiver.
   c. **Protocol** - Select the protocol to be used by the receiver from the pull down menu. Select the IPv4 if the receiver’s address is IPv4 address or IPv6 if the receiver’s address is IPv6.
   d. **Address** - Enter the IPv4 address in x.x.x.x format or IPv6 address in x:x:x:x:x:x:x or a hostname starting with an alphabet to receive SNMP traps from this device. Length of address can not exceed 158 characters.
   e. **Status** - Select the receiver’s status from the pull-down menu:
      - **Enable** - Send traps to the receiver
      - **Disable** - Do not send traps to the receiver.

2. To modify information about an existing SNMP recipient, select the check box next to the recipient, change the desired fields, and then click **APPLY**. Configuration changes take effect immediately.

3. To delete a recipient, select the check box next to the recipient and click **DELETE**.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
Trap Flags

Use the Trap Flags page to enable or disable traps. When the condition identified by an active trap is encountered by the switch, a trap message is sent to any enabled SNMP Trap Receivers, and a message is written to the trap log.

To access the Trap Flags page, click System > SNMP > SNMP V1/V2 > Trap Flags. The following screen shows some, but not all, of the SNMPv1/v2 trap flags.

To configure the trap flags:

1. Use Authentication to enable or disable activation of authentication failure traps by selecting the corresponding radio button. The factory default is enabled.
2. Use Link Up/Down to enable or disable activation of link status traps by selecting the corresponding radio button. The factory default is enabled.
3. Use Multiple Users to enable or disable activation of multiple user traps by selecting the corresponding radio button. The factory default is enabled. This trap is triggered when the same user ID is logged into the switch more than once at the same time (either via telnet or the serial port).
4. Use Spanning Tree to enable or disable activation of spanning tree traps by selecting the corresponding radio button. The factory default is enabled.
5. Use **ACL** to enable or disable activation of ACL traps by selecting the corresponding radio button. The factory default is disabled.

6. Use **PoE** to enable or disable activation of PoE traps by selecting the corresponding radio button. The factory default is enabled. Indicates whether PoE traps will be sent.

7. Use **DVMRP** to enable or disable activation of DVMRP traps by selecting the corresponding radio button. The factory default is disabled.

8. Use **PIM** to enable or disable activation of spanning tree traps by selecting the corresponding radio button. The factory default is disabled.

9. Use the options under the **OSPFv2 Traps** heading to enable or disable activation of specific OSPF traps by selecting the corresponding radio button. The factory default is disabled. This field can be configured only if the OSPF admin mode is enabled.

10. Use the options under the **OSPFv3 Traps** heading to enable or disable activation of specific OSPFv3 traps by selecting the corresponding radio button. The factory default is disabled. This field can be configured only if the OSPFv3 admin mode is enabled.

11. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.

12. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**Supported MIBs**

This page displays all the MIBs supported by the switch. To access this page, click **System > SNMP > SNMP V1/V2-Supported MIBs**. The following screen shows some, but not all, of the supported MIBs.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RFC 1907 – SNMPv2-MIB</td>
<td>The MIB module for SNMPv2 entities</td>
</tr>
<tr>
<td>RFC 2819 – SNMP-MIB</td>
<td>Remote Network Monitoring Management Information Base</td>
</tr>
<tr>
<td>RFC 3273 – MIB</td>
<td>The original version of the MIB, published as RFC 3273.</td>
</tr>
<tr>
<td>RFC 3424 – HC-ALARM-MIB</td>
<td>Initial version of the High Capacity Alarm MIB module. This version published as RFC 3424.</td>
</tr>
<tr>
<td>RFC 3273 – MIB</td>
<td>A MIB module containing textual conventions for high capacity data types.</td>
</tr>
<tr>
<td>RFC 3424 – MIB</td>
<td>Broadcast Reference</td>
</tr>
<tr>
<td>RFC 3424 – MIB</td>
<td>This MIB module defines objects to help support coexistence between SNMPv1, SNMPv2, and SNMPv3.</td>
</tr>
<tr>
<td>RFC 3578 – MIB</td>
<td>The SNMP Management Architecture MIB</td>
</tr>
<tr>
<td>RFC 3578 – MIB</td>
<td>The MIB for Message Processing and Dispatching</td>
</tr>
<tr>
<td>RFC 3578 – MIB</td>
<td>The Notification MIB Module</td>
</tr>
<tr>
<td>RFC 3578 – MIB</td>
<td>The management information definitions for the SNMP user-based Security Model.</td>
</tr>
<tr>
<td>RFC 3578 – MIB</td>
<td>The management information definitions for the View-based Access Control Model for SNMP.</td>
</tr>
</tbody>
</table>

The following table describes the SNMP Supported MIBs Status fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The RFC number if applicable and the name of the MIB.</td>
</tr>
<tr>
<td>Description</td>
<td>The RFC title or MIB description.</td>
</tr>
</tbody>
</table>
SNMP V3 User Configuration

To access this page, click System > SNMP > SNMP V3 > User Configuration. A screen similar to the following displays.

To configure SNMPv3 settings for the user account:

1. Use User Name to specify the user account to be configured.

2. SNMP v3 Access Mode - Indicates the SNMPv3 access privileges for the user account. The admin account always has 'Read/Write' access, and all other accounts have 'Read Only' access.

3. Use Authentication Protocol to specify the SNMPv3 Authentication Protocol setting for the selected user account. The valid Authentication Protocols are None, MD5 or SHA:
   • If you select None, the user will be unable to access the SNMP data from an SNMP browser.
   • If you select MD5 or SHA, the user login password will be used as the SNMPv3 authentication password, and you must therefore specify a password, and it must be eight characters long.

4. Use Encryption Protocol to specify the SNMPv3 Encryption Protocol setting for the selected user account. The valid Encryption Protocols are None or DES:
   • If you select the DES Protocol you must enter a key in the Encryption Key field.
   • If None is specified for the Protocol, the Encryption Key is ignored.

5. Encryption Key - If you selected DES in the Encryption Protocol field enter the SNMPv3 Encryption Key here, otherwise, this field is ignored. Valid keys are 0 to 15 characters long. The APPLY checkbox must be checked in order to change the Encryption Protocol and Encryption Key.

6. Click CANCEL to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.

7. Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.
LLDP

The IEEE 802.1AB-defined standard, Link Layer Discovery Protocol (LLDP), allows stations on an 802 LAN to advertise major capabilities and physical descriptions. This information is viewed by a network manager to identify system topology and detect bad configurations on the LAN.

From the LLDP link, you can access the following pages:

- LLDP on page 93
- LLDP-MED on page 100

LLDP is a one-way protocol; there are no request/response sequences. Information is advertised by stations implementing the transmit function, and is received and processed by stations implementing the receive function. The transmit and receive functions can be enabled/disabled separately per port. By default, both transmit and receive are disabled on all ports. The application is responsible for starting each transmit and receive state machine appropriately, based on the configured status and operational state of the port.

The Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) is an enhancement to LLDP with the following features:

- Auto-discovery of LAN policies (such as VLAN, Layer 2 Priority, and DiffServ settings), enabling plug and play networking.
- Device location discovery for creation of location databases.
- Extended and automated power management of Power over Ethernet endpoints.
- Inventory management, enabling network administrators to track their network devices and determine their characteristics (manufacturer, software and hardware versions, serial/asset number).

LLDP

From the LLDP link, you can access the following pages:

- LLDP Global Configuration on page 94
- LLDP Interface Configuration on page 95
- LLDP Statistics on page 96
- LLDP Local Device Information on page 97
- LLDP Remote Device Information on page 99
- LLDP Remote Device Inventory on page 100
LLDP Global Configuration

Use the LLDP Global Configuration page to specify LLDP parameters that are applied to the switch.

To display this page, click System > LLDP > Global Configuration. A screen similar to the following displays.

To configure global LLDP settings:

1. Use **Transmit Interval** to specify the interval in seconds to transmit LLDP frames. The range is from 5 to 32768 secs. Default value is 30 seconds.
2. Use **Transmit Hold Multiplier** to specify the multiplier on Transmit Interval to assign TTL. The range is from 2 to 10 secs. Default value is 4.
3. Use **Re-Initialization Delay** to specify the delay before re-initialization. The range is from 1 to 10 secs. Default value is 2 seconds.
4. Use **Notification Interval** to specify the interval in seconds for transmission of notifications. The range is from 5 to 3600 secs. Default value is 5 seconds.
5. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.
6. Click **APPLY** to send the updated configuration to the switch and cause the changes to take effect on the switch but these changes will not be retained across a power cycle unless a save is performed.
LLDP Interface Configuration

To display this page, click System > LLDP > Interface Configuration. A screen similar to the following displays.

1. Use Port to specify the list of ports on which LLDP - 802.1AB can be configured.
2. Link Status indicates whether the Link is up or down.
3. Use Transmit to specify the LLDP - 802.1AB transmit mode for the selected interface.
4. Use Receive to specify the LLDP - 802.1AB receive mode for the selected interface.
5. Use Notify to specify the LLDP - 802.1AB notification mode for the selected interface.
6. Use Transmit Management Information to specify whether management address is transmitted in LLDP frames for the selected interface.
7. Optional TLV(s):
   - Use System Name to include system name TLV in LLDP frames.
   - Use System Description to include system description TLV in LLDP frames.
   - Use System Capabilities to include system capability TLV in LLDP frames.
   - Use Port Description to include port description TLV in LLDP frames.
**LLDP Statistics**

To display this page, click **System > LLDP > Statistics**. A screen similar to the following displays.

The following table describes the LLDP Statistics fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Update</td>
<td>Specifies the time when an entry was created, modified or deleted in the tables associated with the remote system.</td>
</tr>
<tr>
<td>Total Inserts</td>
<td>Specifies the number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) has been inserted into tables associated with the remote systems.</td>
</tr>
<tr>
<td>Total Deletes</td>
<td>Specifies the number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) has been deleted from tables associated with the remote systems.</td>
</tr>
<tr>
<td>Total Drops</td>
<td>Specifies the number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) could not be entered into tables associated with the remote systems because of insufficient resources.</td>
</tr>
<tr>
<td>Total Age outs</td>
<td>Specifies the number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) has been deleted from tables associated with the remote systems because the information timeliness interval has expired.</td>
</tr>
<tr>
<td>Interface</td>
<td>Specifies the unit/slot/port for the interfaces.</td>
</tr>
<tr>
<td>Transmit Total</td>
<td>Specifies the number of LLDP frames transmitted by the LLDP agent on the corresponding port.</td>
</tr>
</tbody>
</table>
ProSafe M5300 Switch

Configuring System Information

To display this page, click System > LLDP > Local Device Information. A screen similar to the following displays.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receive Total</td>
<td>Specifies the number of valid LLDP frames received by this LLDP agent on the corresponding port, while the LLDP agent is enabled.</td>
</tr>
<tr>
<td>Discards</td>
<td>Specifies the number of LLDP TLVs discarded for any reason by the LLDP agent on the corresponding port.</td>
</tr>
<tr>
<td>Errors</td>
<td>Specifies the number of invalid LLDP frames received by the LLDP agent on the corresponding port, while the LLDP agent is enabled.</td>
</tr>
<tr>
<td>Age outs</td>
<td>Specifies the number of age-outs that occurred on a given port. An age-out is the number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) has been deleted from tables associated with the remote entries because information timeliness interval had expired.</td>
</tr>
<tr>
<td>TLV Discards</td>
<td>Specifies the number of LLDP TLVs discarded for any reason by the LLDP agent on the corresponding port.</td>
</tr>
<tr>
<td>TLV Unknowns</td>
<td>Specifies the number of LLDP TLVs received on the local ports which were not recognized by the LLDP agent on the corresponding port.</td>
</tr>
<tr>
<td>TLV MED</td>
<td>Specifies the total number of LLDP-MED TLVs received on the local ports.</td>
</tr>
<tr>
<td>TLV 802.1</td>
<td>Specifies the total number of LLDP TLVs received on the local ports which are of type 802.1.</td>
</tr>
<tr>
<td>TLV 802.3</td>
<td>Specifies the total number of LLDP TLVs received on the local ports which are of type 802.3.</td>
</tr>
</tbody>
</table>

**LLDP Local Device Information**

To display this page, click System > LLDP > Local Device Information. A screen similar to the following displays.
To view LLDP information transmitted by an interface, select the desired interface from the Interface menu. The following table describes the LLDP Local Device Information fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chassis ID Subtype</td>
<td>Specifies the string that describes the source of the chassis identifier.</td>
</tr>
<tr>
<td>Chassis ID</td>

                         • Type - Specifies the type of the management address. |

LLDP-MED

From the LLDP-MED link, you can access the following pages:

- **LLDP-MED Global Configuration** on page 101
- **LLDP-MED Interface Configuration** on page 102
- **LLDP-MED Local Device Information** on page 103
- **LLDP-MED Remote Device Information** on page 105
- **LLDP-MED Remote Device Inventory** on page 108

Configuring System Information

100
**LLDP-MED Global Configuration**

Use the LLDP-MED Global Configuration page to specify LLDP-MED parameters that are applied to the switch.

To display this page, click **System > LLDP > LLDP-MED > Global Configuration**. A screen similar to the following displays.

**LLDP-MED Global Configuration**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device Class</strong></td>
<td>Specifies local device's MED Classification. There are four different kinds of devices, three of them represent the actual end points</td>
</tr>
<tr>
<td></td>
<td>(classified as Class I Generic [IP Communication Controller etc.], Class II Media [Conference Bridge etc.], Class III Communication [IP</td>
</tr>
<tr>
<td></td>
<td>Telephone etc.]). The fourth device is Network Connectivity Device, which is typically a LAN Switch/Router, IEEE 802.1 Bridge, IEEE 802.11</td>
</tr>
<tr>
<td></td>
<td>Wireless Access Point etc.</td>
</tr>
</tbody>
</table>

To configure global LLDP-MED settings:

1. Use **Fast Start Repeat Count** to specify the number of LLDP PDUs that will be transmitted when the protocol is enabled. The range is from (1 to 10). Default value of fast repeat count is 3.
2. Click **APPLY** to update the switch with the modified setting.
3. Click **CANCEL** to abandon the changes.

The following table describes the LLDP-MED Global Configuration fields.
LLDP-MED Interface Configuration

To display this page, click System > LLDP > LLDP-MED > Interface Configuration. A screen similar to the following displays.

To configure LLDP-MED interface settings:

1. To configure LLDP-MED settings on one or more interfaces, select the check box associated with each interface to configure, or select the check box in the heading row to apply the same settings to all interfaces.

2. Use MED Status to specify whether LLDP-MED mode is enabled or disabled on this interface.

3. Use Notification Status to specify the LLDP-MED topology notification mode of the interface.

4. Use Transmit Type Length Values to specify which optional type length values (TLVs) in the LLDP-MED will be transmitted in the LLDP PDUs frames for the selected interface:
   - MED Capabilities - To transmit the capabilities TLV in LLDP frames.
   - Network Policy - To transmit the network policy TLV in LLDP frames.
   - Location Identification - To transmit the location TLV in LLDP frames.
   - Extended Power via MDI - PSE - To transmit the extended PSE TLV in LLDP frames.
   - Extended Power via MDI - PD - To transmit the extended PD TLV in LLDP frames.
   - Inventory Information - To transmit the inventory TLV in LLDP frames.

The following table describes the LLDP-MED Interface Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

ISDP

The Industry Standard Discovery Protocol (ISDP) is a proprietary Layer 2 network protocol which inter-operates with Cisco® devices running the Cisco Discovery Protocol (CDP). ISDP is used to share information between neighboring devices. ISDP software participates in the CDP protocol and is able to both discover and be discovered by other CDP supporting devices.

From the ISDP link, you can access the following pages:

- ISDP Global Configuration on page 109
- Advanced ISDP Configuration on page 110

ISDP Global Configuration

Use this page to configure global ISDP settings for the switch.

To display this page, click System > ISDP > Basic > Global Configuration. A screen similar to the following displays.

To configure global ISDP settings:

1. Use Admin Mode to specify whether the ISDP Service is to be Enabled or Disabled. The default value is Enabled.
2. Use Timer to specify the period of time between sending new ISDP packets. The range is 5 to 254 seconds. Default value is 30 seconds.
3. Use Hold Time to specify the hold time for ISDP packets that the switch transmits. The hold time specifies how long a receiving device should store information sent in the ISDP packet before discarding it. The range 10 to 255 seconds. Default value is 180 seconds.
4. Use Version 2 Advertisements to enable or disable the sending of ISDP version 2 packets from the device. The default value is Enabled.
The following table describes the ISDP Basic Global Configuration fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbors table last time changed</td>
<td>The amount of time that has passed since the ISDP neighbor table was updated.</td>
</tr>
<tr>
<td>Device ID</td>
<td>The Device ID advertised by this device. The format of this Device ID is characterized by the value of Device ID Format object.</td>
</tr>
<tr>
<td>Device ID format capability</td>
<td>Indicates the Device ID format capability of the device.</td>
</tr>
<tr>
<td></td>
<td>• serialNumber—Indicates that the device uses serial number as the format for its Device ID.</td>
</tr>
<tr>
<td></td>
<td>• macAddress—Indicates that the device uses layer 2 MAC address as the format for its Device ID.</td>
</tr>
<tr>
<td></td>
<td>• other—Indicates that the device uses its platform specific format as the format for its Device ID.</td>
</tr>
<tr>
<td>Device ID format</td>
<td>Indicates the Device ID format of the device.</td>
</tr>
<tr>
<td></td>
<td>• serialNumber—Indicates that the value is in the form of an ASCII string containing the device serial number.</td>
</tr>
<tr>
<td></td>
<td>• macAddress—Indicates that the value is in the form of Layer 2 MAC address.</td>
</tr>
<tr>
<td></td>
<td>• other—Indicates that the value is in the form of a platform specific ASCII string containing info that identifies the device. For example: ASCII string contains serialNumber appended/prepended with system name.</td>
</tr>
</tbody>
</table>

**Advanced ISDP Configuration**

From the Advanced link, you can access the following pages:

- *ISDP Global Configuration* on page 109
- *ISDP Interface Configuration* on page 111
- *ISDP Neighbor* on page 111
- *ISDP Statistics* on page 113
ISDP Interface Configuration

To display this page, click System > ISDP > Advanced > Interface Configuration. A screen similar to the following displays.

![ISDP Interface Configuration](image)

To configure per-interface ISDP settings:

1. To configure ISDP settings on one or more interfaces, select the check box associated with each interface to configure, or select the check box in the heading row to apply the same settings to all interfaces.

2. Use Admin Mode to enable or disable ISDP on the port. The default value is enable.

3. Click APPLY to update the switch with the changes.

4. Click CANCEL to abandon the changes.

ISDP Neighbor

Use the ISDP Neighbor page to view information about other devices the switch has discovered through the ISDP.

To display this page, click System > ISDP > Advanced > Neighbor. A screen similar to the following displays.

![ISDP Neighbor](image)
The following table describes the ISDP Neighbor fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device ID</td>
<td>The device ID of the ISDP neighbor.</td>
</tr>
<tr>
<td>Interface</td>
<td>The interface on which the neighbor is discovered.</td>
</tr>
<tr>
<td>Address</td>
<td>Displays the address of the neighbor.</td>
</tr>
<tr>
<td>Capability</td>
<td>Displays the capability of the neighbor. These are supported:</td>

</table>
Timer Schedule

The Timer Schedule feature allows you to configure time ranges to use in time-based access control list (ACL) rules. For switches that support PoE+, timers can also control when power can and cannot be delivered to the port.

Time-based ACLs allow one or more rules within an ACL to be based on a periodic or absolute time. Each ACL rule within an ACL except for the implicit deny all rule can be configured to be active and operational only during a specific time period. The time range pages allow you to define specific times of the day and week in order to implement time-based ACLs. The time range is identified by a name and can then be referenced by an ACL rule defined within an ACL.

From Timer Schedule link under the System tab, you can configure the Timer Schedule settings.

From the Timer Schedule link, you can access the following pages:

- **Timer Global Configuration** on page 114
- **Timer Schedule Configuration** on page 115

Timer Global Configuration

Use the Timer Global Configuration page to add or remove a timer. After you create a timer, use the Timer Schedule Configuration page to add an absolute time and/or one or more periodic time schedules.

To display the Timer Global Configuration page, click **System > Services > Timer Schedule > Basic > Global Configuration**. A screen similar to the following displays.

![Timer Schedule Global Configuration](image)

To configure a timer:

1. Use **Admin Mode** to **Enable** or **Disable** the Timer Control service. The default value is **Disable**.
2. Use the **Timer Schedule Name** to specify the name of a timer schedule.
3. Click **ADD** to add the new timer schedule with a specified name. The configuration changes take effect immediately.

4. To remove a configured timer, select the entry to remove and click **DELETE**. The configuration changes take effect immediately.

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest values.

6. To change the administrative mode, select the desired option and click **APPLY**. The configuration changes take effect immediately.

The following table describes the Timer Schedule non-configurable fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer Schedule Status</td>
<td>Indicates whether the timer is currently active or inactive. A timer is inactive if the current day and time does not fall within the time entry specified in the time range.</td>
</tr>
<tr>
<td>ID</td>
<td>Identification of the timer Schedule. Maximum number of schedules that can be created is 100.</td>
</tr>
</tbody>
</table>

**Timer Schedule Configuration**

Use the Timer Schedule Configuration page to add time ranges to a configured timer.

**Note:** The time range entries use the system time for the time periods in which they take effect. Make sure you configure the SNTP server settings so that the SNTP client on the switch can obtain the correct date and time from the server.

To display the Timer Schedule Configuration page, click **System > Services > Timer Schedule > Advanced > Schedule Configuration**. The fields available on the screen change depending on the type of timer schedule selected from the **Timer Schedule Type** menu. A screen similar to one of the two following screens displays.
To configure a timer schedule:

1. Select the name of the schedule created on the Timer Global Configuration page.

2. Specify the type of timer to configure:
   - **Absolute.** The timer occurs once.
   - **Periodic.** The timer occurs periodically at regular intervals.

   The fields available for the timer schedule configuration depend on the selected timer type.

3. In the Timer Schedule Entry menu, select new to configure a new schedule, or select an existing entry to change its settings.

4. Specify the start and end times for the timer in the appropriate fields. The time range is from 00:00 to 23:59.

5. Specify the start and end dates for the timer by clicking the calendar icon and selecting the date. If the timer schedule is periodic, you can specify that there is no end date.
6. Use the **Recurrence Pattern** to show with what period the event will repeat. These fields are available only if the scheduler type is periodic. If recurrence is not needed (a timer schedule should be triggered just once), then set 'Date Stop' as equal to 'Date Start'. There are the following possible values of recurrence:

   - **Daily** - The timer schedule works with daily recurrence
     - **Daily Mode** - Every WeekDay selection means that the schedule will be triggered every day from Monday to Friday. Every Day(s) selection means that the schedule will be triggered every defined number of days. If number of days is not specified, then the schedule will be triggered every day.

   - **Weekly** - The timer schedule works with weekly recurrence
     - **Every Week(s)** - Define the number of weeks when the schedule will be triggered. If number of weeks is not specified, then the schedule will be triggered every week.
     - **WeekDay** - Specify the days of week when the schedule should operates.

   - **Monthly** - The timer schedule works with monthly recurrence
     - **Monthly Mode** - Show the day of the month when the schedule will be triggered. Field Every Month(s) means that the schedule will be triggered every defined number of months.

7. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest values.

8. Click **APPLY** to send the updated configuration to the switch. The configuration changes take effect immediately.
Use the features in the Switching tab to define Layer 2 features. The Switching tab contains links to the following features:

- **VLANs** on page 119
- **Auto-VoIP Configuration** on page 134
- **iSCSI** on page 139
- **Spanning Tree Protocol** on page 143
- **Multicast** on page 156
- **MVR Configuration** on page 173
- **Address Table** on page 177
- **Ports** on page 181
- **Link Aggregation Groups** on page 184

### VLANs

Adding Virtual LAN (VLAN) support to a Layer 2 switch offers some of the benefits of both bridging and routing. Like a bridge, a VLAN switch forwards traffic based on the Layer 2 header, which is fast, and like a router, it partitions the network into logical segments, which provides better administration, security and management of multicast traffic.

By default, all ports on the switch are in the same broadcast domain. VLANs electronically separate ports on the same switch into separate broadcast domains so that broadcast packets are not sent to all the ports on a single switch. When you use a VLAN, users can be grouped by logical function instead of physical location.

Each VLAN in a network has an associated VLAN ID, which appears in the IEEE 802.1Q tag in the Layer 2 header of packets transmitted on a VLAN. An end station may omit the tag, or the VLAN portion of the tag, in which case the first switch port to receive the packet may either reject it or insert a tag using its default VLAN ID. A given port may handle traffic for more than one VLAN, but it can only support one default VLAN ID.

From the VLAN link, you can access the following pages:

- **Basic** on page 120
- **Advanced** on page 122
Basic
From the Basic link, you can access the following pages:

• VLAN Configuration on page 120

VLAN Configuration
Use the VLAN Configuration page to define VLAN groups stored in the VLAN membership table. Each switch in the ProSafe family supports up to 1024 VLANs. Two VLANs are created by default:

• VLAN 1 is the default VLAN of which all ports are members.
• VLAN 2 is the default VLAN for the Auto VoIP feature.

To display the VLAN Configuration page, click Switching > VLAN > Basic > VLAN Configuration.

Reset to Factory Default Settings
To reset the VLAN configuration to the default values:

1. Select the Reset Configuration check box.
2. Confirm the action.
3. Click the APPLY button.

All VLAN configuration parameters will be reset to their factory default values. Also, all VLANs, except for the default VLAN, will be deleted. The factory default values are:

• All ports are assigned to the default VLAN of 1.
• All ports are configured with a PVID of 1.
• All ports are configured to an Acceptable Frame Types value of Admit All Frames.
• All ports are configured with Ingress Filtering disabled.
• All ports are configured to transmit only untagged frames.
• GVRP is disabled on all ports and all dynamic entries are cleared.

**Internal VLAN Configuration**

This section displays the allocation base and the allocation mode of internal VLAN. The internal VLAN is reserved by port-based routing interface and invisible to the end user. Once these internal VLANs are allocated by port-based routing interface, they are cannot be assigned to a routing VLAN interface.

1. Use **Internal VLAN Allocation Base** to specify the VLAN Allocation Base for the routing interface. The default base of the internal VLAN is 1 to 4093.
2. Use the optional **Internal VLAN Allocation Policy** field to specify a policy for the internal VLAN allocation. There are two policies supported: ascending and descending.

**VLAN Configuration**

To add or remove a VLAN:

1. Use **VLAN ID** to specify the VLAN Identifier for the new VLAN. The range of the VLAN ID is 1 to 4093.
2. Use the optional **VLAN Name** field to specify a name for the VLAN. It can be up to 32 alphanumeric characters long, including blanks. The default is blank. VLAN ID 1 always has a name of ‘Default’.
3. Click **ADD** to add a new VLAN to the switch.
4. Click **DELETE** to delete a selected VLAN from the switch.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Type</td>
<td>This field identifies the type of the VLAN you are configuring. You cannot change the type of the default VLAN (VLAN ID = 1); it is always type ‘Default’. When you create a VLAN, using this screen, its type will always be ‘Static’. A VLAN that is created by GVRP registration initially has a type of ‘Dynamic’. When configuring a Dynamic VLAN, you can change its type to ‘Static’.</td>
</tr>
</tbody>
</table>
Advanced

From the Advanced link, you can access the following pages:

- VLAN Configuration on page 120
- VLAN Membership on page 122
- VLAN Status on page 124
- Port PVID Configuration on page 125
- MAC Based VLAN on page 126
- Protocol Based VLAN Group Configuration on page 127
- Protocol Based VLAN Group Membership on page 128
- IP Subnet Based VLAN on page 129
- Port DVLAN Configuration on page 130
- Voice VLAN Configuration on page 131
- GARP Switch Configuration on page 132
- GARP Port Configuration on page 133

VLAN Membership

Use this page to add ports and LAGs as members of existing VLANs. To display the VLAN Membership page, click Switching > VLAN > Advanced > VLAN Membership. In the following screen, the Port area for stack Unit 1 has been expanded to show ports and their membership status for VLAN 1.
To configure VLAN membership:

1. Use **VLAN ID** to select the VLAN ID for which you want to display or configure data.
2. Use **Group Operation** to select all the ports and configure them:
   - **Untag All** - Select all the ports on which all frames transmitted for this VLAN will be untagged. All the ports will be included in the VLAN.
   - **Tag All** - Select the ports on which all frames transmitted for this VLAN will be tagged. All the ports will be included in the VLAN.
   - **Remove All** - All the ports that may be dynamically registered in this VLAN via GVRP. This selection has the effect of excluding all ports from the selected VLAN.
3. Click the orange bar to show the ports available on each stack member or to show the available LAGs.
4. Click box directly under the port ID or LAG ID to add the port/LAG to the selected VLAN.
   The interface can be added as a member in one of the following modes:
   - **T (Tagged)** - All frames transmitted for this VLAN will be tagged. The ports that are selected will be included in the VLAN.
   - **U (Untagged)** - All frames transmitted for this VLAN will be untagged. The ports that are selected will be included in the VLAN.
   - **Blank (Autodetect)** - The port/LAG can be dynamically registered in this VLAN via GVRP. This selection has the effect of excluding a port from the selected VLAN.

<table>

</tbody>
</table>
Port PVID Configuration

The Port PVID Configuration screen lets you assign a port VLAN ID (PVID) to an interface. There are certain requirements for a PVID:

- All ports must have a defined PVID.
- If no other value is specified, the default VLAN PVID is used.
- If you want to change the port’s default PVID, you must first create a VLAN that includes the port as a member.
- Use the Port VLAN ID (PVID) Configuration page to configure a virtual LAN on a port.

To access the Port PVID Configuration page, click Switching > VLAN > Advanced > Port PVID Configuration.

To configure PVID information:

1. Click ALL to display information for all Physical ports and LAGs.
2. Select the check box next to the interfaces to configure. You can select multiple interfaces to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.
3. Use Interface to select the interface you want to configure.
4. Use Configured PVID to specify the VLAN ID you want assigned to untagged or priority tagged frames received on this port. The factory default is 1. The Current PVID field shows the PVID currently in use on the interface.
5. Use Acceptable Frame Types to specify the types of frames that may be received on this port. The options are 'VLAN only' and 'Admit All':
   - When set to VLAN only, untagged frames or priority tagged frames received on this port are discarded.
   - When set to Admit All, untagged frames or priority tagged frames received on this port are accepted and assigned the value of the Port VLAN ID for this port. With either option, VLAN tagged frames are forwarded in accordance to the 802.1Q VLAN specification.
6. **Ingress Filtering:**
   - When enabled, the frame is discarded if this port is not a member of the VLAN with which this frame is associated. In a tagged frame, the VLAN is identified by the VLAN ID in the tag. In an untagged frame, the VLAN is the Port VLAN ID specified for the port that received this frame.
   - When disabled, all frames are forwarded in accordance with the 802.1Q VLAN bridge specification. The factory default is disabled.

   The **Current Ingress Filtering** field shows the current administrative mode of ingress filtering on the interface.

7. Use **Port Priority** to specify the default 802.1p priority assigned to untagged packets arriving at the port. The possible value is from 0 to 7.

**MAC Based VLAN**

The MAC Based VLAN feature allows incoming untagged packets to be assigned to a VLAN and thus classify traffic based on the source MAC address of the packet.

A MAC to VLAN mapping is defined by configuring an entry in the MAC to VLAN table. An entry is specified via a source MAC address and the desired VLAN ID. The MAC to VLAN configurations are shared across all ports of the device (i.e. there is a system wide table that has MAC address to VLAN ID mappings).

When untagged or priority tagged packets arrive at the switch and entries exist in the MAC to VLAN table, the source MAC address of the packet is looked up. If an entry is found the corresponding VLAN ID is assigned to the packet. If the packet is already priority tagged it will maintain this value, otherwise the priority will be set to zero. The assigned VLAN ID is verified against the VLAN table, if the VLAN is valid ingress processing on the packet continues, otherwise the packet is dropped. This implies that the user is allowed to configure a MAC address mapping to a VLAN that has not been created on the system.

To display the MAC Based VLAN page, click **Switching > VLAN > Advanced > MAC Based VLAN**.

<table>
<thead>
<tr>
<th>MAC Based VLAN Group Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>MAC Address</strong></td>
</tr>
<tr>
<td>00:00:00:00:00:00:00</td>
</tr>
<tr>
<td>00:02:00:00:00:00:00</td>
</tr>
</tbody>
</table>

To configure a MAC-based VLAN group:

1. Use the **MAC Address** field to specify a valid MAC Address which is to be bound to a VLAN ID.0
2. Use **VLAN ID** to specify a VLAN ID in the range of 1 to 4093.
3. Click **ADD** to add an entry of MAC Address to VLAN mapping.
4. Click **DELETE** to delete and entry of MAC Address to VLAN mapping.
Protocol Based VLAN Group Configuration

You can use a protocol based VLAN to define filtering criteria for untagged packets. By default, if you do not configure any port- (IEEE 802.1Q) or protocol based VLANs, untagged packets will be assigned to VLAN 1. You can override this behavior by defining either port-based VLANs or protocol based VLANs, or both. Tagged packets are always handled according to the IEEE 802.1Q standard, and are not included in protocol based VLANs.

If you assign a port to a protocol based VLAN for a specific protocol, untagged frames received on that port for that protocol will be assigned the protocol based VLAN ID. Untagged frames received on the port for other protocols will be assigned the Port VLAN ID - either the default PVID (1) or a PVID you have specifically assigned to the port using the Port VLAN Configuration screen.

You define a protocol based VLAN by creating a group. Each group has a one-to-one relationship with a VLAN ID, can include one to three protocol definitions, and can include multiple ports. When you create a group you will choose a name and a Group ID will be assigned automatically.

To display the Protocol Based VLAN Group Configuration page, click Switching > VLAN > Advanced > Protocol Based VLAN Group Configuration.

To configure a protocol-based VLAN group:

1. Use Group ID to specify a unique ID for the group.
2. Use Group Name to assign a name to a new group. You may enter up to 16 characters.
3. Use Protocol(s) to specify the protocols you want to be associated with the group. The protocol options are as follows:
   • IP - IP is a network layer protocol that provides a connectionless service for the delivery of data.
   • ARP - Address Resolution Protocol (ARP) is a low-level protocol that dynamically maps network layer addresses to physical medium access control (MAC) addresses
   • IPX - The Internetwork Packet Exchange (IPX) is a connectionless datagram Network-layer protocol that forwards data over a network.
   • User-specified hexadecimal or decimal value in the range of 0x0600 (1536) to 0xFFFF (65535).
4. Use **VLAN ID** to select the VLAN ID. It can be any number in the range of 1 to 4093. All the ports in the group will assign this VLAN ID to untagged packets received for the protocols you included in this group.

5. Click **ADD** to add a new Protocol Based VLAN group to the switch.

6. Click **DELETE** to remove the Protocol Based VLAN group identified by the value in the Group ID field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ports</td>
<td>Identifies all the member ports which belong to the group.</td>
</tr>
</tbody>
</table>

### Protocol Based VLAN Group Membership

To display the Protocol Based VLAN Group Membership page, click **Switching > VLAN > Advanced > Protocol Based VLAN Group Membership**. In the following screen, the port area for Unit 1 has been expanded to show that ports 7–9 are members of the selected group.

![Protocol Based VLAN Group Membership](image)

To configure member ports for a protocol-based VLAN group:

1. Use **Group ID** to select the protocol-based VLAN Group ID for which you want to display or configure data.

2. Use **Port List** to add the ports you selected to this Protocol Based VLAN Group. Note that a given interface can only belong to one group for a given protocol. For example, if you have already added a port to a group for IP, you cannot add it to another group that also includes IP, although you could add it to a new group for IPX.

3. Click **APPLY** to update the switch with the changes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>This field identifies the name for the protocol-based VLAN you selected. It can be up to 32 alphanumeric characters long, including blanks.</td>
</tr>
<tr>
<td>Current Members</td>
<td>This button can be click to show the current numbers in the selected protocol based VLAN Group.</td>
</tr>
</tbody>
</table>
IP Subnet Based VLAN

IP Subnet to VLAN mapping is defined by configuring an entry in the IP Subnet to VLAN table. An entry is specified via a source IP address, network mask, and the desired VLAN ID. The IP Subnet to VLAN configurations are shared across all ports of the device.

To display the MAC Based VLAN page, click Switching > VLAN > Advanced > IP Subnet Based VLAN.

To configure a VLAN based on an IP subnet:

1. Use **IP Address** to specify a valid IP Address bound to VLAN ID. Enter the IP Address in dotted decimal notation.
2. Use **Subnet Mask** to specify a valid Subnet Mask of the IP Address. Enter the Subnet mask in dotted decimal notation.
3. Use **VLAN ID** to specify a VLAN ID in the range of (1 to 4093).
4. Click **ADD** to add a new IP subnet-based VLAN.
5. Click **DELETE** to delete the IP subnet-based VLAN selected.
Port DVLAN Configuration

Use this page to view and configure the double VLAN (DVLAN) tag settings for each interface. Double VLAN tagging allows service providers to create Virtual Metropolitan Area Networks (VMANs). With DVLAN tagging, service providers can pass VLAN traffic from one customer domain to another through a metro core. By using an additional tag on the traffic, the interface can differentiate between customers in the MAN while preserving an individual customer's VLAN identification that is used when the traffic enters the customer's 802.1Q domain.

To display the Port DVLAN Configuration page, click Switching > VLAN > Advanced > Port DVLAN Configuration.

![Port DVLAN Configuration](image)

To configure a DVLAN settings:

1. Use the **Global EtherType** menu to select the 2-byte hex code to use as the first 16 bits of the DVLAN tag. The value configured in this field is used as the primary Tag Protocol Identifier (TPID) to include in frames transmitted by interfaces that are enabled for DVLAN tagging. Select one of the following:
   - **802.1Q Tag** - Commonly used tag representing 0x8100
   - **vMAN Tag** - Commonly used tag representing 0x88A8
   - **Custom Tag** - Configure the EtherType in any range from 0 to 65535. If you select this value, specify the tag in the **Custom Value** field that appears.

2. Select the check box associated with each **Interface** to configure, or select the check box in the header row to apply the same settings to all interfaces.

3. Use **Admin Mode** to specify the administrative mode via which Double VLAN Tagging can be enabled or disabled. The default value for this is Disabled.

4. Click **APPLY** to update the switch with the changes.

5. Click **CANCEL** to abandon the changes.
Voice VLAN Configuration

Use this menu to configure the parameters for Voice VLAN Configuration. Voice VLAN enables ports to carry voice traffic that has a defined priority. Voice over IP (VoIP) traffic is inherently time-sensitive: for a network to provide acceptable service, the transmission rate is vital. The priority level enables the separation of voice and data traffic entering the port.

To display the Voice VLAN Configuration page, click **Switching > VLAN > Advanced > Voice VLAN Configuration**.

To configure Voice VLAN settings:

1. Use **Admin Mode** to select the administrative mode for Voice VLAN on the switch. The default is disable.
2. Select the check box associated with each **Interface** to configure, or select the check box in the header row to apply the same settings to all interfaces.
3. Use **Interface Mode** to select the Voice VLAN mode for selected interface(s):
   - **Disable** - Default value
   - **None** - Allow the IP phone to use its own configuration to send untagged voice traffic
   - **VLAN ID** - Configure the phone to send tagged voice traffic.
   - **dot1p** - Configure Voice Vlan 802.1p priority tagging for voice traffic. When this is selected, please enter the dot1p value in the Value field.
   - **Untagged** - Configure the phone to send untagged voice traffic.
4. Use **Value** to enter the VLAN ID or dot1p value. This field is available only when VLAN ID or dot1p is selected as Interface Mode.
5. Use **CoS Override Mode** to select the Cos Override mode for selected interface:
   - **Enabled** – The port ignores the 802.1p priority value in the Ethernet frames it receives from connected devices.
   - **Disabled** – The port trusts the priority value in the received frame. The default is disable.
6. Click **APPLY** to update the switch with the changes.

7. Click **CANCEL** to abandon the changes.

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational State</td>
<td>This is the operational status of the voice vlan on the given interface. To be enabled, Voice VLAN must be globally enabled and enabled on the interface. Additionally, the interface must be up and have a link.</td>
</tr>
</tbody>
</table>

### GARP Switch Configuration

The switch supports Generic Attribute Registration Protocol (GARP), GARP VLAN Registration Protocol (GVRP), and GARP Multicast Registration Protocol (GMRP). GVRP relies on the services provided by GARP to provide IEEE 802.1Q-compliant VLAN pruning and dynamic VLAN creation on 802.1Q trunk ports. GMRP uses GARP services to help control the flooding of multicast traffic by keeping track of group membership information.

**Note:** It can take up to 10 seconds for GARP configuration changes to take effect.

To display the GARP Switch Configuration page, click **Switching > VLAN > Advanced > GARP Switch Configuration**.

To configure the global GARP settings:

1. Use **GVRP Mode** to choose the GARP VLAN Registration Protocol administrative mode for the switch by selecting enable or disable from the radio button. When GARP is enabled, switches can dynamically register (and de-register) VLAN membership information with other switches attached to the same segment. Information about the active VLANs is propagated across all networking switches in the bridged LAN that support GVRP. The factory default is disable.

2. Use **GMRP Mode** to choose the GARP Multicast Registration Protocol administrative mode for the switch by selecting enable or disable from the radio button. GMRP is similar to IGMP snooping in its purpose, but IGMP snooping is more widely used. GMRP must be running on both the host and the switch to function properly. The factory default is disable.

3. Click **APPLY** to update the switch with the changes.

4. Click **CANCEL** to abandon the changes.
**GARP Port Configuration**

**Note:** It can take up to 10 seconds for GARP configuration changes to take effect.

To display the GARP Port Configuration page, click **Switching > VLAN > Advanced > GARP Port Configuration**.

![GARP Port Configuration Table]

To configure the per-interface GARP settings:

1. Select the check box associated with each **Interface** to configure, or select the check box in the header row to apply the same settings to all interfaces.

2. Use **Port GVRP Mode** to choose the GARP VLAN Registration Protocol administrative mode for the port by selecting enable or disable from the dropdown list. If you select disable, the protocol will not be active and the Join Time, Leave Time and Leave All Time will have no effect. The factory default is disable.

3. Use **Port GMRP Mode** to choose the GARP Multicast Registration Protocol administrative mode for the port by selecting enable or disable from the dropdown list. If you select disable, the protocol will not be active, and Join Time, Leave Time and Leave All Time have no effect. The factory default is disable.

4. Use **Join Time (centiseconds)** to specify the time between the transmission of GARP PDUs registering (or re-registering) membership for a VLAN or multicast group in centiseconds. Enter a number between 10 and 100 (0.1 to 1.0 seconds). The factory default is 20 centiseconds (0.2 seconds). An instance of this timer exists for each GARP participant for each port.

5. Use **Leave Time (centiseconds)** to specify the time to wait after receiving an unregister request for a VLAN or multicast group before deleting the associated entry, in centiseconds. This allows time for another station to assert registration for the same attribute in order to maintain uninterrupted service. Enter a number between 20 and 600 (0.2 to 6.0 seconds). The factory default is 60 centiseconds (0.6 seconds). An instance of this timer exists for each GARP participant for each port.
6. Use **Leave All Time (centiseconds)** to control how frequently LeaveAll PDUs are generated. A LeaveAll PDU indicates that all registrations will shortly be deregistered. Participants will need to rejoin in order to maintain registration. The Leave All Period Timer is set to a random value in the range of LeaveAllTime to 1.5*LeaveAllTime. The timer is specified in centiseconds. Enter a number between 200 and 6000 (2 to 60 seconds). The factory default is 1000 centiseconds (10 seconds). An instance of this timer exists for each GARP participant for each port.

7. Click **APPLY** to update the switch with the changes.

8. Click **CANCEL** to abandon the changes.

**Auto-VoIP Configuration**

The Auto-VoIP automatically makes sure that time-sensitive voice traffic is given priority over data traffic on ports that have this feature enabled. Protocol-based Auto-VoIP checks for packets carrying the following VoIP protocols:

- Session Initiation Protocol (SIP)
- H.323
- Signalling Connection Control Part (SCCP)
- Media Gateway Control Protocol (MGCP)

VoIP frames that are received on ports that have the Auto-VoIP feature enabled are marked with the configured CoS Traffic Class.

OUI-based Auto VoIP scans traffic for Organizationally Unique Identifier (OUI) bits. Traffic with known OUI-bits can be placed in a specific VLAN and assigned an 802.1p priority value.

From the Auto-VoIP link, you can access the following pages:

- **Protocol-Based** on page 134
- **OUI-Based** on page 136

**Protocol-Based**

Use this page to configure the protocol-based Auto VoIP priority settings and to enable or disable the protocol-based Auto VoIP mode on the interfaces.

To display the Protocol-Based Port Settings page, click **Switching > Auto-VoIP > Protocol-based > Port Settings.**
To configure protocol-based Auto-VoIP settings:

1. From the **Prioritization Type** menu, select the method used to prioritize VoIP traffic when a call-control protocol is detected, which is one of the following:
   - Remark – Remark the voice traffic with the specified 802.1p priority value at the ingress interface.
   - Traffic Class – Assign VoIP traffic to the specified traffic class when egressing the interface.

2. From the **Class Value** field, select the traffic class used for protocol-based VoIP traffic. If the Auto VoIP mode is enabled and the interface detects a call-control protocol, the switch assigns the traffic in that session to the configured Class of Service (CoS) queue. Traffic classes with a higher value are generally used for time-sensitive traffic. The CoS queue associated with the specified traffic class should be configured with the appropriate bandwidth allocation to allow priority treatment for VoIP traffic.

3. Select the check box associated with each **Interface** to configure, or select the check box in the header row to apply the same settings to all interfaces.

4. From the **Auto-VoIP Mode** menu, select the Auto-VoIP administrative mode for the interface.

5. Click **APPLY** to update the switch with the changes.

6. Click **CANCEL** to abandon the changes.

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational Status</td>
<td>This is the operational status of the Auto-VoIP feature on the given interface.</td>
</tr>
</tbody>
</table>
OUI-Based

The OUI-based Auto VoIP feature helps provide a classification mechanism for voice packets that include OUI bits so that they can be prioritized above data packets in order to provide better Quality of Service (QoS).

From the OUI-based link, you can access the following pages:

- **OUI Based Properties** on page 136
- **OUI Port Settings** on page 137
- **OUI Table** on page 138

**OUI Based Properties**

Use this page to configure the VLAN ID for the Auto VoIP VLAN. When the switch identifies voice traffic based on the presence of an OUI, the traffic is placed in the VLAN specified on this page and assigned the selected 802.1p priority value.

To display the OUI Based Properties page, click **Switching > Auto-VoIP > OUI-based > Properties**.

To configure OUI-based Auto-VoIP properties:

1. From the **VolP VLAN ID** menu, select the VLAN used to segregate VoIP traffic from other non-voice traffic. All VoIP traffic that matches a value in the known OUI list gets assigned to this VolP VLAN.
2. From the **OUI-based priority** menu, select the 802.1p priority used for traffic that matches a value in the known OUI list. If the Auto VoIP mode is enabled and the interface detects an OUI match, the device assigns the traffic in that session to the traffic class mapped to this priority value. Traffic classes with a higher value are generally used for time-sensitive traffic.
3. Click **APPLY** to update the switch with the changes.
4. Click **CANCEL** to abandon the changes.
OUI Port Settings

Use this page to configure the OUI-based Auto VoIP administrative mode on the interfaces. To display the OUI Port Settings page, click Switching > Auto-VoIP > OUI-based > OUI Port Settings.

To configure protocol-based Auto-VoIP settings:

1. Select the check box associated with each Interface to configure, or select the check box in the header row to apply the same settings to all interfaces.
2. From the Auto VoIP Mode menu, select the administrative mode of OUI-based Auto-VoIP on the selected interfaces.
3. Click APPLY to update the switch with the changes.
4. Click CANCEL to abandon the changes.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
OUI Table

Use this page to add and remove Organizationally Unique Identifiers (OUIs) from the OUI database the device maintains. Device hardware manufacturers can include an OUI in a network adapter to help identify the device. The OUI is a unique 24-bit number assigned by the IEEE registration authority. Several default OUIs have been preconfigured in the OUI database on the device.

To display the OUI Table page, click Switching > Auto-VoIP > OUI-based > OUI Table.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

To configure entries in the OUI table:

1. In the **Telephony OUI** field, specify the unique OUI that identifies the device manufacturer or vendor. The OUI is specified in three octet values (each octet is represented as two hexadecimal digits) separated by colons.

2. In the **Description** field, provide a description of the manufacturer or vendor associated with the OUI.

3. Click **APPLY** to update the switch with the changes.

4. Click **CANCEL** to abandon the changes.

5. To remove an OUI from the table, select the check box next to each entry to remove and click **DELETE**.
iSCSI

The Internet Small Computer System Interface (iSCSI) feature helps network administrators track iSCSI traffic between iSCSI initiators and target systems. This is accomplished by monitoring, or snooping traffic to detect packets used by iSCSI stations in establishing iSCSI sessions and connections. Data from these exchanges may optionally be used to create classification rules to assign the traffic between the stations to a configured traffic class. This affects how the packets in the flow are queued and scheduled for egress on the destination port.

In networks containing iSCSI initiators and targets, iSCSI helps to monitor iSCSI sessions or give iSCSI traffic preferential QoS treatment. Dynamically-generated classifier rules are used to direct the iSCSI data traffic to queues that can be given the desired preference characteristics over other data traveling through the switch. This may help to avoid session interruptions during times of congestion that would otherwise cause iSCSI packets to be dropped. However, in systems where a large proportion of traffic is iSCSI, it may also interfere with other network control-plane traffic, such as ARP or LACP.

The preferential treatment of iSCSI traffic needs to be balanced against the needs of other critical data in the network.

From the iSCSI link, you can access the following pages:

- **Basic** on page 139
- **Advanced** on page 141

Basic

From the iSCSI Basic link, you can access the following pages:

- **Global Configuration** on page 139
- **Sessions** on page 141

Global Configuration

Use this page to configure the global iSCSI settings on the switch.

To access the iSCSI Global Configuration page, click **Switching > iSCSI > Basic > Global Configuration**.
To configure global iSCSI settings:

1. In the **iSCSI Status** field, either Enable or Disable iSCSI optimization on the switch. The default is Disable.

2. In the **QoS Profile** field, select the quality of service profile that will be applied to iSCSI flows.
   - VLAN Priority Tag
   - DSCP

   By default, iSCSI flows are assigned to the highest VPT/DSCP mapped to the highest queue not used for stack management or voice VLAN. Be sure to configure the relevant Class of Service parameters for the queue in order to complete the setting.

   Setting the VPT/DSCP sets the QoS profile which determines the egress queue to which the frame is mapped. The switch default setting for egress queues scheduling is Weighted Round Robin (WRR). You can complete the QoS setting by configuring the relevant ports to work in other scheduling and queue management modes via the Class of Service settings.

3. If using VLAN Priority as the QoS profile, use the **VLAN Priority Tag** field to assign a VLAN Priority value to iSCSI session packets.

4. If using DSCP as the QoS profile, use the **DSCP** field to assign a DSCP value to iSCSI session packets.

5. If using DSCP as the QoS profile, specify whether to enable or disable the Remark mode. The default is Disable.

   Enabling Remark allows the packets to be updated with IEEE 802.1p or IP-DSCP values. Remarketing packets with priority data provides special QoS treatment as the packets continue through the network.

6. In the **iSCSI Aging Time** field, set the number of minutes a session can be inactive prior to removal.

7. Click **APPLY** to update the switch with the changes.

8. Click **CANCEL** to abandon the changes.
Sessions

Use this page to view active iSCSI session information.
To access the iSCSI Global Configuration page, click Switching > iSCSI > Basic > Sessions.

The fields on this page display the information the following table describes:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target Name</td>
<td>Shows the name assigned to the iSCSI target.</td>
</tr>
<tr>
<td>Initiator Name</td>
<td>Shows the name of the initiator.</td>
</tr>
<tr>
<td>ISID (Initiator Session ID)</td>
<td>Shows the unique identifier an initiator assigns to the session endpoint.</td>
</tr>
<tr>
<td></td>
<td>When it is combined with the iSCSI initiator name, it provides a unique</td>
</tr>
<tr>
<td></td>
<td>name in the world for the SCSI initiator port.</td>
</tr>
</tbody>
</table>

Advanced

From the iSCSI Advanced link, you can access the following pages:
- iSCSI Targets on page 141
- Sessions on page 141
- Sessions Detailed on page 142

iSCSI Targets

Use this page to view iSCSI targets and to assign target ports/port IP address combinations for iSCSI optimization on the switch.
To access the iSCSI Targets page, click Switching > iSCSI > Advanced > iSCSI Targets.
To configure iSCSI target settings:

1. In the **TCP Port** field, specify the TCP port number for the target that will monitor for iSCSI traffic. The well-known iSCSI ports 3260 and 860 are configured as the default ports.

2. In the **IP Address** field, specify an IP address for the target that will monitor for iSCSI traffic.

3. In the **Target Name** field, specify a name to assign to the Target.

4. Click **APPLY** to update the switch with the changes.

5. Click **CANCEL** to abandon the changes.

**Sessions Detailed**
Use this page to view detailed information about active iSCSI sessions.

To access the iSCSI Global Configuration page, click **Switching > iSCSI > Advanced > Sessions Detailed**.

The fields on this page display the information the following table describes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session Index</td>
<td>Shows the list of Session indices. The information displayed in the other fields corresponds to the selected Session Index.</td>

<td>Shows the Target TCP Port number of one of the connections between the Target and Initiator.</td>
</tr>
</tbody>
</table>
Spanning Tree Protocol

The Spanning Tree Protocol (STP) provides a tree topology for any arrangement of bridges. STP also provides one path between end stations on a network, eliminating loops. Spanning tree versions supported include Common STP, Multiple STP, and Rapid STP.

Classic STP provides a single path between end stations, avoiding and eliminating loops. For information on configuring Common STP, see "CST Port Configuration" on page 3-148.

Multiple Spanning Tree Protocol (MSTP) supports multiple instances of Spanning Tree to efficiently channel VLAN traffic over different interfaces. Each instance of the Spanning Tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree (RSTP), with slight modifications in the working but not the end effect (chief among the effects, is the rapid transitioning of the port to ‘Forwarding’). The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full-duplex connectivity and ports which are connected to end stations, resulting in rapid transitioning of the port to ‘Forwarding’ state and the suppression of Topology Change Notification. These features are represented by the parameters ‘pointtopoint’ and ‘edgeport’. MSTP is compatible to both RSTP and STP. It behaves appropriately to STP and RSTP bridges. A MSTP bridge can be configured to behave entirely as a RSTP bridge or a STP bridge.

**Note:** For two bridges to be in the same region, the force version should be 802.1s and their configuration name, digest key, and revision level should match. For additional information about regions and their effect on network topology, refer to the IEEE 802.1Q standard.

From the VLAN link, you can access the following pages:

- **Basic** on page 143
- **Advanced** on page 145

**Basic**

From the Basic link, you can access the following pages:

- **STP Configuration** on page 143

**STP Configuration**

The Spanning Tree Configuration/Status page contains fields for enabling STP on the switch. To display the Spanning Tree Configuration/Status page, click **Switching > STP > Basic > STP Configuration**.
To configure the global STP settings:

1. **Use Spanning Tree Admin Mode** to specify whether spanning tree operation is enabled on the switch. Value is enabled or disabled.

2. **Use Force Protocol Version** to specify the Force Protocol Version parameter for the switch. The options are IEEE 802.1d, IEEE 802.1w and IEEE 802.1s.

3. **Use Configuration Name** to specify an identifier used to identify the configuration currently being used. It may be up to 32 alphanumeric characters.

4. **Use Configuration Revision Level** to specify an identifier used to identify the configuration currently being used. The values allowed are between 0 and 65535. The default value is 0.

5. **Use Forward BPDU while STP Disabled** to specify whether spanning tree BPDUs should be forwarded or not while spanning-tree is disabled on the switch. Value is enabled or disabled.

6. **Use BPDU Guard** to specify whether the BPDU guard feature is enabled. The STP BPDU guard allows a network administrator to enforce the STP domain borders and keep the active topology consistent and predictable. The switches behind the edge ports that have STP BPDU guard enabled will not be able to influence the overall STP topology. At the reception of BPDUs, the BPDU guard operation disables the port that is configured with this option and transitions the port into disable state. This would lead to administrative disable of the port.

7. **Use BPDU Filter** to specify whether the BPDU Filter feature is enabled. STP BPDU filtering applies to all operational edge ports. Edge Port in an operational state is supposed to be connected to hosts that typically drop BPDUs. If an operational edge port receives a BPDU, it immediately loses its operational status. In that case, if BPDU filtering is enabled on this port then it drops the BPDUs received on this port.

### Advanced

From the Advanced link, you can access the following pages:

- *STP Configuration* on page 143
- *CST Configuration* on page 146
- *CST Port Configuration* on page 148
- *CST Port Status* on page 150
- *MST Configuration* on page 151
- *MST Port Status* on page 153
- *STP Statistics* on page 155
CST Configuration

Use the Spanning Tree CST Configuration page to configure Common Spanning Tree (CST) and Internal Spanning Tree on the switch.

To display the Spanning Tree CST Configuration page, click **Switching > STP > Advanced > CST Configuration**.

To configure CST settings:

1. Specify values for CST in the appropriate fields:
   - **Bridge Priority** - When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. Specifies the bridge priority value for the Common and Internal Spanning Tree (CST). The valid range is 0–61440. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if the priority is attempted to be set to any value between 0 and 4095, it will be set to 0. The default priority is 32768.
   - **Bridge Max Age (secs)** - Specifies the bridge maximum age time for the Common and Internal Spanning Tree (CST), which indicates the amount of time in seconds a bridge waits before implementing a topological change. The valid range is 6–40, and
the value must be less than or equal to $(2 \times \text{Bridge Forward Delay}) - 1$ and greater than or equal to $2 \times (\text{Bridge Hello Time} + 1)$. The default value is 20.

- **Bridge Hello Time (secs)** - Specifies the bridge Hello time for the Common and Internal Spanning Tree (CST), which indicates the amount of time in seconds a root bridge waits between configuration messages. The value is fixed at 2 seconds. The value must be less than or equal to $(\text{Bridge Max Age} / 2) - 1$. The default hello time value is 2.

- **Bridge Forward Delay (secs)** - Specifies the bridge forward delay time, which indicates the amount of time in seconds a bridge remains in a listening and learning state before forwarding packets. The value must be greater or equal to $(\text{Bridge Max Age} / 2) + 1$. The time range is from 4 seconds to 30 seconds. The default value is 15.

- **Spanning Tree Maximum Hops** - Specifies the maximum number of bridge hops the information for a particular CST instance can travel before being discarded. The valid range is 1–127.

- **Spanning Tree Tx Hold Count** - Configures the maximum number of bpdus the bridge is allowed to send within the hello time window. The default value is 6.

<table>

</table>
CST Port Configuration

Use the Spanning Tree CST Port Configuration page to configure Common Spanning Tree (CST) and Internal Spanning Tree on a specific port on the switch.

To display the Spanning Tree CST Port Configuration page, click Switching > STP > Advanced > CST Port Configuration.

To configure CST port settings:

1. **Interface** - One of the physical or port channel interfaces associated with VLANs associated with the CST.

2. Use **Port Priority** to specify the priority for a particular port within the CST. The port priority is set in multiples of 16. For example if the priority is attempted to be set to any value between 0 and 15, it will be set to 0. If it is tried to be set to any value between 16 and (2\(^*\)16-1) it will be set to 16 and so on.

3. Use **Admin Edge Port** to specify if the specified port is an Edge Port within the CIST. It takes a value of TRUE or FALSE, where the default value is FALSE.
4. Use **Port Path Cost** to set the Path Cost to a new value for the specified port in the common and internal spanning tree. It takes a value in the range of 1 to 200000000.

5. Use **External Port Path Cost** to set the External Path Cost to a new value for the specified port in the spanning tree. It takes a value in the range of 1 to 200000000.

6. Use **BPDU Filter** to configure the BPDU Filter, which filters the BPDU traffic on this port when STP is enabled on this port. The possible values are Enable or Disable.

7. Use **BPDU Flood** to configure the BPDU Flood, which floods the BPDU traffic arriving on this port when STP is disabled on this port. The possible values are Enable or Disable.

8. Use **Auto Edge** to configure the auto edge mode of a port, which allows the port to become an edge port if it does not see BPDUs for some duration. The possible values are Enable or Disable.

9. Use **Root Guard** to configure the root guard mode, which sets a port to discard any superior information received by the port and thus protect against root of the device from changing. The port gets put into discarding state and does not forward any packets. The possible values are Enable or Disable.

10. Use **Loop Guard** to configure the loop guard on the port to protect layer 2 forwarding loops. If loop guard is enabled, the port moves into the STP loop inconsistent blocking state instead of the listening/learning/forwarding state.

11. Use **TCN Guard** to configure the TCN guard for a port restricting the port from propagating any topology change information received through that port. The possible values are Enable or Disable.

12. Use **Port Mode** to enable/disable Spanning Tree Protocol Administrative Mode associated with the port or port channel. The possible values are Enable or Disable.

</tr>
</tbody>
</table>
To configure an MST instance:

1. To add an MST instance, configure the MST values and click **ADD**:
   - **MST ID** - Specify the ID of the MST to create. Valid values for this are between 1 and 4094. This is only visible when the select option of the MST ID select box is selected.
   - **Priority** - Specifies the bridge priority value for the MST. When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if the priority is attempted to be set to any value between 0 and 4095, it will be set to 0. The default priority is 32768. The valid range is 0–61440.
   - **VLAN ID** - This gives a combo box of each VLAN on the switch. These can be selected or unselected for re-configuring the association of VLANs to MST instances.

2. To delete an MST instance, select the check box next to the instance and click **DELETE**.

3. To modify an MST instance, select the check box next to the instance to configure, update the values, and click **APPLY**. You can select multiple check boxes to apply the same setting to all selected ports.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

For each configured instance, the information described in the following table displays on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bridge Identifier</td>
<td>The bridge identifier for the selected MST instance. It is made up using the bridge priority and the base MAC address of the bridge.</td>

</tbody>
</table>
**MST Port Status**

Use the Spanning Tree MST Port Status page to configure and display Multiple Spanning Tree (MST) settings on a specific port on the switch.

To display the Spanning Tree MST Port Status page, click **Switching > STP > Advanced > MST Port Status.**

---

**Note:** If no MST instances have been configured on the switch, the page displays a “No MSTs Available” message and does not display the fields shown in the field description table that follows.
To configure MST port settings:

1. Use **MST ID** to select one MST instance from existing MST instances.

2. Use **Interface** to select one of the physical or port channel interfaces associated with VLANs associated with the selected MST instance.

3. Use **Port Priority** to specify the priority for a particular port within the selected MST instance. The port priority is set in multiples of 16. For example if the priority is attempted to be set to any value between 0 and 15, it will be set to 0. If it is tried to be set to any value between 16 and (2*16-1) it will be set to 16 and so on.

4. Use **Port Path Cost** to set the Path Cost to a new value for the specified port in the selected MST instance. It takes a value in the range of 1 to 200000000.

The following table describes the read-only MST port configuration information displayed on the Spanning Tree CST Configuration page.

<table>

MFDB Table

The Multicast Forwarding Database holds the port membership information for all active multicast address entries. The key for an entry consists of a VLAN ID and MAC address pair. Entries may contain data for more than one protocol.

To display the MFDB Table page, click Switching > Multicast > MFDB > MFDB Table.

To search for a specific MAC address, use the Search by MAC Address field to enter a MAC Address whose MFDB table entry you want displayed. Enter six two-digit hexadecimal numbers separated by colons, for example 00:01:23:43:45:67. Then click on the “GO” button. If the address exists, that entry will be displayed. An exact match is required.

<td>The largest number of entries that have been present in the Multicast Forwarding Database table since last reset. This value is also known as the MFDB high-water mark.</td>
</tr>
<tr>
<td>Current Entries</td>
<td>The current number of entries in the Multicast Forwarding Database table.</td>
</tr>
</tbody>
</table>
IGMP Snooping

Internet Group Management Protocol (IGMP) Snooping is a feature that allows a switch to forward multicast traffic intelligently on the switch. Multicast IP traffic is traffic that is destined to a host group. Host groups are identified by class D IP addresses, which range from 224.0.0.0 to 239.255.255.255. Based on the IGMP query and report messages, the switch forwards traffic only to the ports that request the multicast traffic. This prevents the switch from broadcasting the traffic to all ports and possibly affecting network performance.

A traditional Ethernet network may be separated into different network segments to prevent placing too many devices onto the same shared media. Bridges and switches connect these segments. When a packet with a broadcast or multicast destination address is received, the switch will forward a copy into each of the remaining network segments in accordance with the IEEE MAC Bridge standard. Eventually, the packet is made accessible to all nodes connected to the network.

This approach works well for broadcast packets that are intended to be seen or processed by all connected nodes. In the case of multicast packets, however, this approach could lead to less efficient use of network bandwidth, particularly when the packet is intended for only a small number of nodes. Packets will be flooded into network segments where no node has any interest in receiving the packet. While nodes will rarely incur any processing overhead to filter packets addressed to unrequested group addresses, they are unable to transmit new packets onto the shared media for the period of time that the multicast packet is flooded. The problem of wasting bandwidth is even worse when the LAN segment is not shared, for example in full-duplex links.

Allowing switches to snoop IGMP packets is a creative effort to solve this problem. The switch uses the information in the IGMP packets as they are being forwarded throughout the network to determine which segments should receive packets directed to the group address.

From the IGMP Snooping link, you can access the following pages:

- **IGMP Snooping Configuration** on page 159
- **IGMP Snooping Interface Configuration** on page 160
- **IGMP VLAN Configuration** on page 161
- **Multicast Router Configuration** on page 162
- **Multicast Router VLAN Configuration** on page 163
- **IGMP Snooping Querier** on page 163
  - **IGMP Snooping Querier Configuration** on page 164
  - **IGMP Snooping Querier VLAN Configuration** on page 165
IGMP Snooping Configuration

Use the IGMP Snooping Configuration page to configure the parameters for IGMP snooping, which is used to build forwarding lists for multicast traffic.

Note that only a user with Read/Write access privileges may change the data on this screen.

To access the IGMP Snooping Configuration page, click Switching > Multicast > IGMP Snooping > Configuration.

To configure IGMP Snooping:

1. Use the Admin Mode Enable/Disable radio button to select the administrative mode for IGMP Snooping for the switch. The default is disable.

2. Use the Unknown Multicast Filtering Enable/Disable radio button to select the unknown multicast filtering mode for the switch. The default is disable.

The following table displays information about the global IGMP snooping status and statistics on the page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Control Frame Count</td>
<td>The number of multicast control frames that are processed by the CPU.</td>
</tr>
<tr>
<td>Interfaces Enabled for IGMP Snooping</td>
<td>A list of all the interfaces currently enabled for IGMP Snooping.</td>
</tr>
<tr>
<td>Data Frames Forwarded by the CPU</td>
<td>The number of data frames forwarded by the CPU.</td>
</tr>
<tr>
<td>VLAN Ids Enabled For IGMP Snooping</td>
<td>Displays VLAN Ids enabled for IGMP snooping.</td>
</tr>
</tbody>
</table>
IGMP Snooping Interface Configuration

Use the IGMP Snooping Interface Configuration page to configure IGMP snooping settings on specific interfaces.

To access the IGMP Snooping Interface Configuration page, click **Switching > Multicast > IGMP Snooping > Interface Configuration**.

To configure IGMP Snooping interface settings:

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.

2. Use **Admin Mode** to select the interface mode for the selected interface for IGMP Snooping for the switch from the pull-down menu. The default is disable.

3. Use **Group Membership Interval** to specify the amount of time you want the switch to wait for a report for a particular group on a particular interface before it deletes that interface from the group. Enter a value between 1 and 3600 seconds. The default is 260 seconds.

4. Use **Max Response Time** to specify the amount of time you want the switch to wait after sending a query on an interface because it did not receive a report for a particular group on that interface. Enter a value greater or equal to 1 and less than the Group Membership Interval in seconds. The default is 10 seconds. The configured value must be less than the Group Membership Interval.

5. Use **Present Expiration Time** to specify the amount of time you want the switch to wait to receive a query on an interface before removing it from the list of interfaces with multicast routers attached. Enter a value between 0 and 3600 seconds. The default is 0 seconds. A value of zero indicates an infinite time-out, i.e. no expiration.

6. Use **Fast Leave Admin** mode to select the Fast Leave mode for the a particular interface from the pull-down menu. The default is disable.

7. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

8. If you make any configuration changes, click **APPLY** to apply the new settings to the switch. Configuration changes take effect immediately.
IGMP VLAN Configuration

Use the IGMP Snooping VLAN Configuration page to configure IGMP snooping settings for VLANs on the system.

To access the IGMP Snooping VLAN Configuration page, click Switching > Multicast > IGMP Snooping > IGMP VLAN Configuration.

To configure IGMP snooping settings for VLANs:

1. To enable IGMP snooping on a VLAN, enter the VLAN ID in the appropriate field and configure the IGMP Snooping values:
   - Use Admin Mode to enable or disable IGMP Snooping for the specified VLAN ID.
   - Use Fast Leave Admin Mode to enable or disable the IGMP Snooping Fast Leave Mode for the specified VLAN ID.
   - Use Group Membership Interval to set the value for group membership interval of IGMP Snooping for the specified VLAN ID. Valid range is (Maximum Response Time + 1) to 3600 seconds.
   - Use Maximum Response Time to set the value for maximum response time of IGMP Snooping for the specified VLAN ID. Valid range is 1 to (Group Membership Interval - 1). Its value should be greater than group membership interval value.
   - Use Multicast Router Expiry Time to set the value for multicast router expiry time of IGMP Snooping for the specified VLAN ID. Valid range is 0 to 3600 seconds.

2. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

3. To disable IGMP snooping on a VLAN and remove it from the list, select the check box next to the VLAN ID and click DELETE.

4. To modify IGMP snooping settings for a VLAN, select the check box next to the VLAN ID, update the desired values, and click APPLY.

5. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
**Multicast Router Configuration**

This page configures the interface as the one the multicast router is attached to. All IGMP packets snooped by the switch will be forwarded to the multicast router reachable from this interface. The configuration is not needed most of the time since the switch will automatically detect the presence of multicast router and forward IGMP packet accordingly. It is only needed when you want to make sure the multicast router always receives IGMP packets from the switch in a complex network.

To access the Multicast Router Configuration page, click **Switching > Multicast > IGMP Snooping > Multicast Router Configuration**.

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.
2. Use **Multicast Router** to enable or disable Multicast Router on the selected interfaces.
3. Click **APPLY** to update the switch with the changes.
4. Click **CANCEL** to abandon the changes.
**Multicast Router VLAN Configuration**

This page configures the interface to only forward the snooped IGMP packets that come from VLAN ID (<vlanId>) to the multicast router attached to this interface. The configuration is not needed most of the time since the switch will automatically detect the presence of a multicast router and forward IGMP packets accordingly. It is only needed when you want to make sure that the multicast router always receives IGMP packets from the switch in a complex network.

To access the Multicast Router VLAN Configuration page, click **Switching > Multicast > IGMP Snooping > Multicast Router VLAN Configuration**.

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.
2. Use **VLAN ID** to select the VLAN ID for which the Multicast Router Mode is to be Enabled or Disabled.
3. Use **Multicast Router** to enable or disable multicast router for the VLAN ID.
4. Click **APPLY** to update the switch with the changes.
5. Click **CANCEL** to abandon the changes.

**IGMP Snooping Querier**

IGMP snooping requires that one central switch or router periodically query all end-devices on the network to announce their multicast memberships. This central device is the IGMP querier. The IGMP query responses, known as IGMP reports, keep the switch updated with the current multicast group membership on a port-by-port basis. If the switch does not receive updated membership information in a timely fashion, it will stop forwarding multicasts to the port where the end device is located.

These pages enable you to configure and display information on IGMP snooping queriers on the network and, separately, on VLANs.
IGMP Snooping Querier Configuration

Use this menu to configure the parameters for IGMP Snooping Querier. Note that only a user with Read/Write access privileges may change the data on this screen.

To access this page, click **Switching > Multicast > IGMP Snooping > Querier Configuration**.

To configure IGMP Snooping Querier settings:

1. Use **Querier Admin Mode** to select the administrative mode for IGMP Snooping for the switch. The default is disable.
2. Use **Querier IP Address** to specify the Snooping Querier Address to be used as source address in periodic IGMP queries. This address is used when no address is configured on the VLAN on which query is being sent.
3. Use **IGMP Version** to specify the IGMP protocol version used in periodic IGMP queries.
4. Use **Query Interval(secs)** to specify the time interval in seconds between periodic queries sent by the snooping querier. The Query Interval must be a value in the range of 1 and 1800. The default value is 60.
5. Use **Querier Expiry Interval(secs)** to specify the time interval in seconds after which the last querier information is removed. The Querier Expiry Interval must be a value in the range of 60 and 300. The default value is 60.

<table>

IGMP Snooping Querier VLAN Configuration

Use this page to configure IGMP queriers for use with VLANs on the network.

To access this page, click **Switching > Multicast > IGMP Snooping > Querier VLAN Configuration**.

To configure Querier VLAN settings:

1. To create a new VLAN ID for IGMP Snooping, select New Entry from the VLAN ID field and complete the following fields. User can also set pre-configurable Snooping Querier parameters.
   - **VLAN ID** - Specifies the VLAN ID for which the IGMP Snooping Querier is to be enabled.
   - **Querier Election Participate Mode** - Enable or disable Querier Participate Mode.
     - **Disabled** - Upon seeing another querier of the same version in the VLAN, the snooping querier moves to the non-querier state.
     - **Enabled** - The snooping querier participates in querier election, in which the least IP address operates as the querier in that VLAN. The other querier moves to non-querier state.
   - **Snooping Querier VLAN Address** - Specify the Snooping Querier IP Address to be used as the source address in periodic IGMP queries sent on the specified VLAN.

2. Click **APPLY** to apply the new settings to the switch. Configuration changes take effect immediately.

3. To disable Snooping Querier on a VLAN, select the VLAN ID and click **DELETE**.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

5. Click **REFRESH** to update the page with the latest information from the switch.

MLD Snooping Interface Configuration

To access the MLD Snooping Interface Configuration page, click **Switching** > **Multicast** > **MLD Snooping** > **Interface Configuration**.

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.
2. Use **Admin Mode** to select the interface mode for the selected interface for MLD Snooping for the switch. The default is disable.
3. Use **Group Membership Interval (secs)** to specify the amount of time you want the switch to wait for a report for a particular group on a particular interface before it deletes that interface from the group. The valid range is from (2 to 3600) seconds. The configured value must be greater than Max Response Time. The default is 260 seconds.
4. Use **Max Response Time (secs)** to specify the amount of time you want the switch to wait after sending a query on an interface because it did not receive a report for a particular group on that interface. Enter a value greater or equal to 1 and less than the Group Membership Interval in seconds. The default is 10 seconds. The configured value must be less than the Group Membership Interval.
5. Use **Present Expiration Time** to specify the amount of time you want the switch to wait to receive a query on an interface before removing it from the list of interfaces with multicast routers attached. Enter a value between 0 and 3600 seconds. The default is 0 seconds. A value of zero indicates an infinite time-out, i.e. no expiration.
6. Use **Fast Leave Admin mode** to select the Fast Leave mode for the a particular interface from the pull-down menu. The default is disable.
7. Click **APPLY** to apply the new settings to the switch. Configuration changes take effect immediately.
8. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
**MLD VLAN Configuration**

To access the MLD VLAN Configuration page, click **Switching > Multicast > MLD Snooping > MLD VLAN Configuration**.

1. Use **VLAN ID** to set the VLAN IDs for which MLD Snooping is enabled.
2. Use **Admin Mode** to enable MLD Snooping for the specified VLAN ID.
3. Use **Fast Leave Admin Mode** to enable or disable the MLD Snooping Fast Leave Mode for the specified VLAN ID.
4. Use **Group Membership Interval** to set the value for group membership interval of MLD Snooping for the specified VLAN ID. Valid range is (Maximum Response Time + 1) to 3600.
5. Use **Maximum Response Time** to set the value for maximum response time of MLD Snooping for the specified VLAN ID. Valid range is 1 to (Group Membership Interval - 1). Its value should be less than group membership interval value.
6. Use **Multicast Router Expiry Time** to set the value for multicast router expiry time of MLD Snooping for the specified VLAN ID. Valid range is 0 to 3600.
7. Click **APPLY** to apply the new settings to the switch. Configuration changes take effect immediately
8. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
Multicast Router Configuration

To access the Multicast Router Configuration page, click Switching > Multicast > MLD Snooping > Multicast Router Configuration.

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.
2. Use Multicast Router to enable or disable Multicast Router on the selected interface.

Multicast Router VLAN Configuration

To access the Multicast Router VLAN Configuration page, click Switching > Multicast > MLD Snooping > Multicast Router VLAN Configuration.

1. Use Interface to select the interface for which you want Multicast Router to be enabled.
2. Use VLAN ID to select the VLAN ID for which the Multicast Router Mode is to be Enabled or Disabled.
3. Use Multicast Router to enable or disable the multicast router for the Vlan ID.
4. Click APPLY to apply the new settings to the switch. Configuration changes take effect immediately.
5. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
MLD Snooping Querier Configuration

Use this menu to configure the parameters for MLD Snooping Querier. Note that only a user with Read/Write access privileges may change the data on this screen.

To access the MLD Snooping Querier Configuration page, click **Switching > Multicast > MLD Snooping > Querier Configuration**.

1. Use **Querier Admin Mode** to select the administrative mode for MLD Snooping for the switch. The default is disable.

2. Use **Querier Address** to specify the Snooping Querier Address to be used as source address in periodic MLD queries. This address is used when no address is configured on the VLAN on which query is being sent. The supported IPv6 formats are x:x:x:x:x:x:x and x::x.

3. Use **MLD Version** to specify the MLD protocol version used in periodic MLD queries.

4. Use **Query Interval(secs)** to specify the time interval in seconds between periodic queries sent by the snooping querier. The Query Interval must be a value in the range of 1 and 1800. The default value is 60.

5. Use **Querier Expiry Interval(secs)** to specify the time interval in seconds after which the last querier information is removed. The Querier Expiry Interval must be a value in the range of 60 and 300. The default value is 60.

MVR Configuration

IGMP snooping helps limit multicast traffic when member ports are in the same VLAN; however, when ports belong to different VLANs, a copy of the multicast stream is sent to each VLAN that has member ports in the multicast group. MVR eliminates the need to duplicate the multicast traffic when multicast group member ports belong to different VLANs.

MVR uses a dedicated multicast VLAN to forward multicast traffic over the L2 network. Only one MVLAN can be configured per switch, and it is used only for certain multicast traffic, such as traffic from an IPTV application, to avoid duplication of multicast streams for clients in different VLANs. Clients can dynamically join or leave the multicast VLAN without interfering with their membership in other VLANs.

MVR, like IGMP Snooping, allows a layer 2 switch to listen to IGMP messages to learn about multicast group membership.

From the MVR Configuration link under the Switching tab, you can configure the MVR settings.

From the MVR Configuration link, you can access the following links:

- **Basic** on page 173
- **Advanced** on page 174

Basic

From the Basic link, you can access the following pages:

- **MVR Configuration** on page 173

MVR Configuration

To display the MVR Configuration page, click **Switching > MVR > Basic > MVR Configuration**. A screen similar to the following displays.

1. **Use** **MVR Running** to Enable or Disable the MVR feature. The factory default is Disable.
2. **Use** **MVR multicast** to specify the VLAN on which MVR multicast data will be received. All source ports belong to this VLAN. The value can be set in a range of 1 to 4093. The default value is 1.
### Field Definition

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MVR Max Multicast Groups</td>
<td>Displays the maximum number of multicast groups that MVR supports.</td>
</tr>
<tr>
<td>MVR Current Multicast Groups</td>
<td>Displays current number of the MVR groups allocated.</td>
</tr>
</tbody>
</table>

3. Use **MVR Global query response time** to set the maximum time to wait for the IGMP reports membership on a receiver port. This time applies only to receiver-port leave processing. When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from the multicast group membership. The value is equal to the tenths of second. The range is from 1 to 100 tenths. The factory default is 5 tenths or one-half.

4. Use **MVR Mode** to specify the MVR mode of operation. The factory default is compatible.

### Advanced

From the Advanced link, you can access the following pages:

- **MVR Group Configuration** on page 174
- **MVR Interface Configuration** on page 175
- **MVR Group Membership** on page 176
- **MVR Statistics** on page 176

### MVR Group Configuration

To display the MVR Group Configuration page, click **Switching > MVR > Advanced > MVR Group Configuration**. A screen similar to the following displays.

1. Use the **MVR Group IP** to specify the IP Address for the new MVR group.
2. Click **ADD** to add a new MVR group.
3. Click **DELETE** to delete a selected MVR group.
4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

<table>
<thead>

</table>
**MVR Group Membership**

To display the MVR Configuration page, click **Switching > MVR > Advanced > MVR Group Membership**. A screen similar to the following displays.

1. Use the **Group IP** to specify the IP multicast address of the MVR group for which you want to display or configure data.
2. Use the **Port List** to show the configured list of members of the selected MVR group. You can use this port list to add the ports you selected to this MVR group.
3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen.
4. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**MVR Statistics**

To display the MVR Configuration page, click **Switching > MVR > Advanced > MVR Statistics**. A screen similar to the following displays.

Click **REFRESH** to refresh the web page to show the latest MVR statistics.

Address Table

From the Address Table link, you can access the following pages:

- Basic on page 177
- Advanced on page 179

Basic

From the Basic link, you can access the following pages:

- Address Table on page 177

Address Table

This table contains information about unicast entries for which the switch has forwarding and/or filtering information. This information is used by the transparent bridging function in determining how to propagate a received frame.

To display the Address Table page, click **Switching > Address Table > Basic > Address Table.**

<table>
<thead>
<tr>
<th>Field</th>

IGMP Query Transmitted Displays the number of transmitted IGMP Queries.
IGMP Report V1 Transmitted Displays the number of transmitted IGMP Reports V1.
IGMP Report V2 Transmitted Displays the number of transmitted IGMP Reports V2.
IGMP Leave Transmitted Displays the number of transmitted IGMP Leaves.
IGMP Packet Receive Failures Displays the number of IGMP packet receive failures.
IGMP Packet Transmit Failures Displays the number of IGMP packet transmit failures.
1. Use **Search By** to search for MAC Addresses by MAC Address, VLAN ID, and port:

   **Searched by MAC Address** - Select MAC Address from pull-down menu, enter the 6 byte hexadecimal MAC Address in two-digit groups separated by colons, for example 01:23:45:67:89:AB. Then click on the “Go” button. If the address exists, that entry will be displayed as the first entry followed by the remaining (greater) mac addresses. An exact match is required.

   **Searched by VLAN ID** - Select VLAN ID from pull-down menu, enter the VLAN ID, for example 100. Then click on the “Go” button. If the address exists, the entry will be displayed as the first entry followed by the remaining (greater) mac addresses.

   **Searched by Port** - Select Port from pull-down menu, enter the port ID in Unit/Slot/Port, for example 2/1/1. Then click on the “Go” button. If the address exists, the entry will be displayed as the first entry followed by the remaining (greater) mac addresses.

2. Click **Go** to initiate the search.

<table>

</tr>
</tbody>
</table>
Advanced

From the Advanced link, you can access the following pages:

- Dynamic Addresses on page 179
- Address Table on page 177
- Static MAC Address on page 180

Dynamic Addresses

This page allows the user to set the Address Aging Interval for the specified forwarding database.

To display the Address Table page, click Switching > Address Table> Advanced > Dynamic Addresses.

1. Use Address Aging Timeout (seconds) to specify the time-out period in seconds for aging out dynamically learned forwarding information. 802.1D-1990 recommends a default of 300 seconds. The value may be specified as any number between 10 and 1000000 seconds. The factory default is 300.

2. Click APPLY to update the switch with the changes.

3. Click CANCEL to abandon the changes.
Static MAC Address

Use this page to configure static MAC addresses in the MAC address table. Each static MAC address can be associated with one or more interfaces and VLANs. Unlike dynamic MAC addresses in the MAC address table, static MAC addresses do not age out.

To display the Static MAC Address page, click **Switching > Address Table > Advanced > Static MAC Address**.

1. Use **Interface** to select the physical interface/LAGs for which you want to configure a MAC address or display data.
2. Use the **Static MAC Address** to input the MAC address to be added.
3. Select the **VLAN ID** associated with the MAC address.
4. Click **ADD** to add a new static MAC address to the switch.
5. To delete a static MAC address from the table, select the check box associated with the entry to remove and click **DELETE**.
6. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
Ports

The pages on the Ports tab allow you to view and monitor the physical port information for the ports available on the switch. From the Ports link, you can access the following pages:

- *Port Configuration* on page 181
- *Port Description* on page 182

Port Configuration

Use the Port Configuration page to configure the physical interfaces on the switch. To access the Port Configuration page, click **Switching > Ports > Port Configuration**.

</table>
To configure port settings:

1. Select the check box associated with each Port to configure, or select the check box in the header row to apply the same settings to all ports.
2. Use STP Mode to select the Spanning Tree Protocol Administrative Mode for the port or LAG. The possible values are:
   - **Enable** - Select this to enable the Spanning Tree Protocol for this port.
   - **Disable** - Select this to disable the Spanning Tree Protocol for this port.
3. Use the Admin Mode pull-down menu to select the Port control administration state. You must select enable if you want the port to participate in the network. The factory default is enabled.
4. Use LACP Mode to select the Link Aggregation Control Protocol administration state. The mode must be enabled in order for the port to participate in Link Aggregation. May be enabled or disabled by selecting the corresponding line on the pull-down entry field. The factory default is enabled.
5. Use the Physical Mode pull-down menu to select the port's speed and duplex mode. If you select auto, the duplex mode and speed will be set by the auto-negotiation process. Note that the port's maximum capability (full duplex and speed) will be advertised. Otherwise, your selection will determine the port's duplex mode and transmission rate. The factory default is auto.
6. Use Link Trap to determine whether to send a trap when link status changes. The factory default is enabled.
7. Use Maximum Frame Size to specify the maximum Ethernet frame size the interface supports or is configured, including ethernet header, CRC, and payload (1518 to 9216). The default maximum frame size is 1518.
8. Click CANCEL to abandon the changes.
9. Click APPLY to update the switch with the values you entered. If you want the switch to retain the new values across a power cycle you must perform a save.

### Port Description

This screen configures and displays the description for all ports in the box.
To access the Port Description page, click **Switching > Ports > Port Description.**

1. Select the check box associated with each **Port** to configure, or select the check box in the header row to apply the same settings to all ports.

2. Use **Port Description** to enter the description string to be attached to a port. It can be up to 64 characters in length.

3. Click **CANCEL** to abandon the changes.

4. Click **APPLY** to update the switch with the values you entered. If you want the switch to retain the new values across a power cycle you must perform a save.

Link Aggregation Groups

Link aggregation groups (LAGs), which are also known as port-channels, allow you to combine multiple full-duplex Ethernet links into a single logical link. Network devices treat the aggregation as if it were a single link, which increases fault tolerance and provides load sharing. You assign the LAG VLAN membership after you create a LAG. The LAG by default becomes a member of the management VLAN.

A LAG interface can be either static or dynamic, but not both. All members of a LAG must participate in the same protocols. A static port-channel interface does not require a partner system to be able to aggregate its member ports.

Static LAGs are supported. When a port is added to a LAG as a static member, it neither transmits nor receives LACPDUs.

From the LAGs link, you can access the following pages:

- **LAG Configuration** on page 184
- **LAG Membership** on page 186

LAG Configuration

Use the LAG (Port Channel) Configuration page to group one or more full-duplex Ethernet links to be aggregated together to form a link aggregation group, which is also known as a port-channel. The switch treats the LAG as if it were a single link.

To access the LAG Configuration page, click **Switching > LAG > LAG Configuration**.

![LAG Configuration Table]

</tr>
</tbody>
</table>
To configure LAG settings:

1. Use **LAG Name** to enter the name you want assigned to the LAG. You may enter any string of up to 15 alphanumeric characters. A valid name has to be specified in order to create the LAG.

2. Use **Hash Mode** to select the load-balancing mode used on a port-channel (LAG). Traffic is balanced on a port-channel (LAG) by selecting one of the links in the channel over which to transmit specific packets. The link is selected by creating a binary pattern from selected fields in a packet, and associating that pattern with a particular link:
   - **Src MAC,VLAN,EType,incoming port** - Source MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Dest MAC,VLAN,EType,incoming port** - Destination MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Src/Dest MAC,VLAN,EType,incoming port** - Source/Destination MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Src IP and Src TCP/UDP Port fields** - Source IP and Source TCP/UDP fields of the packet.
   - **Dest IP and Dest TCP/UDP Port fields** - Destination IP and Destination TCP/UDP Port fields of the packet.
   - **Src/Dest IP and TCP/UDP Port Fields** - Source/Destination IP and source/destination TCP/UDP Port fields of the packet.
   - **Enhanced hashing mode** - Features MODULO-N operation based on the number of ports in the LAG, non-Unicast traffic and unicast traffic hashing using a common hash algorithm, excellent load balancing performance, and packet attributes selection based on the packet type:
     - For L2 packets, source and destination MAC address are used for hash computation.
     - For L3 packets, source IP, destination IP address, TCP/UDP ports are used.

3. Use **Link Trap** to specify whether you want to have a trap sent when link status changes. The factory default is enable, which will cause the trap to be sent.

4. Use **Admin Mode** to select enable or disable from the pull-down menu. When the LAG is disabled no traffic will flow and LACPDUs will be dropped, but the links that form the LAG will not be released. The factory default is enable.

5. Use **STP Mode** to enable or disable the Spanning Tree Protocol Administrative Mode associated with the LAG. The possible values are:
   - **Disable** - Spanning tree is disabled for this LAG.
   - **Enable** - Spanning tree is enabled for this LAG.

6. Use **Static Mode** to select enable or disable from the pull-down menu. When the LAG is enabled it does not transmit or process received LACPDUs i.e. the member ports do not transmit LACPDUs and all the LACPDUs it may receive are dropped. The factory default is disable.

7. Click **APPLY** to update the switch with the changes.

8. Click **DELETE** to remove the currently selected configured LAG. All ports that were members of this LAG are removed from the LAG and included in the default VLAN.
<table>
<thead>
<tr>

</tbody>
</table>

**LAG Membership**

Use the LAG Membership page to select two or more full-duplex Ethernet links to be aggregated together to form a link aggregation group (LAG), which is also known as a port-channel. The switch can treat the port-channel as if it were a single link.

To access the LAG Membership page, click **Switching > LAG > LAG Membership**. The following figure shows LAG 1 with ports 6, 7, and 8 as members.

To configure LAG Membership information:

1. Use **LAG ID** to select the identification of the LAG.
2. Use **LAG Name** to enter the name you want assigned to the LAG. You may enter any string of up to 15 alphanumeric characters. A valid name has to be specified in order to create the LAG.
3. Use **LAG Description** to enter the Description string to be attached to a LAG. It can be up to 64 characters in length.
4. Use **Admin Mode** to select enable or disable from the pull-down menu. When the LAG is disabled no traffic will flow and LACPDUs will be dropped, but the links that form the LAG will not be released. The factory default is enable.
5. Use **Link Trap** to specify whether you want to have a trap sent when link status changes. The factory default is enable, which will cause the trap to be sent.

6. Use **STP Mode** to enable or disable the Spanning Tree Protocol Administrative Mode associated with the LAG. The possible values are:
   - **Disable** - Spanning tree is disabled for this LAG.
   - **Enable** - Spanning tree is enabled for this LAG.

7. Use **Static Mode** to select enable or disable from the pull-down menu. When the LAG is enabled it does not transmit or process received LACPDUs i.e. the member ports do not transmit LACPDUs and all the LACPDUs it may receive are dropped. The factory default is disable.

8. Use **Hash Mode** to select the load-balancing mode used on a port-channel (LAG). Traffic is balanced on a port-channel (LAG) by selecting one of the links in the channel over which to transmit specific packets. The link is selected by creating a binary pattern from selected fields in a packet, and associating that pattern with a particular link:
   - **Src MAC,VLAN,EType, incoming port** - Source MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Dest MAC,VLAN,EType, incoming port** - Destination MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Src/Dest MAC,VLAN,EType, incoming port** - Source/Destination MAC, VLAN, EtherType, and incoming port associated with the packet.
   - **Src IP and Src TCP/UDP Port** fields - Source IP and Source TCP/UDP fields of the packet.
   - **Dest IP and Dest TCP/UDP Port** fields - Destination IP and Destination TCP/UDP Port fields of the packet.
   - **Src/Dest IP and TCP/UDP Port** fields - Source/Destination IP and source/destination TCP/UDP Port fields of the packet.
   - **Enhanced Hashing mode** - Features MODULO-N operation based on the number of ports in the LAG, non-Unicast traffic and unicast traffic hashing using a common hash algorithm, excellent load balancing performance, and packet attributes selection based on the packet type:
     - For L2 packets, source and destination MAC address are used for hash computation.
     - For L3 packets, source IP, destination IP address, TCP/UDP ports are used.

9. Use the **Port Selection Table** to select the ports as members of the LAG.

10. **Click CANCEL** to abandon the changes.

11. **Click APPLY** to update the switch with the values you entered. If you want the switch to retain the new values across a power cycle you must perform a save.
The **Routing** tab contains links to the following features:

- *Routing Table* on page 189
- *IP* on page 193
- *IPv6* on page 201
- *IPv6* on page 201 (Licensed Feature)
- *ARP* on page 220
- *RIP* on page 225 (Licensed Feature)
- *OSPF* on page 232 (Licensed Feature)
- *OSPFv3* on page 257 (Licensed Feature)
- *Router Discovery* on page 279 (Licensed Feature)
- *VRRP* on page 280 (Licensed Feature)
- *Multicast* on page 286 (Licensed Feature)
- *IPv6 Multicast* on page 313 (Licensed Feature)

---

**Note:** Some routing features are available only when a valid license is installed.

---

**Routing Table**

The Routing Table collects routes from multiple sources: static routes, RIP routes, OSPF routes, and local routes. The Routing Table may learn multiple routes to the same destination from multiple sources. The Routing Table lists all routes.

From the Routing Table link, you can access the following pages:

- *Basic* on page 190
- *Advanced* on page 192
Basic

From the Basic link, you can access the following pages:

- **Route Configuration** on page 190

**Route Configuration**

To display the Route Configuration page, click **Routing > Routing Table > Basic > Route Configuration**.

**Route Configuration**

1. Use the **Route Type** field to specify default or static. If creating a default route, all that needs to be specified is the next hop IP address, otherwise each field needs to be specified.

2. **Network Address** displays the IP route prefix for the destination.

3. **Subnet Mask** indicates the portion of the IP interface address that identifies the attached network. This is also referred to as the subnet/network mask.

4. **Next Hop IP Address** displays the outgoing router IP address to use when forwarding traffic to the next router (if any) in the path towards the destination. The next router will always be one of the adjacent neighbors or the IP address of the local interface for a directly attached network.

5. **Preference** displays an integer value from (1 to 255). The user can specify the preference value (sometimes called “administrative distance”) of an individual static route. Among routes to the same destination, the route with the lowest preference value is the route entered into the forwarding database. By specifying the preference of a static route, the user controls whether a static route is more or less preferred than routes from dynamic routing protocols. The preference also controls whether a static route is more or less preferred than other static routes to the same destination.

6. Use **Identifier** to specify the description of this route that identifies the route.

7. Click **ADD** to add a new static route entry to the switch.

8. Click **DELETE** to delete a existing static route entry from the switch.
### Learned Routes

<table>
<thead>
<tr>

<td>Network Address</td>
<td>The IP route prefix for the destination.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>Also referred to as the subnet/network mask, this indicates the portion of the IP interface address that identifies the attached network.</td>
</tr>
</tbody>
</table>
| Protocol        | This field tells which protocol created the specified route. The possibilities are one of the following:  
• Local  
• Static  
• OSPF  
• RIP                                                                                                                                               |
| Next Hop IP Address | The outgoing router IP address to use when forwarding traffic to the next router (if any) in the path towards the destination. The next router will always be one of the adjacent neighbors or the IP address of the local interface for a directly attached network. |
| Next Hop Interface | The outgoing router interface to use when forwarding traffic to the destination.                                                                                                                                  |
| Metric          | Administrative cost of the path to the destination. If no value is entered, default is 1. The range is 0 - 255.                                                                                               |
| Preference      | The preference is an integer value from (0 to 255). The user can specify the preference value (sometimes called “administrative distance”) of an individual static route. Among routes to the same destination, the route with the lowest preference value is the route entered into the forwarding database. By specifying the preference of a static route, the user controls whether a static route is more or less preferred than routes from dynamic routing protocols. The preference also controls whether a static route is more or less preferred than other static routes to the same destination. |

Click **REFRESH** to refresh the web page to show the latest learned routes.
Advanced

From the Advanced link, you can access the following pages:

- Route Configuration on page 190
- Route Preferences on page 192

Route Preferences

Use this panel to configure the default preference for each protocol, e.g., 60 for static routes, 120 for RIP. These values are arbitrary values in the range of 1 to 255 and are independent of route metrics. Most routing protocols use a route metric to determine the shortest path known to the protocol, independent of any other protocol.

The best route to a destination is chosen by selecting the route with the lowest preference value. When there are multiple routes to a destination, the preference values are used to determine the preferred route. If there is still a tie, the route with the best route metric will be chosen. To avoid problems with mismatched metrics (i.e., RIP and OSPF metrics are not directly comparable) you must configure different preference values for each of the protocols.

To display the Route Preferences page, click Routing > Routing Table > Advanced > Route Preferences.

1. Use Static to specify the static route preference value in the router. The default value is 1. The range is 1 to 255.
2. Click APPLY to update the switch with the changes.
3. Click CANCEL to abandon the changes.

<table>
<thead>
<tr>

### IP

The IP folder contains links to the following web pages that configure and display IP routing data:

- **Basic** on page 193
- **Advanced** on page 197

### Basic

From the Basic link, you can access the following pages:

- **IP Configuration** on page 193
- **Statistics** on page 194

### IP Configuration

Use this menu to configure routing parameters for the switch, as opposed to an interface. To display the IP Configuration page, click **Routing > IP > Basic > IP Configuration**.

![IP Configuration Menu](image)

To configure global IP routing:

1. Use **Routing Mode** to select enable or disable. You must enable routing for the switch before you can route through any of the interfaces. The default value is disable.
2. Use **ICMP Echo Replies** to select enable or disable. If it is enable then only the router can send ECHO replies. By default ICMP Echo Replies are sent for echo requests.
3. Use **ICMP Redirects** to select enable or disable. If it is enabled globally and on interface level then only the router can send ICMP Redirects.
4. Use **ICMP Rate Limit Interval** to control the ICMP error packets by specifying the number of ICMP error packets that are allowed per burst interval. By default, Rate limit is 100 packets/sec i.e., burst interval is 1000 msec. To disable ICMP Rate limiting, set this field to '0'. Valid Rate Interval must be in the range 0 to 2147483647.
5. Use **ICMP Rate Limit Burst Size** to control the ICMP error packets by specifying the number of ICMP error packets that are allowed per burst interval. By default, burst size is 100 packets. When burst interval is 0 then configuring this field is not a valid operation. Valid Burst Size must be in the range 1 to 200.

<table>
<thead>
<tr>

```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IpInReceives</td>
<td>The total number of input datagrams received from interfaces, including those received in error.</td>
</tr>
<tr>
<td>IpInHdrErrors</td>
<td>The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.</td>
</tr>
<tr>
<td>IpInAddrErrors</td>
<td>The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.</td>
</tr>
<tr>
<td>IpForwDatagrams</td>
<td>The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.</td>
</tr>
<tr>
<td>IpInUnknownProtos</td>
<td>The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.</td>
</tr>
<tr>
<td>IpInDiscards</td>
<td>The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.</td>
</tr>
<tr>
<td>IpInDelivers</td>
<td>The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).</td>
</tr>
<tr>
<td>IpOutRequests</td>
<td>The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.</td>
</tr>
<tr>
<td>IpOutDiscards</td>
<td>The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.</td>
</tr>
<tr>
<td>IpOutNoRoutes</td>
<td>The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this 'no-route' criterion. Note that this includes any datagrams which a host cannot route because all of its default gateways are down.</td>
</tr>
<tr>
<td>IpReasmTimeout</td>
<td>The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.</td>
</tr>
<tr>
<td>IpReasmReqds</td>
<td>The number of IP fragments received which needed to be reassembled at this entity.</td>
</tr>
<tr>
<td>IpReasmOKs</td>
<td>The number of IP datagrams successfully re-assembled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IpReasmFails</td>
<td>The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms can lose track of the number of fragments by combining them as they are received.</td>
</tr>
<tr>
<td>IpFragOKs</td>
<td>The number of IP datagrams that have been successfully fragmented at this entity.</td>
</tr>
<tr>
<td>IpFragFails</td>
<td>The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.</td>
</tr>
<tr>
<td>IpFragCreates</td>
<td>The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.</td>
</tr>
<tr>
<td>IpRoutingDiscards</td>
<td>The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free-up buffer space for other routing entries.</td>
</tr>
<tr>
<td>IcmpInMsgs</td>
<td>The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.</td>
</tr>
<tr>
<td>IcmpInErrors</td>
<td>The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, etc.).</td>
</tr>
<tr>
<td>IcmpInDestUnreachs</td>
<td>The number of ICMP Destination Unreachable messages received.</td>
</tr>
<tr>
<td>IcmpInTimeExcds</td>
<td>The number of ICMP Time Exceeded messages received.</td>
</tr>
<tr>
<td>IcmpInParmProbs</td>
<td>The number of ICMP Parameter Problem messages received.</td>
</tr>
<tr>
<td>IcmpInSrcQuenchs</td>
<td>The number of ICMP Source Quench messages received.</td>
</tr>
<tr>
<td>IcmpInRedirects</td>
<td>The number of ICMP Redirect messages received.</td>
</tr>
<tr>
<td>IcmpInEchos</td>
<td>The number of ICMP Echo (request) messages received.</td>
</tr>
<tr>
<td>IcmpInEchoReps</td>
<td>The number of ICMP Echo Reply messages received.</td>

</tbody>
</table>
To configure IP routing on an interface:

1. Use **Go To Interface** to enter the Interface in unit/slot/port format and click **Go**. The entry corresponding to the specified interface is selected.
2. Use **Port** to select the interface for which data is to be displayed or configured.
3. Use **Description** to enter the description for the interface.
4. Use **IP Address Configuration Method** to enter the method by which an IP address is configured on the interface. There are three methods: None, Manual, and DHCP. By default the method is None. Method 'None' should be used to reset the DHCP method.

**Note:** When the configuration method is changed from **DHCP** to **None** there will be a minor delay before the page refreshes.

5. Use **IP Address** to enter the IP address for the interface.

6. Use **Subnet Mask** to enter the subnet mask for the interface. This is also referred to as the subnet/network mask, and defines the portion of the interface's IP address that is used to identify the attached network.

7. Use **Routing Mode** to enable or disable routing for an interface. The default value is enable.

8. Use **Administrative Mode** to enable/disable the Administrative Mode of the interface. The default value is enable. This mode is not supported for Logical VLAN Interfaces.

9. Use **Forward Net Directed Broadcasts** to select how network directed broadcast packets should be handled. If you select enable from the pull-down menu, network directed broadcasts will be forwarded. If you select disable they will be dropped. The default value is disable.

10. Use **Encapsulation Type** to select the link layer encapsulation type for packets transmitted from the specified interface from the pull-down menu. The possible values are Ethernet and SNAP. The default is Ethernet.

11. Use **Proxy Arp** to disable or enable proxy Arp for the specified interface from the pull-down menu.

12. Use **Local Proxy Arp** to disable or enable Local Proxy ARP for the specified interface from the pull-down menu.

13. Use **Bandwidth** to specify the configured bandwidth on this interface. This parameter communicates the speed of the interface to higher level protocols. OSPF uses bandwidth to compute link cost. Valid range is (1 to 10000000).

14. Use **ICMP Destination Unreachables** to specify the Mode of Sending ICMP Destination Unreachables on this interface. If this is Disabled then this interface will not send ICMP Destination Unreachables. By default Destination Unreachables mode is enable.

15. Use **ICMP Redirects** to enable/disable ICMP Redirects Mode. The router sends an ICMP Redirect on an interface only if Redirects are enabled both globally and on the interface. By default ICMP Redirects Mode is enable.

16. Use **IP MTU** to specify the maximum size of IP packets sent on an interface. Valid range is 68 bytes to the link MTU. Default value is 0. A value of 0 indicates that the IP MTU is unconfigured. When the IP MTU is unconfigured the router uses the link MTU as the IP MTU. The link MTU is the maximum frame size minus the length of the layer 2 header.

17. Click **APPLY** to update the switch with the changes.

18. Click **CANCEL** to abandon the changes.

19. Click **DELETE** to delete the IP Address from the selected interface.

20. Click **REFRESH** to refresh the web page to show the latest IP information.
Field | Description
--- | ---
VLAN ID | Displays the VLAN ID for the interface.
Link State | The state of the specified interface is either Active or Inactive. An interface is considered active if it the link is up and it is in forwarding state.
OSPF Admin Mode | Displays OSPF admin mode of the interface. The default value is disable.

**Secondary IP Address**

To display the Secondary IP Address page, click Routing > IP > Advanced > Secondary IP.

![Secondary IP Address](image)

To configure a secondary IP address on an interface enabled for routing:

1. Use **Interface** to select the interface for which data is to be displayed or configured.
2. Use **Secondary IP Address** to add a secondary IP address to the selected interface.
3. Use **Secondary IP Subnet Mask** to enter the subnet mask for the interface. This is also referred to as the subnet/network mask, and defines the portion of the interface's IP Address that is used to identify the attached network. This value is read only once configured.
4. Click **ADD** to add a Secondary IP Address for the selected interface.
5. Click **DELETE** to delete the Secondary IP Address from the selected interface.

Field | Description
--- | ---
VLAN ID | The VLAN ID associated with the displayed or configured interface.
Primary IP Address | The Primary IP Address for the Interface.
IPv6

IPv6 is the next generation of the Internet Protocol. With 128-bit addresses, versus 32-bit addresses for IPv4, IPv6 solves the address depletion issues seen with IPv4 and removes the requirement for Network Address Translation (NAT), which is used in IPv4 networks to reduce the number of globally unique IP addresses required for a given network. Its aggregate addresses can dramatically reduce the size of the global routing table through well known address combinations. Security is more integrated and network configuration is simplified yet more flexible.

IPv6 can coexists with IPv4. As with IPv4, IPv6 routing can be enabled on physical and VLAN interfaces. Each L3 routing interface can be used for IPv4, IPv6, or both. IP protocols running over L3 (for example, UDP and TCP) do not change with IPv6. For this reason, a single CPU stack is used for transport of both IPv4 and IPv6, and a single sockets interface provides access to both. Routing protocols are capable of computing routes for one or both IP versions.

From the IPv6 link, you can access the following pages:

- Basic on page 201
- Advanced on page 204

Basic

From the Basic link, you can access the following pages:

- IPv6 Global Configuration on page 202
- IPv6 Route Table on page 203
IPv6 Global Configuration

Use the Global Configuration page to enable IPv6 forwarding on the router and to enable the forwarding of IPv6 unicast datagrams.

To display the IPv6 Global Configuration page, click Routing > IPv6 > Basic > Global Configuration.

To configure global IPv6 routing:

1. Use IPv6 Unicast Routing to globally enable or disable IPv6 unicast routing on the entity.

2. Use the Hop Limit option to define the unicast hop count used in IPv6 packets originated by the node. The value is also included in router advertisements. Valid values for <hops> are 1-64 inclusive. The default "not configured" means that a value of zero is sent in router advertisements and a value of 64 is sent in packets originated by the node. Note that this is not the same as configuring a value of 64.

3. Use ICMPv6 Rate Limit Error Interval to control the ICMPv6 error packets by specifying the number of ICMP error packets that are allowed per burst interval. By Default Rate limit is 100 packets/sec i.e., burst interval is 1000 msec. To disable ICMP rate limiting set this field to '0'. Valid Rate Interval must be in the range 0 to 2147483647.

4. Use ICMPv6 Rate Limit Burst Size to control the ICMP error packets by specifying the number of ICMP error packets that are allowed per burst interval. Default burst size is 100 packets. When burst interval is 0 then configuring this field is not a valid operation. Valid Burst Size must be in the range 1 to 200.

5. Click APPLY to update the switch with the changes.

6. Click CANCEL to abandon the changes.
**IPv6 Route Table**

Use the IPv6 Route Table page to display all active IPv6 routes and their settings. To display the IPv6 Route Table page, click **Routing > IPv6 > Basic > Route Table.**

To view the IPv6 route table:

1. Use **Routes Displayed** to choose from:
   - **Configured Routes** - Shows the routes configured by the user.
   - **Best Routes** - Shows only the best active routes.
   - **All Routes** - Shows all active IPv6 routes.

2. Click **REFRESH** to update the page with the most current information.

**IPv6 Interface Configuration**

Use the Interface Configuration page to configure IPv6 interface parameters.

To display the IPv6 Interface Configuration page, click **Routing > IPv6 > Advanced > Interface Configuration**.
To configure IPv6 interface information:

1. Use **Interface** to select the interface to be configured or displayed. All physical interfaces are valid.

2. Use **IPv6 Mode** to enable/disable IPv6 mode. When IPv6 mode is enabled, interface is capable of IPv6 operation without a global address. In this case, an EUI-64 based link-local address is used. This selector lists the two options for IPv6 mode: enable and disable. Default value is disable.

3. Use **DHCPv6 Client Mode** to enable or disable the DHCPv6 client mode on an interface. At any point of time only one interface can act as a Client. Default value is disable.

4. Use **Stateless Address AutoConfig Mode** to enable or disable Stateless Address AutoConfig mode on an interface. Default value is disable.

5. Use **Routing Mode** to enable/disable routing mode of an interface. Default value is disable.

6. Use **Admin Mode** to enable/disable the Administrative Mode of the interface. The default value is enable. This mode is not supported for Logical VLAN Interfaces.

7. Use **MTU** to specify the maximum transmit unit on an interface. If the value is 0 then this interface is not enabled for routing. It is not valid to set this value to 0 if routing is enabled. Range of MTU is 1280 to 1500.

8. Use **Duplicate Address Detection Transmits** to specify the number of duplicate address detections transmits on an interface. DAD transmits values must be in range 0 to 600.

9. Use **Life Time Interval** to specify the router advertisement lifetime field sent from the interface. This value must be greater than or equal to the maximum advertisement interval. 0 means do not use the router as the default router. The range of router lifetime is 0 to 9000.

10. Use **Adv NS Interval** to specify the retransmission time field of router advertisement sent from the interface. A value of 0 means interval is not specified for router. Range of neighbor solicit interval is 1000 to 4294967295.

11. Use **Adv Reachable Time** to specify the router advertisement time to consider neighbor reachable after ND confirmation. Range of reachable time is 0 to 3600000.

12. Use **Adv Interval** to specify the maximum time allowed between sending router advertisements from the interface. Default value is 600. Range of maximum advertisement interval is 4 to 1800.

13. Use **Adv Managed Config Flag** to specify the router advertisement managed address configuration flag. When true, end nodes use DHCPV6. When false, end nodes auto configure addresses. Default value of managed flag is disable.

14. Use **Adv Other Config Flag** To specify router advertisement for other Stateful configuration flag. Default value of other config flag is disable.

15. Use **Adv Suppress Flag** to specify router advertisement suppression on an interface. Default value of suppress flag is disable.

16. Use **Destination Unreachables** to specify the Mode of Sending ICMPv6 Destination Unreachables on this interface. If Disabled then this interface will not send ICMPv6 Destination Unreachables. By default IPv6 Destination Unreachables mode is enable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational Mode</td>
<td>Specifies operational state of an interface. Default value is disable.</td>
</tr>
</tbody>
</table>
IPv6 Prefix Configuration

Use this page to manually configure an IPv6 address for an interface.

To display the IPv6 Prefix Configuration page, click **Routing > IPv6 > Advanced > Prefix Configuration**.

To configure IPv6 address information for an interface:

1. Use **Interface** to select the interface to be configured. When the selection is changed, a screen refresh will occur causing all fields to be updated for the newly selected port. All physical interfaces are valid.
2. Use **IPv6 Prefix/Prefix Length** to specify the IPv6 prefix with prefix length for an interface.
3. Use **EUI-64** to specify 64 bit unicast prefix.
4. Use **Valid Lifetime** to specify router advertisement per prefix time to consider prefix valid for purposes of on link determination. Valid lifetime must be in the range 0 to 4294967295.
5. Use **Preferred Lifetime** to specify router advertisement per prefix time. An auto configured address generated from this prefix is preferred. Preferred lifetime must be in range 0 to 4294967295.
6. Use **OnLink Flag** to specify selected prefix can be used for on-link determination. Default value is enable. This selector lists the two options for on-link flag: enable and disable.
7. Use **Autonomous Flag** to specify selected prefix can be used for autonomous address configuration. Default value is disable. This selector lists the two options for autonomous flag: enable and disable.
8. Click **ADD** to add a new IPv6 address to the interface.
9. Click **DELETE** to delete an existing IPv6 address entry from the interface.

<table>

<tr>
<td>Received Datagrams With Unknown Protocol</td>
<td>The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol. This counter is incremented at the interface to which these datagrams were addressed which might not be necessarily the input interface for some of the datagrams.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To Invalid Address</td>
<td>The number of input datagrams discarded because the IPv6 address in their IPv6 header's destination field was not a valid address to be received at this entity. This count includes invalid addresses, e.g., ::0, and unsupported addresses, e.g., addresses with unallocated prefixes. For entities which are not IPv6 routers and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Due To Truncated Data</td>
<td>The number of input datagrams discarded because datagram frame didn't carry enough data.</td>
</tr>
<tr>
<td>Received Datagrams Discarded Other</td>
<td>The number of input IPv6 datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.</td>
</tr>
<tr>
<td>Received Datagrams Reassembly Required</td>
<td>The number of IPv6 fragments received which needed to be reassembled at this interface. Note that this counter is incremented at the interface to which these fragments were addressed which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>

<tr>
<td>Datagrams Successfully Reassembled</td>
<td>The number of IPv6 datagrams successfully reassembled. Note that this counter is incremented at the interface to which these datagrams were addressed which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Datagrams Failed To Reassemble</td>
<td>The number of failures detected by the IPv6 reassembly algorithm (for whatever reason: timed out, errors, etc.). Note that this is not necessarily a count of discarded IPv6 fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received. This counter is incremented at the interface to which these fragments were addressed which might not be necessarily the input interface for some of the fragments.</td>
</tr>
<tr>
<td>Datagrams Forwarded</td>
<td>The number of output datagrams which this entity received and forwarded to their final destinations. In entities which do not act as IPv6 routers, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route processing was successful. Note that for a successfully forwarded datagram the counter of the outgoing interface is incremented.</td>
</tr>
<tr>
<td>Datagrams Locally Transmitted</td>
<td>The number of datagrams which this entity has successfully transmitted from this output interface.</td>
</tr>
<tr>
<td>Datagrams Transmit Failed</td>
<td>The number of datagrams which this entity failed to transmit successfully.</td>
</tr>
<tr>
<td>Datagrams Successfully Fragmented</td>
<td>The number of IPv6 datagrams that have been successfully fragmented at this output interface.</td>
</tr>
<tr>
<td>Datagrams Failed To Fragment</td>
<td>The number of output datagrams that could not be fragmented at this interface.</td>
</tr>
<tr>
<td>Datagrams Fragments Created</td>
<td>The number of output datagram fragments that have been generated as a result of fragmentation at this output interface.</td>
</tr>
<tr>
<td>Multicast Datagrams Received</td>
<td>The number of multicast packets received by the interface.</td>
</tr>
<tr>
<td>Multicast Datagrams Transmitted</td>
<td>The number of multicast packets transmitted by the interface.</td>

IPv6 Neighbor Table

Use the IPv6 Neighbor Table page to display IPv6 neighbor details for a specified interface. To display the IPv6 Neighbor Table page, click Routing > IPv6 > Advanced > Neighbor Table.

To search for an entry in the IPv6 neighbor table, use the Search By menu to specify the search criteria:

- Searched by IPv6 Address - Select IPv6 Address from pull-down menu, enter the 128 byte hexadecimal IPv6 Address in four-digit groups separated by colons, for example 2001:231F::1. Then click Go. If the address exists, that entry will be displayed. An exact match is required.
- Searched by Interface - Select Interface from pull-down menu, enter the interface ID in Unit/Slot/Port, for example 2/1/1. Then click Go. If the IPv6 route exists, the entry will be displayed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Specifies the interface whose settings are displayed in the current table row.</td>
</tr>
<tr>
<td>IPv6 Address</td>
<td>Specifies the IPv6 address of neighbor or interface.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Specifies MAC address associated with an interface.</td>
</tr>
<tr>
<td>IsRtr</td>
<td>Indicates whether the neighbor is a router. If the neighbor is a router, the value is TRUE. If the neighbor is not a router, the value is FALSE.</td>
</tr>
</tbody>
</table>
Neighbor State

Specifies the state of the neighbor cache entry. Following are the states for dynamic entries in the IPv6 neighbor discovery cache:

- **Incmp** - Address resolution is being performed on the entry. A neighbor solicitation message has been sent to the solicited-node multicast address of the target, but the corresponding neighbor advertisement message has not yet been received.
- **Reach** - Positive confirmation was received within the last Reachable Time milliseconds that the forward path to the neighbor was functioning properly. While in REACH state, the device takes no special action as packets are sent.
- **Stale** - More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. While in STALE state, the device takes no action until a packet is sent.
- **Delay** - More than ReachableTime milliseconds have elapsed since the last positive confirmation was received that the forward path was functioning properly. A packet was sent within the last DELAY_FIRST_PROBE_TIME seconds. If no reachability confirmation is received within DELAY_FIRST_PROBE_TIME seconds of entering the DELAY state, send a neighbor solicitation message and change the state to PROBE.
- **Probe** - A reachability confirmation is actively sought by resending neighbor solicitation messages every RetransTimer milliseconds until a reachability confirmation is received.

**IPv6 Route Configuration**

Use this page to configure static IPv6 routes.

To display the IPv6 Route Configuration page, click **Routing > IPv6 > Advanced > Static Route Configuration**.

To configure a static IPv6 route:

1. Use **IPv6 Prefix/Prefix Length** to enter the Network Prefix and Prefix Length for the Configured Route.
2. Use **Next Hop IPv6 Address Type** to specify if the Next Hop IPv6 Address is a Global IPv6 Address or a Link-local IPv6 Address or a Static-Reject IPv6 Address. If the Next Hop IPv6 address specified is a Link-Local IPv6 Address, specify the Interface for the Link-local IPv6 Next Hop Address. Select Static-Reject from this menu to create a static reject route for a destination prefix. No next hop address is specified in that case.
3. Use **Next Hop IPv6 Address** to enter the Next Hop IPv6 Address for the Configured Route.
4. Use **Interface** to specify the unit, slot, and port number for the Link-local IPv6 Next Hop Address. This field is enabled only if the Link-local is selected.
5. Use **Preference** to specify the Route Preference of the Configured Route.
6. Click **ADD** to configure a new route.
7. Click **DELETE** to delete the corresponding route.
**IPv6 Route Preferences**

Use this panel to configure the default preference for each protocol. These values are arbitrary values in the range of 1 to 255 and are independent of route metrics. Most routing protocols use a route metric to determine the shortest path known to the protocol, independent of any other protocol. The best route to a destination is chosen by selecting the route with the lowest preference value. When there are multiple routes to a destination, the preference values are used to determine the preferred route. If there is still a tie, the route with the best route metric will be chosen. To avoid problems with mismatched metrics you must configure different preference values for each of the protocols.

To display the IPv6 Route Preferences page, click Routing > IPv6 > Advanced > Route Preferences.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local</td>
<td>Local preference.</td>
</tr>
<tr>
<td>Static</td>
<td>1</td>
</tr>
<tr>
<td>OSPFv3 Intra</td>
<td>110</td>
</tr>
<tr>
<td>OSPFv3 Inter</td>
<td>110</td>
</tr>
<tr>
<td>OSPFv3 External</td>
<td>110</td>
</tr>
</tbody>
</table>

To configure IPv6 Route Preferences:

1. Use **Static** to specify the Static Route preference value for the router. The default value is 1. The range is 1 to 255.
2. Use **OSPFv3 Intra** to specify the OSPFv3 intra route preference value in the router. The default value is 110. The range is 1 to 255.
3. Use **OSPFv3 Inter** to specify the OSPFv3 inter route preference value in the router. The default value is 110. The range is 1 to 255.
4. Use **OSPFv3 External** to specify the OSPFv3 External route preference value in the router. The default value is 110. The range is 1 to 255.
5. Click **APPLY** to update the switch with the configured information.
6. Click **CANCEL** to abandon the changes.
Tunnel Configuration

ProSafe software provides for the creation, deletion, and management of tunnel interfaces. These are dynamic interfaces that are created and deleted via user-configuration. ProSafe support configured IPv6 over IPv4 tunnels to facilitate the transition of IPv4 networks to IPv6 networks. With configured tunnels, the user specifies the endpoints of the tunnel. Tunnels operate as point-to-point links.

Tunnels can be created, configured, and deleted from this page.

To display the Tunnel Configuration page, click Routing > IPv6 > Advanced > Tunnel Configuration.

To configure an IPv6 tunnel:
1. Use Tunnel ID to select from a list of all of available tunnel IDs.
2. Use Mode to select the Tunnel mode. The supported modes are 6-in-4-configured and 6-to-4.
3. Use IPv6 Mode to enable IPv6 on this interface using the IPv6 address. This option is only configurable prior to specifying an explicit IPv6 address.
4. Use IPv6 Unreachables to specify the Mode of Sending ICMPv6 Destination Unreachables on this interface. If Disabled then this interface will not send ICMPv6 Destination Unreachables. By default IPv6 Destination Unreachables mode is enable.
5. Use IPv6 Address to select a list of configured IPv6 addresses for the selected interface. Address must be entered in the format prefix/length.
6. Use EUI64 to specify the 64-bit extended unique identifier (EUI-64). For 6to4 tunnels, configure the ipv6 address with first 48-bits in the format 2002:tunnel-source-ipv4-address::/48.
7. Use Source Address to specify the desired source address. The source address for this tunnel must be entered in dotted decimal notation.
8. Use Source Interface to specify the source interface for this tunnel. The address associated with the selected interface will be used as the source address.
9. Use **Destination Address** to specify the destination address for this tunnel in dotted decimal notation.

10. Click **ADD** to allow the user to configure a new tunnel.

11. Click **DELETE** to delete the corresponding tunnel.

12. Click **CANCEL** to discard the changes made on the page and navigate back to the referring page.
You can configure ProSafe M5300 Switch software with some ports supporting VLANs and some supporting routing. You can also configure the software to allow traffic on a VLAN to be treated as if the VLAN were a router port.

When a port is enabled for bridging (default) rather than routing, all normal bridge processing is performed for an inbound packet, which is then associated with a VLAN. Its MAC Destination Address (MAC DA) and VLAN ID are used to search the MAC address table. If routing is enabled for the VLAN, and the MAC DA of an inbound unicast packet is that of the internal bridge-router interface, the packet is routed. An inbound multicast packet is forwarded to all ports in the VLAN, plus the internal bridge-router interface, if it was received on a routed VLAN.

Since a port can be configured to belong to more than one VLAN, VLAN routing might be enabled for all of the VLANs on the port, or for a subset. VLAN Routing can be used to allow more than one physical port to reside on the same subnet. It could also be used when a VLAN spans multiple physical networks, or when additional segmentation or security is required. This section shows how to configure the NETGEAR switch to support VLAN routing. A port can be either a VLAN port or a router port, but not both. However, a VLAN port may be part of a VLAN that is itself a router port.

From the VLAN link, you can access the following pages:

- VLAN Routing Wizard on page 218
- VLAN Routing Configuration on page 219

### VLAN Routing Wizard

The VLAN Routing Wizard creates a VLAN, adds selected ports to the VLAN. The VLAN Wizard gives the user the option to add the selected ports as a Link Aggregation (LAG). The Wizard will:

- Create a VLAN and generate a unique name for VLAN.
- Add selected ports to the newly created VLAN and remove selected ports from the default VLAN.
- Create a LAG, add selected ports to a LAG, then add LAG to the newly created VLAN.
- Enable tagging on selected ports if the port is in another VLAN. Disable tagging if a selected port does NOT exist in another VLAN.
- Exclude ports NOT selected from the VLAN.
- Enable routing on the VLAN using the IP address and subnet mask entered.

To display the VLAN Routing Wizard page, click Routing > VLAN > VLAN Routing Wizard.
To configure a VLAN routing interface by using the VLAN Routing Wizard:

1. Use **VLAN ID** to specify the VLAN Identifier (VID) associated with this VLAN. The range of the VLAN ID is 1 to 4093.

2. Use **Ports** to display selectable physical ports and LAGs (if any). Selected ports will be added to the Routing VLAN. Each port has three modes:
   - **T (Tagged)** - Select the ports on which all frames transmitted for this VLAN will be tagged. The ports that are selected will be included in the VLAN.
   - **U (Untagged)** - Select the ports on which all frames transmitted for this VLAN will be untagged. The ports that are selected will be included in the VLAN.
   - **Blank (Autodetect)** - Select the ports that may be dynamically registered in this VLAN via GVRP. This selection has the effect of excluding a port from the selected VLAN.

3. Use the **LAG Enabled** option to add selected ports to VLAN as a LAG. The default is No.

4. Use **IP Address** to define the IP address of the VLAN interface.

5. Use **Network Mask** to define the subnet mask of the VLAN interface.

**VLAN Routing Configuration**

Use the VLAN Routing Configuration page to configure VLAN Routing interfaces on the system.

To display the VLAN Routing Configuration page, click **Routing > VLAN > VLAN Routing**.

To configure an existing VLAN as a VLAN routing interface:

1. Use **VLAN ID** to enter the ID of a VLAN you want to configure for VLAN Routing. The field will display the all IDs of the VLAN configured on this switch.

2. Use **IP Address** to enter the IP Address to be configured for the VLAN Routing Interface.
3. Use **Subnet Mask** to enter the Subnet Mask to be configured for the VLAN Routing Interface.

4. Click **ADD** to add the VLAN Routing Interface specified in the VLAN ID field to the switch configuration.

5. Click **DELETE** to remove the VLAN Routing Interface specified in the VLAN ID field from the switch configuration.

<table>

<td>The MAC Address assigned to the VLAN Routing Interface</td>
</tr>
</tbody>
</table>

**ARP**

The ARP protocol associates a layer 2 MAC address with a layer 3 IPv4 address. ProSafe software features both dynamic and manual ARP configuration. With manual ARP configuration, you can statically add entries into the ARP table.

ARP is a necessary part of the internet protocol (IP) and is used to translate an IP address to a media (MAC) address, defined by a local area network (LAN) such as Ethernet. A station needing to send an IP packet must learn the MAC address of the IP destination, or of the next hop router, if the destination is not on the same subnet. This is achieved by broadcasting an ARP request packet, to which the intended recipient responds by unicasting an ARP reply containing its MAC address. Once learned, the MAC address is used in the destination address field of the layer 2 header prepended to the IP packet.

The ARP cache is a table maintained locally in each station on a network. ARP cache entries are learned by examining the source information in the ARP packet payload fields, regardless of whether it is an ARP request or response. Thus, when an ARP request is broadcast to all stations on a LAN segment or virtual LAN (VLAN), every recipient has the opportunity to store the sender’s IP and MAC address in their respective ARP cache. The ARP response, being unicast, is normally seen only by the requestor, who stores the sender information in its ARP cache. Newer information always replaces existing content in the ARP cache.

The number of supported ARP entries is platform-dependent.

Devices can be moved in a network, which means the IP address that was at one time associated with a certain MAC address is now found using a different MAC, or may have disappeared from the network altogether (i.e., it has been reconfigured, disconnected, or powered off). This leads to stale information in the ARP cache unless entries are updated in reaction to new information seen on the network, periodically refreshed to determine if an address still exists, or removed from the cache if the entry has not been identified as a sender of an ARP packet during the course of an ageout interval, usually specified via configuration.

From the ARP link, you can access the following pages:

- *Basic* on page 221
- *Advanced* on page 221
Basic

From the Basic link, you can access the following pages:

- **ARP Cache** on page 221

ARP Cache

Use this screen to show ARP entries in the ARP Cache.

To display the ARP Cache page, click **Routing > ARP > Basic > ARP Cache**.

![ARP Cache Table]

To view the ARP cache

1. Use **Port** to select the associated Unit/Slot/Port of the connection
2. **IP Address** displays the IP address. It must be the IP address of a device on a subnet attached to one of the switch's existing routing interfaces.
3. **MAC Address** displays the unicast MAC address of the device. The address is six two-digit hexadecimal numbers separated by colons, for example 00:06:29:32:81:40.
4. Click **REFRESH** to show the latest IP information.

Advanced

From the Advanced link, you can access the following pages:

- **Static ARP Cache** on page 222
- **ARP Table Configuration** on page 223
Static ARP Cache

To display the Static ARP Cache page, click Routing > ARP > Advanced > ARP Create.

ARP Static Configuration

Use this screen to add an entry to the Address Resolution Protocol table.

1. Use IP Address to enter the IP address you want to add. It must be the IP address of a device on a subnet attached to one of the switch’s existing routing interfaces.
2. Use MAC Address to specify the unicast MAC address of the device. Enter the address as six two-digit hexadecimal numbers separated by colons, for example 00:06:29:32:81:40.
3. Click ADD to add a new static ARP entry to the switch.
4. Click DELETE to delete an existing static ARP entry from the switch.
5. Click APPLY to change the MAC Address mapping to the IP. Configuration changes take effect immediately.

ARP Cache

Use this screen to show ARP entries in the ARP Cache.

<table>

Click REFRESH to show the latest IP information.
ARP Table Configuration

You can use this screen to change the configuration parameters for the Address Resolution Protocol Table. You can also use this screen to display the contents of the table.

To display the ARP Table Configuration page, click **Routing > ARP > Advanced > ARP Table Configuration**.

### ARP Table Configuration

To configure the ARP table:

1. Use **Age Time** to enter the value for the switch to use for the ARP entry ageout time. You must enter a valid integer, which represents the number of seconds it will take for an ARP entry to age out. The range for this field is 15 to 21600 seconds. The default value for Age Time is 1200 seconds.

2. Use **Response Time** to enter the value for the switch to use for the ARP response time-out. You must enter a valid integer, which represents the number of seconds the switch will wait for a response to an ARP request. The range for this field is 1 to 10 seconds. The default value for Response Time is 1 second.

3. Use **Retries** to enter an integer that specifies the maximum number of times an ARP request will be retried. The range for this field is 0 to 10. The default value for Retries is 4.

4. Use **Cache Size** to enter an integer that specifies the maximum number of entries for the ARP cache. The range for this field is 256 to 1664. The default value for Cache Size is 1664.

5. Use **Dynamic Renew** to control whether the ARP component automatically attempts to renew ARP Entries of type Dynamic when they age out. The default setting is Enable.

6. Use **Remove from Table** to remove certain entries from the ARP Table. The choices listed specify the type of ARP Entry to be deleted:
   - **All Dynamic Entries**
   - **All Dynamic and Gateway Entries**
   - **Specific Dynamic/Gateway Entry** - Selecting this allows the user to specify the required IP Address.
- **Specific Static Entry** - Selecting this allows the user to specify the required IP Address.
- **None** - Selected if the user does not want to delete any entry from the ARP Table.

7. Use **Remove IP Address** to enter the IP Address against the entry that is to be removed from the ARP Table. This appears only if the user selects Specific Dynamic/Gateway Entry or Specific Static Entry in the Remove from Table Drop Down List.

<table>
<thead>

</tbody>
</table>
RIP

Note: RIP is a licensed feature and is available only on switches that have an active license installed.

RIP is an Interior Gateway Protocol (IGP) based on the Bellman-Ford algorithm and targeted at smaller networks (network diameter no greater than 15 hops). The routing information is propagated in RIP update packets that are sent out both periodically and in the event of a network topology change. On receipt of a RIP update, depending on whether the specified route exists or does not exist in the route table, the router may modify, delete, or add the route to its route table.

From the RIP link, you can access the following pages:

• Basic on page 225
• Advanced on page 226

Basic

From the Basic link, you can access the following pages:

• RIP Configuration (Basic) on page 225

RIP Configuration (Basic)

Use the RIP Configuration page to enable and configure or disable RIP in Global mode.

To display the RIP Configuration page, click Routing > RIP > Basic > RIP Configuration.

To configure the administrative mode of ARP on the switch:

1. Use the RIP Admin Mode field and select Disable or Enable.
2. Click APPLY to update the switch with the change.
3. Click CANCEL to abandon the change.
Advanced

From the Advanced link, you can access the following pages:

- **RIP Configuration (Advanced)** on page 226
- **Interface Configuration** on page 227
- **Route Redistribution** on page 230

**RIP Configuration (Advanced)**

Use the RIP Configuration page to enable and configure or disable RIP in Global mode and to configure global RIP settings.

To display the RIP Configuration page, click **Routing > RIP > Advanced > RIP Configuration**.

To configure the advanced RIP global settings:

1. Use **RIP Admin Mode** to enable or disable RIP for the switch. The default is enable.

2. Use **Split Horizon Mode** to select none, simple, or poison reverse from the radio buttons. Split horizon is a technique for avoiding problems caused by including routes in updates sent to the router from which the route was originally learned. The options are:
   - **None** - No special processing for this case.
   - **Simple** - A route will not be included in updates sent to the router from which it was learned.
   - **Poison reverse** - A route will be included in updates sent to the router from which it was learned, but the metric will be set to infinity.

   The default is simple.

3. Use **Auto Summary Mode** to select enable or disable. If you select enable, groups of adjacent routes will be summarized into single entries in order to reduce the total number of entries. The default is disable.

4. Use **Host Routes Accept Mode** to select enable or disable. If you select enable, the router will be accept host routes. The default is enable.

5. Use **Default Information Originate** to enable or disable Default Route Advertise.
6. Use **Default Metric** to set a default for the metric of redistributed routes. This field displays the default metric if one has already been set or blank if not configured earlier. The valid values are 1 to 15.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Route Changes</td>
<td>The number of route changes made to the IP Route Database by RIP. This does not include the refresh of a route’s age.</td>

<td>The number of responses sent to RIP queries from other systems.</td>
</tr>
</tbody>
</table>

**Interface Configuration**

Use the RIP Interface Configuration page to enable and configure or to disable RIP on a specific interface.

To display the Interface Configuration page, click **Routing > RIP > Advanced > Interface Configuration**.

To configure the advanced RIP global settings:

1. Use **Interface** to select the interface for which data is to be configured.
2. Use **Send Version** to select the version of RIP control packets the interface should send from the pull-down menu. The value is one of the following:
   - **RIP-1** - Send RIP version 1 formatted packets via broadcast.
   - **RIP-1c** - RIP version 1 compatibility mode. Send RIP version 2 formatted packets via broadcast.
   - **RIP-2** - Send RIP version 2 packets using multicast. The default is RIP-2.
   - **None** - No RIP control packets will be sent.
3. Use **Receive Version** to select what RIP control packets the interface will accept from the pull-down menu. The value is one of the following:
   - **RIP-1** - Accept only RIP version 1 formatted packets.
   - **RIP-2** - Accept only RIP version 2 formatted packets. The default is RIP-2.
   - **Both** - Accept packets in either format.
   - **None** - No RIP control packets will be accepted.

4. Use **RIP admin mode** to enable RIP for an interface. The default is Disable.

5. Use **Authentication Type** to select an authentication type other than none by clicking on the 'Configure Authentication' button. You will then see a new screen, where you can select the authentication type from the pull-down menu. The choices are:
   - **None** - This is the initial interface state. If you select this option from the pull-down menu on the second screen you will be returned to the first screen and no authentication protocols will be run.
   - **Simple** - If you select 'Simple' you will be prompted to enter an authentication key. This key will be included, in the clear, in the RIP header of all packets sent on the network. All routers on the network must be configured with the same key.
   - **Encrypt** - If you select 'Encrypt' you will be prompted to enter both an authentication key and an authentication ID. Encryption uses the MD5 Message-Digest algorithm. All routers on the network must be configured with the same key and ID.

6. Use **Authentication Key** to enter the RIP Authentication Key for the specified interface. If you do not choose to use authentication you will not be prompted to enter a key. If you choose 'simple' or 'encrypt' the key may be up to 16 octets long. The key value will only be displayed if you are logged on with Read/Write privileges.

7. Use **Authentication Key ID** to enter the RIP Authentication Key ID for the specified interface. If you choose not to use authentication or to use 'simple' you will not be prompted to enter the key ID. If you choose 'encrypt' the key ID may be in range from 0 to 255. The key ID value will be displayed only if you are logged on with Read/Write privileges.

8. Click **APPLY** to update the switch with the changes.

9. Click **REFRESH** to update the screen with the most recent information.

10. Click **CANCEL** to abandon the changes.

</table>
Route Redistribution

Use the RIP Route Redistribution page to configure which routes are redistributed to other routers using RIP. The allowable values for each fields are displayed next to the field. If any invalid values are entered, an alert message is displayed with the list of all the valid values.

To display the Route Redistribution page, click **Routing** > **RIP** > **Advanced** > **Route Redistribution**.

### RIP Route Redistribution Configuration

This screen can be used to configure the RIP Route Redistribution parameters. The allowable values for each fields are displayed next to the field. If any invalid values are entered, an alert message will be displayed with the list of all the valid values.

1. The Source select box is a dynamic selector and is populated by only those Source Routes that have already been configured for redistribute by RIP. Use Source to configure another Source Route from among the Available Source Routes. The valid values are:
   - Static
   - Connected
   - OSPF

2. Use **Redistribute Mode** to enable or disable RIP redistribute mode. The default value is disable.

3. Use **Metric** to specify the Metric of redistributed routes for the given Source Route.

4. Use **Distribute List** to set the Access List that filters the routes to be redistributed by the destination protocol. Only permitted routes are redistributed. If this command refers to a non-existent access list, all routes are permitted. The valid values for Access List IDs are 1 to 199. When used for route filtering, the only fields in an access list that get used are:
   - Source IP Address and netmask
   - Destination IP Address and netmask
   - Action (permit or deny)

   All other fields (source and destination port, precedence, ToS, etc.) are ignored.

5. Click **APPLY** to update the switch with the changes.

6. Click **CANCEL** to abandon the changes.
The source IP address is compared to the destination IP address of the route. The source IP netmask in the access list rule is treated as a wildcard mask, indicating which bits in the source IP address must match the destination address of the route. (Note that a 1 in the mask indicates a "don't care" in the corresponding address bit.)

When an access list rule includes a destination IP address and netmask (an extended access list), the destination IP address is compared to the network mask of the destination of the route. The destination netmask in the access list serves as a wildcard mask, indicating which bits in the route's destination mask are significant for the filtering operation.

**RIP Route Redistribution Summary**

This screen displays the RIP Route Redistribution Configurations.

<table>
<thead>
<tr>

<tr>
<td>Metric</td>
<td>The Metric of redistributed routes for the given Source Route. Displays &quot;Unconfigured&quot; when not configured.</td>
</tr>
</tbody>
</table>
| Match            | List of Routes redistributed when "OSPF" is selected as Source. The list may include one or more of:  
|                  | • Internal: Sets Internal OSPF Routes to be redistributed  
|                  | • External Type 1: Sets External Type 1 OSPF Routes to be redistributed  
|                  | • External Type 2: Sets External Type 2 OSPF Routes to be redistributed  
|                  | • NSSA External Type 1: Sets NSSA External Type 1 OSPF Routes to be redistributed  
|                  | • NSSA External Type 2: Sets NSSA External Type 2 OSPF Routes to be redistributed  |
| Distribute List  | The Access List that filters the routes to be redistributed by the Destination Protocol. Displays 0 when not configured. |
OSPF

**Note:** OSPF is a licensed feature and is available only on switches that have an active license installed.

From the OSPF link, you can access the following pages:

- **Basic** on page 232
- **Advanced** on page 233

Basic

From the Basic link, you can access the following pages:

- **OSPF Configuration (Basic)** on page 232

**OSPF Configuration (Basic)**

Use the OSPF Configuration page to enable OSPF on a router and to configure the related OSPF settings.

To display the OSPF Configuration page, click **Routing > OSPF > Basic > OSPF Configuration**.

To configure the administrative mode of OSPF on the switch:

1. Use **Router ID** to specify a 32-bit integer in dotted decimal format that uniquely identifies the router within the autonomous system (AS). To change the Router ID you must first disable OSPF. After you set the new Router ID, you must re-enable OSPF to have the change take effect. The default value is 0.0.0.0, although this is not a valid Router ID.

2. Use **Admin Mode** to select enable or disable. If you select enable, OSPF will be activated for the switch. The default value is disable. You must configure a Router ID before OSPF can become operational; see step 1 or by issuing the CLI command:
   
   ```text
   (Config-router)#router-id.
   ```

3. Click **APPLY** to update the switch with the changes.

4. Click **CANCEL** to abandon the changes.
Advanced

From the Advanced link, you can access the following pages:

- OSPF Configuration (Advanced) on page 234
- Common Area Configuration on page 237
- Stub Area Configuration on page 238
- NSSA Area Configuration on page 239
- Area Range Configuration on page 241
- Interface Configuration on page 242
- OSPF Interface Statistics on page 246
- OSPF Neighbor Table on page 249
- Link State Database on page 251
- Virtual Link Configuration on page 252
- Route Redistribution on page 255
- NSF OSPF Summary on page 256
**OSPF Configuration (Advanced)**

Use the OSPF Configuration page to enable OSPF on a router and to configure the related OSPF settings.

To display the OSPF Configuration page, click **Routing > OSPF > Advanced > OSPF Configuration**.

---

### Default Route Advertise Configuration

1. **Default Information Originate** is enabled, OSPF originates an external LSA advertising a default route (0.0.0.0/0.0.0.0).

2. **Always** - If Default Information Originate is enabled, but the Always option is FALSE, OSPF will only originate a default route if the router already has a default route in its routing table. Set Always to TRUE to force OSPF to originate a default route regardless of whether the router has a default route.
3. Use **Metric** to specify the metric of the default route. The range of valid values is 0 to 16777214.

4. Use **Metric Type** to set the OSPF metric type of the default route. Two types are supported:
   - **External Type 1**
   - **External Type 2** - Default is External Type 2.

**OSPF Configuration**

1. Use **Router ID** to specify the 32-bit integer in dotted decimal format that uniquely identifies the router within the autonomous system (AS). If you want to change the Router ID you must first disable OSPF. After you set the new Router ID, you must re-enable OSPF to have the change take effect. The default value is 0.0.0.0, although this is not a valid Router ID.

2. Use **Admin Mode** to select enable or disable. If you select enable, OSPF will be activated for the switch. The default value is disable. You must configure a Router ID before OSPF can become operational; see step 1 or by issuing the CLI command:
   (Config-router)#router-id.

3. Enable or disable **RFC 1583 Compatibility** to specify the preference rules that will be used when choosing among multiple AS-external-LSAs advertising the same destination. If you select enable, the preference rules will be those defined by RFC 1583. If you select disable, the preference rules will be those defined in Section 16.4.1 of the OSPF-2 standard (RFC 2328), which will prevent routing loops when AS-external-LSAs for the same destination have been originated from different areas. The default value is ‘enable’. All routers in the OSPF domain must be configured the same. If all OSPF routers are capable of operating according to RFC 2328, RFC 1583 Compatibility should be disabled.

4. Set the **Opaque LSA Status** parameter to enable if OSPF should store and flood opaque LSAs. An opaque LSA is used for flooding user-defined information within an OSPF router domain.

5. Use **Exit Overflow Interval(secs)** to specify how long OSPF must wait before attempting to leave overflow state. When the number of non-default external LSAs exceeds a configured limit, the router enters an overflow state as defined in RFC 1765. In overflow state, OSPF cannot originate non-default external LSAs. If the Exit Overflow Interval is 0, OSPF will not leave overflow state until it is disabled and re-enabled. The range is 0 to 2,147,483,647 seconds.

6. Use **SPF DelayTime (secs)** to specify the number of seconds from when OSPF receives a topology change to the start of the next SPF calculation. Delay Time is an integer from 0 to 65535 seconds. The default time is 5 seconds. A value of 0 means that there is no delay; that is, the SPF calculation is started upon a topology change.

7. Use **SPF HoldTime (secs)** to specify the minimum time in seconds between two consecutive SPF calculations. The range is 0 to 65,535 seconds. The default time is 10 seconds. A value of 0 means that there is no delay; that is, two SPF calculations can be done, one immediately after the other.

8. Use **External LSDB Limit** to set the number of the external LSDB limit for OSPF. If the value is -1, then there is no limit. When the number of non-default AS-external-LSAs in a router's link-state database reaches the external LSDB limit, the router enters overflow state. The router never holds more than the external LSDB limit none-default AS-external-LSAs in database. The external LSDB limit MUST be set identically in all routers attached to the OSPF backbone and/or any regular OSPF area. The range for limit is -1 to 2147483647.
9. Use **Default Metric** to set a default for the metric of redistributed routes. This field is blank if a default metric has not been configured. The range of valid values is 1 to 16777214.

10. Use **Maximum Paths** to set the number of paths that OSPF can report for a given destination. The range of valid values is 1 to 4.

11. Use **AutoCost Reference Bandwidth** to configure the auto-cost reference-bandwidth to control how OSPF calculates link cost. Specify the reference bandwidth in megabits per second. Unless a link cost is configured, the link cost is computed by dividing the reference bandwidth by the interface bandwidth. The range is 1 to 4294967.

12. Use **Default Passive Setting** to configure the global passive mode setting for all OSPF interfaces. Configuring this field overwrites any present interface level passive mode setting. OSPF does not form adjacencies on passive interfaces, but does advertise attached networks as stub networks.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>

<tr>
<td>New LSAs Originated</td>
<td>In any given OSPF area, a router will originate several LSAs. Each router originates a router-LSA. If the router is also the Designated Router for any of the area's networks, it will originate network-LSAs for those networks. This value represents the number of LSAs originated by this router.</td>
</tr>
<tr>
<td>LSAs Received</td>
<td>The number of LSAs (link state advertisements) received that were determined to be new instantiations. This number does not include newer instantiations of self-originated LSAs.</td>
</tr>
</tbody>
</table>
Common Area Configuration

The OSPF Common Area Configuration page lets you create a Common Area Configuration once you have enabled OSPF on an interface. At least one router must have OSPF enabled for this web page to display.

To display the Common Area Configuration page, click Routing > OSPF > Advanced > Common Area Configuration.

To configure the OSPF area:

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32-bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging Interval</td>
<td>The Link State Advertisement (LSA) aging timer interval.</td>
</tr>
</tbody>
</table>
| External Routing       | A definition of the router's capabilities for the area, including whether or not AS-external-LSAs are flooded into/throughout the area. If the area is a stub area, then these are the possible options for which you may configure the external routing capability, otherwise the only option is "Import External LSAs":
  - Import External LSAs: Import and propagate external LSAs
  - Import No LSAs: Do not import and propagate external LSAs                                                                 |
| SPF Runs               | The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm. |
| Area Border Router Count | The total number of area border routers reachable within this area. This is initially zero, and is calculated in each SPF Pass.             |
| Area LSA Count         | The total number of link-state advertisements in this area's link-state database, excluding AS External LSAs.                                |
| Area LSA Checksum      | The 32-bit unsigned sum of the link-state advertisements' LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers. |
| Import Summary LSAs    | The summary LSAs will be enabled/disabled imported into this area.                                                                           |

Click **ADD** to configure the area as a common area.

Click **DELETE** to delete the common area.
**Stub Area Configuration**

To display the Stub Area Configuration page, click **Routing > OSPF > Advanced > Stub Area Configuration**.

To configure an OSPF stub area:

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32-bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.
2. Use **Import Summary LSAs** to select enable or disable. If you select enable, summary LSAs will be imported into stub areas.
3. Use **Default Cost** to enter the metric value you want applied for the default route advertised into the stub area. Valid values range from 1 to 16,777,215.
4. Click **ADD** to configure the area as a stub area.
5. Click **DELETE** to delete the stub area designation. The area will be returned to normal state.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPF Runs</td>
<td>The number of times that the intra-area route table has been calculated using this area's link-state database. This is typically done using Dijkstra's algorithm.</td>

</tr>
<tr>
<td>Type of Service</td>
<td>This field is the normal TOS associated with the stub metric.</td>
</tr>
</tbody>
</table>
NSSA Area Configuration

To display the NSSA Area Configuration page, click **Routing > OSPF > Advanced > NSSA Area Configuration**.

To configure an OSPF NSSA area:

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32-bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.

2. Use **Import Summary LSAs** to select enable or disable. If you select enable, summary LSAs will be imported into NSSA areas.

3. The **Default Information Originate** area displays the default Route Information. These options will permit a user to advertise a default route into the NSSA when Import Summary LSAs is disabled. They can also be applied by the CLI command `area (area-id) nssa default-info-originate` in the ip router OSPF config mode.
   - Use **Admin Mode** to enable or disable the default information originate. Valid values are True or False.
   - Use **Metric Value** to set the Default Metric value for default information originate. The valid range of values is 1 to 16777214.
   - Use **Metric Type** to select the type of metric specified in the Metric Value field:
     - **Comparable Cost** - External Type 1 metrics that are comparable to the OSPF metric
     - **Non-comparable Cost** - External Type 2 metrics that are assumed to be larger than the cost of the OSPF metric.

4. Use **Translate Role** to select the translator role of the NSSA:
   - **always** - Cause the router to assume the role of the translator the instant it becomes a border router.
   - **candidate** - Cause the router to participate in the translator election process when it attains border router status.

5. Use **Translate Stability Interval** to configure the translator of the NSSA. The value is the period of time that an elected translation continues to perform its duties after it determines that its translator status has been deposed by another router.

6. Use **No-Redistribute Mode** to configure the NSSA ABR so that learned external routes will not be redistributed to the NSSA.

7. Click **ADD** to configure the area as a NSSA area.

8. Click **DELETE** to delete the NSSA area designation. The area will be returned to normal state.
<table>

  - enabled: The NSSA border router's translator role has been set to always.  
  - elected: The candidate NSSA border router is translating type-7 LSAs into type-5.  
  - disabled: The candidate NSSA border router is NOT translating type-7 LSAs into type-5. |
Area Range Configuration

Use the OSPF Area Range Configuration page to configure and display an area range for a specified NSSA.

To display the Area Range Configuration page, click Routing > OSPF > Advanced > Area Range Configuration.

To configure an OSPF area range:

1. Use Area ID to specify the area for which data is to be configured.
2. Use IP address to enter the IP Address for the address range for the selected area.
3. Use Subnet Mask to enter the Subnet Mask for the address range for the selected area.
4. Use LSDB Type to select the type of Link Advertisement associated with the specified area and address range. The default type is ‘Network Summary’.
5. Use Advertise to select Enable or Disable. If you select Enable, the address range will be advertised outside the area via a Network Summary LSA. The default is Enable.
6. Click ADD to add the new address range to the switch.
7. Click DELETE to remove the specified address range from the area configuration.
**Interface Configuration**

Use the OSPF Interface Configuration page to configure an OSPF interface.

To display the Interface Configuration page, click **Routing > OSPF > Advanced > Interface Configuration**.

To configure an interface for OSPF:

1. Use the check boxes to the left of the **Interface** field to select each interface to configure. The same settings are applied to all selected interfaces.

2. Use **Area ID** to enter the 32-bit integer in dotted decimal format that uniquely identifies the OSPF area to which the selected router interface connects. If you assign an Area ID which does not exist, the area will be created with default values.
3. Use **Admin Mode** to select enable or disable. The default value is 'disable.' You can configure OSPF parameters without enabling OSPF Admin Mode, but they will have no effect until you enable Admin Mode. The following information will be displayed only if the Admin Mode is enabled: State, Designated Router, Backup Designated Router, Number of Link Events, LSA ACK Interval, and Metric Cost. For OSPF to be fully functional, you must enter a valid IP Address and Subnet Mask via the Interface IP Configuration page or through the CLI command `ip address <ipaddr> <subnet-mask>`.

   **Note:** *Once OSPF is initialized on the router, it will remain initialized until the router is reset.*

4. Use **Router Priority** to enter the OSPF priority for the selected interface. The priority of an interface is specified as an integer from 0 to 255. The default is 1, which is the highest router priority. A value of '0' indicates that the router is not eligible to become the designated router on this network.

5. Use **Retransmit Interval** to enter the OSPF retransmit interval for the specified interface. This is the number of seconds between link-state advertisements for adjacencies belonging to this router interface. This value is also used when retransmitting database descriptions and link-state request packets. Valid values range from 1 to 3600 seconds (1 hour). The default is 5 seconds.

6. Use **Hello Interval** to enter the OSPF hello interval for the specified interface in seconds. This parameter must be the same for all routers attached to a network. Valid values range from 1 to 65,535. The default is 10 seconds.

7. Use **Dead Interval** to enter the OSPF dead interval for the specified interface in seconds. This specifies how long a router will wait to see a neighbor router's Hello packets before declaring that the router is down. This parameter must be the same for all routers attached to a network. This value should a multiple of the Hello Interval, e.g., 4. Valid values range from 1 to 2147483647. The default is 40.

8. Use **Transit Delay Interval** to enter the OSPF Transit Delay for the specified interface. This specifies the estimated number of seconds it takes to transmit a link state update packet over the selected interface. Valid values range from 1 to 3600 seconds (1 hour). The default value is 1 second.

9. Use **MTU Ignore** to disable OSPF MTU mismatch detection on received database description packets. Default value is Disable (MTU mismatch detection is enabled).

10. Use **Passive Mode** to make an interface passive to prevent OSPF from forming an adjacency on an interface. OSPF advertises networks attached to passive interfaces as stub networks. Interfaces are not passive by default.

11. Use **Network Type** to set the OSPF network type on the interface to broadcast or point-to-point. OSPF only selects a designated router and originates network LSAs for broadcast networks. No more than two OSPF routers may be present on a point-to-point link. The default network type for Ethernet interfaces is broadcast.
12. Use **Authentication Type** to select an authentication type other than none. You can select the authentication type from the pull-down menu. The choices are:

- **None**: This is the initial interface state. If you select this option from the pull-down menu, no authentication protocols will be run.

- **Simple**: If you select 'Simple' you will be prompted to enter an authentication key. This key will be included, in the clear, in the OSPF header of all packets sent on the network. All routers on the network must be configured with the same key.

- **Encrypt**: If you select 'Encrypt' you will be prompted to enter both an authentication key and an authentication ID. Encryption uses the MD5 Message-Digest algorithm. All routers on the network must be configured with the same key and ID.

13. Use **Authentication Key** to enter the OSPF Authentication Key for the specified interface. If you do not choose to use authentication you will not be prompted to enter a key. If you choose 'simple' authentication you cannot use a key of more than eight octets. If you choose 'encrypt' the key may be up to 16 octets long. The key value will only be displayed if you are logged on with Read/Write privileges, otherwise it will be displayed as asterisks.

14. Use **Authentication Key ID** to enter the ID to be used for authentication. You will only be prompted to enter an ID when you select 'Encrypt' as the authentication type. The ID is a number between 0 and 255, inclusive.

15. Use **Metric Cost** to enter the link cost. OSPF uses this value in computing shortest paths. The range is from 1 to 65,535.

16. Click **APPLY** to update the switch with the configured settings.

17. Click **CANCEL** to abandon the changes.

<table>

</tr>
</tbody>
</table>
### Field | Description
--- | ---
**State** | The current state of the selected router interface. One of:
- **Down**: This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable. In this state, interface parameters will be set to their initial values. All interface timers will be disabled, and there will be no adjacencies associated with the interface.
- **Loopback**: In this state, the router's interface to the network is looped back either in hardware or software. The interface is unavailable for regular data traffic. However, it may still be desirable to gain information on the quality of this interface, either through sending ICMP pings to the interface or through something like a bit error test. For this reason, IP packets may still be addressed to an interface in Loopback state. To facilitate this, such interfaces are advertised in router-LSAs as single host routes, whose destination is the IP interface address.
- **Waiting**: The router is trying to determine the identity of the (Backup) Designated Router for the network by monitoring received Hello Packets. The router is not allowed to elect a Backup Designated Router or a Designated Router until it transitions out of Waiting state. This prevents unnecessary changes of (Backup) Designated Router.

**Designated Router** | This router is itself the Designated Router on the attached network. Adjacencies are established to all other routers attached to the network. The router must also originate a network-LSA for the network node. The network-LSA will contain links to all routers (including the Designated Router itself) attached to the network.

**Backup Designated Router** | This router is itself the Backup Designated Router on the attached network. It will be promoted to Designated Router if the present Designated Router fails. The router establishes adjacencies to all other routers attached to the network. The Backup Designated Router performs slightly different functions during the LSA flooding, as compared to the Designated Router.

**Other Designated Router** | The interface is connected to a broadcast on which other routers have been selected to be the Designated Router and Backup Designated Router either. The router attempts to form adjacencies to both the Designated Router and the Backup Designated Router.

**Designated Router** | The identity of the Designated Router for this network, in the view of the advertising router. The Designated Router is identified here by its router ID. The value 0.0.0.0 means that there is no Designated Router. This field is only displayed if the OSPF admin mode is enabled.

**Backup Designated Router** | The identity of the Backup Designated Router for this network, in the view of the advertising router. The Backup Designated Router is identified here by its router ID. Set to 0.0.0.0 if there is no Backup Designated Router.

**Number of Link Events** | This is the number of times the specified OSPF interface has changed its state.

**Local Link LSAs** | The number of opaque LSAs whose flooding scope is the link on this interface.

**Local Link LSA Checksum** | The sum of the checksums of local link LSAs for this link.
**OSPF Interface Statistics**

This screen displays statistics for the selected interface. The information will be displayed only if OSPF is enabled.

To display the OSPF Interface Statistics page, click **Routing > OSPF > Advanced > OSPF Interface Statistics**.

Click **REFRESH** to refresh the data on the screen to show the latest interface statistics.
Click **CLEAR** to clear all the statistics of the OSPF interface.
**OSPF Neighbor Table**

This screen displays the OSPF neighbor table list. When a particular neighbor ID is specified, detailed information about a neighbor is given. The information below will only be displayed if OSPF is enabled.

To display the OSPF Neighbor Table page, click **Routing > OSPF > Advanced > OSPF Neighbor Table**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the interface for which data is to be displayed or configured. Slot 0 is the base unit.</td>
</tr>
<tr>
<td>Router ID</td>
<td>A 32-bit integer in dotted decimal format representing the neighbor interface.</td>
</tr>
<tr>
<td>Neighbor IP Address</td>
<td>The IP address of the neighboring router's interface to the attached network. It is used as the destination IP address when protocol packets are sent as unicasts along this adjacency. Also used in router-LSAs as the Link ID for the attached network if the neighboring router is selected to be designated router. The Neighbor IP address is learned when Hello packets are received from the neighbor. For virtual links, the Neighbor IP address is learned during the routing table build process.</td>
</tr>
<tr>
<td>Area ID</td>
<td>The area ID of the OSPF area associated with the interface.</td>
</tr>
<tr>
<td>Options</td>
<td>An integer value that indicates the optional OSPF capabilities supported by the neighbor. The neighbor's optional OSPF capabilities are also listed in its Hello packets. This enables received Hello Packets to be rejected (i.e., neighbor relationships will not even start to form) if there is a mismatch in certain crucial OSPF capabilities.</td>
</tr>
<tr>
<td>Router Priority</td>
<td>The OSPF priority for the specified interface. The priority of an interface is a priority integer from 0 to 255. A value of '0' indicates that the router is not eligible to become the designated router on this network.</td>
</tr>
<tr>
<td>Neighbor Interface Index</td>
<td>A Unit/Slot/Port identifying the neighbor interface index.</td>
</tr>
</tbody>
</table>
**State**
The state of a neighbor can be the following:
- **Down** - This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor. On NBMA networks, Hello packets may still be sent to “Down” neighbors, although at a reduced frequency.
- **Attempt** - This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort should be made to contact the neighbor. This is done by sending the neighbor Hello packets at intervals of Hello Interval.
- **Init** - In this state, a Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (i.e., the router itself did not appear in the neighbor's Hello packet). All neighbors in this state (or greater) are listed in the Hello packets sent from the associated interface.
- **2-Way** - In this state, communication between the two routers is bidirectional. This has been assured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (Backup) Designated Router is selected from the set of neighbors in state 2-Way or greater.
- **Exchange Start** - This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial DD sequence number. Neighbor conversations in this state or greater are called adjacencies.
- **Exchange** - In this state the router is describing its entire link state database by sending Database Description packets to the neighbor. In this state, Link State Request Packets may also be sent asking for the neighbor's more recent LSAs. All adjacencies in Exchange state or greater are used by the flooding procedure. These adjacencies are fully capable of transmitting and receiving all types of OSPF routing protocol packets.
- **Loading** - In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.
- **Full** - In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.

**Events**
The number of times this neighbor relationship has changed state, or an error has occurred.

**Permanence**
This variable displays the status of the entry. 'dynamic' and 'permanent' refer to how the neighbor became known.

**Hellos Suppressed**
This indicates whether Hellos are being suppressed to the neighbor.

**Retransmission Queue Length**
An integer representing the current length of the retransmission queue of the specified neighbor router Id of the specified interface.

**Up Time**
Neighbor uptime; how long since the adjacency last reached the Full state.

**Dead Time**
The amount of time, in seconds, to wait before the router assumes the neighbor is unreachable.

Click **REFRESH** to show the latest DHCP bindings information.

Click **CLEAR** to clear all the neighbors in the table.
**Link State Database**

Use the OSPF Link State Database page to display OSPF link state information.

To display the Link State Database page, click **Routing > OSPF > Advanced > Link State Database**.

<table>

<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Checksum</td>
<td>The checksum is used to detect data corruption of an advertisement. This corruption can occur while an advertisement is being flooded, or while it is being held in a router's memory. This field is the checksum of the complete contents of the advertisement, except the LS age field.</td>
</tr>
</tbody>
</table>
| Options         | The Options field in the link state advertisement header indicates which optional capabilities are associated with the advertisement. The options are:  
• Q: This enables support for QoS Traffic Engineering.  
• E: This describes the way AS-external-LSAs are flooded.  
• MC: This describes the way IP multicast datagrams are forwarded according to the standard specifications.  
• O: This describes whether Opaque-LSAs are supported.  
• V: This describes whether OSPF++ extensions for VPN/COS are supported. |

Checksum: The checksum is used to detect data corruption of an advertisement. This corruption can occur while an advertisement is being flooded, or while it is being held in a router's memory. This field is the checksum of the complete contents of the advertisement, except the LS age field.

Options: The Options field in the link state advertisement header indicates which optional capabilities are associated with the advertisement. The options are:
• Q: This enables support for QoS Traffic Engineering.
• E: This describes the way AS-external-LSAs are flooded.
• MC: This describes the way IP multicast datagrams are forwarded according to the standard specifications.
• O: This describes whether Opaque-LSAs are supported.
• V: This describes whether OSPF++ extensions for VPN/COS are supported.

To configure an OSPF virtual link:

1. Use **Area ID** to enter the area ID of the OSPF area. Virtual links may be configured between any pair of area border routers having interfaces to a common (non-backbone) area.
2. Use **Neighbor Router ID** to enter the neighbor portion of a Virtual Link specification. Virtual links may be configured between any pair of area border routers having interfaces to a common (non-backbone) area.
3. Use **Hello Interval** to enter the OSPF hello interval for the specified interface in seconds. This parameter must be the same for all routers attached to a network. Valid values range from 1 to 65,535. The default is 10 seconds.

4. Use **Dead Interval** to enter the OSPF dead interval for the specified interface in seconds. This specifies how long a router will wait to see a neighbor router's Hello packets before declaring that the router is down. This parameter must be the same for all routers attached to a network. This value should a multiple of the Hello Interval, e.g., 4. Valid values range from 1 to 2147483647. The default is 40.

5. Use **Iftransit Delay Interval** to enter the OSPF Transit Delay for the specified interface. This specifies the estimated number of seconds it takes to transmit a link state update packet over the selected interface. Valid values range from 1 to 3600 seconds (1 hour). The default value is 1 second.

6. Use **Retransmit interval** to enter the OSPF retransmit interval for the specified interface. This is the number of seconds between link-state advertisements for adjacencies belonging to this router interface. This value is also used when retransmitting database descriptions and link-state request packets. Valid values range from 1 to 3600 seconds (1 hour). The default is 5 seconds.

7. Use **Authentication Type** to select an authentication type other than none by clicking on the 'Configure Authentication' button. You will then see a new screen, where you can select the authentication type from the pull-down menu. The choices are:
   - **None** - This is the initial interface state. If you select this option from the pull-down menu on the second screen you will be returned to the first screen.
   - **Simple** - If you select 'Simple' you will be prompted to enter an authentication key. This key will be included, in the clear, in the OSPF header of all packets sent on the network. All routers on the network must be configured with the same key.
   - **Encrypt** - If you select 'Encrypt' you will be prompted to enter both an authentication key and an authentication ID. Encryption uses the MD5 Message-Digest algorithm. All routers on the network must be configured with the same key and ID.

8. Use **Authentication Key** to enter the OSPF Authentication Key for the specified interface. If you do not choose to use authentication you will not be prompted to enter a key. If you choose 'simple' authentication you cannot use a key of more than eight octets. If you choose 'encrypt' the key may be up to 16 octets long. The key value will only be displayed if you are logged on with Read/Write privileges, otherwise it will be displayed as asterisks.

9. Use **Authentication ID** to enter the ID to be used for authentication. You will only be prompted to enter an ID when you select 'Encrypt' as the authentication type. The ID is a number between 0 and 255, inclusive.

10. Click **ADD** to add a new virtual link to the switch.

11. Click **DELETE** to remove the specified virtual link from the switch configuration.
Field | Description
---|---
Neighbor State | The OSPF interface state, it can be these values:
• Down: This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable. In this state, interface parameters will be set to their initial values. All interface timers will be disabled, and there will be no adjacencies associated with the interface.
• Waiting: The router is trying to determine the identity of the (Backup) Designated Router by monitoring received Hello Packets. The router is not allowed to elect a Backup Designated Router or a Designated Router until it transitions out of Waiting state. This prevents unnecessary changes of (Backup) Designated Router.
• Point-to-Point: The interface is operational, and is connected either to the virtual link. On entering this state the router attempts to form an adjacency with the neighboring router. Hello Packets are sent to the neighbor every HelloInterval seconds.
• Designated Router: This router is itself the Designated Router on the attached network. Adjacencies are established to all other routers attached to the network. The router must also originate a network-LSA for the network node. The network-LSA will contain links to all routers (including the Designated Router itself) attached to the network.
• Backup Designated Router: This router is itself the Backup Designated Router on the attached network. It will be promoted to Designated Router if the present Designated Router fails. The router establishes adjacencies to all other routers attached to the network. The Backup Designated Router performs slightly different functions during the Flooding Procedure, as compared to the Designated Router.
• Other Designated Router: The interface is connected to a broadcast or NBMA network on which other routers have been selected to be the Designated Router and Backup Designated Router either. The router attempts to form adjacencies to both the Designated Router and the Backup Designated Router.

Neighbor State | The state of the Virtual Neighbor Relationship.
**Route Redistribution**

This screen can be used to configure the OSPF Route Redistribution parameters. The allowable values for each fields are displayed next to the field. If any invalid values are entered, an alert message will be displayed with the list of all the valid values.

To display the Route Redistribution page, click **Routing > OSPF > Advanced > Route Redistribution**.

The table below shows the configuration options for OSPF route redistribution:

<table>
<thead>
<tr>
<th>Source</th>
<th>Redistribute Option</th>
<th>Metric</th>
<th>Metric Type</th>
<th>Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connected</td>
<td>Disable</td>
<td>0</td>
<td>External Type 2</td>
<td>0</td>
</tr>
<tr>
<td>Static</td>
<td>Disable</td>
<td>0</td>
<td>External Type 2</td>
<td>0</td>
</tr>
</tbody>
</table>

To configure OSPF route redistribution:

1. Use **Source** to list available source routes that have not previously been configured for redistribution by OSPF. The valid values are 'Static', 'Connected', and 'RIP'.
2. Use **Redistribute Option** to enable or disable the redistribution for the selected source protocol.
3. Use **Metric** to set the metric value to be used as the metric of redistributed routes. This field displays the metric if the source was pre-configured and can be modified. The valid values are 0 to 16777214.
4. Use **Metric Type** to set the OSPF metric type of redistributed routes.
5. Use **Tag** to set the tag field in routes redistributed. This field displays the tag if the source was pre-configured, otherwise 0 and can be modified. The valid values are 0 to 4294967295.
6. Use **Subnets** to set whether the subnetted routes should be redistributed.
7. Use **Distribute List** to set the Access List that filters the routes to be redistributed by the destination protocol. Only permitted routes are redistributed. If this command refers to a non-existent access list, all routes are permitted. The valid values for Access List IDs are 1 to 199.

When used for route filtering, the only fields in an access list that get used are:

- Source IP Address and netmask
- Destination IP Address and netmask
- Action (permit or deny)

All other fields (source and destination port, precedence, ToS, and so on) are ignored.
**NSF OSPF Summary**

Use the NSF OSPF Configuration page to configure the non-stop forwarding (NSF) support mode and to view NSF summary information for the OSPF feature. NSF is a feature used in switch stacks to maintain switching and routing functions in the event of a stack unit failure. For information about NSF, see *Nonstop Forwarding* on page 71.

To display the page, click **Routing > OSPF > Advanced > NSF OSPF Summary**.

To configure NSF settings for OSPF:

1. Use **Support Mode** to configure the administrative mode of NSF for the OSPF feature.
2. Use **Restart Interval** to configure the length of the grace period on the restarting router. The value you specify is the number of seconds that the restarting router asks its neighbors to wait before exiting helper mode. The restarting router includes the restart interval in its grace LSAs. The valid range is 1–1800 seconds, and the default value is 120 seconds.
3. Click **APPLY** to update the switch with the changes.
4. Click **REFRESH** to update the screen with the most recent information.
5. Click **CANCEL** to abandon the changes.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
OSPFv3

OSPFv3 is the Open Shortest Path First routing protocol for IPv6. It is similar to OSPFv2 in its concept of a link state database, intra/inter area, and AS external routes and virtual links. It differs from its IPv4 counterpart in a number of respects, including the following: peering is done via link-local addresses; the protocol is link-based rather than network-based; and addressing semantics have been moved to leaf LSAs, which eventually allow its use for both IPv4 and IPv6. Point-to-point links are also supported in order to enable operation over tunnels.

It is possible to enable OSPF and OSPFv3 at the same time. OSPF works with IPv4 and OSPFv3 works with IPv6.

From the OSPF link, you can access the following pages:

- **Basic** on page 257
- **Advanced** on page 258

Basic

From the Basic link, you can access the following pages:

- **OSPFv3 Configuration** on page 257

OSPFv3 Configuration

Use the OSPFv3 Configuration page to activate and configure OSPFv3 for a switch.

To display the OSPFv3 Configuration page, click **Routing > OSPFv3 > Basic > OSPFv3 Configuration**.

To configure global OSPFv3 settings:

1. Use **Admin Mode** to select enable or disable. If you select enable, OSPFv3 will be activated for the switch. The default value is disable. You must configure a Router ID before OSPFv3 can become operational. This can also be done by issuing the CLI command **router-id**, in the IPv6 router OSPF mode.

2. Use **Router ID** to specify the 32-bit integer in dotted decimal format that uniquely identifies the router within the autonomous system (AS). If you want to change the Router ID you must first disable OSPFv3. After you set the new Router ID, you must re-enable OSPFv3 to have the change take effect. The default value is 0.0.0.0, although this is not a valid Router ID.
ProSafe M5300 Switch

Note: *Once OSPFv3 is initialized on the router, it will remain initialized until the router is reset.

3. Click APPLY to update the switch with the changes.
4. Click CANCEL to abandon the changes.

Advanced

From the Advanced link, you can access the following pages:

- OSPFv3 Configuration on page 259
- Common Area Configuration on page 262
- Stub Area Configuration on page 263
- NSSA Area Configuration on page 264
- Area Range Configuration on page 265
- Interface Configuration on page 266
- Interface Statistics on page 269
- Neighbor Table on page 272
- Link State Database on page 273
- Virtual Link Configuration on page 275
- Route Redistribution on page 277
- NSF OSPFv3 Summary on page 278
**Routing**

ProSafe M5300 Switch

**OSPFv3 Configuration**

Use the OSPFv3 Configuration page to activate and configure OSPFv3 for a switch.

To display the OSPFv3 Configuration page, click **Routing > OSPFv3 > Advanced > OSPFv3 Configuration**.

![OSPFv3 Configuration](image)

**Default Route Advertise**

1. Use **Default Information Originate** to enable or disable Default Route Advertise. Note that the values for 'Always', 'Metric' and 'Metric Type' can only be configured after Default Information Originate is set to enable. If Default Information Originate is set to enable and values for 'Always', 'Metric' and 'Metric Type' are already configured, then setting Default Information Originate back to disable will set the 'Always', 'Metric' and 'Metric Type' values to default.

2. Use **Always** to set the router advertise when set to "True".

3. Use **Metric** to specify the metric of the default route. The valid values are 0 to 16777214.

4. Use **Metric Type** to set the metric type of the default route. Valid values are External Type 1 and External Type 2.
OSPFv3 Configuration

1. Use *Router ID* to specify the 32-bit integer in dotted decimal format that uniquely identifies the router within the autonomous system (AS). If you want to change the Router ID you must first disable OSPFv3. After you set the new Router ID, you must re-enable OSPFv3 to have the change take effect. The default value is 0.0.0.0, although this is not a valid Router ID.

2. Use *Admin Mode* to select enable or disable. If you select enable, OSPFv3 will be activated for the switch. The default value is enable. You must configure a Router ID before OSPFv3 can become operational. This can also be done by issuing the CLI command `router-id`, in the IPv6 router OSPF mode.

   **Note:** *Once OSPFv3 is initialized on the router, it will remain initialized until the router is reset.*

3. Use *Exit Overflow Interval* to enter the number of seconds that, after entering overflow state, the router should wait before attempting to leave overflow state. This allows the router to again originate non-default AS-external-LSAs. If you enter 0, the router will not leave Overflow State until restarted. The range is 0 to 2147483647 seconds.

4. Use *External LSDB Limit* to specify the maximum number of AS-External-LSAs that can be stored in the database. A value of -1 implies there is no limit on the number that can be saved. The valid range of values is -1 to 2147483647.

5. Use *Default Metric* to set a default for the metric of redistributed routes. This field displays the default metric if one has already been set or blank if not configured earlier. The valid values are 1 to 16777214.

6. Use *Maximum Paths* to configure the maximum number of paths that OSPFv3 can report to a given destination. The valid values are 1 to 4.

7. Use *AutoCost Reference Bandwidth* to configure the auto-cost reference-bandwidth to control how OSPF calculates default metrics for the interface. The valid values are 1 to 4294967.

8. Use *Default Passive Setting* to configure the global passive mode setting for all OSPF interfaces. Configuring this field overwrites any present interface level passive mode setting. OSPF does not form adjacencies on passive interfaces, but does advertise attached networks as stub networks.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASBR Mode</td>
<td>Reflects whether the ASBR mode is enabled or disabled. Enable implies that the router is an autonomous system border router. Router automatically becomes an ASBR when it is configured to redistribute routes learnt from other protocol.</td>
</tr>
<tr>
<td>ABR Status</td>
<td>The values of this are enabled or disabled. Enabled implies that the router is an area border router. Disabled implies that it is not an area border router.</td>
</tr>
<tr>
<td>External LSA Count</td>
<td>The number of external (LS type 5) LSAs (link state advertisements) in the link state database.</td>
</tr>
<tr>
<td>External LSA Checksum</td>
<td>The sum of the LS checksums of the external LSAs (link state advertisements) contained in the link-state database. This sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state databases of two routers.</td>
</tr>
<tr>
<td>New LSAs Originated</td>
<td>In any given OSPFv3 area, a router will originate several LSAs. Each router originates a router-LSA. If the router is also the Designated Router for any of the area's networks, it will originate network-LSAs for those networks. This value represents the number of LSAs originated by this router.</td>
</tr>
<tr>
<td>LSAs Received</td>
<td>The number of LSAs (link state advertisements) received that were determined to be new instantiations. This number does not include newer instantiations of self-originated LSAs.</td>
</tr>
</tbody>
</table>
Common Area Configuration
Use the Common Area Configuration page to create and configure an OSPFv3 area.

To display the Common Area Configuration page, click **Routing > OSPFv3 > Advanced > Common Area Configuration**.

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32 bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.
2. Click **ADD** to configure the area as a common area.
3. Click **DELETE** to delete the common area.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Routing</td>
<td>A definition of the router's capabilities for the area, including whether or not AS-external-LSAs are flooded into/throughout the area.</td>
</tr>
<tr>
<td>SPF Runs</td>
<td>The number of times that the intra-area route table has been calculated using this area's link-state database. This is done using Dijkstra's algorithm.</td>
</tr>
<tr>
<td>Area Border Router Count</td>
<td>The total number of area border routers reachable within this area. This is initially zero, and is calculated in each SPF Pass.</td>
</tr>
<tr>
<td>Area LSA Count</td>
<td>The total number of link-state advertisements in this area's link-state database, excluding AS External LSAs.</td>
</tr>
<tr>
<td>Area LSA Checksum</td>
<td>The 32-bit unsigned sum of the link-state advertisements' LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.</td>
</tr>
<tr>
<td>Import Summary LSAs</td>
<td>The summary LSAs will be enabled/disabled imported into this area.</td>
</tr>
</tbody>
</table>
**Stub Area Configuration**

To display the Stub Area Configuration page, click **Routing > OSPFv3 > Advanced > Stub Area Configuration**.

To configure an OSPFv3 stub area:

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32 bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.
2. Use **Import Summary LSAs** to select enable or disable. If you select enable, summary LSAs will be imported into areas. Defaults to Enable.
3. Use **Default Cost** to enter the metric value you want applied for the default route advertised into the stub area. Valid values range from 1 to 16,777,215. This value is applicable only to Stub areas.
4. Click **ADD** to configure the area as a stub area.
5. Click **DELETE** to delete the stub area designation. The area will be returned to normal state.

<table>
<thead>

### NSSA Area Configuration

To display the NSSA Area Configuration page, click **Routing > OSPFv3 > Advanced > NSSA Area Configuration**.

1. Use **Area ID** to enter the OSPF area ID. An Area ID is a 32-bit integer in dotted decimal format that uniquely identifies the area to which a router interface connects.

2. Use **Import Summary LSAs** to select enable or disable. If you select enable summary LSAs will be imported into areas. Defaults to Enable.

3. Use **Default Information Originate** to advertise a default route into the NSSA when Import Summary LSAs is disabled. This can also be applied by the CLI command `area <areaid> nssa default-info-originate` in the IPv6 router OSPF config mode.

4. Use **Admin Mode** to enable or disable the default information originate. Valid values are True or False.

5. Use **Metric Value** to set the Default Metric value for default information originate. The valid range of values is 1 to 16777214.

6. Use **Metric Type** to select the type of metric specified in the Metric Value field.
   - **Comparable Cost** - External Type 1 metrics that are comparable to the OSPFv3 metric
   - **Non-comparable Cost** - External Type 2 metrics that are assumed to be larger than the cost of the OSPFv3 metric

7. Use **Translator Role** to specify the NSSA Border router's ability to perform NSSA translation of type-7 LSAs into type-5 LSAs. The valid values are 'Always' and 'Candidate'.

8. Use **Translator Stability Interval** to specify the number of seconds after an elected translator determines its services are no longer required, that it should continue to perform its translation duties. The valid range of values is 0 to 3600.

9. Use **No-Redistribute Mode** to enable or disable the No-Redistribute Mode.

10. Click **ADD** to configure the area as a NSSA area.

11. Click **DELETE** to delete the NSSA area designation. The area will be returned to normal state.

<table>

<td>The 32-bit unsigned sum of the link-state advertisements' LS checksums contained in this area's link-state database. This sum excludes external (LS type 5) link-state advertisements. The sum can be used to determine if there has been a change in a router's link state database, and to compare the link-state database of two routers.</td>
</tr>
<tr>
<td>Translator State</td>
<td>Translator State 'Enabled' means that the NSSA router OSPFv3 Area NssA Translator Role has been set to always. Translator State of 'Elected' means a candidate NSSA Border router is translating type-7 LSAs into type-5.' Disabled' implies that a candidate NSSA Border router is NOT translating type-7 LSAs into type-5.</td>
</tr>
</tbody>
</table>

**Area Range Configuration**

Use the Area Range Configuration page to configure OSPFv3 area ranges.

To display the Area Range Configuration page, click Routing > OSPFv3 > Advanced > Area Range Configuration.

1. Use **Area ID** to specify the area for which data is to be configured.
2. Use **IPv6 Prefix** to enter the IPv6 Prefix/Prefix Length for the address range for the selected area.
3. Use **LSDB Type** to select the type of Link Advertisement associated with the specified area and address range. The default type is ‘Network Summary’.
4. Use **Advertise** to select Enable or Disable. If you select Enable, the address range will be advertised outside the area via a Network Summary LSA. The default is Enable.
5. Click **ADD** to add the new address range to the switch.
6. Click **DELETE** to remove the specified address range from the area configuration.
Interface Configuration
Use the OSPFv3 Interface Configuration page to create and configure OSPFv3 interfaces.

To display the Interface Configuration page, click Routing > OSPFv3 > Advanced > Interface Configuration.

To configure an interface for OSPFv3 routing:

1. Interface - The interface for which data is to be displayed or configured.
2. Use Area ID to enter the 32-bit integer in dotted decimal format that uniquely identifies the OSPFv3 area to which the selected router interface connects. If you assign an Area ID which does not exist, the area will be created with default values.
3. Use Admin Mode* to select enable or disable. The default value is 'disable.' You can configure OSPFv3 parameters without enabling OSPFv3 Admin Mode, but they will have no effect until you enable Admin Mode. The following information will be displayed only if the Admin Mode is enabled: State, Designated Router, Backup Designated Router, Number of Link Events, LSA ACK Interval, and Metric Cost. For OSPFv3 to be fully functional, the interface must have a valid IPv6 Prefix/Prefix Length. This can be done through the CLI using the IPv6 address command in the interface configuration mode.

**Note:** *Once OSPFv3 is initialized on the router, it will remain initialized until the router is reset.*
4. Use **Router Priority** to enter the OSPFv3 priority for the selected interface. The priority of an interface is specified as an integer from 0 to 255. The default is 1, which is the highest router priority. A value of '0' indicates that the router is not eligible to become the designated router on this network.

5. Use **Retransmit Interval** to enter the OSPFv3 retransmit interval for the specified interface. This is the number of seconds between link-state advertisements for adjacencies belonging to this router interface. This value is also used when retransmitting database descriptions and link-state request packets. Valid values range from 0 to 3600 seconds (1 hour). The default is 5 seconds.

6. Use **Hello Interval** to enter the OSPFv3 hello interval for the specified interface in seconds. This parameter must be the same for all routers attached to a network. Valid values range from 1 to 65,535. The default is 10 seconds.

7. Use **Dead Interval** to enter the OSPFv3 dead interval for the specified interface in seconds. This specifies how long a router will wait to see a neighbor router's Hello packets before declaring that the router is down. This parameter must be the same for all routers attached to a network. This value should a multiple of the Hello Interval (e.g. 4). Valid values range from 1 to 65535. The default is 40.

8. Use **Transit Delay Interval** to enter the OSPFv3 Transit Delay for the specified interface. This specifies the estimated number of seconds it takes to transmit a link state update packet over the selected interface. Valid values range from 1 to 3600 seconds (1 hour). The default value is 1 second.

9. Use **MTU Ignore** to disable OSPFv3 MTU mismatch detection on receiving packets. Default value is Disable.

10. Use **Passive Mode** to make an interface passive to prevent OSPF from forming an adjacency on an interface. OSPF advertises networks attached to passive interfaces as stub networks. Interfaces are not passive by default.

11. Use **Interface Type** to set the interface type to broadcast mode or point to point mode. The default interface type is broadcast.

12. Use **Metric Cost** to enter the value on this interface for the cost TOS (type of service). The range for the metric cost is between 1 and 65,535. Metric Cost is only configurable if OSPFv3 is initialized on the interface.
### Field | Description
--- | ---
IPv6 Address | The IPv6 address of the interface.
LSA Ack Interval | The number of seconds between LSA Acknowledgment packet transmissions, which must be less than the Retransmit Interval.
State | The current state of the selected router interface. One of:
  - **Down**: This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable. In this state, interface parameters will be set to their initial values. All interface timers will be disabled, and there will be no adjacencies associated with the interface.
  - **Loopback**: In this state, the router’s interface to the network is looped back either in hardware or software. The interface is unavailable for regular data traffic. However, it may still be desirable to gain information on the quality of this interface, either through sending ICMP pings to the interface or through something like a bit error test. For this reason, IP packets may still be addressed to an interface in Loopback state. To facilitate this, such interfaces are advertised in router-LSAs as single host routes, whose destination is the IP interface address.
  - **Waiting**: The router is trying to determine the identity of the (Backup) Designated Router for the network by monitoring received Hello Packets. The router is not allowed to elect a Backup Designated Router or a Designated Router until it transitions out of Waiting state. This prevents unnecessary changes of (Backup) Designated Router.
  - **Designated Router**: This router is itself the Designated Router on the attached network. Adjacencies are established to all other routers attached to the network. The router must also originate a network-LSA for the network node. The network-LSA will contain links to all routers (including the Designated Router itself) attached to the network.
  - **Backup Designated Router**: This router is itself the Backup Designated Router on the attached network. It will be promoted to Designated Router if the present Designated Router fails. The router establishes adjacencies to all other routers attached to the network. The Backup Designated Router performs slightly different functions during the Flooding Procedure, as compared to the Designated Router.
  - **Other Designated Router**: The interface is connected to a broadcast or NBMA network on which other routers have been selected to be the Designated Router and Backup Designated Router either. The router attempts to form adjacencies to both the Designated Router and the Backup Designated Router.

The State is only displayed if the OSPFv3 admin mode is enabled.

Designated Router | The identity of the Designated Router for this network, in the view of the advertising router. The Designated Router is identified here by its router ID. The value 0.0.0.0 means that there is no Designated Router. This field is only displayed if the OSPFv3 admin mode is enabled.
ProSafe M5300 Switch

1. Click **REFRESH** to refresh the page with the latest OSPFv3 neighbor information for the selected interface.
2. Click **CLEAR** to clear all the neighbor in the table.
Link State Database

Use the OSPFv3 Link State Database page to display the link state database.

To display the Link State Database page, click Routing > OSPFv3 > Advanced > Link State Database.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router ID</td>
<td>The 32 bit integer in dotted decimal format that uniquely identifies the router within the autonomous system (AS). The Router ID is set on the OSPFv3 Configuration page. If you want to change the Router ID you must first disable OSPFv3. After you set the new Router ID, you must re-enable OSPFv3 to have the change take effect. The default value is 0.0.0.0, although this is not a valid Router ID.</td>
</tr>
<tr>
<td>Area ID</td>
<td>The ID of an OSPFv3 area to which one of the router interfaces is connected. An Area ID is a 32 bit integer in dotted decimal format that uniquely identifies the area to which an interface is connected.</td>
</tr>
<tr>
<td>LSA Type</td>
<td>The format and function of the link state advertisement. One of the following:</td>
</tr>
<tr>
<td></td>
<td>• Router LSA: A router may originate one or more router-lsas for a given area. Each router-lsa originated in an area describes the collected states of all the router's interfaces to the area.</td>
</tr>
<tr>
<td></td>
<td>• Network LSA: A network lsa is originated for every link having two or more attached routers, by the designated router. It lists all the routers attached to the link.</td>
</tr>
<tr>
<td></td>
<td>• Inter-Area Router LSA: This type describes a prefix external to the area, yet internal to the autonomous system. It is originated by an Area Border Router.</td>
</tr>
<tr>
<td></td>
<td>• AS-External LSA: This LSA type describes a path to a prefix external to the autonomous system and is originated by an Autonomous System Border Router.</td>
</tr>
<tr>
<td></td>
<td>• Link LSA: A router originates a separate Link-lsa for each attached link. It provides router's link local address to routers attached to the link and also inform them of a list of IPv6 prefixes to associate with the link.</td>
</tr>
<tr>
<td></td>
<td>• Intra-Area-Prefix LSA: A link's designated router originates one or more intra-area prefix Isas to advertise the link's prefixes throughout the area. A router may originate multiple intra-area-prefix Isas for a given area to advertise its own prefixes and those of its attached stub links.</td>
</tr>
<tr>
<td>LS ID</td>
<td>The Link State ID identifies the piece of the routing domain that is being described by the advertisement. The value of the LS ID depends on the advertisement's LS type.</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
Age | The time since the link state advertisement was first originated, in seconds.
Sequence | The sequence number field is a signed 32-bit integer. It is used to detect old and duplicate link state advertisements. The larger the sequence number, the more recent the advertisement.
Checksum | The checksum is used to detect data corruption of an advertisement. This corruption can occur while an advertisement is being flooded, or while it is being held in a router's memory. This field is the checksum of the complete contents of the advertisement, except the LS age field.
Options | The Options field in the link state advertisement header indicates which optional capabilities are associated with the advertisement. The options are:
  - Q: This enables support for QoS Traffic Engineering.
  - E: This describes the way AS-external-LSAs are flooded.
  - MC: This describes the way IP multicast datagrams are forwarded according to the standard specifications.
  - O: This describes whether Opaque-LSAs are supported.
  - V: This describes whether OSPF++ extensions for VPN/COS are supported.
Router Options | The router specific options.

Click **REFRESH** to show the latest OSPFv3 Link State information.
Virtual Link Configuration

Use the Virtual Link Configuration page to define a new or configure an existing virtual link. To display this page, a valid OSPFv3 area must be defined via the OSPFv3 Area Configuration page.

To display the Virtual Link Configuration page, click Routing > OSPFv3 > Advanced > Virtual Link Configuration.

1. Use Area ID to specify the Area ID portion of the virtual link identification for which data is to be displayed. The Area ID and Neighbor Router ID together define the virtual link.
2. Use Neighbor Router ID to specify the neighbor portion of the virtual link identification. Virtual links may be configured between any pair of area border routers having interfaces to a common (non-backbone) area.
3. Use Hello Interval to specify the OSPFv3 hello interval for the specified interface in seconds. This parameter must be the same for all routers attached to a network. Valid values range from 1 to 65,535. The default is 10 seconds.
4. Use Dead Interval to specify the OSPFv3 dead interval for the specified interface in seconds. This specifies how long a router will wait to see a neighbor router's Hello packets before declaring that the router is down. This parameter must be the same for all routers attached to a network. This value should be a multiple of the Hello Interval (e.g. 4). Valid values range from 1 to 65535. The default is 40.
5. Use Iftransit Delay Interval to specify the OSPFv3 Transit Delay for the specified interface. This specifies the estimated number of seconds it takes to transmit a link state update packet over the selected interface. Valid values range from 1 to 3600 seconds (1 hour). The default value is 1 second.
6. Use Retransmit Interval to specify the OSPFv3 retransmit interval for the specified interface. This is the number of seconds between link-state advertisements for adjacencies belonging to this router interface. This value is also used when retransmitting database descriptions and link-state request packets. Valid values range from 1 to 3600 seconds (1 hour). The default is 5 seconds.
7. Click ADD to add a new virtual link to the switch.
8. Click DELETE to remove the specified virtual link from the switch configuration.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor State</td>
<td>The state of the Virtual Neighbor Relationship.</td>
</tr>
</tbody>
</table>
| State       | The state of the interface:  
  - Down: This is the initial interface state. In this state, the lower-level protocols have indicated that the interface is unusable. In this state, interface parameters will be set to their initial values. All interface timers will be disabled, and there will be no adjacencies associated with the interface.  
  - Waiting: The router is trying to determine the identity of the (Backup) Designated Router by monitoring received Hello Packets. The router is not allowed to elect a Backup Designated Router or a Designated Router until it transitions out of Waiting state. This prevents unnecessary changes of (Backup) Designated Router.  
  - Point-to-Point: The interface is operational, and is connected either to the virtual link. On entering this state the router attempts to form an adjacency with the neighboring router. Hello Packets are sent to the neighbor every HelloInterval seconds.  
  - Designated Router: This router is itself the Designated Router on the attached network. Adjacencies are established to all other routers attached to the network. The router must also originate a network-LSA for the network node. The network-LSA will contain links to all routers (including the Designated Router itself) attached to the network.  
  - Backup Designated Router: This router is itself the Backup Designated Router on the attached network. It will be promoted to Designated Router if the present Designated Router fails. The router establishes adjacencies to all other routers attached to the network. The Backup Designated Router performs slightly different functions during the Flooding Procedure, as compared to the Designated Router.  
  - Other Designated Router: The interface is connected to a broadcast or NBMA network on which other routers have been selected to be the Designated Router and Backup Designated Router either. The router attempts to form adjacencies to both the Designated Router and the Backup Designated Router. |
| Metric      | The metric value used by the Virtual Link. |
**Route Redistribution**

This screen can be used to configure the OSPFv3 Route Redistribution parameters. The allowable range for each field is displayed next to it. If an invalid value is entered in one or multiple fields, an alert message will be displayed with the list of all the valid values.

To display the Route Redistribution page, click **Routing > OSPFv3 > Advanced > Route Redistribution**.

1. Use **Source** to select those Source Protocols that have already been configured for redistribution by OSPFv3. The valid values are 'Static' and 'Connected'.
2. Use **Redistribute Option** to enable or disable the redistribution for the selected source protocol.
3. Use **Metric** to set the metric value to be used as the metric of redistributed routes. This field displays the metric if the source was pre-configured and can be modified. The valid values are 0 to 16777214.
4. Use **Metric Type** to set the OSPFv3 metric type of redistributed routes.
5. Use **Tag** to set the tag field in routes redistributed. This field displays the tag if the source was pre-configured, else a default tag value of 0 is displayed. The valid values are 0 to 4294967295.
NSF OSPFv3 Summary

Use the NSF OSPFv3 Summary page to configure the non-stop forwarding (NSF) support mode and to view NSF summary information for the OSPF feature. NSF is a feature used in switch stacks to maintain switching and routing functions in the event of a stack unit failure. For information about NSF, see Nonstop Forwarding on page 71.

To display the page, click To display the Route Redistribution page, click Routing > OSPFv3> Advanced > NSF OSPFv3 Summary.

To configure NSF settings for OSPFv3:

1. Use Support Mode to configure the administrative mode of NSF for the OSPF feature.
2. Use Restart Interval to configure the length of the grace period on the restarting router. The value you specify is the number of seconds that the restarting router asks its neighbors to wait before exiting helper mode. The restarting router includes the restart interval in its grace LSAs. The valid range 1–1800 seconds, and the default value is 120 seconds.
3. Click APPLY to update the switch with the changes.
4. Click REFRESH to update the screen with the most recent information.
5. Click CANCEL to abandon the changes.

Router Discovery

The Router Discovery protocol is used by hosts to identify operational routers on the subnet. Router Discovery messages are of two types: Router Advertisements and Router Solicitations. The protocol mandates that every router periodically advertise the IP Addresses it is associated with. Hosts listen for these advertisements and discover the IP Addresses of neighboring routers.

From the Router Discovery tab, you can access the following pages:

- **Router Discovery Configuration** on page 279

Router Discovery Configuration

Use the Router Discovery Configuration page to enter or change Router Discovery parameters.

To display the Router Discovery Configuration page, click Routing > Router Discovery > Router Discovery Configuration.

To configure router discovery settings:

1. Use **Interface** to select the router interface for which data is to be configured.
2. Use **Advertise Mode** to select enable or disable. If you select enable, Router Advertisements will be transmitted from the selected interface.
3. Use **Advertise Address** to enter the IP Address to be used to advertise the router.
4. Use **Maximum Advertise Interval** to enter the maximum time (in seconds) allowed between router advertisements sent from the interface.
5. Use **Minimum Advertise Interval** to enter the minimum time (in seconds) allowed between router advertisements sent from the interface.
6. Use **Advertise Lifetime** to enter the value (in seconds) to be used as the lifetime field in router advertisements sent from the interface. This is the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts.
7. Use **Preference Level** to specify the preference level of the router as a default router relative to other routers on the same subnet. Higher numbered addresses are preferred. You must enter an integer.
VRRP

The Virtual Router Redundancy protocol is designed to handle default router failures by providing a scheme to dynamically elect a backup router. The driving force was to minimize “black hole” periods due to the failure of the default gateway router during which all traffic directed towards it is lost until the failure is detected. Though static configuration of default routes is popular, such an approach is susceptible to a single point of failure when the default router fails. VRRP advocates the concept of a “virtual router” associated with one or more IP Addresses that serve as default gateways. In the event that the VRRP Router controlling these IP Addresses (formally known as the Master) fails, the group of IP Addresses and the default forwarding role is taken over by a Backup VRRP Router.

From the VRRP link, you can access the following pages:

- Basic on page 280
- Advanced on page 282

Basic

From the Basic link, you can access the following pages:

- VRRP Configuration on page 280

VRRP Configuration

Use the VRRP Configuration page to enable or disable the administrative status of a virtual router.

To display the VRRP Configuration page, click Routing > VRRP > Basic > VRRP Configuration.

<table>
<thead>
<tr>
<th>VRRP Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Configuration</td>
</tr>
<tr>
<td>Admin Mode</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRID (1 to 255)</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

To configure the global VRRP settings:

1. VRID is only configurable if you are creating new Virtual Router, in which case enter the VRID in the range 1 to 255.
2. Use Interface to select the Unit/Slot/Port for the new Virtual Router from the pull-down menu.
3. Use **Pre-empt Mode** to select enable or disable. If you select enable, a backup router will preempt the master router if it has a priority greater than the master virtual router’s priority provided the master is not the owner of the virtual router IP address. The default is enable.

4. Use **Priority** to enter the priority value to be used by the VRRP router in the election for the master virtual router. If the Virtual IP Address is the same as the interface IP Address, the priority gets set to 255 no matter what the user enters. If the user enters a priority of 255 when the Virtual and interface IP Addresses are not the same, the priority gets set to the default value of 100.

5. Use **Advertisement Interval** to enter the time, in seconds, between the transmission of advertisement packets by this virtual router. Enter a number between 1 and 255. The default value is 1 second.

6. Use **Primary IP Address** to enter the IP Address associated with the Virtual Router. The default is 0.0.0.0.

7. Use **Authentication Type** to select the type of Authentication for the Virtual Router from the pull-down menu. The default is None. The choices are:
   - **0-None** - No authentication will be performed.
   - **1-Simple** - Authentication will be performed using a text password.

8. **Authentication Data**: If you selected simple authentication, enter the password.

9. Use **Status** to select active or inactive to start or stop the operation of the Virtual Router. The default is inactive.

10. Click **ADD** to add a new Virtual Router to the switch configuration.

11. Click **DELETE** to delete the selected Virtual Router. Note that the router can not be deleted if there are secondary addresses configured.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</table>
Advanced

From the Advanced link, you can access the following pages:

- **VRRP Configuration** on page 280
- **VRRP Secondary IP** on page 282
- **Tracking Configuration** on page 283
- **Virtual Router Statistics** on page 284

**VRRP Secondary IP**

To display the VRRP Secondary IP page, click Routing > VRRP > Advanced > VRRP Secondary IP.

To configure a secondary IP address for the VRRP pair:

1. Use **VRRP ID and Interface** to select one of the existing Virtual Routers, listed by interface number and VRRP ID.
2. Use **Secondary IP Address** to enter the IP address for the interface. This address must be a member of one of the subnets currently configured on the interface. This value is read only once configured.
3. Click **ADD** to add a new secondary IP address to the selected VRRP interface.
4. Click **DELETE** to delete the selected secondary IP address.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual Router ID</td>
<td>The Virtual Router ID for which data is to be displayed or configured.</td>

Tracking Configuration

Use Tracking Configuration to track specific route IP states within the router that can alter the priority level of a virtual router for a VRRP group.

To display the Tracking Configuration page, click Routing > VRRP > Advanced > Tracking Configuration.

To configure VRRP tracking settings:

1. Use **VRRP ID and Interface** to select one of the existing Virtual Routers, listed by interface number and VRRP ID.

2. Use **Tracked Interface** to select a routing interface which is not yet tracked for this VRRP ID and interface configuration. Exception: loopback and tunnels could not be tracked.

3. Use **Tracked Interface Priority Decrement** to specify the priority decrement for the tracked interface. The valid range is 1 - 254. Default value is 10.

4. Use **Tracked Route Prefix** to specify the Prefix of the route.

5. Use **Tracked Route Prefix Length** to specify the prefix length of the route.

6. Use **Tracked Route Priority Decrement** to specify the priority decrement for the Route. The valid range is 1 - 254. Default value is 10.

7. Click **ADD** to add a new tracked interface or tracked route to the VRRP.

8. Click **DELETE** to delete a selected tracked interface or tracked route.

<table>

Click **REFRESH** to show the latest VRRP information.
Multicast

IP Multicasting enables a network host (or multiple hosts) to send an IP datagram to multiple destinations simultaneously. The initiating host sends each multicast datagram only once to a destination multicast group address, and multicast routers forward the datagram only to hosts who are members of the multicast group. Multicast enables efficient use of network bandwidth because each multicast datagram needs to be transmitted only once on each network link, regardless of the number of destination hosts. Multicasting contrasts with IP unicasting, which sends a separate datagram to each recipient host. The IP routing protocols can route multicast traffic, but the IP multicast protocols handle the multicast traffic more efficiently with better use of network bandwidth.

You use the IPv4/IPv6 multicast feature on the ProSafe managed switch to route multicast traffic between VLANs on the switch. If all hosts connected to the switch are on the same subnet, there is no need to configure the IP/IPv6 multicast feature. If the switch does not handle L3 routing, you can use IGMP snooping or MLD snooping to manage port-based multicast group membership. For more information, see IGMP Snooping on page 158. If the local network does not have a multicast router, you can configure the switch to act as the IGMP querier. For more information, see IGMP Snooping Querier on page 163.

If the switch is configured as a layer-3 switch and handles inter-VLAN routing through static routes, OSPF, or RIP, and multicast traffic is transmitted within the network, enabling and configuring layer-3 multicast routing on the switch is recommended.

From the Multicast link, you can access the following pages:

- Mroute Table on page 287

</tr>
</tbody>
</table>
Multicast Interface Configuration

To display the Multicast Interface Configuration page, click **Routing > Multicast > Interface Configuration**.

![Configuration Table]

To configure the TTL threshold for one or more interfaces:

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.

2. Use **TTL Threshold** to enter the TTL threshold below which a multicast data packet will not be forwarded from the selected interface. You should enter a number between 0 and 255. If you enter 0 all multicast packets for the selected interface will be forwarded. You must configure at least one router interface before you will see this field.

3. Click **APPLY** to update the switch with the changes.

4. Click **CANCEL** to abandon the changes.
**DVMRP**

DVMRP is an interior gateway protocol that is suitable for routing multicast traffic within an autonomous system (AS). DVMRP should not be used between different autonomous systems due to limitations with hop count and scalability.

---

**Note:** Only one multicast routing protocol can be operational on the switch at any time. If you enable DVMRP, PIM must be disabled. Similarly, if PIM is enabled, DVMRP must be disabled.

---

DVMRP exchanges probe packets with all its DVMRP-enabled routers, it establishes two-way neighboring relationships, and it builds a neighbor table. DVMRP exchanges report packets and creates a unicast topology table, with which it builds the multicast routing table. This table is used to route the multicast packets. Since every DVMRP router uses the same unicast routing protocol, routing loops are avoided.

From the DVMRP link, you can access the following pages:

- **DVMRP Global Configuration** on page 291
- **DVMRP Interface Configuration** on page 291
- **DVMRP Neighbor** on page 293
- **DVMRP Next Hop** on page 294
- **DVMRP Prune** on page 294
- **DVMRP Route** on page 295
**DVMRP Global Configuration**

To display the Global Configuration page, click Routing > Multicast > DVMRP > Global Configuration.

![DVMRP Global Configuration](image)

To configure global DVMRP settings:

1. Use **Admin Mode** to set the administrative status of DVMRP to active or inactive. The default is disable.

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>
IGMP

The Internet Group Management Protocol (IGMP) is used by IPv4 systems (hosts, L3 switches, and routers) to report their IP multicast group memberships to any neighboring multicast routers. The ProSafe managed switch performs the multicast router role of the IGMP protocol, which means it collects the membership information needed by the active multicast routing protocol.

The ProSafe managed switch supports IGMP Version 3. Version 3 adds support for source filtering, which is the ability for a system to report interest in receiving packets only from specific source addresses, as required to support Source-Specific Multicast (SSM), or from all but specific source addresses, sent to a particular multicast address. Version 3 is designed to be interoperable with Versions 1 and 2.

From the IGMP link, you can access the following pages:

- IGMP Global Configuration on page 296
- IGMP Routing Interface Configuration on page 297
- IGMP Routing Interface Statistics on page 298
- IGMP Groups on page 299
- IGMP Membership on page 300
- IGMP Proxy Interface Configuration on page 301
- IGMP Proxy Interface Statistics on page 302
- IGMP Proxy Membership on page 303

IGMP Global Configuration

To display the IGMP Global Configuration page, click Routing > Multicast > IGMP > Global Configuration.

![IGMP Global Configuration](image)

To configure the administrative mode of IGMP on the switch, select the desired option from the Admin Mode field. The default is disable. If you change the mode, click APPLY to update the switch with the change.
**IGMP Routing Interface Configuration**

To display the IGMP Routing Interface Configuration page, click **Routing > Multicast > IGMP > Routing Interface Configuration**.

To configure an interface for IGMP:

1. Use the check boxes associated with the **Interface** field to select each interface to configure. The same settings are applied to all selected interfaces.

2. Use **Admin Mode** to set the administrative status of IGMP on the selected interface. The default is disable.

3. Use **Version** to enter the version of IGMP you want to configure on the selected interface. Valid values are (1 to 3) and the default value is 3. This field is configurable only when IGMP interface mode is enabled.

4. Use **Robustness** to enter the robustness value. This variable allows tuning for the expected packet loss on a subnet. If you expect the subnet to be lossy, you should enter a higher number for this parameter. IGMP is robust to (robustness variable-1) packet losses. Valid values are from 1 to 255. The default value is 2.

5. Use **Query Interval** to enter the frequency in seconds at which IGMP host-query packets are to be transmitted on this interface. Valid values are from 1 to 1800. The default value is 125.

6. Use **Query Max Response Time** to enter the maximum query response time to be advertised in IGMPv2 queries on this interface, in tenths of a second. The default value is 100. Valid values are from 0 to 255.

7. Use **Startup Query Interval** to enter the number of seconds between the transmission of startup queries on the selected interface. The valid values are from 1 to 300. The default value is 31.

8. Use **Startup Query Count** to enter the number of queries to be sent on startup. The valid values are from 1 to 20. The default value is 2.

9. Use **Last Member Query Interval** to enter the last member query interval in tenths of a second. This the maximum response time to be inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages. Valid values are from 0 to 255. The default value is 10. This value is not used for IGMP version 1.
10. Use **Last Member Query Count** to enter the number of queries to be sent on receiving a leave group report. Valid values are from 1 to 20. The default value is 2.

11. Click **APPLY** to update the switch with the changes.

12. Click **CANCEL** to abandon the changes.

**IGMP Routing Interface Statistics**

To display the IGMP Routing Interface Statistics page, click **Routing > Multicast > IGMP > Routing Interface Statistics**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

<tr>
<td>Filter Mode</td>
<td>The source filter mode (Include/Exclude/NA) for the specified group on this interface. When NA mode is active the field is blank.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with latest IGMP groups information.

Click **REFRESH** to refresh the data on the screen with latest IGMP member information.
**IGMP Proxy Interface Configuration**

To display the IGMP Proxy Interface Configuration page, click **Routing > Multicast > IGMP > Proxy Interface Configuration**.

To configure an interface as an IGMP proxy:

1. **Use** **Interface** to select the port for which data is to be configured. You must have configured at least one router interface before configuring or displaying data for an IGMP Proxy interface and it should not be a IGMP routing interface.

2. **Use** **Admin Mode** to set the administrative status of IGMP Proxy on the selected interface. The default is disable. Routing, IGMP and Multicast global admin modes should be enabled to enable IGMP Proxy interface mode.

3. **Use** **Version** to enter the version of IGMP you want to configure on the selected interface. Valid values are (1 to 3) and the default value is 3. This field is configurable only when IGMP Proxy interface mode is enabled.

4. **Use** **Unsolicited Report Interval** to enter the unsolicited time interval value in seconds. The Unsolicited Report Interval is the time between repetitions of a host's initial report of membership in a group. Valid values are from (1 to 260). The default value is 1.

<table>

Click **REFRESH** to refresh the data on the screen with latest IGMP proxy member information.
The Protocol Independent Multicast protocol is a simple, protocol-independent multicast routing protocol. PIM uses an existing unicast routing table and a Join/Prune/Graft mechanism to build a tree. PIM The ProSafe managed switch supports two types of PIM: sparse mode (PIM-SM) and dense mode (PIM-DM).

PIM-SM is most effective in networks with a sparse population of multicast receivers. In contrast, PIM-DM is most effective in networks with densely populated multicast receivers. In other words, PIM-DM can be used if the majority of network hosts request to receive a multicast stream, while PIM-SM might be a better choice in networks in which a small percentage of network hosts, located throughout the network, wish to receive the multicast stream.

From the PIM-DM link, you can access the following pages:

- **PIM Global Configuration** on page 304
- **SSM Configuration** on page 305
- **PIM Interface Configuration** on page 306
- **PIM Neighbor** on page 307
- **Candidate RP Configuration** on page 308
- **BSR Candidate Configuration** on page 309
- **Static RP Configuration** on page 310

**PIM Global Configuration**

To display the PIM Global Configuration page, click **Routing > Multicast > PIM > Global Configuration**.

To configure global PIM settings:

1. Use **PIM Protocol Type** to select the PIM type to run:
   - **PIM-SM**. Recommended for networks with sparsely-populated multicast receivers.
   - **PIM-DM**. Recommended for networks with densely-populated multicast receivers.

2. Use **Admin Mode** to set the administrative status of PIM on the router. The default is disable.

3. Click **APPLY** to update the switch with the new settings.

4. Click **CANCEL** to abandon the changes.
SSM Configuration

The settings on this page are valid for PIM-SM and do not apply if the PIM mode is PIM-DM.

While PIM-SM employs a specially-configured RP router that serves as a meeting junction for multicast senders and listeners, Protocol-Independent Multicast Source Specific Multicast (PIM-SSM) does not use an RP. It supports only source route deliver trees. It is used between routers so that they can track which multicast packets to forward to each other and to their directly-connected LANs. The SSM service model can be implemented with a strict subset of the PIM-SM protocol mechanisms. Both regular IP Multicast and SSM semantics can coexist on a single router and both can be implemented using the PIM-SM protocol. A range of multicast addresses, currently 232.0.0.0/8 in IPv4, is reserved for SSM.

To display the SSM Configuration page, click Routing > Multicast > PIM > SSM Configuration.

To configure PIM SSM:

1. Use SSM Group Address to enter the source-specific multicast group ip-address.
2. Use SSM Group Mask to enter the source-specific multicast group ip-address mask.
3. Click ADD to add a new source-specific group.
4. Click DELETE to delete an existing source-specific group.
**PIM Interface Configuration**

To display the PIM Interface Configuration page, click **Routing > Multicast > PIM > Interface Configuration**.

To configure per-interface PIM settings:

1. Select the check box associated with each interface you want to configure. Select the check box in the heading row to apply the same settings to all interfaces.
2. Use **Admin Mode** to set the administrative status of PIM in the router. The default is disable.
3. Use **Hello Interval (secs)** to enter the time in seconds between the transmission of which PIM Hello messages on this interface. The valid values are from 0 to 18000. The default value is 30.
4. Use **Join/Prune Interval (secs)** to enter the frequency at which PIM Join/Prune messages are transmitted on this PIM interface. The valid values are from 0 to 18000. The default value is 60.
5. Use **BSR Border** to set BSR border status on the selected interface.
6. Use **DR Priority** to enter the DR priority for the selected interface. The valid values are from 0 to 2147483647. The default value is 1.

<table>

<td>Expiry Time</td>
<td>The minimum time remaining before this PIM neighbor will be aged out.</td>
</tr>
</tbody>
</table>

Click REFRESH to refresh the data on the screen with the latest PIM-SM neighbor information.
Candidate RP Configuration

The settings on this page are valid for PIM-SM and do not apply if the PIM mode is PIM-DM.

To display the PIM Candidate RP Configuration page, click Routing > Multicast > PIM-SM > Candidate RP Configuration.

To configure a candidate RP:

1. Use Interface to select the interface for which data is to be displayed.
2. Use Group Address to specify the group address transmitted in Candidate-RP-Advertisements.
3. Use Group Mask to specify the group address mask transmitted in Candidate-RP-Advertisements.
4. Click ADD to add a new Candidate RP Address for the PIM-SM router.
5. Click DELETE to delete an extant Candidate RP Address for the PIM-SM router.
BSR Candidate Configuration

The settings on this page are valid for PIM-SM and do not apply if the PIM mode is PIM-DM.

To display the PIM BSR Candidate Configuration page, click Routing > Multicast > PIM-SM > BSR Candidate Configuration.

To configure a BSR candidate:

1. Use Interface to select the interface for which data is to be configured.
2. Use Priority to enter the priority of C-BSR.
3. Use Hash Mask Length to enter the C-BSR hash mask length to be advertised in bootstrap messages. This hash mask length will be used in the hash algorithm for selecting the RP for a particular group. The valid values are from 0 to 32. Default value is 30.
4. Click DELETE to delete the RP address selected.
5. Click REFRESH to refresh the data on the screen with the latest PIM-SM neighbor information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Displays the IP address of the Elected BSR.</td>
</tr>
<tr>
<td>Next bootstrap Message</td>
<td>Time (in hours, minutes, and seconds) in which the next bootstrap message is due from this BSR.</td>
</tr>
<tr>

<td>Time (in hours, minutes, and seconds) in which the next candidate RP advertisement will be sent.</td>
</tr>
</tbody>
</table>
Static RP Configuration

This page is used to statically configure the RP address for one or more multicast groups.

To display the PIM-SM Static RP Configuration page, click **Routing** > **Multicast** > **PIM-SM** > **Static RP Configuration**.

To configure a static RP:

1. Use **RP Address** to specify the IP Address of the RP to be created or deleted.
2. Use **Group Address** to specify the Group Address of the RP to be created or deleted.
3. Use **Group Mask** to specify the Group Mask of the RP to be created or deleted.
4. Use **Override** to indicate that if there is a conflict, the RP configured with this option prevails over the RP learned by BSR.
5. Click **ADD** to add a new static RP address for one or more multicast groups.
6. Click **DELETE** to delete the RP address selected.
Static Routes Configuration

To display the Static Routes Configuration page, click Routing > Multicast > Static Routes Configuration.

To configure a static multicast route:

1. Use Source IP to enter the IP Address that identifies the multicast packet source for the entry you are creating.
2. Use Source Mask to enter the subnet mask to be applied to the Source IP address.
3. Use RPF Neighbor to enter the IP address of the neighbor router on the path to the source.
4. Use Metric to enter the link state cost of the path to the multicast source. The range is 0 - 255 and the default is one. You can change the metric for a configured route by selecting the static route and editing this field.
5. Use RPF Interface to select the interface number. This is the interface that connects to the neighbor router for the given source IP address.
6. Click ADD to add a new static route to the switch.
7. Click DELETE to delete the multicast static routes selected.
Admin Boundary Configuration

The definition of an administratively scoped boundary is a mechanism to stop the ingress and egress of multicast traffic for a given range of multicast addresses on a given routing interface.

To display the Admin Boundary Configuration page, click Routing > Multicast > Admin Boundary Configuration.

To configure an administrative boundary:

1. Use Interface to select the router interface for which the administratively scoped boundary is to be configured.
2. Use Group IP to enter the multicast group address for the start of the range of addresses to be excluded. The address must be in the range of 239.0.0.0 through 239.255.255.255.
3. Use Group Mask to enter the mask to be applied to the multicast group address. The combination of the mask and the Group IP gives the range of administratively scoped addresses for the selected interface.
4. Click ADD to add a new administratively scoped boundary.
5. Click DELETE to delete the administratively scoped boundary selected.
IPv6 Multicast

The in the ProSafe M5300 switches support IPv6 multicast routing.

From the IPv6 Multicast link, you can access the following pages:

- *Mroute Table* on page 313
- *IPv6 PIM* on page 314
- *MLD* on page 321
- *Static Routes Configuration* on page 329

Mroute Table

This screen displays contents of the Mroute Table in tabular form.

To display the Mroute Table page, click **Routing > IPv6 Multicast > Mroute Table**.

<table>
<thead>
<tr>

IPv6 PIM

From the IPv6 PIM-DM link, you can access the following pages:

- *PIM Global Configuration* on page 314
- *PIM SSM Configuration* on page 315
- *PIM Interface Configuration* on page 316
- *PIM Neighbor* on page 317
- *PIM Candidate RP Configuration* on page 318
- *PIM BSR Candidate Configuration* on page 319
- *PIM Static RP Configuration* on page 320

**PIM Global Configuration**

To display the IPv6 PIM Global Configuration page, click *Routing > IPv6 Multicast > PIM > Global Configuration*.

To configure global IPv6 PIM settings:

1. Use **PIM Protocol Type** to select the PIM type to run:
   - **PIM-SM**. Recommended for networks with sparsely-populated multicast receivers.
   - **PIM-SM**. Recommended for networks with densely-populated multicast receivers.

2. Use **Admin Mode** to set the administrative status of PIM on the router. The default is disable.

3. Click **APPLY** to update the switch with the new settings.

4. Click **CANCEL** to abandon the changes.
**PIM SSM Configuration**

While PIM-SM employs a specially-configured RP router that serves as a meeting junction for multicast senders and listeners, Protocol-Independent Multicast Source Specific Multicast (PIM-SSM) does not use an RP. It supports only source route deliver trees. It is used between routers so that they can track which multicast packets to forward to each other and to their directly-connected LANs. The SSM service model can be implemented with a strict subset of the PIM-SM protocol mechanisms. Both regular IP Multicast and SSM semantics can coexist on a single router and both can be implemented using the PIM-SM protocol. A range of multicast addresses, currently FF3x::/96 in IPv6, is reserved for SSM.

To display the PIM SSM Configuration page, click **Routing > IPv6 Multicast > PIM-SM > SSM Configuration**.

To configure SSM settings for IPv6 PIM-SM:

1. Use **SSM Group Address** to enter the source-specific multicast group ip-address.
2. Use **SSM Group Mask** to enter the source-specific multicast IPv6 group prefix length.
3. Click **ADD** to add a new source-specific group.
4. Click **DELETE** to delete an extant source-specific group.
5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
**PIM Interface Configuration**

</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with the latest PIM-DM neighbor information.
PIM Candidate RP Configuration
To display the IPv6 PIM Candidate RP Configuration page, click **Routing > IPv6 Multicast > PIM > Candidate RP Configuration**.

To configure candidate RP settings for IPv6 PIM-SM:

1. Use **Interface** to select the interface for which data is to be displayed.
2. Use **Group Address** to specify the group IPv6 address prefix transmitted in Candidate-RP-Advertisements.
3. Use **Prefix Length** to specify the group IPv6 Prefix Length transmitted in Candidate-RP-Advertisements.
4. Click **ADD** to add a new Candidate RP Address for the PIM-SM router.
5. Click **DELETE** to delete an extant Candidate RP Address for the PIM-SM router.
PIM BSR Candidate Configuration

To display the IPv6 PIM-SM BSR Candidate Configuration page, click Routing > IPv6 Multicast > PIM-SM > BSR Candidate Configuration.

To configure BSR candidate settings for IPv6 PIM-SM:

1. Use **Interface** to select the interface for which data is to be configured.
2. Use **Priority** to enter the priority of C-BSR.
3. Use **Hash Mask Length** to enter the C-BSR hash mask length to be advertised in bootstrap messages. This hash mask length will be used in the hash algorithm for selecting the RP for a particular group. The valid values are from 0 to 128. Default value is 126.

<table>

</tbody>
</table>
**PIM Static RP Configuration**

This page is used to statically configure the RP address for one or more multicast groups.

To display the IPv6 PIM Static RP Configuration page, click **Routing > IPv6 Multicast > PIM > Static RP Configuration**.

To configure static RP settings for IPv6 PIM-SM:

1. Use **RP Address** to specify the IP Address of the RP to be created or deleted.
2. Use **Group Address** to specify the Group Address of the RP to be created or deleted.
3. Use **Prefix Length** to specify the Group IPv6 Prefix Length of the RP to be created or deleted.
4. Use **Override** to indicate that if there is a conflict, the RP configured with this option prevails over the RP learned by BSR.
5. Click **ADD** to add a new static RP address for one or more multicast groups.
6. Click **DELETE** to delete the RP address selected.
MLD

MLD is used by IPv6 systems (listeners and routers) to report their IP multicast addresses memberships to any neighboring multicast routers. The implementation of MLD v2 is backward compatible with MLD v1.

MLD protocol enables the IPv6 router to discover the presence of multicast listeners, the nodes that want to receive the multicast data packets, on its directly attached interfaces. The protocol specifically discovers which multicast addresses are of interest to its neighboring nodes and provides this information to the multicast routing protocol that make the decision on the flow of the multicast data packets.

From the MLD link, you can access the following pages:

- **MLD Global Configuration** on page 321
- **MLD Routing Interface Configuration** on page 322
- **MLD Routing Interface Statistics** on page 323
- **MLD Groups** on page 324
- **MLD Traffic** on page 325
- **MLD Proxy Interface Configuration** on page 326
- **MLD Proxy Interface Statistics** on page 327
- **MLD Proxy Membership** on page 328

**MLD Global Configuration**

To display the MLD Global Configuration page, click **Routing > IPv6 Multicast > MLD > Global Configuration**.

![MLD Global Configuration](image)

To configure the administrative mode of MLD on the switch, select the desired option from the **Admin Mode** field. The default is disable. If you change the mode, click **APPLY** to update the switch with the change.
MLD Routing Interface Configuration

To display the MLD Routing Interface Configuration page, click Routing > IPv6 Multicast > MLD > Routing Interface Configuration.

To configure per-interface MLD settings:

1. Use Interface to select the interface for which data is to be configured or displayed.
2. Use Admin Mode to set the administrative status of MLD on the selected interface. The default value is disable.
3. Use Version to enter the version to be configured on the selected interface. Valid values are (1 to 2). The default value is 2.
4. Use Query Interval to enter the frequency in seconds at which MLD host-query packets are to be transmitted on this interface. Valid values are from 1 to 1800. The default value is 125.
5. Use Query Max Response Time to enter the maximum query response time to be advertised in MLDv2 queries on this interface, in milliseconds. Valid values are from 0 to 65535. The default value is 10000 milliseconds.
6. Use Robustness to specify the robustness parameter for the selected interface. This variable allows tuning for the expected packet loss on a subnet. If a subnet is expected to be lossy, the robustness variable may be increased. MLD is robust to (robustness variable-1) packet losses.
7. Use Startup Query Interval to specify the value that indicates the configured interval (in seconds) between General Queries sent by a Querier on startup.
8. Use **Startup Query Count** to specify the value that indicates the configured number of Queries sent out on startup, separated by the Startup Query Interval.

9. Use **Last Member Query Interval** to enter the last member query interval in milliseconds. This is the maximum response time to be inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages. Valid values are from 0 to 65535. The default value is 1000 milliseconds.

10. Use **Last Member Query Count** to enter the number of queries to be sent on receiving a leave group report. Valid values are from 1 to 20. The default value is 2.

</tr>
<tr>
<td>Group IP</td>
<td>Indicates the address of the MLD members.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>The IP Address of the source of the last membership report received for this multicast group address on the interface.</td>
</tr>
<tr>
<td>Up Time</td>
<td>Time elapsed in seconds since the multicast group has been known.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>Time left in seconds before the entry is removed from the MLD membership table of this interface.</td>
</tr>
<tr>
<td>Filter Mode</td>
<td>The filter mode of the multicast group on this interface. The values it can take are INCLUDE and EXCLUDE.</td>
</tr>
<tr>
<td>Version1 Host Timer</td>
<td>The time remaining until the router assumes there are no longer any MLD version-1 Hosts on the specified interface.</td>
</tr>
<tr>
<td>Group Compat Mode</td>
<td>The compatibility mode of the multicast group on the interface. The values it can take are MLDv1 and MLDv2.</td>
</tr>
<tr>
<td>Source Hosts</td>
<td>This parameter shows source addresses which are members of this multicast address.</td>
</tr>
<tr>
<td>Source Address(Expiry Time)</td>
<td>This parameter shows expiry time interval against each source address which are members of this multicast group. This is the amount of time after which the specified source entry is aged out.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with latest MLD groups information.
**MLD Traffic**

To display the MLD Traffic page, click **Routing > IPv6 Multicast > MLD > MLD Traffic**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Valid MLD Packets Received</td>
<td>The number of valid MLD packets received by the router.</td>
</tr>
<tr>
<td>Valid MLD Packets Sent</td>

<td>The number of valid MLD leaves sent by the router.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with the latest MLD traffic.
Click **CLEAR** to clear all the MLD traffic.
MLD Proxy Interface Configuration

To display the MLD Proxy Interface Configuration page, click Routing > IPv6 Multicast > MLD > Proxy Interface Configuration.

To configure MLD proxy interface settings:

1. Use **Interface** to select the interface to be configured.

2. Use **Admin Mode** to set the administrative status of MLD Proxy on the selected interface. The default is disable. Routing, MLD and Multicast global admin modes should be enabled to enable MLD Proxy interface mode.

3. Use **Version** to enter the version of MLD you want to configure on the selected interface. Valid values are 1 to 2 and the default value is 3. This field is configurable only when MLD Proxy interface mode is enabled.

4. Use **Unsolicited Report Interval** to enter the unsolicited time interval value in seconds. The Unsolicited Report Interval is the time between repetitions of a host's initial report of membership in a group. Valid values are from 1 to 260. The default value is 1.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Prefix</td>
<td>The IPv6 address of the MLD Proxy interface.</td>
</tr>
<tr>

<tr>
<td>Leaves Sent</td>
<td>The number of MLD Proxy leaves sent.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with the latest MLD Proxy interface statistics.
**MLD Proxy Membership**

To display the MLD Proxy Membership page, click **Routing > IPv6 Multicast > MLD > Proxy Membership**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group IP</td>
<td>The IPv6 multicast group address.</td>
</tr>
<tr>
<td>Source Hosts</td>
<td>This parameter shows source addresses which are members of this multicast address.</td>
</tr>
<tr>
<td>Last Reporter</td>
<td>The IPv6 address of the source of the last membership report received for the IPv6 Multicast group address on the MLD Proxy interface.</td>
</tr>
<tr>
<td>Up Time</td>
<td>The time elapsed since this entry was created.</td>
</tr>
<tr>
<td>Expiry Time</td>
<td>This parameter shows expiry time interval against each source address which is a member of this multicast group. This is the amount of time after which the specified source entry is aged out.</td>
</tr>
<tr>
<td>State</td>
<td>The state of the host entry. A Host can be in one of the state. Non-member state - does not belong to the group on the interface. Delaying member state - host belongs to the group on the interface and report timer running. The report timer is used to send out the reports. Idle member state - host belongs to the group on the interface and no report timer running.</td>
</tr>
<tr>
<td>Filter Mode</td>
<td>The group filter mode (Include/Exclude/None) for the specified group on the MLD Proxy interface.</td>
</tr>
<tr>
<td>Number of Sources</td>
<td>The number of source hosts present in the selected multicast group.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to refresh the data on the screen with the latest MLD proxy membership information.
Static Routes Configuration

To display the Static Routes Configuration page, click Routing > IPv6 Multicast > Static Routes Configuration.

To configure static IPv6 multicast routes:

1. Use **Source IP** to enter the IP Address that identifies the multicast packet source for the entry you are creating.
2. Use **Prefix Length** to enter the Prefix Length to be applied to the Source IPv6 address.
3. Use **RPF Neighbor** to enter the IP address of the neighbor router on the path to the source.
4. Use **Metric** to enter the link state cost of the path to the multicast source. The range is 0 - 255 and the default is 1. You can change the metric for a configured route by selecting the static route and editing this field.
5. Use **RPF Interface** to select the interface number from the drop-dead menu. This is the interface that connects to the neighbor router for the given source IP address.
6. Click **ADD** to add a new static route to the switch.
7. Click **DELETE** to delete the multicast static routes selected.
ProSafe M5300 Switch

Routing

330
Configuring Quality of Service

Use the features in the QoS tab to configure Quality of Service (QoS) settings on the switch. The QoS tab contains links to the following features:

- *Class of Service* on page 331
- *Differentiated Services* on page 339

In a typical switch, each physical port consists of one or more queues for transmitting packets on the attached network. Multiple queues per port are often provided to give preference to certain packets over others based on user-defined criteria. When a packet is queued for transmission in a port, the rate at which it is serviced depends on how the queue is configured and possibly the amount of traffic present in the other queues of the port. If a delay is necessary, packets get held in the queue until the scheduler authorizes the queue for transmission. As queues become full, packets have no place to be held for transmission and get dropped by the switch.

QoS is a means of providing consistent, predictable data delivery by distinguishing between packets that have strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given “special treatment” in a QoS-capable network. With this in mind, all elements of the network must be QoS-capable. The presence of at least one node which is not QoS-capable creates a deficiency in the network path and the performance of the entire packet flow is compromised.

Class of Service

The Class of Service (CoS) queueing feature lets you directly configure certain aspects of switch queueing. This provides the desired QoS behavior for different types of network traffic when the complexities of DiffServ are not required. The priority of a packet arriving at an interface can be used to steer the packet to the appropriate outbound CoS queue through a mapping table. CoS queue characteristics that affect queue mapping, such as minimum guaranteed bandwidth, or transmission rate shaping are user-configurable at the queue (or port) level.

Eight queues per port are supported.
From the Class of Service link under the QoS tab, you can access the following pages:

- **Basic** on page 332
- **Advanced** on page 333

## Basic

From the Basic link, you can access the following pages:

- **CoS Configuration** on page 332

## CoS Configuration

To display the CoS Configuration page, click **QoS > CoS > Basic > CoS Configuration**.

Use the CoS Configuration page to set the class of service trust mode of an interface. Each port in the switch can be configured to trust one of the packet fields (802.1p or IP DSCP), or to not trust any packet's priority designation (untrusted mode). If the port is set to a trusted mode, it uses a mapping table appropriate for the trusted field being used. This mapping table indicates the CoS queue to which the packet should be forwarded on the appropriate egress port(s). Of course, the trusted field must exist in the packet for the mapping table to be of any use, so there are default actions performed when this is not the case. These actions involve directing the packet to a specific CoS level configured for the ingress port as a whole, based on the existing port default priority as mapped to a traffic class by the current 802.1p mapping table.

Alternatively, when a port is configured as untrusted, it does not trust any incoming packet priority designation and uses the port default priority value instead. All packets arriving at the ingress of an untrusted port are directed to a specific CoS queue on the appropriate egress port(s), in accordance with the configured default priority of the ingress port. This process is also used for cases where a trusted port mapping is unable to be honored, such as when a non-IP packet arrives at a port configured to trust the IP DSCP value.

To configure global CoS settings:

1. Use **Global** to specify all CoS configurable interfaces. The option “Global” represents the most recent global configuration settings.
2. Use **Interface** to specify CoS configuration settings based per-interface.
3. Use **Global Trust Mode** to specify whether to trust a particular packet marking at ingress. Global Trust Mode can only be one of the following. Default value is trust dot1p.
   - untrusted
   - trust dot1p
   - trust ip-dscp

4. Use **Interface Trust Mode** to specify whether to trust a particular packet marking at ingress. Interface Trust Mode can only be one of the following. Default value is untrusted.
   - untrusted
   - trust dot1p
   - trust ip-dscp

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

6. If you change any of the settings on the page, click **APPLY** to send the updated configuration to the switch.

**Advanced**

From the Advanced link, you can access the following pages:

- **CoS Configuration** on page 332
- **802.1p to Queue Mapping** on page 333
- **IP DSCP to Queue Mapping** on page 334
- **CoS Interface Configuration** on page 335
- **Interface Queue Configuration** on page 336
- **CoS Queue Drop Precedence Configuration** on page 337

**802.1p to Queue Mapping**

The 802.1p to Queue Mapping page also displays the Current 802.1p Priority Mapping table.

To display the 802.1p to Queue Mapping page, click **QoS > CoS > Advanced > 802.1p to Queue Mapping**.
To map 802.1p priorities to queues:

1. Use **Interface** to specify CoS configuration settings based per-interface or specify all CoS configurable interfaces.

2. Specify which internal traffic class to map the corresponding 802.1p value. The queue number depends on the specific hardware.

   The 802.1p Priority row contains traffic class selectors for each of the eight 802.1p priorities to be mapped. The priority goes from low (0) to high (3). For example, traffic with a priority of 0 is for most data traffic and is sent using “best effort.” Traffic with a higher priority, such as 3, might be time-sensitive traffic, such as voice or video.

   The values in each drop down menu represent the traffic class. The traffic class is the hardware queue for a port. Higher traffic class values indicate a higher queue position. Before traffic in a lower queue is sent, it must wait for traffic in higher queues to be sent.

3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

4. If you make changes to the page, click **APPLY** to apply the changes to the system.

**IP DSCP to Queue Mapping**

Use the IP DSCP to Queue Mapping page to specify which internal traffic class to map the corresponding DSCP value.

To display the IP DSCP Queue Mapping page, click **QoS > CoS > Advanced > IP DSCP to Queue Mapping**.
To map DSCP values to queues:

1. Use **Interface** to specify CoS configuration settings based per-interface or specify all CoS configurable interfaces.
2. The **IP DSCP** field displays an IP DSCP value from 0 to 63.
3. For each DSCP value, specify which internal traffic class to map the corresponding IP DSCP value. The queue number depends on specific hardware.
4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
5. If you make changes to the page, click **APPLY** to apply the changes to the system.

**CoS Interface Configuration**

Use the CoS Interface Configuration page to apply an interface shaping rate to all interfaces or to a specific interface.

To display the CoS Interface Configuration page, click **QoS > CoS > Advanced > CoS Interface Configuration**.

To configure CoS settings for an interface:

1. Use **Interface** to specify all CoS configurable interfaces.
2. Use **Interface Trust Mode** to specify whether to trust a particular packet marking at ingress. Interface Trust Mode can only be one of the following. Default value is trust dot1p.
   - untrusted
   - trust dot1p
   - trust ip-dscp
3. Use **Interface Shaping Rate** to specify the maximum bandwidth allowed, typically used to shape the outbound transmission rate. This value is controlled independently of any per-queue maximum bandwidth configuration. It is effectively a second-level shaping mechanism. Default value is 0. Valid Range is 0 to 100 in increments of 1. The value 0 means maximum is unlimited.

4. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.

5. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**Interface Queue Configuration**

Use the Interface Queue Configuration page to define what a particular queue does by configuring switch egress queues. User-configurable parameters control the amount of bandwidth used by the queue, the queue depth during times of congestion, and the scheduling of packet transmission from the set of all queues on a port. Each port has its own CoS queue-related configuration.

The configuration process is simplified by allowing each CoS queue parameter to be configured globally or per-port. A global configuration change is automatically applied to all ports in the system.

To display the Interface Queue Configuration page, click the **QoS > CoS >Advanced > Interface Queue Configuration**.

### Interface Queue Configuration

<table>
<thead>
<tr>
<th>Interface</th>
<th>Queue ID</th>
<th>Minimum Bandwidth</th>

<td>TailDrop</td>
</tr>
</tbody>
</table>

To configure CoS queue settings for an interface:

1. Select the check box next to the port or LAG to configure. You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply a trust mode or rate to all interfaces.

2. Configure any of the following settings:
   - **Queue ID** - Use the menu to select the queue to be configured (platform based).
• **Use Minimum Bandwidth** to specify the minimum guaranteed bandwidth allotted to this queue. Setting this value higher than its corresponding Maximum Bandwidth automatically increases the maximum to the same value. Default value is 0. Valid Range is 0 to 100 in increments of 1. The value 0 means no guaranteed minimum. Sum of individual Minimum Bandwidth values for all queues in the selected interface cannot exceed defined maximum (100).

• **Use Scheduler Type** to specify the type of scheduling used for this queue. Options are Weighted and Strict. Defining on a per-queue basis allows the user to create the desired service characteristics for different types of traffic.
  
  • **Weighted** — Weighted round robin associates a weight to each queue. This is the default.
  
  • **Strict** — Services traffic with the highest priority on a queue first.

3. **Queue Management Type** displays the Queue depth management technique used for queues on this interface. This is only used if device supports independent settings per-queue. Queue Management Type can only be taildrop. All packets on a queue are safe until congestion occurs. At this point, any additional packets queued are dropped.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

5. If you make changes to the page, click **APPLY** to apply the changes to the system.

### CoS Queue Drop Precedence Configuration

Use the CoS Queue Drop Precedence Configuration page to configure thresholds for packet loss during times of queue congestion. Each port can have its own drop precedence configuration or all ports can be globally configured.

To display the Interface Queue Configuration page, click the **QoS > CoS >Advanced > CoS Queue Drop Precedence Configuration**.

![CoS Interface Queue Drop Precedence Configuration Table](image)

![CoS Interface Queue Drop Precedence Status Table](image)
To configure CoS Queue Drop Precedence Configuration settings:

1. From the **Interface** menu, select the interface to configure.
2. In the **Queue ID** field, select a queue to associate with the selected interface.
3. From the **Drop Precedence Level** field, select a drop precedence level.
4. In the **WRED Minimum Threshold** field, specify the weighted RED minimum queue threshold below which no packets are dropped for the current drop precedence level. Default values are:
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 0
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 1
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 2
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 3
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 4
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 5
   - 40/30/20/100 for Drop Precedence Levels 1/2/3/4 on QueueID 6
   Valid Range is (0 to 100) in sixteenths of the overall device queue size.

5. In the **WRED Maximum Threshold** field, specify the weighted RED maximum queue threshold above which all packets are dropped for the current drop precedence level. Default values are:
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 0
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 1
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 2
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 3
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 4
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 5
   - 100/90/80/100 for Drop Precedence Levels 1/2/3/4 on QueueID 6
   Valid Range is (0 to 100) in sixteenths of the overall device queue size.

6. In the **WRED Drop Probability** field, specify the packet drop probability for the current drop precedence level. Default value is 10. Valid Range is (0 to 100).

7. Click **APPLY** to update the switch with the configured values.
8. Click **CANCEL** to abandon the changes.
Differentiated Services

The QoS feature contains Differentiated Services (DiffServ) support that allows traffic to be classified into streams and given certain QoS treatment in accordance with defined per-hop behaviors.

Standard IP-based networks are designed to provide “best effort” data delivery service. “Best effort” service implies that the network delivers the data in a timely fashion, although there is no guarantee that it will. During times of congestion, packets may be delayed, sent sporadically, or dropped. For typical Internet applications, such as e-mail and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. Conversely, any degradation of service has undesirable effects on applications with strict timing requirements, such as voice or multimedia.

Defining DiffServ

To use DiffServ for QoS, the Web pages accessible from the Differentiated Services menu page must first be used to define the following categories and their criteria:

1. Class - Create classes and define class criteria.
2. Policy - Create policies, associate classes with policies, and define policy statements.
3. Service - Add a policy to an inbound interface

Packets are classified and processed based on defined criteria. The classification criteria is defined by a class. The processing is defined by a policy’s attributes. Policy attributes may be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs. A policy can contain multiples classes. When the policy is active, the actions taken depend on which class matches the packet.

Packet processing begins by testing the class match criteria for a packet. A policy is applied to a packet when a class match within that policy is found.

The Differentiated Services menu page contains links to the various Diffserv configuration and display features.

From the DiffServ link under the QoS tab, you can access the following pages:

- DiffServ Wizard on page 340
- Basic on page 341
- Advanced on page 343
DiffServ Wizard

The DiffServ Wizard enables DiffServ on the switch by creating a traffic class, adding the traffic class to a policy, and then adding the policy to the ports selected on DiffServ Wizard page. The DiffServ Wizard will:

- Create a **DiffServ Class** and define match criteria used as a filter to determine if incoming traffic meets the requirements to be a member of the class.
- Set the **DiffServ Class** match criteria based on **Traffic Type** selection as below:
  - VOIP - sets match criteria to UDP protocol.
  - HTTP - sets match criteria to HTTP destination port.
  - FTP - sets match criteria to FTP destination port.
  - Telnet - sets match criteria to Telnet destination port.
  - Every - sets match criteria all traffic.
- Create a **Diffserv Policy** and add it to the **DiffServ Class** created.
- If **Policing** is set to **YES**, then **DiffServ Policy** style is set to **Simple**. Traffic which conforms to the **Class Match** criteria will be processed according to the **Outbound Priority** selection. **Outbound Priority** configures the handling of conforming traffic as below:
  - High - sets policing action to markdscp ef.
  - Med - sets policing action to markdscp af31.
  - Low - sets policing action to send.
- If **Policing** is set to **NO**, then all traffic will be marked as specified below:
  - High - sets policy mark ipdscp ef.
  - Low - sets policy mark ipdscp be.
- Each port selected will be added to the policy created.

To display the DiffServ Wizard page, click **QoS > DiffServ > DiffServ Wizard**.
To configure the switch using the DiffServ Wizard:

1. Use Traffic Type to define the DiffServ Class. Traffic type options: VOIP, HTTP, FTP, Telnet, and Every.
2. Ports displays the ports which can be configured to support a DiffServ policy. The DiffServ policy will be added to selected ports.
3. Use Enable Policing to add policing to the DiffServ Policy. The policing rate will be applied.
4. Committed Rate:
   - When Policing is enabled, the committed rate will be applied to the policy and the policing action is set to conform.
   - When Policing is disabled, the committed rate is not applied and the policy is set to markdscp.
5. Outbound Priority:
   - When Policing is enabled, Outbound Priority defines the type of policing conform action where: High sets action to markdscp ef, Med sets action to markdscp af31, and Low sets action to send.
   - When Policing is disabled, Outbound Priority defines the policy where: High sets policy to mark ipdscp ef, Med sets policy to mark ipdscp af31, Low set policy to mark ipdscp be.

**Basic**

From the Basic link, you can access the following pages:

- DiffServ Configuration on page 341

**DiffServ Configuration**

Packets are filtered and processed based on defined criteria. The filtering criteria is defined by a class. The processing is defined by a policy's attributes. Policy attributes may be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs.

The configuration process begins with defining one or more match criteria for a class. Then one or more classes are added to a policy. Policies are then added to interfaces.

Packet processing begins by testing the match criteria for a packet. The 'all' class type option defines that each match criteria within a class must evaluate to true for a packet to match that class. The 'any' class type option defines that at least one match criteria must evaluate to true for a packet to match that class. Classes are tested in the order in which they were added to the policy. A policy is applied to a packet when a class match within that policy is found.

To display the DiffServ Configuration page, click QoS > DiffServ > Basic > DiffServ Configuration.
### DiffServ Configuration

#### Field: DiffServ Admin Mode
The options mode for DiffServ. The default value is 'enable'. While disabled, the DiffServ configuration is retained when saved and can be changed, but it is not activated. When enabled, Diffserv services are activated.

#### Field: Class table
Displays the number of configured DiffServ classes out of the total allowed on the switch.

#### Field: Class Rule table
Displays the number of configured class rules out of the total allowed on the switch.

#### Field: Policy table
Displays the number of configured policies out of the total allowed on the switch.

#### Field: Policy Instance table
Displays the number of configured policy class instances out of the total allowed on the switch.

#### Field: Policy Attributes table
Displays the number of configured policy attributes (attached to the policy class instances) out of the total allowed on the switch.

#### Field: Service table
Displays the number of configured services (attached to the policies on specified interfaces) out of the total allowed on the switch.
Advanced

- **DiffServ Configuration** on page 341
- **Class Configuration** on page 343
- **IPv6 Class Configuration** on page 346
- **Policy Configuration** on page 348
- **Service Interface Configuration** on page 351
- **Service Statistics** on page 352

**Class Configuration**

Use the Class Configuration page to add a new DiffServ class name, or to rename or delete an existing class. The page also allows you to define the criteria to associate with a DiffServ class. As packets are received, these DiffServ classes are used to prioritize packets. You can have multiple match criteria in a class. The logic is a Boolean logical-and for this criteria. After creating a Class, click the class link to the Class page.

To display the page, click **QoS** > **DiffServ** > **Advanced** > **Class Configuration**.

To configure a DiffServ class:

1. To create a new class, enter a **class name**, select the **class type**, and click **ADD**. This field also lists all the existing DiffServ class names, from which one can be selected.

   The switch supports only the **Class Type** value **All**, which means all the various match criteria defined for the class should be satisfied for a packet match. All signifies the logical AND of all the match criteria. Only when a new class is created, this field is a selector field. After class creation this becomes a non-configurable field displaying the configured class type.

2. To rename an existing class, select the check box next to the configured class, update the name, and click **APPLY**.

3. To remove a class, click the check box beside the Class Name, then click **DELETE**.

4. Click **REFRESH** to refresh the page with the most current data from the switch.

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch. After creating a Class, click the class link to the Class page.
To configure the class match criteria:

1. Click the **class name** for an existing class.

   The class name is a hyperlink. The following figure shows the configuration fields for the class.

2. **Class Name** - Displays the name for the configured DiffServ class.

3. **Class Type** - Displays the DiffServ class type. Options:
   - **All**

   Only when a new class is created, this field is a selector field. After class creation this becomes a non-configurable field displaying the configured class type.

4. Define the criteria to associate with a DiffServ class:
   - **Match Every** - This adds to the specified class definition a match condition whereby all packets are considered to belong to the class.
   - **Reference Class** - This lists the class(es) that can be assigned as reference class(es) to the current class.
• **Class of Service** - This lists all the values for the class of service match criterion in the range 0 to 7 from which one can be selected.

• **VLAN** - This is a value in the range of 0-4095.

• **Ethernet Type** - This lists the keywords for the Ethertype from which one can be selected.

• **Source MAC Address** - This is the source MAC address specified as six, two-digit hexadecimal numbers separated by colons.

• **Source MAC Mask** - This is a bit mask in the same format as MAC Address indicating which part(s) of the source MAC Address to use for matching against packet content.

• **Destination MAC Address** - This is the destination MAC address specified as six, two-digit hexadecimal numbers separated by colons.

• **Destination MAC Mask** - This is a bit mask in the same format as MAC Address indicating which part(s) of the destination MAC Address to use for matching against packet content.

• **Protocol Type** - This lists the keywords for the layer 4 protocols from which one can be selected. The list includes 'other' as an option for the remaining values.

• **Source IP Address** - This is a valid source IP address in the dotted decimal format.

• **Source Mask** - This is a bit mask in IP dotted decimal format indicating which part(s) of the source IP Address to use for matching against packet content.

• **Source L4 Port** - This lists the keywords for the known source layer 4 ports from which one can be selected. The list includes 'other' as an option for the unnamed ports.

• **Destination IP Address** - This is a valid destination IP address in the dotted decimal format.

• **Destination Mask** - This is a bit mask in IP dotted decimal format indicating which part(s) of the destination IP Address to use for matching against packet content.

• **Destination L4 Port** - This lists the keywords for the known destination layer 4 ports from which one can be selected. The list includes 'other' as an option for the unnamed ports.

• **IP DSCP** - This lists the keywords for the known DSCP values from which one can be selected. The list includes 'other' as an option for the remaining values.

• **Precedence Value** - This lists the keywords for the IP Precedence value in the range 0 to 7.

• **IP ToS** - Configure the IP ToS field:
  • **ToS Bits** - This is the Type of Service octet value in the range 00 to ff to compare against.
  • **ToS Mask** - This indicates which ToS bits are subject to comparison against the Service Type value.

5. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.

6. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.
IPv6 Class Configuration

Use the IPv6 Class Configuration page to add a new IPv6 DiffServ class name, or to rename or delete an existing class. The page also allows you to define the criteria to associate with a DiffServ class. As packets are received, these DiffServ classes are used to prioritize packets. You can have multiple match criteria in a class. The logic is a Boolean logical-and for this criteria. After creating a Class, click the class link to the Class page.

To display the page, click QoS > DiffServ > Advanced > IPv6 Class Configuration.

To configure a DiffServ class:

1. To create a new class, enter a class name, select the class type, and click ADD. This field also lists all the existing DiffServ class names, from which one can be selected.

   The switch supports only the Class Type value All, which means all the various match criteria defined for the class should be satisfied for a packet match. All signifies the logical AND of all the match criteria. Only when a new class is created, this field is a selector field. After class creation this becomes a non-configurable field displaying the configured class type.

2. To rename an existing class, select the check box next to the configured class, update the name, and click APPLY.

3. To remove a class, click the check box beside the Class Name, then click DELETE.

4. Click REFRESH to refresh the page with the most current data from the switch.

5. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch. After creating a Class, click the class link to the Class page.
To configure the class match criteria:

1. Click the **class name** for an existing class.

   The class name is a hyperlink. The following figure shows the configuration fields for the class.

2. **Class Name** - Displays the name for the configured DiffServ class.

3. **Class Type** - Displays the DiffServ class type. Options:
   - All

   Only when a new class is created, this field is a selector field. After class creation this becomes a non-configurable field displaying the configured class type.

4. Define the criteria to associate with a DiffServ class:
   - **Match Every** - This adds to the specified class definition a match condition whereby all packets are considered to belong to the class.
   - **Reference Class** - This lists the class(es) that can be assigned as reference class(es) to the current class.
   - **Protocol Type** - This lists the keywords for the layer 4 protocols from which one can be selected. The list includes ‘other’ as an option for the remaining values.
   - **Source Prefix Length** - This is a valid Source IPv6 Prefix to compare against an IPv6 Packet. Prefix is always specified with the Prefix Length. Prefix can be entered in the range of ::0 to FFFF:FFFF:FFFF:FFFF:FFFF:FFFF and Prefix Length can be entered in the range of 0 to 128.
Configuring Quality of Service

- **Source L4 Port** - This lists the keywords for the known source layer 4 ports from which one can be selected. The list includes 'other' as an option for the unnamed ports.

- **Destination Prefix/Length** - This is a valid Destination IPv6 Prefix to compare against an IPv6 Packet. Prefix is always specified with the Prefix Length. Prefix can be entered in the range of ::0 to FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF and Prefix Length can be entered in the range of 0 to 128.

- **Destination L4 Port** - This lists the keywords for the known destination layer 4 ports from which one can be selected. The list includes 'other' as an option for the unnamed ports.

- **Flow Label** - This is a 20-bit number that is unique to an IPv6 Packet, used by end stations to signify Quality of Service handling in routers. Flow Label can be specified in the range of (0 to 1048575).

- **IP DSCP** - This lists the keywords for the known DSCP values from which one can be selected. The list includes 'other' as an option for the remaining values.

5. **Match Criteria** - Displays the configured match criteria for the specified class.

6. **Values** - Displays the values of the configured match criteria.

7. Click **CANCEL** to cancel the configuration on the screen. Resets the data on the screen to the latest value of the switch.

8. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

**Policy Configuration**

Use the Policy Configuration page to associate a collection of classes with one or more policy statements. After creating a Policy, click the policy link to the Policy page.

To display the page, click **QoS > DiffServ > Advanced > Policy Configuration**.

<table>
<thead>
<tr>
<th>Policy Name</th>
<th>Policy Type</th>
<th>Member Class</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy1</td>
<td>In</td>
<td>VoIP</td>
</tr>
</tbody>
</table>

1. Use **Policy Name** to uniquely identify a policy using a case-sensitive alphanumeric string from 1 to 31 characters.

2. **Member Class** - This lists all existing DiffServ classes currently defined as members of the specified Policy, from which one can be selected. This list is automatically updated as a new class is added to or removed from the policy. This field is a selector field only when an existing policy class instance is to be removed. After removal of the policy class instance this becomes a non-configurable field.

3. **Policy Type** - Indicates the type is specific to inbound traffic direction.

4. Click **ADD** to add a new policy to the switch.
5. Click **DELETE** to delete the currently selected policy from the switch.

To configure the policy attributes:

1. Click the name of the policy.

   The policy name is a hyperlink. The following figure shows the configuration fields for the policy.

   ![Policy Class Configuration](image)

2. Select the queue to which packets will of this policy-class will be assigned. This is an integer value in the range 0 to 7.

3. Configure the policy attributes:
   - **Drop** - Select the drop radio button. This flag indicates that the policy attribute is defined to drop every inbound packet.
   - **Mark VLAN CoS** - This is an integer value in the range from 0 to 7 for setting the VLAN priority.
   - **Mark IP Precedence** - This is an IP Precedence value in the range from 0 to 7.
• **Mark IP DSCP** - This lists the keywords for the known DSCP values from which one can be selected. The list includes 'other' as an option for the remaining values.

• **Simple Policy** - Use this attribute to establish the traffic policing style for the specified class. This command uses single data rate and burst size resulting in two outcomes (conform and violate).

4. If you select the **Simple Policy** attribute, you can configure the following fields:

• **Color Mode** - This lists the color mode. The default is 'Color Blind'.
  • Color Blind
  • Color Aware

  **Color Aware** mode requires the existence of one or more color classes that are valid for use with this policy instance. A valid color class contains a single, non-excluded match criterion for one of the following fields (provided the field does not conflict with the classifier of the policy instance itself):
  • CoS
  • IP DSCP
  • IP Precedence

• **Committed Rate** - This value is specified in the range 1 to 4294967295 kilobits-per-second (Kbps).

• **Committed Burst Size** - This value is specified in the range 1 to 128 KBytes. The committed burst size is used to determine the amount of conforming traffic allowed.

• **Conform Action** - This lists the actions to be taken on conforming packets per the policing metrics, from which one can be selected. The default is 'send'.

• **Violate Action** - This lists the actions to be taken on violating packets per the policing metrics, from which one can be selected. The default is 'send'.

  For each of the above Action Selectors one of the following actions can be taken:
  • **Drop** - These packets are immediately dropped.
  • **Mark IP DSCP** - These packets are marked by DiffServ with the specified DSCP value before being presented to the system forwarding element. This selection requires that the DSCP value field be set.
  • **Mark CoS** - These packets are marked by DiffServ with the specified CoS value before being presented to the system forwarding element. This selection requires that the Mark CoS value field be set.
  • **Send** - These packets are presented unmodified by DiffServ to the system forwarding element.
  • **Mark IP Precedence** - These packets are marked by DiffServ with the specified IP Precedence value before being presented to the system forwarding element. This selection requires that the Mark IP Precedence value field be set.

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

6. If you change any of the settings on the page, click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.
Field | Description
---|---
Policy Name | Displays name of the DiffServ policy.
Policy Type | Displays type of the policy as In
Member Class Name | Displays name of each class instance within the policy.

**Service Interface Configuration**

Use the Service Interface Configuration page to activate a policy on an interface.

To display the page, click **QoS** > **DiffServ** > **Advanced** > **Service Interface Configuration**.

To configure DiffServ policy settings on an interface:

1. Use **Interface** to select the interface on which you will configure the DiffServ service.
2. **Policy Name** - Lists all the policy names from which one can be selected. This field is not shown for Read/Write users where inbound service policy attachment is not supported by the platform.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction</td>
<td>Shows that the traffic direction of this service interface is In.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>Shows the operational status of this service interface, either Up or Down.</td>
</tr>
</tbody>
</table>
Service Statistics

This screen displays class-oriented statistical information for the policy, which is specified by the interface and direction. The 'Member Classes' drop down list is populated on the basis of the specified interface and direction and hence the attached policy (if any). Highlighting a member class name displays the statistical information for the policy-class instance for the specified interface and direction.

To display the Service Statistics page, click QoS > DiffServ > Advanced > Service Statistics.

Counter Mode Selector specifies the format of the displayed counter values, which must be either Octets or Packets. The default is 'Octets'.

The following table describes the information available on the Service Statistics page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>List of all valid slot number and port number combinations in the system that have a DiffServ policy currently attached in In direction.</td>
</tr>
<tr>
<td>Direction</td>
<td>List of the traffic direction of interface as In. Only shows the direction(s) for which a DiffServ policy is currently attached.</td>
</tr>
<tr>
<td>Policy Name</td>
<td>Name of the policy currently attached to the specified interface and direction.</td>
</tr>
<tr>
<td>Operational Status</td>
<td>Operational status of the policy currently attached to the specified interface and direction. The value is either Up or Down.</td>
</tr>
<tr>
<td>Member Classes</td>
<td>List of all DiffServ classes currently defined as members of the selected Policy Name. Choose one member class name at a time to display its statistics. If no class is associated with the chosen policy then nothing will be populated in the list.</td>
</tr>
<tr>
<td>Offered Packets/Octets</td>
<td>A count of the total number of packets/octets offered to all class instances in this service policy before their defined DiffServ treatment is applied. This is the overall count per-interface, per-direction.</td>
</tr>
</tbody>
</table>
### Discarded Packets/Octets
A count of the total number of packets/octet discarded for all class instances in this service policy for any reason due to DiffServ treatment. This is the overall count per-interface, per-direction.

### Sent Packets/Octets
A count of the total number of packets/octet forwarded for all class instances in this service policy after their defined DiffServ treatments were applied. In this case, forwarding means the traffic stream was passed to the next functional element in the data path, such as the switching or routing function of an outbound link transmission element. This is the overall count per-interface, per-direction.

<table>
<thead>

Configuring Quality of Service

354

ProSafe M5300 Switch
Managing Device Security

Use the features available from the Security tab to configure management security settings for port, user, and server security. The Security tab contains links to the following features:

- Management Security Settings on page 355
- Configuring Management Access on page 372
- Port Authentication on page 386
- Traffic Control on page 397
- Control on page 414
- Configuring Access Control Lists on page 435

Management Security Settings

From the Management Security Settings page, you can configure the login password, Remote Authorization Dial-In User Service (RADIUS) settings, Terminal Access Controller Access Control System (TACACS+) settings, and authentication lists.

To display the page, click the Security > Management Security tab. The Management Security folder contains links to the following features:

- Local User on page 356
- Enable Password Configuration on page 358
- Line Password Configuration on page 358
- RADIUS on page 359
- Configuring TACACS+ on page 364
- Authentication List Configuration on page 366
- Login Sessions on page 371
Local User

From the Local User link, you can access the following pages:

- *User Management* on page 356
- *User Password Configuration* on page 357

**User Management**

By default, two user accounts exist:

- admin, with Read/Write privileges
- guest, with Read Only privileges

By default, both of these accounts have blank passwords. The names are not case sensitive.

If you logon with a user account with ‘Read/Write’ privileges (i.e. as admin) you can use the User Accounts screen to assign passwords and set security parameters for the default accounts, and to add and delete accounts (other than admin) up to the maximum of six. Only a user with ‘Read/Write’ privileges may alter data on this screen, and only one account may be created with ‘Read/Write’ privileges.

To display the User Management page, click **Security > Management Security > Local User > User Management**.

![User Management](image)

To manage users that have access to the switch management interface:

1. Use **User Name** to enter the name you want to give to the new account. (You can only enter data in this field when you are creating a new account.) User names are up to eight characters in length and are not case sensitive. Valid characters include all the alphanumeric characters as well as the dash (‘-’) and underscore (‘_’) characters. User name “default” is not valid. User names once created cannot be changed/modified.

2. Set the **Edit Password** field to “Enable” only when you want to change the password. The default value is “Disable”.

3. Use **Password** to enter the optional new or changed password for the account. It will not display as it is typed, only asterisks(*) will show. Passwords are up to eight alpha numeric characters in length, and are case sensitive.

4. Use **Confirm Password** to enter the password again, to confirm that you entered it correctly. This field will not display, but will show asterisks (*).
5. **Access Mode** indicates the user's access mode. The admin account always has 'Read/Write' access, and all other accounts have 'Read Only' access.

6. Click **ADD** to add a user account with 'Read Only' access.

7. Click **DELETE** to delete the currently selected user account. This button is only visible when you have selected a user account with 'Read Only' access. You cannot delete the 'Read/Write' user.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lockout Status</td>
<td>Indicates whether the user account is locked out (TRUE or FALSE).</td>
</tr>
<tr>
<td>Password Expiration Date</td>
<td>Indicates the current password expiration date in date format.</td>
</tr>
</tbody>
</table>

**User Password Configuration**

To display the User Password Configuration page, click **Security > Management Security > Local User > User Password Configuration**.

To manage password security for users that have access to the switch management interface:

1. Use **Password Minimum Length** to specify the minimum character length of all new local user passwords.

2. Use **Password Aging (days)** to specify the maximum time that user passwords are valid, in days, from the time the password is set. Once a password expires, the user will be required to enter a new password following the first login after password expiration. A value of 0 indicates that passwords never expire.

3. Use **Password History** to specify the number of previous passwords to store for prevention of password reuse. This ensures that each user does not reuse passwords often. A value of 0 indicates that no previous passwords will be stored.

4. Use **Lockout Attempts** to specify the number of allowable failed local authentication attempts before the user's account is locked. A value of 0 indicates that user accounts will never be locked.
Enable Password Configuration

Use this page to configure a local password to control CLI access to privileged levels. Passwords are a maximum of 64 alphanumeric characters. The password is case sensitive.

To display the Enable Password Configuration page, click Security > Management Security > Enable Password.

To configure the enable password:

1. Use Password to specify a password. Passwords are a maximum of 64 alphanumeric characters.
2. Use Confirm Password to enter the password again, to confirm that you entered it correctly.

Line Password Configuration

Use this page to configure a password to control CLI access to the switch by using one of the following methods:

- Console
- Telnet
- SSH

To display the Line Password Configuration page, click Security > Management Security > Line Password.
To configure the line password:

1. Use **Console Password** to enter the Console password. Passwords are a maximum of 64 alphanumeric characters.

2. Use **Confirm Console Password** to enter the password again, to confirm that you entered it correctly.

3. Use **Telnet Password** to enter the Telnet password. Passwords are a maximum of 64 alphanumeric characters.

4. Use **Confirm Telnet Password** to enter the password again, to confirm that you entered it correctly.
   - The Encrypted option allows the administrator to transfer the privileged EXEC password between devices without having to know the password. The Password field must be exactly 128 hexadecimal characters.

5. Use **SSH Password** to enter the SSH password. Passwords are a maximum of 64 alphanumeric characters.

6. Use **Confirm SSH Password** to enter the password again, to confirm that you entered it correctly.
   - The Encrypted option allows the administrator to transfer the privileged EXEC password between devices without having to know the password. The Password field must be exactly 128 hexadecimal characters.

**RADIUS**

Use this page to configure global settings for the Remote Authorization Dial-In User Service (RADIUS) feature. The device includes a RADIUS client that can contact one or more RADIUS servers to provide additional security for the network. The RADIUS server maintains a user database, which contains per-user authentication information. The switch passes information to the configured RADIUS server, which can authenticate a user name and password before authorizing use of the network. RADIUS servers provide a centralized authentication method for:

- Web Access
- Access Control Port (802.1X)

The RADIUS folder contains links to the following features:

- **Radius Configuration** on page 360
- **RADIUS Server Configuration** on page 361
- **Accounting Server Configuration** on page 363
Radius Configuration

Use the Radius Configuration page to add information about one or more RADIUS servers on the network.

To access the Radius Configuration page, click Security > Management Security > RADIUS > Radius Configuration.

The Current Server IP Address field is blank if no servers are configured (see RADIUS Server Configuration on page 361). The switch supports up to three configured RADIUS servers. If more than one RADIUS servers are configured, the current server is the server configured as the primary server. If no servers are configured as the primary server, the current server is the most recently added RADIUS server.

To configure global RADIUS server settings:

1. In the Max Number of Retransmits field, specify the value of the maximum number of times a request packet is retransmitted to the RADIUS server. The value of the maximum number of times a request packet is retransmitted. The valid range is 1 - 15.

   Consideration to maximum delay time should be given when configuring RADIUS max retransmit and RADIUS time-out. If multiple RADIUS servers are configured, the max retransmit value on each will be exhausted before the next server is attempted. A retransmit will not occur until the configured time-out value on that server has passed without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the sum of (retransmit times time-out) for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces will be blocked until the RADIUS application returns a response.

2. In the Timeout Duration field, specify the time-out value, in seconds, for request retransmissions. The valid range is 1 - 30.

   Consideration to maximum delay time should be given when configuring RADIUS max retransmit and RADIUS time-out. If multiple RADIUS servers are configured, the max retransmit value on each will be exhausted before the next server is attempted. A retransmit will not occur until the configured time-out value on that server has passed without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the sum of (retransmit times time-out) for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces will be blocked until the RADIUS application returns a response.
all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces will be blocked until the RADIUS application returns a response.

3. From the **Accounting Mode** menu, select whether the RADIUS accounting mode is enabled or disabled on the current server.

4. Use **RADIUS Attribute 4** to enable or disable RADIUS attribute 4. Default value is Disable.
   This is an optional field and can be seen only when RADIUS attribute 4 is enabled. It takes IP address value in the format (xx.xx.xx.xx).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Server Address</td>
<td>The Address of the current server. This field is blank if no servers are configured.</td>
</tr>
<tr>
<td>Number of Configured Servers</td>
<td>The number of RADIUS servers that have been configured. This value will be in the range of 0 and 3.</td>
</tr>
</tbody>
</table>

**RADIUS Server Configuration**

Use the RADIUS Server Configuration page to view and configure various settings for the current RADIUS server configured on the system.

To access the RADIUS Server Configuration page, click **Security > Management Security > RADIUS > Server Configuration** link.

To configure a RADIUS server:

1. To add a RADIUS server, specify the settings the following list describes, and click **ADD**.
   - In the **Radius Server IP Address** field, specify the IP address of the RADIUS server to add.
   - In the **Radius Server Name** field, specify the Name of the server being added.
   - Use **Port** to specify the UDP port used by this server. The valid range is 0 - 65535.
   - **Secret Configured** - The Secret will only be applied if this option is "yes". If the option is "no", anything entered in the Secret field will have no affect and will not be retained.
   - Use **Secret** to specify the shared secret for this server.
   - Use **Primary Server** to set the selected server to the Primary or Secondary server.
   - Use **Message Authenticator** to enable or disable the message authenticator attribute for the selected server.
2. Click **ADD** to add a new server to the switch. This button is only available to READWRITE users. These changes will not be retained across a power cycle unless a save is performed.

3. Click **DELETE** to remove the selected server from the configuration. This button is only available to READWRITE users. These changes will not be retained across a power cycle unless a save is performed.

<table>
<thead>
<tr>

<tr>
<td>Pending Requests</td>
<td>The number of RADIUS Access-Request packets destined for this server that have not yet timed out or received a response.</td>
</tr>
<tr>
<td>Timeouts</td>
<td>The number of authentication timeouts to this server.</td>
</tr>
</tbody>
</table>
Accounting Server Configuration

Use the RADIUS Accounting Server Configuration page to view and configure various settings for one or more RADIUS accounting servers on the network.

To access the RADIUS Accounting Server Configuration page, click Security > Management Security > RADIUS > Accounting Server Configuration.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unknown Types</td>
<td>The number of RADIUS packets of unknown type which were received from this server on the authentication port.</td>
</tr>
<tr>
<td>Packets Dropped</td>
<td>The number of RADIUS packets received from this server on the authentication port and dropped for some other reason.</td>
</tr>
</tbody>
</table>

To configure the RADIUS accounting server:

1. In the Accounting Server IP Address field, specify the IP address of the RADIUS accounting server to add.
2. In the Accounting Server Name field, enter the Name of the accounting server to add.
3. In the Port field, specify the UDP port number the server uses to verify the RADIUS accounting server authentication. The valid range is 0–65535. If the user has READONLY access, the value is displayed but cannot be changed.
4. From the Secret Configured menu, select Yes to add a RADIUS secret in the next field. You must select Yes before you can configure the RADIUS secret. After you add the RADIUS accounting server, this field indicates whether the shared secret for this server has been configured.
5. In the Secret field, type the shared secret to use with the specified accounting server.
6. From the Accounting Mode menu, enable or disable the RADIUS accounting mode.
7. To delete a configured RADIUS Accounting server, click DELETE.

The following table describes RADIUS accounting server statistics available on the page.

Click CLEAR COUNTERS to clear the accounting server statistics.
### Configuring TACACS+

TACACS+ provides a centralized user management system, while still retaining consistency with RADIUS and other authentication processes. TACACS+ provides the following services:

- **Authentication**: Provides authentication during login and via user names and user-defined passwords.
- **Authorization**: Performed at login. When the authentication session is completed, an authorization session starts using the authenticated user name. The TACACS+ server checks the user privileges.

The TACACS+ protocol ensures network security through encrypted protocol exchanges between the device and TACACS+ server.
The TACACS+ folder contains links to the following features:

- Configuring TACACS+ on page 364
- TACACS+ Server Configuration on page 365

**TACACS+ Configuration**

The TACACS+ Configuration page contains the TACACS+ settings for communication between the switch and the TACACS+ server you configure via the inband management port.

To display the TACACS+ Configuration page, click **Security > Management Security > TACACS+ > TACACS+ Configuration**.

To configure global TACACS+ settings:

1. In the **Key String** field, specify the authentication and encryption key for TACACS+ communications between the Managed Switch and the TACACS+ server. The valid range is 0–128 characters. The key must match the key configured on the TACACS+ server.
2. In the **Connection Timeout** field, specify the maximum number of seconds allowed to establish a TCP connection between the Managed Switch and the TACACS+ server.
3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
4. If you make any changes to the page, click **APPLY** to apply the new settings to the system.

**TACACS+ Server Configuration**

Use the TACACS+ Server Configuration page to configure up to five TACACS+ servers with which the switch can communicate.

To display the TACACS+ Server Configuration page, click **Security > Management Security > TACACS+ > TACACS+ Server Configuration**.
To configure TACACS+ server settings:

1. Use **TACACS+ Server** to enter the configured TACACS+ server IP address.
2. Use **Priority** to specify the order in which the TACACS+ servers are used. It should be within the range 0-65535.
3. Use **Port** to specify the authentication port. It should be within the range 0-65535.
4. Use **Key String** to specify the authentication and encryption key for TACACS+ communications between the device and the TACACS+ server. The valid range is 0-128 characters. The key must match the encryption used on the TACACS+ server.
5. Use **Connection Timeout** to specify the amount of time that passes before the connection between the device and the TACACS+ server time out. The range is between 1-30.
6. Click **ADD** to add a new server to the switch. This button is only available to READWRITE users. These changes will not be retained across a power cycle unless a save is performed.
7. Click **DELETE** to delete the selected server from the configuration.

**Authentication List Configuration**

The Authentication List folder contains links to the following features:

- **Login Authentication List** on page 366
- **Enable Authentication List** on page 367
- **Dot1x Authentication List** on page 369
- **HTTP Authentication List** on page 369
- **HTTPS Authentication List** on page 370

**Login Authentication List**

You use this page to configure login lists. A login list specifies the authentication method(s) you want to be used to validate switch or port access for the users associated with the list. The pre-configured users, admin and guest, are assigned to a pre-configured list named defaultList, which you may not delete. All newly created users are also assigned to the defaultList until you specifically assign them to a different list.

To display the Login Authentication List page, click **Security > Management Security > Authentication List > Login Authentication List**.
To configure the authentication lists for access to the switch management interface:

1. **List Name** - If you are creating a new login list, enter the name you want to assign. It can be up to 15 alphanumeric characters long and is not case sensitive.

2. Use the drop-down menu to select the method that should appear *first* in the selected authentication login list. If you select a method that does not time out as the first method, such as *local* no other method will be tried, even if you have specified more than one method. The options are:
   - **Local** — The user's locally stored ID and password will be used for authentication.
   - **Radius** — The user's ID and password will be authenticated using the RADIUS server instead of locally.
   - **Line** — The line password will be used for authentication.
   - **Enable** — The privileged EXEC password will be used for authentication.
   - **Tacacs** — The user's ID and password will be authenticated using the TACACS+ server.
   - **None** — The user will not be authenticated.

3. Use the drop-down menu to select the method, if any, that should appear *second* in the selected authentication login list. This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. Note that this parameter will not appear when you first create a new login list.

4. Use the drop-down menu to select the method, if any, that should appear *third* in the selected authentication login list.

5. Click **ADD** to add a new login list to the switch.

6. Click **DELETE** to remove the selected authentication login list from the configuration. The delete will fail if the selected login list is assigned to any user (including the default user) for system login. You can only use this button if you have Read/Write access. The change will not be retained across a power cycle unless you perform a save.

### Enable Authentication List

Use this page to configure the *enable* access methods for Privileged EXEC-level management access to the CLI by using a console connection or a telnet or SSH session. In Privileged EXEC mode, read-write users have access to all CLI commands. The pre-configured users, admin and guest, are assigned to a pre-configured list named defaultList, which you may not delete. All newly created users are also assigned to the defaultList until you specifically assign them to a different list.

To display the Enable Authentication List page, click **Security > Management Security > Authentication List > Enable Authentication List.**
To configure authentication list methods for *enable* access:

1. **List Name** - If you are creating a new enable list, enter the name you want to assign. It can be up to 15 alphanumeric characters long and is not case sensitive.

2. Use the drop-down menu to select the method that should appear first in the selected authentication login list. If you select a method that does not time out as the first method, such as 'local' no other method will be tried, even if you have specified more than one method. The options are:
   - **Radius** - The user’s ID and password will be authenticated using the RADIUS server instead of locally.
   - **Line** - The line password will be used for authentication.
   - **Enable** - The privileged EXEC password will be used for authentication.
   - **Tacacs** - The user’s ID and password will be authenticated using the TACACS+ server.
   - **None** - The user will not be authenticated.
   - **Deny** - Authentication will be denied always.

3. Use the drop-down menu to select the method, if any, that should appear second in the selected authentication login list. This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. Note that this parameter will not appear when you first create a new login list.

4. Use the drop-down menu to select the method, if any, that should appear third in the selected authentication login list.

5. Click **ADD** to add a new login list to the switch.

6. Click **DELETE** to remove the selected authentication enable list from the configuration. You can only use this button if you have Read/Write access. The change will not be retained across a power cycle unless you perform a save.
Managing Device Security

Dot1x Authentication List

You use this page to configure IEEE 802.1X (Dot1x) lists. Dot1x controls port-based access to the network through a switch port that is controlled by IEEE 802.1X. A dot1x list specifies the authentication method(s) you want to be used to validate port access for the users associated with the list. Only one dot1x method can be supported.

To display the Dot1x Authentication List page, click Security > Management Security > Authentication List > Dot1x Authentication List.

To configure authentication list method for Dot1x access:

1. **List Name** - Select the dot1x list name for which you want to configure data.
2. Use the drop-down menu to select the method that should appear first in the selected authentication login list. The options are:
   * **Local** - The user's locally stored ID and password will be used for authentication.
   * **Radius** - The user's ID and password will be authenticated using the RADIUS server instead of locally.
   * **None** - The user will not be authenticated.
3. Click **APPLY** to update the switch with the new settings.
4. Click **CANCEL** to abandon the changes.

HTTP Authentication List

You use this page to configure HTTP lists. Configuring this list affects management-level access to the web-based user interface by using HTTP.

To display the HTTP Authentication List page, click Security > Management Security > Authentication List > HTTP Authentication List.

Managing Device Security

369
To configure authentication list methods for HTTP access:

1. **List Name** - Select the HTTP list name for which you want to configure data.
2. Use the drop-down menu to select the method that should appear first in the selected authentication login list. If you select a method that does not time out as the first method, such as 'local' no other method will be tried, even if you have specified more than one method. The options are:
   - **Local** - The user's locally stored ID and password will be used for authentication.
   - **Radius** - The user's ID and password will be authenticated using the RADIUS server instead of locally.
   - **Tacacs** - The user's ID and password will be authenticated using the TACACS+ server.
   - **None** - The user will not be authenticated.
3. Use the drop-down menu to select the method, if any, that should appear second in the selected authentication login list. This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. Note that this parameter will not appear when you first create a new login list.
4. Use the drop-down menu to select the method, if any, that should appear third in the selected authentication login list.

**HTTPS Authentication List**

You use this page to configure HTTPS lists. This list specifies the authentication method(s) you want used to control management-level access to the web-based user interface by using secure HTTP.

To display the HTTPS Authentication List page, click **Security > Management Security > Authentication List > HTTPS Authentication List**.

![HTTPS Authentication List](https://example.com/image.png)

To configure authentication list methods for HTTPS access:

1. **List Name** - Select the HTTPS list name for which you want to configure data.
2. Use the drop-down menu to select the method that should appear first in the selected authentication login list. If you select a method that does not time out as the first method, such as 'local' no other method will be tried, even if you have specified more than one method. The options are:
   - **Local** - The user's locally stored ID and password will be used for authentication.
   - **Radius** - The user's ID and password will be authenticated using the RADIUS server instead of locally.
**Tacacs** - The user's ID and password will be authenticated using the TACACS+ server.

**None** - The user will not be authenticated.

3. Use the drop-down menu to select the method, if any, that should appear second in the selected authentication login list. This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. Note that this parameter will not appear when you first create a new login list.

4. Use the drop-down menu to select the method, if any, that should appear third in the selected authentication login list.

**Login Sessions**

This page identifies the users that are logged in to the management interface of the device. The page also provides information about their connections.

To display the Login Sessions page, click Security > Management Security > Login Sessions.

<table>
<thead>
<tr>

Configuring Management Access

From the Access page, you can configure HTTP and Secure HTTP access to the ProSafe M5300 management interface.

The Security > Access tab contains the following folders:

- HTTP on page 372
- HTTPS Configuration on page 373
- SSH on page 377
- Telnet on page 380
- Console Port on page 381
- Denial of Service on page 382
- Access Control on page 384

HTTP

From the HTTP link, you can access the following pages:

- HTTP Configuration on page 372

HTTP Configuration

To access the switch over a web you must first configure it with IP information (IP address, subnet mask, and default gateway). You can configure the IP information using any of the following:

- BOOTP
- DHCP
- Terminal interface via the EIA-232 port

Once you have established in-band connectivity, you can change the IP information using a Web-based management.

To access the HTTP Configuration page, click Security > Access > HTTP > HTTP Configuration.
To configure the HTTP server settings:

1. **Use HTTP Access** to specify whether the switch may be accessed from a web browser. If you choose to enable web mode you will be able to manage the switch from a web browser. The factory default is enabled.

2. **Use Java Mode** to enable or disable the java applet that displays a picture of the switch at the top right of the screen. If you run the applet you will be able to click on the picture of the switch to select configuration screens instead of using the navigation tree at the left side of the screen. The factory default is disabled.

3. **Use HTTP Session Soft Timeout (Minutes)** to set the inactivity time-out for HTTP sessions. The value must be in the range of (1 to 60) minutes. The default value is 5 minutes. The currently configured value is shown when the web page is displayed.

4. **Use HTTP Session Hard Timeout (Hours)** to set the hard time-out for HTTP sessions. This time-out is unaffected by the activity level of the session. The value must be in the range of (1 to 168) hours. The default value is 24 hours. The currently configured value is shown when the web page is displayed.

5. **Use Maximum Number of HTTP Sessions** to set the maximum allowable number of HTTP sessions. The value must be in the range of (0 to 16). The default value is 16. The currently configured value is shown when the web page is displayed.

<table>
<thead>
<tr>

</tbody>
</table>

**HTTPS**

From the HTTPS link, you can access the following pages:

- **HTTPS Configuration** on page 373
- **Certificate Management** on page 375
- **Certificate Download** on page 375

**HTTPS Configuration**

Secure HTTP enables the transmission of HTTP over an encrypted Secure Sockets Layer (SSL) or Transport Layer Security (TLS) connection. When you manage the switch by using a Web interface, secure HTTP can help ensure that communication between the management system and the switch is protected from eavesdroppers and man-in-the-middle attacks.

Use the Secure HTTP Configuration page to configure the settings for HTTPS communication between the management station and the switch.

To display the Secure HTTP Configuration page, click Security > Access > HTTPS > HTTPS Configuration.
To configure HTTPS settings:

1. Use **HTTPS Admin Mode** to Enable or Disable the Administrative Mode of Secure HTTP. The currently configured value is shown when the web page is displayed. The default value is Disable. You can only download SSL certificates when the HTTPS Admin mode is disabled.

2. Use **SSL Version 3** to Enable or Disable Secure Sockets Layer Version 3.0. The currently configured value is shown when the web page is displayed. The default value is Enable.

3. Use **TLS Version 1** to Enable or Disable Transport Layer Security Version 1.0. The currently configured value is shown when the web page is displayed. The default value is Enable.

4. Use **HTTPS Port** to set the HTTPS Port Number. The value must be in the range of 1 to 65535. Port 443 is the default value. The currently configured value is shown when the web page is displayed.

5. Use **HTTPS Session Soft Timeout (Minutes)** to set the inactivity time-out for HTTPS sessions. The value must be in the range of (1 to 60) minutes. The default value is 5 minutes. The currently configured value is shown when the web page is displayed.

6. Use **HTTPS Session Hard Timeout (Hours)** to set the hard time-out for HTTPS sessions. This time-out is unaffected by the activity level of the session. The value must be in the range of (1 to 168) hours. The default value is 24 hours. The currently configured value is shown when the web page is displayed.

7. Use **Maximum Number of HTTPS Sessions** to set the maximum allowable number of HTTPS sessions. The value must be in the range of (0 to 16). The default value is 16. The currently configured value is shown when the web page is displayed.

<table>

</tr>
</tbody>
</table>
Certificate Management

Use this menu to generate or delete certificates.

To display the Certificate Management page, click Security  >  Access  >  HTTPS  > HTTPS Certificate Management.

To manage certificates:

1. Use None to specify there is no certificate management. This is the default selection.
2. Use Generate Certificates to begin generating the Certificate files.
3. Use DELETE Certificates to delete the corresponding Certificate files, if present.

<table>
<thead>
<tr>

<td>Certificate Generation Status</td>
<td>Displays whether SSL certificate generation is in progress.</td>
</tr>
</tbody>
</table>

Certificate Download

Use this menu to transfer a certificate file to the switch.

For the Web server on the switch to accept HTTPS connections from a management station, the Web server needs a public key certificate. You can generate a certificate externally (for example, off-line) and download it to the switch.

To display the Certificate Download page, click Security  >  Access> HTTPS  > Certificate Download.

Downloading SSL Certificates

Before you download a file to the switch, the following conditions must be true:

- The file to download from the TFTP server is on the server in the appropriate directory.
- The file is in the correct format.
- The switch has a path to the TFTP server.
To configure the certificate download settings for HTTPS sessions:

1. Use **File Type** to specify the type of file you want to transfer:
   - SSL Trusted Root Certificate PEM File - SSL Trusted Root Certificate File (PEM Encoded)
   - SSL Server Certificate PEM File - SSL Server Certificate File (PEM Encoded)
   - SSL DH Weak Encryption Parameter PEM File - SSL Diffie-Hellman Weak Encryption Parameter File (PEM Encoded)
   - SSL DH Strong Encryption Parameter PEM File - SSL Diffie-Hellman Strong Encryption Parameter File (PEM Encoded)

2. Use **Transfer Mode** to specify the protocol to use to transfer the file:
   - TFTP - Trivial File Transfer Protocol
   - SFTP - Secure File Transfer Program
   - SCP - Secure Copy

3. Use **Server Address Type** to specify either IPv4 or IPv6 to indicate the format of the TFTP/SFTP/SCP Server Address field. The factory default is IPv4.

4. Use **Server Address** to enter the IP address of the server in accordance with the format indicated by the Server Address Type. The factory default is the IPv4 address 0.0.0.0.

5. Use **Remote File Name** to enter the name on the TFTP server of the file you want to download. You may enter up to 32 characters. The factory default is blank.
SSH

From the SSH link, you can access the following pages:

- SSH Configuration on page 377
- Host Keys Management on page 378
- Host Keys Download on page 379

SSH Configuration

To display the SSH Configuration page, click Security > Access > SSH > SSH Configuration.

To configure the SSH client settings on the switch:

1. Use SSH Admin Mode to Enable or Disable the administrative mode of SSH. The currently configured value is shown when the web page is displayed. The default value is Disable.
2. Use SSH Version 1 to Enable or Disable Protocol Level 1 for SSH. The currently configured value is shown when the web page is displayed. The default value is Enable.
3. Use SSH Version 2 to Enable or Disable Protocol Level 2 for SSH. The currently configured value is shown when the web page is displayed. The default value is Enable.
4. Use SSH Session Timeout to configure the inactivity time-out value for incoming SSH sessions to the switch. The acceptable range for this value is (1-160) minutes.
5. Use Maximum Number of SSH Sessions to configure the maximum number of inbound SSH sessions allowed on the switch. The currently configured value is shown when the web page is displayed. The range of acceptable values for this field is (0-5).
6. Use Login Authentication List to select an authentication list from the pull down menu. This list is used to authenticate users who try to login the switch.
7. Use Enable Authentication List to select an authentication list from the pull down menu. This list is used to authenticate users who try to get "enable" level privilege.
8. Click REFRESH to refresh the web page to show the latest SSH Sessions.
Host Keys Management

Use this menu to generate or delete RSA and DSA keys.

To display the Host Keys Management page, click Security > Access > SSH > Host Keys Management.

To configure the SSH host key information:

1. **Host Keys Management** - None is the default selection.
2. Use **Generate RSA Keys** to begin generating the RSA host keys. Note that to generate SSH key files SSH must be administratively disabled and there can be no active SSH sessions.
3. Use **DELETE RSA Keys** to delete the corresponding RSA key file, if it is present.
4. **DSA Keys Management** - None is the default selection.
5. Use **Generate DSA Keys** to begin generating the DSA host keys. Note that to generate SSH key files SSH must be administratively disabled and there can be no active SSH sessions.
6. Use **DELETE DSA Keys** to delete the corresponding DSA key file, if it is present.
7. Click **APPLY** to start to download the Host Key file. Note that to download SSH key files SSH must be administratively disabled and there can be no active SSH sessions.
8. Click **REFRESH** to refresh the web page to show the latest SSH Sessions.
### Managing Device Security

#### Host Keys Download

Use this page to transfer a host key file to the switch from a remote host.

To display the Host Keys Download page, click **Security > Access > SSH > Host Keys Download**.

To download an SSH host key to the switch:

1. Use **File Type** to specify the type of file you want to transfer:
   - **SSH-1 RSA Key File** - SSH-1 Rivest-Shamir-Adleman (RSA) Key File
   - **SSH-2 RSA Key PEM File** - SSH-2 Rivest-Shamir-Adleman (RSA) Key File (PEM Encoded)
   - **SSH-2 DSA Key PEM File** - SSH-2 Digital Signature Algorithm (DSA) Key File (PEM Encoded)

2. Use **Transfer Mode** to specify the protocol to use to transfer the file:
   - **TFTP** - Trivial File Transfer Protocol
   - **SFTP** - Secure File Transfer Program
   - **SCP** - Secure Copy

3. Use **Server Address Type** to specify either IPv4 or IPv6 to indicate the format of the TFTP/SFTP/SCP Server Address field. The factory default is IPv4.

4. Use **Server Address** to enter the IP address of the server in accordance with the format indicated by the Server Address Type. The factory default is the IPv4 address 0.0.0.0.

5. Use **Remote File Name** to enter the name on the TFTP server of the file you want to download. You may enter up to 32 characters. The factory default is blank.

6. Click **APPLY** to start to download the Host Key file. Note that to download SSH key files SSH must be administratively disabled and there can be no active SSH sessions.
Telnet

To display the Telnet page, click Security > Access > Telnet.

Telnet Authentication List

This page allows you to select the login and enable authentication list available. The login list specifies the authentication method(s) you want used to validate switch or port access for the users associated with the list. The enable list specifies the authentication method(s) you want used to validate privileged EXEC access for the users associated with the list. These list can be created by Authentication List page under Management Security.

1. Use Login Authentication List to specify which authentication list to use when you login through telnet. The default value is networkList.
2. Use Enable Authentication List to specify which authentication list you are using when going into the privileged EXEC mode. The default value is enableList.

Inbound Telnet Configuration

This page regulates new telnet sessions. If Allow New Telnet Sessions are enabled, new inbound telnet sessions can be established until there are no more sessions available. If Allow New Telnet Sessions are disabled, no new inbound telnet sessions are established. An established session remains active until the session is ended or an abnormal network error ends the session.

1. Use Allow New Telnet Sessions to specify whether the new Inbound Telnet session is Enabled or Disabled. Default value is Enabled.
2. Use Session Timeout to specify how many minutes of inactivity should occur on a telnet session before the session is logged off. You may enter any number from 1 to 160. The factory default is 5.
3. Use Maximum Number of Sessions to select how many simultaneous telnet sessions will be allowed. The maximum is 5, which is also the factory default.
4. Current Number of Sessions - Displays the number of current sessions.
Outbound Telnet Client Configuration

This page regulates new outbound telnet connections. If Allow New Telnet Sessions are enabled, new outbound telnet sessions can be established until there are no more sessions available. If Allow New Telnet Sessions are disabled, no new outbound telnet sessions are established. An established session remains active until the session is ended or an abnormal network error ends the session.

1. Use **Allow New Telnet Sessions** to specify whether the new Outbound Telnet Session is Enabled or Disabled. Default value is Enabled.

2. Use **Maximum Number of Sessions** to specify the maximum number of Outbound Telnet Sessions allowed. Default value is 5. Valid Range is (0 to 5).

3. Use **Session Timeout** to specify the Outbound Telnet login inactivity time-out. Default value is 5. Valid Range is (1 to 160).

4. **Current Number of Sessions** - Displays the number of current sessions.

Console Port

To display the Console Port page, click **Security > Access > Console Port**.

To configure console port settings:

1. Use **Serial Port Login Timeout (minutes)** to specify how many minutes of inactivity should occur on a serial port connection before the switch closes the connection. Enter a number between 0 and 160: the factory default is 5. Entering 0 disables the time-out.

2. Use **Baud Rate (bps)** to select the default baud rate for the serial port connection from the pull-down menu. You may choose from 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200 baud. The factory default is 9600 baud.

3. Use **Login Authentication List** to specify which authentication list to use when you login through Telnet. The default value is defaultList.

4. Use **Enable Authentication List** to specify which authentication list you are using when going into the privileged EXEC mode. The default value is enableList.
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Character Size (bits)</td>
<td>The number of bits in a character. This is always 8.</td>
</tr>
<tr>
<td>Flow Control</td>
<td>Whether hardware flow control is enabled or disabled. It is always disabled.</td>
</tr>
<tr>
<td>Stop Bits</td>
<td>The number of stop bits per character. Its is always 1.</td>
</tr>
<tr>
<td>Parity</td>
<td>The parity method used on the serial port. It is always None.</td>
</tr>
</tbody>
</table>

## Denial of Service

Use this page to configure settings that help prevent Denial of Service (DoS) attacks against the network. The switch provides support for classifying and blocking several types of DoS attacks.

To display the Denial of Service page, click **Security > Access > Denial of Service**.

### Denial of Service Configuration

- **Denial of Service Min TCP Header Size**: Use to specify the minimum TCP header size allowed. If First Fragment DoS prevention is enabled, the device will drop packets that have a TCP header smaller than this configured value. First Fragment DoS prevention is disabled by default.

- **Denial of Service ICMPv4**: Use to enable ICMPv4 DoS prevention causing the switch to drop ICMP packets that have a type set to ECHO_REQ (ping) and a size greater than the configured ICMP Pkt Size. The factory default is disabled.

To configure protection from DoS attacks:

1. **Use Denial of Service Min TCP Header Size** to specify the minimum TCP header size allowed. If First Fragment DoS prevention is enabled, the device will drop packets that have a TCP header smaller than this configured value. First Fragment DoS prevention is disabled by default.

2. **Use Denial of Service ICMPv4** to enable ICMPv4 DoS prevention causing the switch to drop ICMP packets that have a type set to ECHO_REQ (ping) and a size greater than the configured ICMP Pkt Size. The factory default is disabled.
3. Use **Denial of Service Max ICMP Packet Size** to specify the Max ICMPv4 Packet Size allowed (This includes the ICMP header size of 8 bytes). If ICMP DoS prevention is enabled, the switch will drop ICMP ping packets that have a size greater than this configured Max ICMP Packet Size minus the ICMP header size of 8 bytes. The factory default is 512.

4. Use **Denial of Service ICMPv6** to enable ICMPv6 DoS prevention causing the switch to drop ICMP packets that have a type set to ECHO_REQ (ping) and a size greater than the configured ICMP Pkt Size. The factory default is disabled.

5. Use **Denial of Service Max ICMPv6 Packet Size** to specify the Max ICMPv4 Packet Size allowed (This includes the ICMP header size of 8 bytes). If ICMP DoS prevention is enabled, the switch will drop ICMP ping packets that have a size greater than this configured Max ICMP Packet Size minus the ICMP header size of 8 bytes. The factory default is 512.

6. Use **Denial of Service First Fragment** to enable First Fragment DoS prevention causing the switch to check DoS options on first fragment IP packets when switch are receiving fragmented IP packets. Otherwise, switch ignores the first fragment IP packages. The factory default is disabled.

7. Use **Denial of Service ICMP Fragment** to cause the switch to drop ICMP Fragmented packets. The factory default is disabled.

8. Use **Denial of Service SIP=DIP** to enable SIP=DIP DoS prevention causing the switch to drop packets that have a source IP address equal to the destination IP address. The factory default is disabled.

9. Enable **Denial of Service SMAC=DMAC** to cause the switch to drop packets where the source MAC address = Destination MAC address.

10. Enable **Denial of Service TCP FIN & URG & PSH** to cause the switch to drop packets where the TCP Flags FIN and URG and PSH set and TCP Sequence Number = 0.

11. Enable **Denial of Service TCP Flag & Sequence** to cause the switch to drop packets where the TCP Flag SYN set and Source Port < 1024 or TCP Control Flags = 0 and TCP Sequence Number = 0 or TCP Flags FIN, URG, and PSH set and TCP Sequence Number = 0 or TCP Flags SYN and FIN set.

12. Enable **Denial of Service TCP Fragment** to allow the switch to drop packets that have a TCP payload where the IP payload length minus the IP header size is less than the minimum allowed TCP header size. The factory default is disabled.

13. Enable **Denial of Service TCP Offset** to cause the switch to drop packets where the TCP Header Offset = 1.

14. Enable **Denial of Service TCP Port** to cause the switch to drop packets where the TCP source port equal to TCP destination port. The factory default is disabled.

15. Enable **Denial of Service TCP SYN** to cause the switch to drop packets where the TCP Flag SYN set.

16. Enable **Denial of Service TCP SYN & FIN** to cause the switch to drop packets where the TCP Flags SYN and FIN set.

17. Enable **Denial of Service UDP Port** to cause the switch to drop packets that have UDP source port equal to UDP destination port. The factory default is disabled.

18. Click **APPLY** to update the switch with the new settings.

19. Click **CANCEL** to abandon the changes.
Access Control

The Access Control feature allows you to configure settings that control management access to the switch. Access Control configure requires three steps:

1. Use the Access Profile Configuration page to create an access profile. To add rules to the profile, the access profile must be deactivated, which is the default setting.
2. Use the Access Rule Configuration page to add one or more access rules to the profile.
3. Return to the Access Profile Configuration page to activate the profile.

The access profile is similar to an access control list (ACL) in that you can add multiple rules to the profile that permit or deny access to the switch by protocols transmitted by specific IP addresses.

From the Access Control link, you can access the following pages:

- Access Profile Configuration on page 384
- Access Rule Configuration on page 385

Access Profile Configuration

Use this page to create an access profile, control the administrative mode of the profile, and view summary information about the profile.

To access the Access Profile Configuration page, click Security > Access, and then click the Access Control > Access Profile Configuration link.

In the following figure, a profile called administrators has been created, and one rule has been added to the profile.

To create an Access Profile:

1. In the Access Profile Name field, specify the name of the access profile to be added. The maximum length is 32 characters.
2. To activate an access profile, select the Activate Profile check box. You cannot add rules to an active profile.
3. To deactivate an access profile, select the Deactivate Profile check box.
4. To remove an access profile, select the **Remove Profile** check box. The access profile should be deactivated before removing the access profile.

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

6. If you make changes to the page, click **APPLY** to apply the changes to the system.

The Profile Summary table shows the rules that are configured for the profile, as the following table describes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Type</td>
<td>Identifies the action the rule takes, which is either Permit or Deny.</td>
</tr>
<tr>
<td>Service Type</td>
<td>Displays the type of service to allow or prohibit from accessing the switch management interface:</td>
</tr>
<tr>
<td></td>
<td>• SNMP</td>
</tr>
<tr>
<td></td>
<td>• HTTP</td>
</tr>
<tr>
<td></td>
<td>• HTTPS</td>
</tr>
<tr>
<td>Source IP Address</td>
<td>Displays the IP Address of the client that may or may not originate management traffic.</td>
</tr>
<tr>
<td>Mask</td>
<td>Displays the subnet mask associated with the IP address.</td>
</tr>
<tr>
<td>Priority</td>
<td>Displays the priority of the rule. The rules are validated against the incoming management request in the ascending order of their priorities. If a rule matches, action is performed and subsequent rules below are ignored.</td>
</tr>
</tbody>
</table>

Click **REFRESH** to update the page with the most current information.

**Access Rule Configuration**

Use the Access Rule Configuration page to configure the rules about what systems can access the ProSafe M5300 Web interface and what protocols are allowed.

To access the Access Rule Configuration page, click **Security > Access**, and then click the **Access Control > Access Rule Configuration link**.

Before you create access rules, make sure:

- An access profile exists.
- The access profile is deactivated.

To configure access profile rules:
1. To add an access profile rule, configure the following settings and click **Add**.
   - **Rule Type**: Specify whether the rule permits or denies access to the ProSafe M5300 management interface.
     - Select **Permit** to allow access to the management interface for traffic that meets the criteria you configure for the rule. Any traffic that does not meet the rules is denied.
     - Select **Deny** to prohibit access to the management interface for traffic that meets the criteria you configure for the rule. Any traffic that does not meet the rules is allowed access to the switch. Unlike MAC ACLs and IP ACLs, there is no implied **deny all** rule at the end of the rule list.
   - **Service Type**: Select the type of service to allow or prohibit from accessing the switch management interface:
     - SNMP
     - HTTP
     - HTTPS
   - **Source IP Address**: Specify the IP Address of the client originating the management traffic.
     - **Mask**: Specify the subnet mask associated with the IP address. The subnet mask is a standard subnet mask, and **not** an inverse (wildcard) mask that you use with IP ACLs.
   - **Priority**: Configure priority to the rule. The rules are validated against the incoming management request in the ascending order of their priorities. If a rule matches, action is performed and subsequent rules below are ignored. For example, if a Source IP 10.10.10.10 is configured with priority 1 to permit, and Source IP 10.10.10.10 is configured with priority 2 to Deny, then access is permitted if the profile is active, and the second rule is ignored.

2. To modify an access rule, select the check box next to the Rule Type, update the desired settings, and click **APPLY**

3. To delete an access rule, select the check box next to the Rule Type, and click **DELETE**.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

### Port Authentication

In port-based authentication mode, when 802.1X is enabled globally and on the port, successful authentication of any one supplicant attached to the port results in all users being able to use the port without restrictions. At any given time, only one supplicant is allowed to attempt authentication on a port in this mode. Ports in this mode are under bidirectional control. This is the default authentication mode.

The 802.1X network has three components:

- **Authenticators** - Specifies the port that is authenticated before permitting system access.
- **Supplicants** - Specifies the host connected to the authenticated port requesting access to the system services.
- **Authentication Server** - Specifies the external server, for example, the RADIUS server that performs the authentication on behalf of the authenticator, and indicates whether the user is authorized to access system services.

From the Port Authentication link, you can access the following pages:

- *Basic* on page 387
- *Advanced* on page 389

**Basic**

From the Basic link, you can access the following pages:

- *802.1X Configuration* on page 387

**802.1X Configuration**

Use the 802.1X Configuration page to enable or disable port access control on the system. To display the 802.1X Configuration page, click **Security > Port Authentication > Basic > 802.1X Configuration**.

To configure global 802.1X settings:

1. Select the appropriate radio button in the **Port Based Authentication State** field to enable or disable 802.1X administrative mode on the switch.
   - **Enable**. Port-based authentication is permitted on the switch.
**Note:** If 802.1X is enabled, authentication is performed by a RADIUS server. This means the primary authentication method must be RADIUS. To set the method, go to **Security > Management Security > Authentication List** and select RADIUS as method 1 for defaultList. For more information, see “Authentication List Configuration” on page 6-366.

- **Disable** - The switch does not check for 802.1X authentication before allowing traffic on any ports, even if the ports are configured to allow only authenticated users. Default value.

2. Use **VLAN Assignment Mode** to select one of options for VLAN Assignment mode: enable and disable. The default value is disable.

3. Use **Users** to select the user name that will use the selected login list for 802.1x port security.

4. Use **Login** to select the login to apply to the specified user. All configured logins are displayed.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication List</td>
<td>Displays the authentication list which is used by 802.1X.</td>
</tr>
</tbody>
</table>
Advanced

From the Advanced link, you can access the following pages:

- 802.1X Configuration on page 389
- Port Authentication on page 390
- Port Summary on page 393
- Client Summary on page 396

802.1X Configuration

Use the 802.1X Configuration page to enable or disable port access control on the system.

To display the 802.1X Configuration page, click Security > Port Authentication > Advanced > 802.1X Configuration.

To configure global 801.1X settings:

1. Use Administrative Mode to select one of the options for administrative mode: enable and disable. The default value is disable.

2. Use VLAN Assignment Mode to select one of the options for VLAN Assignment mode: enable and disable. The default value is disable.

3. Use Users to select the user name that will use the selected login list for 802.1x port security.

4. Use Login to select the login to apply to the specified user. All configured logins are displayed.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Authentication List</td>
<td>Displays the authentication list which is used by 802.1X.</td>
</tr>
</tbody>
</table>
Port Authentication

Use the Port Authentication page to enable and configure port access control on one or more ports.

To access the Port Authentication page, click Security > Port Authentication > Advanced > Port Authentication.

**Note:** Use the horizontal scroll bar at the bottom of the browser to view all the fields on the Port Authentication page.

To configure 802.1X settings for the port:

1. Select the check box next to the port to configure. You can also select multiple check boxes to apply the same settings to the select ports, or select the check box in the heading row to apply the same settings to all ports.

2. For the selected port(s), specify the following settings:
   - **Control Mode** - This selector lists the options for control mode. The control mode is only set if the link status of the port is link up. The options are:
     - **force unauthorized** - The authenticator port access entity (PAE) unconditionally sets the controlled port to unauthorized
     - **force authorized** - The authenticator PAE unconditionally sets the controlled port to authorized
• **auto** - The authenticator PAE sets the controlled port mode to reflect the outcome of the authentication exchanges between the supplicant, authenticator, and the authentication server.

• **mac based** - The authenticator PAE sets the controlled port mode to reflect the outcome of the authentication exchanges between the supplicant, authenticator, and the authentication server on a per supplicant basis.

• **Quiet Period** - This input field allows the user to configure the quiet period for the selected port. This command sets the value, in seconds, of the timer used by the authenticator state machine on this port to define periods of time in which it will not attempt to acquire a supplicant. The quiet period is the period for which the authenticator does not attempt to acquire a supplicant after a failed authentication exchange with the supplicant. The quiet period must be a number in the range of 0 and 65535. A quiet period value of 0 means that the authenticator state machine will never acquire a supplicant. The default value is 60. Changing the value will not change the configuration until the APPLY button is pressed.

• **Transmit Period** - This input field allows the user to configure the transmit period for the selected port. The transmit period is the value, in seconds, of the timer used by the authenticator state machine on the specified port to determine when to send an EAPOL EAP Request/Identity frame to the supplicant. The transmit period must be a number in the range of 1 and 65535. The default value is 30. Changing the value will not change the configuration until the APPLY button is pressed.

• **Guest VLAN Id** - This field allows the user to configure Guest VLAN ID on the interface. The valid range is 0-3965. The default value is 0. Changing the value will not change the configuration until the APPLY button is pressed. Enter 0 to clear the Guest VLAN ID on the interface.

• **Guest VLAN Period** - This input field allows the user to enter the guest VLAN period for the selected port. The guest VLAN period is the value, in seconds, of the timer used by the Guest VLAN Authentication. The guest VLAN time-out must be a value in the range of 1 and 300. The default value is 90. Changing the value will not change the configuration until the APPLY button is pressed.

• **Unauthenticated VLAN ID** - This input field allows the user to enter the Unauthenticated VLAN ID for the selected port. The valid range is 0-3965. The default value is 0. Changing the value will not change the configuration until the Submit button is pressed. Enter 0 to clear the Unauthenticated VLAN ID on the interface.

• **Supplicant Timeout** - This input field allows the user to enter the supplicant time-out for the selected port. The supplicant time-out is the value, in seconds, of the timer used by the authenticator state machine on this port to time-out the supplicant. The supplicant time-out must be a value in the range of 1 and 65535. The default value is 30. Changing the value will not change the configuration until the APPLY button is pressed.

• **Server Timeout** - This input field allows the user to enter the server time-out for the selected port. The server time-out is the value, in seconds, of the timer used by the authenticator on this port to time-out the authentication server. The server time-out must be a value in the range of 1 and 65535. The default value is 30. Changing the value will not change the configuration until the APPLY button is pressed.
• **Maximum Requests** - This input field allows the user to enter the maximum requests for the selected port. The maximum requests value is the maximum number of times the authenticator state machine on this port will retransmit an EAPOL EAP Request/Identity before timing out the supplicant. The maximum requests value must be in the range of 1 and 10. The default value is 2. Changing the value will not change the configuration until the APPLY button is pressed.

• **PAE Capabilities** - This field selects the port access entity (PAE) functionality of the selected port. Possible values are “Authenticator” or “Supplicant”.

• **Periodic Reauthentication** - This select field allows the user to enable or disable reauthentication of the supplicant for the specified port. The selectable values are ‘true’ and ‘false’. If the value is ‘true’ reauthentication will occur. Otherwise, reauthentication will not be allowed. The default value is false. Changing the selection will not change the configuration until the APPLY button is pressed.

• **Reauthentication Period** - This input field allows the user to enter the reauthentication period for the selected port. The reauthentication period is the value, in seconds, of the timer used by the authenticator state machine on this port to determine when reauthentication of the supplicant takes place. The reauthentication period must be a value in the range of 1 and 65535. The default value is 3600. Changing the value will not change the configuration until the APPLY button is pressed.

• **User Privileges** - This select field allows the user to add the specified user to the list of users with access to the specified port or all ports.

• **Max Users** - This field allows the user to enter the limit to the number of supplicants on the specified interface.

3. Click **INITIALIZE** to begin the initialization sequence on the selected port. This button is only selectable if the control mode is ‘auto’. If the button is not selectable, it will be grayed out. Once this button is pressed, the action is immediate. It is not required to press the APPLY button for the action to occur.

4. Click **REAUTHENTICATE** to begin the reauthentication sequence on the selected port. This button is only selectable if the control mode is ‘auto’. If the button is not selectable, it will be grayed out. Once this button is pressed, the action is immediate. It is not required to press the APPLY button for the action to occur.
Port Summary

Use the Port Summary page to view information about the port access control settings on a specific port.

To access the Port Summary page, click Security > Port Authentication > Advanced > Port Summary.

The following table describes the fields on the Port Summary page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Specifies the port whose settings are displayed in the current table row.</td>
</tr>
<tr>
<td>Control Mode</td>
<td>This field indicates the configured control mode for the port. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Force Unauthorized: The authenticator port access entity (PAE) unconditionally sets the controlled port to unauthorized.</td>
</tr>
<tr>
<td></td>
<td>• Force Authorized: The authenticator PAE unconditionally sets the controlled port to authorized.</td>
</tr>
<tr>
<td></td>
<td>• Auto: The authenticator PAE sets the controlled port mode to reflect the outcome of the authentication exchanges between the supplicant, authenticator, and the authentication server.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Operating Control Mode</td>
<td>This field indicates the control mode under which the port is actually operating. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• ForceUnauthorized</td>
</tr>
<tr>
<td></td>
<td>• ForceAuthorized</td>
</tr>
<tr>
<td></td>
<td>• Auto</td>
</tr>
<tr>
<td></td>
<td>• N/A: If the port is in detached state it cannot participate in port access control.</td>
</tr>
<tr>
<td>Reauthentication Enabled</td>
<td>This field shows whether reauthentication of the supplicant for the specified port is allowed. The possible values are 'true' and 'false'. If the value is 'true' reauthentication will occur. Otherwise, reauthentication will not be allowed.</td>
</tr>
<tr>
<td>Control Direction</td>
<td>This displays the control direction for the specified port. The control direction dictates the degree to which protocol exchanges take place between Supplicant and Authenticator. This affects whether the unauthorized controlled port exerts control over communication in both directions (disabling both incoming and outgoing frames) or just in the incoming direction (disabling only the reception of incoming frames). This field is not configurable on some platforms.</td>
</tr>
<tr>
<td>Protocol Version</td>
<td>This field displays the protocol version associated with the selected port. The only possible value is 1, corresponding to the first version of the 802.1x specification. This field is not configurable.</td>
</tr>
<tr>
<td>PAE Capabilities</td>
<td>This field displays the port access entity (PAE) functionality of the selected port. Possible values are “Authenticator” or “Supplicant”. This field is not configurable.</td>
</tr>
<tr>
<td>Authenticator PAE State</td>
<td>This field displays the current state of the authenticator PAE state machine. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• “Initialize”</td>
</tr>
<tr>
<td></td>
<td>• “Disconnected”</td>
</tr>
<tr>
<td></td>
<td>• “Connecting”</td>
</tr>
<tr>

<td>• “Held”</td>
</tr>
<tr>
<td></td>
<td>• “ForceAuthorized”</td>
</tr>
<tr>
<td></td>
<td>• “ForceUnauthorized”.</td>
</tr>
<tr>
<td>Backend State</td>
<td>This field displays the current state of the backend authentication state machine. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• “Request”</td>
</tr>
<tr>
<td></td>
<td>• “Response”</td>
</tr>
<tr>
<td></td>
<td>• “Success”</td>
</tr>
<tr>
<td></td>
<td>• “Fail”</td>
</tr>
<tr>
<td></td>
<td>• “Timeout”</td>
</tr>
<tr>
<td></td>
<td>• “Initialize”</td>
</tr>
<tr>
<td></td>
<td>• “Idle”</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Vlan Assigned</td>
<td>This field displays the vlan id assigned to the selected interface by the Authenticator. This field is displayed only when the port control mode of the selected interface is not mac-based. This field is not configurable.</td>
</tr>
</tbody>
</table>
| Vlan Assigned Reason        | This field displays reason for the vlan id assigned by the authenticator to the selected interface. This field is displayed only when the port control mode of the selected interface is not mac-based. This field is not configurable. Possible values are:  
  • “Radius”  
  • “Unauth”  
  • “Default”  
  • “Not Assigned” |
| Key Transmission Enabled    | This field displays if key transmission is enabled on the selected port. This is not a configurable field. The possible values are ‘true’ and ‘false’. If the value is ‘false’ key transmission will not occur. Otherwise Key transmission is supported on the selected port. |
| Session Timeout             | This field displays Session Timeout set by the Radius Server for the selected port. This field is displayed only when the port control mode of the selected port is not mac-based. |
| Session Termination Action  | This field displays Termination Action set by the Radius Server for the selected port. This field is displayed only when the port control mode of the selected port is not mac-based. Possible values are:  
  • “Default”  
  • “Reauthenticate”  
  If the termination action is ‘default’ then at the end of the session, the client details are initialized. Otherwise re-authentication is attempted. |
| Port Status                 | This field shows the authorization status of the specified port. The possible values are 'Authorized', 'Unauthorized' and 'N/A'. If the port is in detached state, the value will be 'N/A' since the port cannot participate in port access control. |
| Port Method                 | This field shows the authorization mode of the specified port. The possible values are 'Mac based', 'Port based'. |

ProSafe M5300 Switch
Client Summary

To access the Client Summary page, click Security > Port Authentication > Advanced > Client Summary.

</table>
Traffic Control

From the Traffic Control link, you can configure MAC Filters, Storm Control, Port Security, and Protected Port settings. To display the page, click the Security > Traffic Control tab.

The Traffic Control folder contains links to the following features:

- MAC Filter on page 397
- Port Security on page 399
- Private Group on page 404
- Protected Ports Configuration on page 406
- Storm Control on page 412

MAC Filter

The MAC Filter folder contains links to the following features:

- MAC Filter Configuration on page 397
- MAC Filter Summary on page 399

MAC Filter Configuration

Use the MAC Filter Configuration page to create MAC filters that limit the traffic allowed into and out of specified ports on the system.

To display the MAC Filter Configuration page, click Security > Traffic Control> MAC Filter > MAC Filter Configuration.
To configure MAC filter settings:

1. Select Create Filter from the **MAC Filter** menu.
   a. This is the list of MAC address and VLAN ID pairings for all configured filters. To change the port mask(s) for an existing filter, select the entry you want to change. To add a new filter, select “Create Filter” from the top of the list.
   b. From the **VLAN ID** menu, select the VLAN to use with the MAC address to fully identify packets you want filtered. You can change this field only when the Create Filter option is selected from the MAC Filter menu.
   c. In the **MAC Address** field, specify the MAC address of the filter in the format 00:01:1A:B2:53:4D. You can change this field when you have selected the Create Filter option.

   You cannot define filters for the following MAC addresses:
   - 00:00:00:00:00
   - 01:80:C2:00:00:00 to 01:80:C2:00:00:0F
   - 01:80:C2:00:00:20 to 01:80:C2:00:00:21
   - FF:FF:FF:FF:FF:FF
   d. Click the orange bar to display the available ports and select the port(s) to include in the inbound filter. If a packet with the MAC address and VLAN ID you specify is received on a port that is not in the list, it will be dropped.
   e. Click the orange bar to display the available ports and select the port(s) you to include in the outbound filter. Packets with the MAC address and VLAN ID you selected will be transmitted only out of ports that are in the list. Destination ports can be included only in the Multicast filter.

2. To delete a configured MAC Filter, select it from the menu, and then click **DELETE**.
3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
4. If you make changes to the page, click **APPLY** to apply the changes to the system. **MAC Filter Summary**
**MAC Filter Summary**

Use the MAC Filter Summary page to view the MAC filters that are configured on the system. To display the MAC Filter Summary page, click **Security > Traffic Control > MAC Filter > MAC Filter Summary**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>The MAC address of the filter in the format 00:01:1A:B2:53:4D.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID associated with the filter.</td>
</tr>
<tr>
<td>Source Port Members</td>
<td>A list of ports to be used for filtering inbound packets.</td>
</tr>
</tbody>
</table>

The following table describes the information displayed on the page:

**Port Security**

Port security, which is also known as port MAC locking, allows you to limit the number of source MAC address that can be learned on a port. If a port reaches the configured limit, any other addresses beyond that limit are not learned, and the frames are discarded. Frames with a source MAC address that has already been learned will be forwarded. Port security can help secure the network by preventing unknown devices from forwarding packets into the network.

The Port Security folder contains links to the following features:

- **Port Security Configuration** on page 399
- **Port Security Interface Configuration** on page 400
- **Dynamic MAC Address** on page 402
- **Static MAC Address** on page 403

**Port Security Configuration**

Use the Port Security feature to lock one or more ports on the system. When a port is locked, only packets with an allowable source MAC addresses can be forwarded. All other packets are discarded.

To display the Port Security Configuration page, click **Security > Traffic Control > Port Security > Port Administration**.
To configure the global port security mode:

1. In the **Port Security Mode** field, select the appropriate radio button to enable or disable port security on the switch.
2. Click **APPLY** to update the switch with the change.
3. Click **CANCEL** to abandon the change.

The Port Security Violation table shows information about violations that occurred on ports that are enabled for port security. The following table describes the fields in the Port Security Violation table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Displays the physical interface for which you want to display data.</td>
</tr>
<tr>
<td>Last Violation MAC</td>
<td>Displays the source MAC address of the last packet that was discarded at a locked port.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN ID corresponding to the Last Violation MAC address.</td>
</tr>
</tbody>
</table>

**Port Security Interface Configuration**

A MAC address can be defined as allowable by one of two methods: dynamically or statically. Both methods are used concurrently when a port is locked.

Dynamic locking implements a first arrival mechanism for Port Security. You specify how many addresses can be learned on the locked port. If the limit has not been reached, then a packet with an unknown source MAC address is learned and forwarded normally. When the limit is reached, no more addresses are learned on the port. Any packets with source MAC addresses that were not already learned are discarded. You can effectively disable dynamic locking by setting the number of allowable dynamic entries to zero.

Static locking allows you to specify a list of MAC addresses that are allowed on a port. The behavior of packets is the same as for dynamic locking: only packets with an allowable source MAC address can be forwarded.

To display the Port Security Interface Configuration page, click **Security > Traffic Control > Port Security > Interface Configuration.**
To configure port security settings:

1. **Port** - Selects the interface to be configured.

2. Select the check box next to the port or LAG to configure. Select multiple check boxes to apply the same setting to all selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

3. Specify the following settings:
   - **Security Mode** - Enables or disables the Port Security feature for the selected interface.
   - **Max Allowed Dynamically Learned MAC** - Sets the maximum number of dynamically learned MAC addresses on the selected interface.
   - **Max Allowed Statically Locked MAC** - Sets the maximum number of statically locked MAC addresses on the selected interface.
   - **Violation Traps** - Enables or disables the sending of new violation traps designating when a packet with a disallowed MAC address is received on a locked port.
Dynamic MAC Address

Use the Dynamic MAC Address page to convert a dynamically learned MAC address to a statically locked address.

To display the Dynamic MAC Address page, click Security > Traffic Control > Port Security > Dynamic MAC Address.

To convert learned MAC addresses:

1. **Port List** - Select the physical interface for which you want to display data.
2. Use **Convert Dynamic Address to Static** to convert a dynamically learned MAC address to a statically locked address. The Dynamic MAC address entries are converted to Static MAC address entries in a numerically ascending order until the Static limit is reached.
3. Click **REFRESH** to refresh the web page to show the latest MAC address learned on a specific port.

The Dynamic MAC Address Table shows the MAC addresses and their associated VLANs learned on the selected port. Use the **Port List** menu to select the interface for which you want to display data.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Dynamic MAC Addresses Learned</td>
<td>Displays the number of dynamically learned MAC addresses on a specific port.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN ID corresponding to the MAC address.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the MAC addresses learned on a specific port.</td>
</tr>
</tbody>
</table>
**Static MAC Address**

Use this page to add and remove the MAC addresses of hosts that are allowed to send traffic to specific interfaces on the device. The number of MAC addresses you can associate with each interface is determined by the maximum static MAC addresses allowed on a given interface.

To display the Static MAC Address page, click **Security > Traffic Control > Port Security > Static MAC Address**.

To configure static MAC address-to-interface associations:

1. When adding a static MAC address entry, use the Interface menu to select the interface to associate with the permitted MAC address. **Interface** - Select the physical interface for which you want to display data.
2. **Static MAC Address** - Accepts user input for the MAC address to be deleted.
3. Use **VLAN ID** to select the VLAN ID corresponding to the MAC address being added.
4. Click **ADD** to add a new static MAC address to the switch.
5. Click **DELETE** to delete a existing static MAC address from the switch.
Private Group

The Private Group feature provides Layer 2 isolation between ports that share the same broadcast domain. Ports can be grouped together as members of the same private group.

The Private Group folder contains links to the following features:

- Private Group Configuration on page 404
- Private Group Membership on page 405

Private Group Configuration

Use this page to create private groups and to specify its mode.

To display the Private Group Configuration page, click Security > Traffic Control> Private Group > Private Group Configuration.

To configure a private group:

1. Use Group Name to enter the Private Group name to be configured. The name string can be up to 24 bytes of non-blank characters.
2. Use the optional Group ID field to specify the private group identifier. If not specified, a group id not used will be assigned automatically. The range of group id is (1 to 192).
3. Use Group Mode to configure the mode of private group. The group mode can be either “isolated” or “community”. When in “isolated” mode, the member port in the group cannot forward its egress traffic to any other members in the same group. By default, the mode is “community” mode that each member port can forward traffic to other members in the same group, but not to members in other groups.
4. Click ADD to create a new private group in the switch.
5. Click DELETE to delete a selected private group from the switch.
Private Group Membership

Use this page to configure the ports that belong to the existing private groups. To display the Private Group Membership page, click Security > Traffic Control > Private Group > Private Group Membership.

To configure private group port membership:

1. Use Group ID to select the Group ID for which you want to display or configure data.
2. Use Port List to add the ports you selected to this private group.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group Name</td>
<td>This field identifies the name for the Private Group you selected. It can be up to 24 non-blank characters long.</td>
</tr>
<tr>
<td>Group Mode</td>
<td>This field identifies the mode of the Private Group you selected. The modes are:</td>
</tr>
<tr>
<td></td>
<td>• community: Each member port can forward traffic to other members in the same group, but not to members in other groups (default).</td>
</tr>
<tr>
<td></td>
<td>• isolated: The member port in the group cannot forward its egress traffic to any other members in the same group.</td>
</tr>
</tbody>
</table>
Protected Ports Configuration

If a port is configured as protected, it does not forward traffic to any other protected port on the switch, but it will forward traffic to unprotected ports. Use the Protected Ports Configuration page to configure the ports as protected or unprotected. You need read-write access privileges to modify the configuration.

To display the Protected Ports Configuration page, click the Security > Traffic Control > Protected Ports.

To configure protected ports:

1. Use Group ID to identify a group of protected ports that can be combined into a logical group. Traffic can flow between protected ports belonging to different groups, but not within the same group. The selection box lists all the possible protected port Group IDs supported for the current platform. The valid range of the Group ID is 0 to 2.

2. Use the optional Group Name field to associate a name with the protected ports group (used for identification purposes). It can be up to 32 alphanumeric characters long, including blanks. The default is blank. This field is optional.

3. Click the orange bar to display the available ports.

4. Click the box below each port to configure as a protected port. The selection list consists of physical ports, protected as well as unprotected. The protected ports are tick-marked to differentiate between them. No traffic forwarding is possible between two protected ports. If left unconfigured, the default state is unprotected. No traffic forwarding is possible between two protected ports.

5. Click REFRESH to refresh the page with the most current data from the switch.

6. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

7. If you make changes to the page, click APPLY to apply the changes to the system. Configuration changes take effect immediately.
Private VLAN

The Private VLANs feature provides Layer 2 isolation between ports that share the same broadcast domain. In other words, it allows a VLAN broadcast domain to be partitioned into smaller point-to-multipoint subdomains. The ports participating in a private VLAN can be located anywhere in the Layer 2 network.

Each subdomain is defined (represented) by a primary VLAN and a secondary VLAN. The primary VLAN ID is the same for all subdomains that belong to a private VLAN. The secondary VLAN ID differentiates subdomains from each another and provides Layer 2 isolation between ports of the same private VLAN.

Private VLANs are typically implemented in the DMZ for security reasons. Servers are not supposed to communicate with each other, but they need to communicate to a router through which they are connected to the users. Such servers are typically connected to host ports and routers are attached to promiscuous ports. Then, if one of the servers is compromised, the intruder cannot use it to attack another server in the same network segment.

The same traffic isolation can be achieved by assigning each port with a different VLAN, allocating an IP subnet for each VLAN and enabling L3 routing between them. On the other hand, in a private VLAN domain, all members can share a common address space of a single subnet which is associated with a primary VLAN. So, the advantage of the private VLANs feature is that it reduces the number of consumed VLANs, improves IP addressing space utilization, and helps to avoid L3 routing.

The Private VLAN folder contains links to the following features:

- Private VLAN Type Configuration on page 407
- Private VLAN Association Configuration on page 408
- Private VLAN Port Mode Configuration on page 409
- Private VLAN Host Interface Configuration on page 410
- Private VLAN Promiscuous Interface Configuration on page 411

Private VLAN Type Configuration

Use this page to set an existing VLAN as a private VLAN type. A private VLAN can be one of the following types:

- A Primary VLAN forwards the traffic from the promiscuous ports to isolated ports, community ports and other promiscuous ports in the same private VLAN. Only one primary VLAN can be configured per private VLAN. All ports within a private VLAN share the same primary VLAN.

- An Isolated VLAN is a secondary VLAN. It carries traffic from isolated ports to promiscuous ports. Only one isolated VLAN can be configured per private VLAN.

- A Community VLAN is a secondary VLAN. It forwards traffic between ports which belong to the same community and to the promiscuous ports. There can be multiple community VLANs per private VLAN.

To display the Private VLAN Type Configuration page, click the Security > Traffic Control > Private VLAN > Private VLAN Type Configuration.
To configure the private VLAN type:

1. Select the check box associated with each VLAN to configure. To apply the same settings to all VLANs, select the check box in the header row.

2. Use the Private VLAN Type menu to identify a group of protected ports that can be combined into a logical group. The options are as follows:
   - **Primary**: Sets Private VLAN as Primary Type that forwards the traffic from the promiscuous ports to isolated ports, community ports and other promiscuous ports in the same private VLAN.
   - **Isolated**: Sets Private VLAN as Isolated Type that carries traffic from isolated ports to promiscuous ports.
   - **Community**: Sets Private VLAN as Isolated Type that forwards traffic between ports which belong to the same community and to the promiscuous ports.
   - **Unconfigured**: Sets the VLAN as non Private VLAN.

3. Click APPLY to send the updated configuration to the switch.

4. Click CANCEL to cancel the configuration on the screen.

**Private VLAN Association Configuration**

Use this page to configure the association between the primary private VLAN and secondary VLANs.

To display the Private VLAN Association Configuration page, click the Security > Traffic Control > Private VLAN > Private VLAN Association Configuration.

To configure an association between a primary and secondary VLAN:

1. From the Primary VLAN field, select the ID of the primary private VLAN to configure.
2. In the **Secondary VLAN** field, specify the VLAN ID of the VLAN to associate with the selected primary VLAN.

3. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.

4. Click **CANCEL** to cancel the configuration on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Isolated VLAN</td>
<td>Displays the isolated VLAN associated with the primary VLAN.</td>
</tr>
<tr>
<td>Community VLAN</td>
<td>Displays the list of community VLAN(s) associated with the primary VLAN.</td>
</tr>
</tbody>
</table>

**Private VLAN Port Mode Configuration**

Use this page to configure the port mode for the ports that belong to a private VLAN.

To display the Private VLAN Port Mode Configuration page, click the **Security > Traffic Control > Private VLAN > Private VLAN Port Mode Configuration**.

To configure the port mode for ports:

1. Select the check box associated with each **Interface** to configure, or select the check box in the header row to apply the same settings to all interfaces.

2. From the **Port VLAN Mode** menu, select the mode to apply to the selected port(s). The modes are as follows:
   - **General**: The port is in general mode and is not a member of the private VLAN.
   - **Promiscuous**: The port belongs to a primary VLAN and can communicate with all interfaces in the private VLAN, including other promiscuous ports, community ports and isolated ports.
   - **Host**: The port belongs to a secondary VLAN and depending upon the type of secondary VLAN can either communicate with other ports in the same community (if the secondary VLAN is community VLAN) and with the promiscuous ports or is able to communicate only with the promiscuous ports (if the secondary VLAN is isolated VLAN).

3. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.
4. Click CANCEL to cancel the configuration on the screen.

**Private VLAN Host Interface Configuration**

Use this page to map host ports to primary and secondary private VLANs.

To display the Private VLAN Host Interface Configuration page, click the Security > Traffic Control > Private VLAN > Private VLAN Host Interface Configuration.

To associate one or more ports to host private VLANs:

1. Select the check box associated with each Interface to configure, or select the check box in the header row to apply the same settings to all interfaces.

2. In the Host Primary VLAN field, specify the VLAN ID of the primary VLAN in which the selected ports are members.

3. In the Host Secondary VLAN field, specify the VLAN ID of the secondary VLAN in which the selected ports are members.

4. Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.

5. Click CANCEL to cancel the configuration on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operational VLAN(s)</td>
<td>Indicates which VLANs associated with the port are operational.</td>
</tr>
</tbody>
</table>
**Private VLAN Promiscuous Interface Configuration**

Use this page to associate a port with a promiscuous primary VLAN. An endpoint connected to a promiscuous port is allowed to communicate with any endpoint within the private VLAN. Multiple promiscuous ports can be defined for a single private VLAN domain.

To display the Private VLAN Promiscuous Interface Configuration page, click the Security > Traffic Control > Private VLAN > Private VLAN Promiscuous Interface Configuration.

To associate ports with promiscuous private VLANs:

1. Select the check box associated with each Interface to configure, or select the check box in the header row to apply the same settings to all interfaces.

2. In the Promiscuous Primary VLAN field, specify the VLAN ID of the primary VLAN in which the selected ports are members.

3. In the Promiscuous Secondary VLAN field, specify the VLAN ID of the secondary VLAN in which the selected ports are members.

4. Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.

5. Click CANCEL to cancel the configuration on the screen.

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</thead>
<tbody>
<tr>
<td>Operational VLAN(s)</td>
<td>Indicates which VLANs associated with the port are operational.</td>
</tr>
</tbody>
</table>
Storm Control

A broadcast storm is the result of an excessive number of broadcast messages simultaneously transmitted across a network by a single port. Forwarded message responses can overload network resources and/or cause the network to time out.

The switch measures the incoming broadcast/multicast/unknown unicast packet rate per port and discards packets when the rate exceeds the defined value. Storm control is enabled per interface, by defining the packet type and the rate at which the packets are transmitted.

The Storm Control folder contains links to the following features:

- Storm Control Global Configuration on page 412
- Storm Control Interface Configuration on page 413

Storm Control Global Configuration

To display the Storm Control Global Configuration page, click Security > Traffic Control > Storm Control > Storm Control Global Configuration.

The following four control radio buttons provide an easy way to enable or disable each type of packets be rate-limited on every port in a global fashion. The effective storm control state of each port can be viewed by going to the port configuration page.

- **Global Flow Control (IEEE 802.3x) Mode** - Enable or disable this option by selecting the corresponding line on the radio button. The factory default is disabled.

- **Broadcast Storm Control All** - Enable or disable the Broadcast Storm Recovery mode on all ports by clicking the corresponding radio button. When you specify Enable for Broadcast Storm Recovery and the broadcast traffic on any Ethernet port exceeds the configured threshold, the switch blocks (discards) the broadcast traffic. The factory default is enabled.

- **Multicast Storm Control All** - Enable or disable the Multicast Storm Recovery mode on all ports by clicking the corresponding radio button. When you specify Enable for Multicast Storm Recovery and the multicast traffic on any Ethernet port exceeds the configured threshold, the switch blocks (discards) the multicast traffic. The factory default is disabled.

- **Unknown Unicast Storm Control All** - Enable or disable the Unicast Storm Recovery mode on all ports by clicking the corresponding radio button. When you specify Enable for Unicast Storm Recovery and the Unicast traffic on any Ethernet port exceeds the configured threshold, the switch blocks (discards) the unicast traffic. The factory default is disabled.
Storm Control Interface Configuration

To display the Storm Control Interface Configuration page, click Security > Traffic Control > Storm Control > Storm Control Interface Configuration.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadcast Storm Recovery Mode</td>

Control

To display the page, click the **Security > Control** tab. The Control folder contains links to the following features:

- **DHCP Snooping** on page 414
- **IP Source Guard** on page 419
- **Dynamic ARP Inspection** on page 421

**DHCP Snooping**

Dynamic Host Configuration Protocol (DHCP) Snooping is a security feature that monitors DHCP messages between a DHCP client and DHCP server to accomplish the following tasks:

- Filter harmful DHCP messages
- Build a bindings database with entries that consist of the following information:
  - MAC address
  - IP address
  - VLAN ID
  - Client port

Entries in the bindings database are considered to be authorized network clients.

The DHCP Snooping folder contains links to the following features:

- **DHCP Snooping Global Configuration** on page 415
- **DHCP Snooping Interface Configuration** on page 416
- **DHCP Snooping Binding Configuration** on page 417
- **DHCP Snooping Persistent Configuration** on page 418
- **DHCP Snooping Statistics** on page 418
DHCP Snooping Global Configuration

Use this page to configure the administrative mode of DHCP snooping on the switch and to enable DHCP snooping on VLANs. When enabled on a VLAN, DHCP snooping forwards valid DHCP client messages it receives in the VLAN. The message is forwarded on all trusted interfaces in the VLAN.

To display the DHCP Snooping Global Configuration page, click Security > Control > DHCP Snooping > Global Configuration.

DHCP Snooping Configuration

1. Use DHCP Snooping Mode to enable or disable the DHCP Snooping feature. The factory default is disabled.

2. Use MAC Address Validation to enable or disable the validation of sender MAC Address for DHCP Snooping. The factory default is enabled.

DHCP Snooping VLAN Configuration

1. Use VLAN ID to enter the VLAN for which the DHCP Snooping Mode is to be enabled.

2. Use DHCP Snooping Mode to enable or disable the DHCP Snooping feature for the specified VLAN. The factory default is disabled.

3. Click APPLY to apply the new configuration and cause the changes to take effect. These changes will not be retained across a power cycle unless a save configuration is performed.

4. Click CANCEL to abandon the changes.
DHCP Snooping Interface Configuration

To display the DHCP Snooping Interface Configuration page, click Security > Control > DHCP Snooping > Interface Configuration.

To configure interfaces for DHCP snooping:

1. Select the check box associated with each interface to configure. To apply the same settings to all interfaces, select the check box in the header row.

2. If Trust Mode is enabled, DHCP snooping application considers as port trusted. DHCP servers must be reached through trusted ports. The factory default is disabled. If the trust mode is disabled (untrusted), DHCP snooping enforces the following security rules:
   - DHCP packets from a DHCP server (DHCPOFFER, DHCPACK, DHCPNAK, DHCPRELEASEQUERY) are dropped if they are received on an untrusted port.
   - DHCPRELEASE and DHCPDECLINE messages are dropped if the MAC addresses in the snooping database, but the binding’s interface is other than the interface where the message was received.
   - On untrusted interfaces, the switch drops DHCP packets with a source MAC address that does not match the client hardware address if MAC Address Validation is globally enabled.

3. If Logging Invalid Packets is enabled, DHCP snooping application logs invalid packets on this interface. The factory default is disabled.

4. Use Rate Limit (pps) to specify rate limit value for DHCP Snooping purpose. If the incoming rate of DHCP packets exceeds the value of this object for consecutively burst interval seconds, the port will be shutdown. If this value is None there is no limit. The factory default is 15pps (packets per second). The range of Rate Limit is (0 to 300).

5. Use Burst Interval (secs) to specify the burst interval value for rate limiting purpose on this interface. If the rate limit is None burst interval has no meaning shows it as N/A. The factory default is 1 second. The range of Burst Interval is (1 to 15).

6. Click APPLY to apply the new configuration and cause the changes to take effect. These changes will not be retained across a power cycle unless a save configuration is performed.

7. Click CANCEL to abandon the changes.
DHCP Snooping Binding Configuration

To display the DHCP Snooping Binding Configuration page, click Security > Control > DHCP Snooping > Binding Configuration.

To configure static DHCP snooping bindings:

1. From the Interface menu, select the interface on which to configure a static binding.
2. Use MAC Address to specify the MAC address for the binding to be added. This is the Key to the binding database.
3. Use VLAN ID to select the VLAN from the list for the binding rule. The range of the VLAN ID is (1 to 4093).
4. Use IP Address to specify valid IP Address for the binding rule.
5. Click ADD to add DHCP snooping binding entry into the database.
6. Click DELETE to delete selected static entries from the database.

The Dynamic Binding Table displays the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the interface to which a binding entry in the DHCP snooping database.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the MAC address for the binding in the binding database.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN for the binding entry in the binding database. The range of the VLAN ID is (1 to 4093).</td>
</tr>
<tr>
<td>IP Address</td>
<td>Displays IP Address for the binding entry in the binding database.</td>
</tr>
<tr>
<td>Lease Time</td>
<td>Displays the remaining Lease time for the Dynamic entries</td>
</tr>
</tbody>
</table>

Click CLEAR to delete all DHCP Snooping binding entries.
DHCP Snooping Persistent Configuration

To display the DHCP Snooping Persistent Configuration page, click **Security > Control > DHCP Snooping > Persistent Configuration**.

1. Use **Store** to select the local store or remote store. Local selection disable the Remote objects like Remote File Name and Remote IP address.
2. Use **Remote IP Address** to configure Remote IP Address on which the snooping database will be stored when Remote is selected.
3. Use **Remote File Name** to configure Remote file name to store the database when Remote is selected.
4. Use **Write Delay** to configure the maximum write time to write the database into local or remote. The range of Write Delay is 15 to 86400.

DHCP Snooping Statistics

To display the DHCP Snooping Statistics page, click **Security > Control > DHCP Snooping > Statistics**.
### Managing Device Security

Click **CLEAR** to clear all interfaces statistics.

Click **REFRESH** to refresh the data on the screen with the latest statistics.

## IP Source Guard

The IP Source Guard (IPSG) feature helps protect the network from attacks that use IP address spoofing to compromise or overwhelm the network. The source ID may be either the source IP address or a {source IP address, source MAC address} pair. You can configure:

- Whether enforcement includes the source MAC address
- Static authorized source IDs

The DHCP snooping bindings database and static IPSG entries identify authorized source IDs. IPSG can be enabled on physical and LAG ports. If you enable IPSG on a port where DHCP snooping is disabled or where DHCP snooping is enabled but the port is trusted, all IP traffic received on that port is dropped depending on the admin-configured IPSG entries.

The IP Source Guard folder contains links to the following features:

- **IP Source Guard Interface Configuration** on page 420
- **IP Source Guard Binding Configuration** on page 420
**IP Source Guard Interface Configuration**

To display the IP Source Guard Interface Configuration page, click **Security > Control > IP Source Guard > Interface Configuration.**

![IP Source Guard Interface Configuration](image)

To configure interfaces for IPSG:

1. Select the check box associated with each interface to configure. To apply the same settings to all interfaces, select the check box in the header row.

2. Use **IPSG Mode** to enable or disable validation of Sender IP Address on this interface. If IPSG is Enabled Packets will not be forwarded if Sender IP Address is not in DHCP Snooping Binding database. The factory default is disabled.

3. Use **IPSG Port Security** to enable or disables the IPSG Port Security on the selected interface. If IPSG Port Security is enabled then the packets will not be forwarded if the sender MAC Address is not in FDB table and it is not in DHCP snooping binding database. To enforce filtering based on MAC address other required configurations are:
   - Enable port-security globally.
   - Enable port-security on the interface level.

IPSG Port Security can't be Enabled if IPSG is Disabled. The factory default is disabled.

**IP Source Guard Binding Configuration**

To display the IP Source Guard Binding Configuration page, click **Security > Control > IP Source Guard > Binding Configuration.**

![IP Source Guard Binding Configuration](image)
**Static Binding Configuration**

1. **Interface** - Selects the interface to add a binding into the IPSG database.
2. Use **MAC Address** to specify the MAC address for the binding.
3. Use **VLAN ID** to select the VLAN from the list for the binding rule.
4. Use **IP Address** to specify valid IP Address for the binding rule.
5. Click **ADD** to add IPSG static binding entry into the database.
6. Click **DELETE** to delete selected static entries from the database.

The Dynamic Binding Configuration table shows the following information:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the interface to add a binding into the IPSG database.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the MAC address for the binding entry.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN from the list for the binding entry.</td>
</tr>
<tr>
<td>IP Address</td>
<td>Displays valid IP Address for the binding entry.</td>
</tr>
<tr>
<td>Filter Type</td>
<td>Filter Type using on the interface. one is source IP address filter type, the other is source IP address and MAC address filter type.</td>
</tr>
</tbody>
</table>

Click **CLEAR** to clear all the dynamic binding entries.

**Dynamic ARP Inspection**

malicious ARP packets. DAI prevents a class of man-in-the-middle attacks where an unfriendly station intercepts traffic for other stations by poisoning the ARP caches of its unsuspecting neighbors. The malicious attacker send ARP requests or responses mapping another station’s IP address to its own MAC address.

When DAI is enabled, the switch drops ARP packets whose sender MAC address and sender IP address do not match an entry in the DHCP snooping bindings database. You can optionally configure additional ARP packet validation. When DAI is enabled on a VLAN, DAI is enabled on the interfaces (physical ports or LAGs) that are members of that VLAN. Individual interfaces are configured as trusted or untrusted. The trust configuration for DAI is independent of the trust configuration for DHCP snooping.

The Dynamic ARP Inspection (DAI) folder contains links to the following features:

- **DAI Configuration** on page 422
- **DAI VLAN Configuration** on page 422
- **DAI Interface Configuration** on page 423
- **DAI ACL Configuration** on page 424
- **DAI ACL Rule Configuration** on page 424
- **DAI Statistics** on page 425
DAI Configuration

To display the DAI Configuration page, click Security > Control > Dynamic ARP Inspection > DAI Configuration.

To configure global DAI settings:

1. Use Validate Source MAC to choose the DAI Source MAC Validation Mode for the switch by selecting Enable or Disable radio button. If you select Enable, Sender MAC validation for the ARP packets will be enabled. The factory default is disable.

2. Use Validate Destination MAC to choose the DAI Destination MAC Validation Mode for the switch by selecting Enable or Disable radio button. If you select Enable, Destination MAC validation for the ARP Response packets will be enabled. The factory default is disable.

3. Use Validate IP to choose the DAI IP Validation Mode for the switch by selecting Enable or Disable radio button. If you select Enable, IP Address validation for the ARP packets will be enabled. The factory default is disable.

DAI VLAN Configuration

To display the DAI VLAN Configuration page, click Security > Control > Dynamic ARP Inspection > DAI VLAN Configuration.

To configure global DAI VLAN settings:

1. VLAN ID - Select the DAI Capable VLANS for which information has to be displayed or configured.

2. Use Dynamic ARP Inspection to indicate whether the Dynamic ARP Inspection is enabled on this VLAN. If this object is set to 'Enable' Dynamic ARP Inspection is enabled. If this object is set to 'Disable', Dynamic ARP Inspection is disabled.
3. Use **Logging Invalid Packets** to indicate whether the Dynamic ARP Inspection logging is enabled on this VLAN. If this object is set to 'Enable' it will log the Invalid ARP Packets information. If this object is set to 'Disable', Dynamic ARP Inspection logging is disabled.

4. Use **ARP ACL Name** to specify a name for the ARP Access list. A VLAN can be configured to use this ARP ACL containing rules as the filter for ARP packet validation. The name can contain up to <1-31> alphanumeric characters.

5. Use **Static Flag** to determine whether the ARP packet needs validation using the DHCP snooping database in case ARP ACL rules don't match. If the flag is enabled then the ARP Packet will be validated by the ARP ACL Rules only. If the flag is disabled then the ARP Packet needs further validation by using the DHCP Snooping entries. The factory default is disable.

**DAI Interface Configuration**

To display the DAI Interface Configuration page, click **Security > Control > Dynamic ARP Inspection > DAI Interface Configuration**.

To configure DAI interface settings:

1. Select the check box associated with each **Interface** to configure. Select the check box in the heading row to apply the same settings to all interfaces.

2. Use **Trust Mode** to indicate whether the interface is trusted for Dynamic ARP Inspection purpose. If this object is set to 'Enable', the interface is trusted. ARP packets coming to this interface will be forwarded without checking. If this object is set to 'Disable', the interface is not trusted. ARP packets coming to this interface will be subjected to ARP inspection. The factory default is disable.

3. Use **Rate Limit (pps)** to specify rate limit value for Dynamic ARP Inspection purpose. If the incoming rate of ARP packets exceeds the value of this object for consecutively burst interval seconds, ARP packets will be dropped. If this value is None there is no limit. The factory default is 15pps (packets per second).

4. Use **Burst Interval (secs)** to specify the burst interval value for rate limiting purpose on this interface. If the rate limit is None burst interval has no meaning shows it as N/A. The factory default is 1 second.
DAI ACL Configuration

Use this page to add DAI access control lists (ACL) and to view DAI ACLs that have been configured.

To display the DAI ACL Configuration page, click **Security > Control > Dynamic ARP Inspection > DAI ACL Configuration.**

1. Use **Name** to create New ARP ACL for DAI.
2. Click **ADD** to add a new DAI ACL to the switch configuration.
3. Click **DELETE** to remove the currently selected DAI ACL from the switch configuration.

DAI ACL Rule Configuration

Use this page to configure the rules to add to existing DAI ACLs.

To display the DAI ACL Rule Configuration page, click **Security > Control > Dynamic ARP Inspection > DAI ACL Rule Configuration.**

To configure DAI ACL rules:

1. Select the DAI ACL with the rule to add or display from the **ACL Name** field.
2. In the **Source IP Address** field, specify the Sender IP address match value for the DAI ARP ACL.
3. In the **Source MAC Address** field, specify the Sender MAC address match value for the DAI ARP ACL.
4. Click **ADD** to add a new Rule to the selected ACL.
5. Click **DELETE** to remove the currently selected Rule from the selected ACL.
**DAI Statistics**

This screen shows the Statistics per VLAN.

To display the DAI Statistics page, click **Security > Control > Dynamic ARP Inspection > DAI Statistics**.

### Dynamic ARP Inspection Statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VLAN</strong></td>
<td>The enabled VLAN ID for which statistics to be displayed.</td>
</tr>
<tr>
<td><strong>DHCP Drops</strong></td>
<td>Number of ARP packets that were dropped by DAI as there is no matching DHCP Snooping binding entry found.</td>
</tr>
<tr>
<td><strong>DHCP Permits</strong></td>
<td>Number of ARP packets that were forwarded by DAI as there is a matching DHCP Snooping binding entry found.</td>
</tr>
<tr>
<td><strong>ACL Drops</strong></td>
<td>Number of ARP packets that were dropped by DAI as there is no matching ARP ACL rule found for this VLAN and the static flag is set on this VLAN.</td>
</tr>
<tr>
<td><strong>ACL Permits</strong></td>
<td>Number of ARP packets that were permitted by DAI as there is a matching ARP ACL rule found for this VLAN.</td>
</tr>
<tr>
<td><strong>Bad Source MAC</strong></td>
<td>Number of ARP packets that were dropped by DAI as the sender MAC address in ARP packet didn't match the source MAC in ethernet header.</td>
</tr>
<tr>
<td><strong>Bad Dest MAC</strong></td>
<td>Number of ARP packets that were dropped by DAI as the target MAC address in ARP reply packet didn't match the destination MAC in ethernet header.</td>
</tr>
<tr>
<td><strong>Invalid IP</strong></td>
<td>Number of ARP packets that were dropped by DAI as the sender IP address in ARP packet or target IP address in ARP reply packet is invalid. Invalid addresses include 0.0.0.0, 255.255.255.255, IP multicast addresses, class E addresses (240.0.0.0/4), loopback addresses (127.0.0.0/8).</td>
</tr>
<tr>
<td><strong>Forwarded</strong></td>
<td>Number of valid ARP packets forwarded by DAI.</td>
</tr>
<tr>
<td><strong>Dropped</strong></td>
<td>Number of invalid ARP packets dropped by DAI.</td>
</tr>
</tbody>
</table>

Click **CLEAR** to clear the DAI statistics.

Click **REFRESH** to refresh the data on the screen with the latest DAI statistics.
Captive Portal

The Captive Portal (CP) feature allows you to block wired and wireless clients from accessing the network until user verification has been established. You can configure CP verification to allow access for both guest and authenticated users. Authenticated users must be validated against a database of authorized Captive Portal users before access is granted. The database can be stored locally on the switch or on a RADIUS server.

The Captive Portal folder contains links to the following features:

- **Captive Portal Global Configuration** on page 426
- **Captive Portal Configuration** on page 428
- **Captive Portal Binding Configuration** on page 430
- **Captive Portal Binding Table** on page 430
- **Captive Portal Group Configuration** on page 431
- **Captive Portal User Configuration** on page 432
- **Captive Portal Trap Flags** on page 433
- **Captive Portal Client** on page 434

**Captive Portal Global Configuration**

Using the Captive Portal Global Configuration page, you can control the administrative state of the CP feature and configure global settings that affect all captive portals configured on the switch.

To display the Captive Portal Global Configuration page, click **Security > Control > Captive Portal > CP Global Configuration**.
1. Use **Admin Mode** to enable or disable Captive Portal feature. By default, the Captive Portal feature is disabled.

2. Use **Additional HTTP Port** to configure an additional port for HTTP traffic (HTTP traffic uses port 80), but you can configure an additional port for HTTP traffic. Enter a port number between 0-65535 (excluding port 80). Enter 0 to unconfigure the Additional HTTP Port. Default is 0.

3. Use **Additional HTTP Secure Port** to configure an additional port for HTTP Secure traffic (HTTP Secure traffic uses port 443). Enter a port number between 0-65535 (excluding port 443). Enter 0 to unconfigure the Additional HTTP Secure Port. Default is 0.

4. Use **Authentication Timeout** to specify the number of seconds to keep the authentication session open with the client. To access the network through a portal, the client must first enter authentication information on an authentication Web page. When the time-out expires, the switch disconnects any active TCP or SSL connection with the client. The valid range is 60 to 600 seconds. Default Authentication Timeout is 300 seconds.

<table>

</tr>
</tbody>
</table>
Captive Portal Configuration

By default, the switch has one captive portal. You can change the settings for that captive portal, and you can also create and configure up to nine additional portals.

To display the Captive Portal Configuration page, click Security > Control> Captive Portal > CP Configuration.

1. Use the **CP ID** pull-down menu to select the CP ID for which to create or update.
2. Use **CP Name** to enter the name of the configuration. Name can contain 1 to 31 alphanumeric characters.
3. Use **Admin Mode** to enable or disable this CP instance.
4. Use **Protocol** to choose whether to use HTTP or HTTPS as the protocol for the portal to use during the verification process:
   - **HTTP** - Does not use encryption during verification.
   - **HTTPS** - Uses the Secure Sockets Layer (SSL), which requires a certificate to provide encryption. The certificate is presented to the user at connection time.
5. Use **Verification** to select the mode for the CP to use to verify clients:
   - **Guest** - The user does not need to be authenticated by a database.
   - **Local** - The switch uses a local database to authenticated users.
   - **RADIUS** - The switch uses a database on a remote RADIUS server to authenticate users.
6. **Use Block** to control the blocked status. If the CP is blocked, users cannot gain access to the network through the CP. Use this function to temporarily protect the network during unexpected events, such as denial of service attacks.

7. If the **Verification Mode** is Local or RADIUS, use **Group** to assign an existing User Group to the captive portal. All users who belong to the group are permitted to access the network through this portal. The User Group list is the same for all CP configurations on the switch.

8. **Use Idle Timeout** to enter the number of seconds to wait before terminating a session. A user is logged out once the idle time-out is reached. If the value is set to 0 then the time-out is not enforced. The valid range is 0 to 86400 seconds and the default value is 0.

9. **Use User Logout** to allow the authenticated client to deauthenticate from the network.

10. **Use Radius Auth Server** to enter the IP address of the RADIUS server used for client authentications. The switch acts as the RADIUS client and performs all RADIUS transactions on behalf of the clients.

11. **Use Redirect URL** to specify the URL to which the newly authenticated client is redirected. The max length for the URL is 512 alphanumeric characters.

12. **Use Background Color** to specify the value of the background color. Example: #BFBFBF.

13. **Use Foreground Color** to specify the value of the foreground color. Example: #999999.

14. **Use Separator Color** to specify the value of the separator color. Example: #46008F.

15. **Use Max Bandwidth Down** to specify the maximum rate (Rate in bytes per seconds) at which a client can receive data from the network. 0 indicates limit not enforced (Range: 0 – 536870911).

16. **Use Max Bandwidth Up** to specify the maximum rate (Rate in bytes per seconds) at which a client can send data into the network. 0 indicates limit not enforced (Range: 0 – 536870911).

17. **Use Max Input** to specify the maximum number of octets the user is allowed to transmit. After this limit has been reached the user will be disconnected. 0 indicates limit not enforced (Range: 0 – 4294967295).

18. **Use Max Output** to specify the maximum number of octets the user is allowed to receive. After this limit has been reached the user will be disconnected. 0 indicates limit not enforced (Range: 0 – 4294967295).

19. **Use Max Total** to specify the maximum number of octets the user is allowed to transfer, i.e., the sum of octets transmitted and received. After this limit has been reached the user will be disconnected. 0 indicates limit not enforced (Range: 0 – 4294967295).

20. **Click ADD** to add a new CP instance.

21. **Click DELETE** to remove the currently selected CP instance.
Captive Portal Binding Configuration

You can associate a configured captive portal with a specific network (SSID). The CP feature only runs on the interfaces you specify. A CP can have multiple interfaces associated with it, but an interface can be associated to only one CP at a time.

To display the Captive Portal Global Configuration page, click Security > Control > Captive Portal > CP Binding Configuration.

1. Use the CP ID pull-down list to select the CP ID for which to create or update a CP instance.
2. Use CP Name to enter the name of the configuration. Name can contain 1 to 31 alphanumeric characters.
3. Use Port List to select the interface or interfaces.

Captive Portal Binding Table

To display the Captive Portal Binding Table page, click Security > Control > Captive Portal > CP Binding Table.

Click DELETE to remove the currently selected interface.
### Captive Portal Group Configuration

When you click **Add** from the CP Group Configuration page, the screen refreshes, and you can add a new group to the User Group database.

To display the Captive Portal Group Configuration page, click **Security > Control > Captive Portal > CP Group Configuration.**

1. Use the **Group ID** pull down menu to select the Group ID for which to create or update a group.
2. Use **Group Name** to enter the name of the user group. Name can contain 1 to 31 alphanumeric characters.
3. Click **ADD** to add a new group.
4. Click **DELETE** to remove the currently selected group.
**Captive Portal User Configuration**

When you click **Add** from the CP User Configuration page, the screen refreshes, and you can add a new user to the Local User database.

To display the Captive Portal User Configuration page, click **Security > Control > Captive Portal > CP User Configuration.**

1. **User ID** identifies the name of the user.
2. Use **User Name** to enter the name of the user. Name can contain 1 to 31 alphanumeric characters. User names once created cannot be changed/modified.
3. Set **Edit Password** to “Enable” only when you want to change the password. The default value is “Disable”.
4. Use **Password** to enter a password for the user. The password length can be from 8 to 64 characters.
5. Use **Confirm Password** to enter the password for the user again.
6. Use **Group** to assign the user to at least one User Group. To assign a user to more than one group, press the Ctrl key and click each group. New users are assigned to the 1-Default user group by default.
7. Use **Session Timeout** to enter the number of seconds a user is permitted to remain connected to the network. Once the Session Timeout value is reached, the user is logged out automatically. A value of 0 means that the user does not have a Session Timeout limit. The valid range is 0 to 86400 seconds and the default value is 0.
8. Use **Idle Timeout** to enable Logout once idle time-out is reached (seconds). If the attribute is 0 or not present then use the value configured for the captive portal.
9. Use **Max Bandwidth Down** to specify the maximum rate (Rate in bits per seconds) at which a client can receive data from the network. 0 indicates use global configuration (Range: 0 – 536870911 bps.)
10. Use **Max Bandwidth Up** to specify the maximum rate (Rate in bits per seconds) at which a client can send data into the network. 0 indicates to use the global limit (Range: 0 – 536870911 bps.)

11. Use **Max Output** to specify the number of octets the user is allowed to transmit. After this limit has been reached the user will be disconnected. 0 indicates to use the global limit (Range: 0 – 4294967295.)

12. Use **Max Input** to specify the number of octets the user is allowed to receive. After this limit has been reached the user will be disconnected. 0 indicates to use the global limit (Range: 0 – 4294967295.)

13. Use **Max Total** to specify the number of bytes the user is allowed to transmit and receive. The maximum number of octets is the sum of octets transmitted and received. After this limit has been reached the user will be disconnected. 0 indicates to use the global limit (Range: 0 – 4294967295.)

**Captive Portal Trap Flags**

Use this page to configure whether or not SNMP traps are sent from the Captive Portal and to specify captive portal events that will generate a trap. All CP SNMP traps are disabled by default.

To display the Captive Portal Trap Flags page, click **Security > Control > Captive Portal > CP Trap Flags**.

<table>
<thead>
<tr>
<th>CP Trap Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Trap Flags</strong></td>
</tr>
<tr>
<td><strong>CP Trap Mode</strong></td>
</tr>
<tr>
<td><strong>Client Auth Failure</strong></td>
</tr>
<tr>
<td><strong>Client Connect</strong></td>
</tr>
<tr>
<td><strong>Client DB Full</strong></td>
</tr>
<tr>
<td><strong>Client Disconnect</strong></td>
</tr>
</tbody>
</table>

1. **CP Trap Mode** - Displays the captive portal trap mode status. To enable or disable the mode, use the System > SNMP > SNMPv1/v2 > Trap Flags page.

2. If you enable the **Client Auth Failure** field, the SNMP agent sends a trap when a client attempts to authenticate with a captive portal but is unsuccessful.

3. If you enable the **Client Connect** field, the SNMP agent sends a trap when a client authenticates with and connects to a captive portal.

4. If you enable the **Client DB Full** field, the SNMP agent sends a trap each time an entry cannot be added to the client database because it is full.

5. If you enable the **Client Disconnect** field, the SNMP agent sends a trap when a client disconnects from a captive portal.
To display the Captive Portal Client page, click Security > Control > Captive Portal > CP Client.

### Captive Portal Client

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>Identifies the MAC address of the client</td>
</tr>
<tr>
<td>IP Address Drops</td>
<td>Identifies the IP address of the client (if applicable)</td>

</tr>
</tbody>
</table>
Configuring Access Control Lists

Access Control Lists (ACLs) ensure that only authorized users have access to specific resources while blocking off any unwarranted attempts to reach network resources. ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and above all provide security for the network. ProSafe software supports IPv4 and MAC ACLs.

You first create an IPv4-based or MAC-based ACL ID. Then, you create a rule and assign it to a unique ACL ID. Next, you define the rules, which can identify protocols, source, and destination IP and MAC addresses, and other packet-matching criteria. Finally, use the ID number to assign the ACL to a port or to a LAG.

The Security > ACL folder contains links to the following features:

- ACL Wizard on page 435
- Basic on page 437 for MAC ACLs
- Advanced on page 441 for IPv4 and IPv6 ACLs

ACL Wizard

The ACL Wizard helps a user to create a simple ACL and apply to the selected ports easily and quickly. Firstly you must select an ACL type with which you will create a ACL. Then add ACL rule to this ACL and at last apply this ACL on the selected ports. The ACL Wizard allows you only to create the ACL but doesn't allow you to modify it. If you want to modify it, please go to the ACL configuration page to do that.

To display the ACL Wizard, click Security > ACL > ACL Wizard.
Note: There is an implicit “deny all” rule at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit “deny all” rule applies and the packet is dropped.

To use the ACL Wizard to configure an ACL:

1. **Use ACL Type** to specify the ACL type you are using to create the ACL. You can select one type from 10 optional types:
   - **ACL Based on Destination MAC** - To create a ACL based on the destination MAC address, destination MAC mask and VLAN.
   - **ACL Based on Source MAC** - To create a ACL based on the source MAC address, source MAC mask and VLAN.
   - **ACL Based on Destination IPv4** - To create a ACL based on the destination IPv4 address and IPv4 address mask.
   - **ACL Based on Source IPv4** - To create a ACL based on the source IPv4 address and IPv4 address mask.
   - **ACL Based on Destination IPv6** - To create a ACL based on the destination IPv6 prefix and IPv6 prefix length.
   - **ACL Based on Source IPv6** - To create a ACL based on the source IPv6 prefix and IPv6 prefix length.
   - **ACL Based on Destination IPv4 L4 Port** - To create a ACL based on the destination IPv4 layer4 port number.
   - **ACL Based on Source IPv4 L4 Port** - To create a ACL based on the source IPv4 layer4 port number.
   - **ACL Based on Destination IPv6 L4 Port** - To create a ACL based on the destination IPv6 layer4 port number.
   - **ACL Based on Source IPv6 L4 Port** - To create a ACL based on the source IPv6 layer4 port number.

2. **Use Rule ID** to enter a whole number in the range of 1 to 1023 that will be used to identify the rule.

3. **Use Action** to specify what action should be taken if a packet matches the rule's criteria. The choices are permit or deny.

5. **Use Destination MAC Mask** to specify the destination MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx). The BPDU keyword may be specified using a Destination MAC mask of 00:00:00:ff:ff:ff.

6. **Click ADD** to add a new rule to the ACL based on destination MAC.
7. Click DELETE to remove the currently selected Rule from the ACL based on destination MAC.

8. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

9. Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.

Basic

The Basic folder contains links to the following features:

- MAC ACL on page 437
- MAC Rules on page 438
- MAC Binding Configuration on page 440
- MAC Binding Table on page 441

MAC ACL

A MAC ACL consists of a set of rules which are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit/Deny) is taken and the additional rules are not checked for a match. On this menu the interfaces to which an MAC ACL applies must be specified, as well as whether it applies to inbound or outbound traffic. Rules for the MAC ACL are specified/created using the MAC ACL Rule Configuration menu.

There are multiple steps involved in defining a MAC ACL and applying it to the switch:

1. Use the MAC ACL page to create the ACL ID.
2. Use the MAC Rules page to create rules for the ACL.
3. Use the MAC Binding Configuration page to assign the ACL by its ID number to a port.
4. Optionally, use the MAC Binding Table page to view the configurations.

To display the MAC ACL page, click Security > ACL > Basic > MAC ACL.
The MAC ACL table displays the number of ACLs currently configured in the switch and the maximum number of ACLs that can be configured. The current size is equal to the number of configured IPv4 ACLs plus the number of configured MAC ACLs.

To configure a MAC ACL:

1. To add a MAC ACL, specify a name for the MAC ACL in the Name field, and click ADD. The name string may include alphabetic, numeric, dash, underscore, or space characters only. The name must start with an alphabetic character.

Each configured ACL displays the following information:

- **Rules** - Displays the number of rules currently configured for the MAC ACL.
- **Direction** - Displays the direction of packet traffic affected by the MAC ACL, which can be Inbound or blank.

2. To delete a MAC ACL, select the check box next to the Name field, then click DELETE.

3. To change the name of a MAC ACL, select the check box next to the Name field, update the name, then click APPLY.

4. Click ADD to add a new MAC ACL to the switch configuration.

**MAC Rules**

Use the MAC Rules page to define rules for MAC-based ACLs. The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. A default 'deny all' rule is the last rule of every list.

To display the MAC Rules page, click Security > ACL > Basic > MAC Rules.

To configure MAC ACL rules:

1. From the ACL Name field, specify the existing MAC ACL to which the rule will apply. To set up a new MAC ACL use the “MAC Binding Table” on page 6-441.

2. To add a new rule, enter a whole number in the range of (1 to 12) that will be used to identify the rule, configure the following settings, and click ADD.
   - **Action** - Specify what action should be taken if a packet matches the rule’s criteria. The choices are permit or deny.
• **Assign Queue Id** - Specifies the hardware egress queue identifier used to handle all packets matching this ACL rule. Valid range of Queue Ids is (0 to 6).

• **CoS** - Specifies the 802.1p user priority to compare against an Ethernet frame. Valid range of values is 0 to 7.

• **Ethertype User Value** - Specifies the user defined customized Ethertype value to be used when the user has selected “User Value” as Ethertype Key, to compare against an Ethernet frame. Valid range of values is 0x0600 to 0xFFFF.

• **Source MAC** - Specifies the Source MAC address to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx).

• **Source MAC Mask** - Specifies the Source MAC address mask specifying which bits in the Source MAC to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx).

• **Destination MAC** - Specifies the destination MAC address to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx). The BPDU keyword may be specified using a Destination MAC address of 01:80:C2:xx:xx:xx.

• **Destination MAC Mask** - Specifies the destination MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx). The BPDU keyword may be specified using a Destination MAC mask of 00:00:00:ff:ff:ff.

• **VLAN** - Specifies the VLAN ID to compare against an Ethernet frame. Valid range of values is 0 to 4095. Either VLAN Range or VLAN can be configured.

• **Logging** - When set to 'Enable', logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, this will cause periodic traps to be generated indicating the number of times this rule was 'hit' during the current report interval. A fixed 5 minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is only supported for a 'Deny' Action.

• **Rate Limit Conform Data Rate** - Specify the allowed transmission rate for frames on the interface

• **Rate Limit Burst Size** - Specify the number of bytes allowed in a temporary traffic burst (Burst Rate).

• **Time Range** - Select the name of the time range that will impose a time limitation on the ACL rule. If a time range with the specified name does not exist, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied immediately. If a time range with specified name exists, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive. The **Rule Status** field indicates whether the ACL falls within the specified time range (active) or is not within the range (inactive).

3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

4. To delete a rule, select the check box associated with the rule and click **DELETE**.

5. To change a rule, select the check box associated with the rule, change the desired fields and click **APPLY**. Configuration changes take effect immediately.
Managing Device Security

ProSafe M5300 Switch

MAC Binding Configuration

When an ACL is bound to an interface, all the rules that have been defined are applied to the selected interface. Use the MAC Binding Configuration page to assign MAC ACL lists to ACL Priorities and Interfaces.

To display the MAC Binding Configuration page, click **Security** > **ACL** > **Basic** > **MAC Binding Configuration**.

![MAC Binding Configuration](image)

1. Select an existing MAC ACL from the ACL ID menu. You can select one and bind it to the interfaces you wanted.

   The packet filtering direction for ACL is Inbound, which means the MAC ACL rules are applied to traffic entering the port.

2. Specify an optional sequence number to indicate the order of this access list relative to other access lists already assigned to this interface and direction.

   A low number indicates high precedence order. If a sequence number is already in use for this interface and direction, the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction will be used. The valid range is 1–4294967295.

3. Click the appropriate orange bar to expose the available ports or LAGs. The Port Selection Table provides a list of all available valid interfaces for ACL binding. All non-routing physical interfaces, VLAN interface and interfaces participating in LAGs are listed.

   - To add the selected ACL to a port or LAG, click the box directly below the port or LAG number so that an X appears in the box.
   - To remove the selected ACL from a port or LAG, click the box directly below the port or LAG number to clear the selection. An X in the box indicates that the ACL is applied to the interface.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.
5. Click **APPLY** to save any changes to the running configuration.

**MAC Binding Table**

Use the MAC Binding Table page to view or delete the MAC ACL bindings.

To display the MAC Binding Table, click **Security > ACL > Basic > Binding Table**.

The following table describes the information displayed in the **MAC Binding Table**.

To delete a MAC ACL-to-interface binding, select the check box next to the interface and click **DELETE**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the interface of the ACL assigned.</td>
</tr>
<tr>
<td>Direction</td>
<td>Displays selected packet filtering direction for ACL.</td>
</tr>
<tr>

</tbody>
</table>

**Advanced**

The Advanced folder contains links to the following features:

- **IP ACL** on page 442
- **IP Rules** on page 443
- **IP Extended Rules** on page 445
- **IPv6 ACL** on page 449
- **IPv6 Rules** on page 450
- **IP Binding Configuration** on page 453
- **IP Binding Table** on page 454
- **IP Binding Table** on page 454
**IP ACL**

An IP ACL consists of a set of rules which are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit/Deny) is taken and the additional rules are not checked for a match. On this menu the interfaces to which an IP ACL applies must be specified, as well as whether it applies to inbound or outbound traffic. Rules for the IP ACL are specified/created using the IP ACL Rule Configuration menu.

To display the IP ACL page, click **Security > ACL > Advanced > IP ACL**.

The IP ACL area shows the current size of the ACL table versus the maximum size of the ACL table. The current size is equal to the number of configured IPv4 plus the number of configured MAC ACLs. The maximum size is 100.

To configure an IP ACL:

1. In the **IP ACL ID** field, specify the ACL ID or IP ACL name. The ID is an integer in the following range:
   - 1–99: Creates an IP Basic ACL, which allows you to permit or deny traffic from a source IP address.
   - 100–199: Creates an IP Extended ACL, which allows you to permit or deny specific types of layer 3 or layer 4 traffic from a source IP address to a destination IP address. This type of ACL provides more granularity and filtering capabilities than the standard IP ACL.
   - **IP ACL Name**: Create a Named IP ACL, which provides alternate to configure the IP Extended ACL. IP ACL Name string which includes alphanumeric characters only and must start with an alphabetic character.

2. To delete an IP ACL, select the check box next to the IP ACL ID field, then click **DELETE**.

3. Click **ADD** to add a new IP ACL to the switch configuration.
IP Rules
Use these screens to configure the rules for the IP Access Control Lists created using the IP Access Control List Configuration screen. What is shown on this screen varies depending on the current step in the rule configuration process.

Note: There is an implicit “deny all” rule at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit “deny all” rule applies and the packet is dropped.

To display the IP Rules page, click Security > ACL> Advanced > IP Rules.

To configure rules for an IP ACL:
1. To add an IP ACL rule, select the ACL ID to add the rule to, complete the fields described in the following list, and click ADD. (Only displays ACL IDs from 1 to 99.)

2. Configure the desired criteria for the new rule:
   - Rule ID - Specify a number from 1–12 to identify the IP ACL rule. You can create up to 12 rules for each ACL.
• **Action** - Selects the ACL forwarding action, which is one of the following:
  • Permit - Forwards packets which meet the ACL criteria.
  • Deny - Drops packets which meet the ACL criteria.

• **Logging** - When set to 'Enable', logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, this will cause periodic traps to be generated indicating the number of times this rule was 'hit' during the current report interval. A fixed 5 minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is visible for a 'Deny' Action.

• **Assign Queue ID** - Specifies the hardware egress queue identifier used to handle all packets matching this ACL rule. Enter an identifying number from 0–6 in the appropriate field.

• **Match Every** - Select true or false from the pull-down menu. True signifies that all packets will match the selected IP ACL and Rule and will be either permitted or denied. In this case, since all packets match the rule, the option of configuring other match criteria will not be offered. To configure specific match criteria for the rule, remove the rule and re-create it, or re-configure 'Match Every' to 'False' for the other match criteria to be visible.

• **Mirror Interface** - Specifies the specific egress interface where the matching traffic stream is copied in addition to being forwarded normally by the device. This field cannot be set if a Redirect Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.

• **Redirect Interface** - Specifies the specific egress interface where the matching traffic stream is forced, bypassing any forwarding decision normally performed by the device. This field cannot be set if a Mirror Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.

• **Source IP Address** - Requires a packet's source IP address to match the address listed here. Type an IP Address in the appropriate field using dotted-decimal notation. The address you enter is compared to a packet's source IP Address.

• **Source IP Mask** - Specify the IP Mask in dotted-decimal notation to be used with the Source IP Address value.

• **Rate Limit Conform Data Rate** - Specify the allowed transmission rate for frames on the interface

• **Rate Limit Burst Size** - Specify the number of bytes allowed in a temporary traffic burst (Burst Rate).

• **Time Range** - Select the name of the time range that will impose a time limitation on the ACL rule. If a time range with the specified name does not exist, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied immediately. If a time range with specified name exists, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

3. To delete an IP ACL rule, select the check box associated with the rule, and then click **DELETE**.
4. To update an IP ACL rule, select the check box associated with the rule, update the desired fields, and then click APPLY. You cannot modify the Rule ID of an existing IP rule.

5. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

6. If you change any of the settings on the page, click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.

**IP Extended Rules**

Use these screens to configure the rules for the IP Access Control Lists created using the IP Access Control List Configuration screen. What is shown on this screen varies depending on the current step in the rule configuration process.

---

**Note:** There is an implicit “deny all” rule at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit “deny all” rule applies and the packet is dropped.

---

To display the IP extended Rules page, click **Security > ACL > Advanced > IP Extended Rules**.

---

To configure rules for an IP ACL:

1. To add an IP ACL rule, select the ACL ID to add the rule to, select the check box in the Extended ACL Rule table, and click ADD. The page displays the extended ACL Rule Configuration fields, as the following figure shows.
2. Configure the desired criteria for the new rule.

- **Rule ID** - Specify a number from 1–12 to identify the IP ACL rule. You can create up to 12 rules for each ACL.

- **Action** - Selects the ACL forwarding action, which is one of the following:
  - Permit - Forwards packets which meet the ACL criteria.
  - Deny - Drops packets which meet the ACL criteria.

- **Logging** - When set to 'Enable', logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, this will cause periodic traps to be generated indicating the number of times this rule was 'hit' during the current report interval. A fixed 5 minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is visible for a 'Deny' Action.

- **Assign Queue** - Specifies the hardware egress queue identifier used to handle all packets matching this IP ACL rule. Valid range of Queue Ids is 0 to 6.

- **Mirror Interface** - Specifies the specific egress interface where the matching traffic stream is copied in addition to being forwarded normally by the device. This field cannot be set if a Redirect Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.

- **Match Every** - Select true or false from the pull-down menu. True signifies that all packets will match the selected IP ACL and Rule and will be either permitted or denied. In this case, since all packets match the rule, the option of configuring other match criteria will not be offered. To configure specific match criteria for the rule,
remove the rule and re-create it, or re-configure 'Match Every' to 'False' for the other match criteria to be visible.

- **Protocol Keyword** - Specify that a packet's IP protocol is a match condition for the selected IP ACL rule. The possible values are ICMP, IGMP, IP, TCP, and UDP.
- **TCP Flag** - Specify that a packet's TCP flag is a match condition for the selected IP ACL rule. The TCP flag values are URG, ACK, PSH, RST, SYN, FIN. Each TCP flag has these possible values below and can be set separately.
  - Ignore - A packet matches this ACL rule whatever the TCP flag in this packet is set or not.
  - Set(+) - A packet matches this ACL rule if the TCP flag in this packet is set.
  - Clear(-) - A packet matches this ACL rule if the TCP flag in this packet is not set.
- **Src IP Address** - Enter an IP address using dotted-decimal notation to be compared to a packet's source IP Address as a match criteria for the selected IP ACL rule.
- **Src IP Mask** - Specify the IP Mask in dotted-decimal notation to be used with the Source IP Address value.
- **Src L4 Port** - Specify a packet's source layer 4 port as a match condition for the selected extended IP ACL rule. This is an optional configuration. The possible values are DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.
- **Dst IP Address** - Enter an IP address using dotted-decimal notation to be compared to a packet's destination IP Address as a match criteria for the selected extended IP ACL rule.
- **Dst IP Mask** - Specify the IP Mask in dotted-decimal notation to be used with the Destination IP Address value.
- **Dst L4 Port** - Specify the destination layer 4 port match conditions for the selected extended IP ACL rule. The possible values are DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range. This is an optional configuration.
- **Service Type** - Select a Service Type match condition for the extended IP ACL rule from the pull-down menu. The possible values are IP DSCP, IP precedence, and IP TOS, which are alternative ways of specifying a match criterion for the same Service Type field in the IP header, however each uses a different user notation. After a selection is made the appropriate value can be specified.
  - **IP DSCP** - Specify the IP DiffServ Code Point (DSCP) field. The DSCP is defined as the high-order six bits of the Service Type octet in the IP header. This is an optional configuration. Enter an integer from 0 to 63. The IP DSCP is selected by possibly selection one of the DSCP keyword from a drop-down menu. If a value is to be selected by specifying its numeric value, then select the Other option in the drop-down menu and a text box will appear where the numeric value of the DSCP can be entered.
Managing Device Security

ProSafe M5300 Switch

- **IP Precedence** - The IP Precedence field in a packet is defined as the high-order three bits of the Service Type octet in the IP header. This is an optional configuration. Enter an integer from 0 to 7.

- **IP TOS** - The IP TOS field in a packet is defined as all eight bits of the Service Type octet in the IP header. The TOS Bits value is a hexadecimal number from 00 to FF. The TOS Mask value is a hexadecimal number from 00 to FF. The TOS Mask denotes the bit positions in the TOS Bits value that are used for comparison against the IP TOS field in a packet. For example, to check for an IP TOS value having bits 7 and 5 set and bit 1 clear, where bit 7 is most significant, use a TOS Bits value of 0xA0 and a TOS Mask of 0xFF. This is an optional configuration.

- **Rate Limit Conform Data Rate** - Specify the allowed transmission rate for frames on the interface.

- **Rate Limit Burst Size** - Specify the number of bytes allowed in a temporary traffic burst (Burst Rate).

- **Time Range** - Select the name of the time range that will impose a time limitation on the ACL rule. If a time range with the specified name does not exist, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied immediately. If a time range with specified name exists, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

3. Click **APPLY** to add the ACL rule with the specified criteria.

4. To delete an IP ACL rule, select the check box associated with the rule, and then click **DELETE**.

5. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

6. To modify an existing IP Extended ACL rule, click the **Rule ID**. The number is a hyperlink to the Extended ACL Rule Configuration page.
IPv6 ACL

An IP ACL consists of a set of rules which are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit/Deny) is taken and the additional rules are not checked for a match. On this menu the interfaces to which an IP ACL applies must be specified, as well as whether it applies to inbound or outbound traffic. Rules for the IP ACL are specified/created using the IP ACL Rule Configuration menu.

To display the IPv6 ACL page, click Security > ACL > Advanced > IPv6 ACL.

1. IP ACL is the IP ACL ID or IP ACL Name which is dependent on the IP ACL Type. IP ACL ID must be an integer from 1 to 99 for an IP basic ACL and from 100 to 199 for an IP Extended ACL. IPv6 ACL Name string includes alphanumeric characters only. The name must start with an alphabetic character.

2. Click ADD to add a new IP ACL to the switch configuration.

3. Click DELETE to remove the currently selected IP ACL from the switch configuration.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Number of ACL</td>
<td>The current number of the IP ACLs configured on the switch.</td>
</tr>
<tr>
<td>Maximum ACL</td>
<td>The maximum number of IP ACL can be configured on the switch, it depends on the hardware.</td>
</tr>
<tr>
<td>Rules</td>
<td>The number of the rules associated with the IP ACL.</td>
</tr>
<tr>
<td>Type</td>
<td>The the ACL type, basic IP ACL with id from 1 to 99 and Extended IP ACL with id from 100 to 199.</td>
</tr>
</tbody>
</table>
IPv6 Rules

Use these screens to configure the rules for the IPv6 Access Control Lists, which is created using the IPv6 Access Control List Configuration screen. By default, no specific value is in effect for any of the IPv6 ACL rules.

To display the IPv6 Rules page, click Security > ACL > Advanced > IPv6 Rules.

1. To add an IP ACL rule, select the ACL ID to add the rule to, select the check box in the Extended ACL Rule table, and click ADD. The page displays the extended ACL Rule Configuration fields, as the following figure shows.
2. Use **Rule ID** to enter a whole number in the range of 1 to 12 that will be used to identify the rule. An IP ACL may have up to 12 rules.

3. Configure the desired rule attributes:
   - Use **Action** to specify what action should be taken if a packet matches the rule's criteria. The choices are permit or deny.
   - Use **Logging** to enable logging for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, this will cause periodic traps to be generated indicating the number of times this rule was 'hit' during the current report interval. A fixed 5 minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is visible for a 'Deny' Action.
   - Use **Assign Queue ID** to specify the hardware egress queue identifier used to handle all packets matching this IPv6 ACL rule. Valid range of Queue IDs is 0 to 6. This field is visible for a 'Permit' Action.
   - Use **Mirror Interface** to specify the specific egress interface where the matching traffic stream is copied in addition to being forwarded normally by the device. This field cannot be set if a Redirect Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.
   - Use **Redirect Interface** to specify the specific egress interface where the matching traffic stream is forced, bypassing any forwarding decision normally performed by the device. This field cannot be set if a Mirror Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.
   - Use **Match Every** to select true or false from the pull down menu. True signifies that all packets will match the selected IPv6 ACL and Rule and will be either permitted or denied. In this case, since all packets match the rule, the option of configuring other match criteria will not be offered. To configure specific match criteria for the rule, remove the rule and recreate it, or reconfigure 'Match Every' to 'False' for the other match criteria to be visible.
   - Use **Protocol** to configure IPv6 protocol:
     - Specify an integer ranging from 0 to 255 after selecting protocol keyword "other". This number represents the IP protocol.
     - Select name of a protocol from the existing list of Internet Protocol (IP), Transmission Control Protocol (TCP), User Datagram Protocol (UDP), Internet Control Message Protocol (ICMP) and Internet Group Management Protocol (IGMP).
   - Use **Source Prefix/Prefix Length** to specify IPv6 Prefix combined with IPv6 Prefix length of the network or host from which the packet is being sent. Prefix length can be in the range 0 to 128.
• **Use Source L4 Port** to specify a packet's source layer 4 port as a match condition for the selected IPv6 ACL rule. Source port information is optional. Source port information can be specified in two ways:
  - Select keyword “other” from the drop down menu and specify the number of the port in the range from 0 to 65535.
  - Select one of the keyword from the list: DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

• **Use Destination Prefix/Prefix Length** to enter up to 128-bit prefix combined with prefix length to be compared to a packet's destination IP Address as a match criteria for the selected IPv6 ACL rule. Prefix length can be in the range 0 to 128.

• **Use Destination L4 Port** to specify a packet's destination layer 4 port as a match condition for the selected IPv6 ACL rule. Destination port information is optional. Destination port information can be specified in two ways:
  - Select keyword “other” from the drop down menu and specify the number of the port in the range from 0 to 65535.
  - Select one of the keyword from the list: DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

• **Flow** label is 20-bit number that is unique to an IPv6 packet, used by end stations to signify quality-of-service handling in routers. Flow label can specified within the range (0 to 1048575).

• **Use IPv6 DSCP Service** to specify the IP DiffServ Code Point (DSCP) field. The DSCP is defined as the high-order six bits of the Service Type octet in the IPv6 header. This is an optional configuration. Enter an integer from 0 to 63. The IPv6 DSCP is selected by possibly selection one of the DSCP keyword from a drop-down menu. If a value is to be selected by specifying its numeric value, then select the Other option in the drop-down menu and a text box will appear where the numeric value of the DSCP can be entered.

• **Rate Limit Conform Data Rate** — Specify the allowed transmission rate for frames on the interface

• **Rate Limit Burst Size** — Specify the number of bytes allowed in a temporary traffic burst (Burst Rate).

• **Time Range** — Select the name of the time range that will impose a time limitation on the ACL rule. If a time range with the specified name does not exist, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied immediately. If a time range with specified name exists, and the ACL containing this ACL rule is associated with an interface, the ACL rule is applied when the time-range with specified name becomes active. The ACL rule is removed when the time-range with specified name becomes inactive.

4. Click **APPLY** to add the ACL rule with the specified criteria.

5. Use **DELETE** to select the check box of the rule you want to delete and click **DELETE**.
**IP Binding Configuration**

When an ACL is bound to an interface, all the rules that have been defined are applied to the selected interface. Use the IP Binding Configuration page to assign ACL lists to ACL Priorities and Interfaces.

To display the IP Binding Configuration page, click **Security > ACL > Advanced > IP Binding Configuration**.

![IP Binding Configuration](image)

To configure IP ACL interface bindings:

1. Select an existing IP ACL from the ACL ID menu.
   
   The packet filtering direction for ACL is Inbound, which means the IP ACL rules are applied to traffic entering the port.

2. Specify an optional sequence number to indicate the order of this access list relative to other access lists already assigned to this interface and direction.
   
   A low number indicates high precedence order. If a sequence number is already in use for this interface and direction, the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction will be used. The valid range is 1–4294967295.

3. Click the appropriate orange bar to expose the available ports or LAGs. The Port Selection Table specifies list of all available valid interfaces for ACL mapping. All non-routing physical interfaces and interfaces participating in LAGs are listed.
   
   • To add the selected ACL to a port or LAG, click the box directly below the port or LAG number so that an X appears in the box.
   
   • To remove the selected ACL from a port or LAG, click the box directly below the port or LAG number to clear the selection. An X in the box indicates that the ACL is applied to the interface.

4. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

5. Click **APPLY** to save any changes to the running configuration.
**IP Binding Table**

Use the IP Binding Table page to view or delete the IP ACL bindings.

To display the IP Binding Table, click **Security > ACL > Advanced > Binding Table**.

The following table describes the information displayed in the **IP ACL Binding Table**.

To delete an IP ACL-to-interface binding, select the check box next to the interface and click **DELETE**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays selected interface.</td>
</tr>
<tr>
<td>Direction</td>

VLAN Binding Table

Use this page to bind ACLs to VLANs on the switch rather than to ports. At the bottom of the page, the table displays any currently-configured ACLs for the selected VLAN. You can also bind an ACL to a port.

To display the VLAN Binding Table, click **Security > ACL > Advanced > VLAN Binding Table**.

The following table describes the information displayed in the **ACL VLAN Binding Table**.

1. In the **VLAN ID** field, specify the VLAN to which an IP will be bound.
2. Use **Direction** to specify the packet filtering direction for ACL. Valid directions are Inbound.
3. Use **Sequence Number** to specify the order of the specified ACL relative to other ACLs assigned to selected interface and direction. A lower number indicates higher precedence order. If a sequence number is already in use for this VLAN and direction, the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user (i.e. the value is 0), a sequence number that is one greater than the highest sequence number currently in use for this VLAN and direction will be used. Valid range is (1 to 4294967295).
4. Use **ACL Type** to specify the type of ACL. Valid ACL Types include IP ACL, MAC ACL, and IPv6 ACL.
5. Use **ACL ID** to display all the ACLs configured, depending on the ACL Type selected.
6. Click **APPLY** to add the configured ACL-to-VLAN binding.
7. To delete a VLAN ACL-to-interface binding, select the check box next to the VLAN and click **DELETE**.
Monitoring the System

Use the features available from the Monitoring tab to view a variety of information about the switch and its ports and to configure how the switch monitors events. The Monitoring tab contains links to the following features:

- **Ports** on page 457
- **Logs** on page 468
- **Port Mirroring** on page 477
- **sFlow** on page 479

Ports

The pages available from the Ports link contain a variety of information about the number and type of traffic transmitted from and received on the switch. From the Ports link, you can access the following pages:

- **Port Statistics** on page 458
- **Port Detailed Statistics** on page 459
- **EAP Statistics** on page 466
- **Cable Test** on page 467
Port Statistics

The Port Statistics page displays a summary of per-port traffic statistics on the switch. To access the Port Statistics page, click Monitoring > Ports > Port Statistics.

The following table describes the per-port statistics displayed on the screen.

Use the buttons at the bottom of the page to perform the following actions:

- To clear all the counters for all ports on the switch, select the check box in the row heading and click CLEAR. The button resets all statistics for all ports to default values.
- To clear the counters for a specific port, select the check box associated with the port and click CLEAR.
- Click REFRESH to refresh the data on the screen and display the most current statistics.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>This object indicates the ifIndex of the interface table entry associated with this port on an adapter.</td>
</tr>
<tr>
<td>Total Packets Received Without Errors</td>
<td>The total number of packets received that were without errors.</td>
</tr>
<tr>
<td>Packets Received With Error</td>
<td>The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of good packets received that were directed to the broadcast address. Note that this does not include multicast packets.</td>
</tr>
<tr>
<td>Packets Transmitted Without Errors</td>
<td>The number of frames that have been transmitted by this port to its segment.</td>
</tr>
<tr>
<td>Transmit Packet Errors</td>
<td>The number of outbound packets that could not be transmitted because of errors.</td>
</tr>
</tbody>
</table>
Port Detailed Statistics

The Port Detailed Statistics page displays a variety of per-port traffic statistics.

To access the Port Detailed page, click Monitoring > Ports > Port Detailed Statistics.

(Following figure show some, but not all, of the fields on the Port Detailed Statistics page.)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Collision Frames</td>
<td>The best estimate of the total number of collisions on this Ethernet segment.</td>
</tr>
<tr>
<td>Time Since Counters Last Cleared</td>
<td>The elapsed time, in days, hours, minutes, and seconds since the statistics for this port were last cleared.</td>
</tr>
</tbody>
</table>
The following table describes the detailed port information displayed on the screen. To view information about a different port, select the port number from the Interface menu.

Use the buttons at the bottom of the page to perform the following actions:

- Click **CLEAR** to clear all the counters. This resets all statistics for this port to the default values.
- Click **REFRESH** to refresh the data on the screen and display the most current statistics.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>This object indicates the ifIndex of the interface table entry associated with this port on an adapter.</td>
</tr>
<tr>
<td>Port Type</td>
<td>For normal ports this field will be ‘normal.’ Otherwise the possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Mirrored - This port is a participating in port mirroring as a mirrored port. Look at the Port Mirroring screens for more information.</td>
</tr>
<tr>
<td></td>
<td>• Probe - This port is a participating in port mirroring as the probe port. Look at the Port Mirroring screens for more information.</td>
</tr>
<tr>
<td></td>
<td>• Trunk Member - The port is a member of a Link Aggregation trunk. Look at the Port Channel screens for more information.</td>
</tr>
<tr>
<td>Port Channel ID</td>
<td>If the port is a member of a port channel, the port channel's interface ID and name are shown. Otherwise “Disable” is shown.</td>
</tr>
<tr>
<td>Port Role</td>
<td>Each MST Bridge Port that is enabled is assigned a Port Role for each spanning tree. The port role will be one of the following values: Root Port, Designated Port, Alternate Port, Backup Port, Master Port or Disabled Port.</td>

<td>No Cable</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1/0/12</td>
<td>Cable status test failed</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1/0/13</td>
<td>No Cable</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
1. **Interface** - Indicates the interface to which the cable to be tested is connected.

2. **Click APPLY** to perform a cable test on the selected interface. The cable test may take up to 2 seconds to complete. If the port has an active link then the link is not taken down and the cable status is always “Normal”. The command returns a cable length estimate if this feature is supported by the PHY for the current link speed. Note that if the link is down and a cable is attached to a 10/100 Ethernet adapter then the cable status may be “Open” or “Short” because some Ethernet adapters leave unused wire pairs unterminated or grounded.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cable Status</td>
<td>This displays the cable status as Normal, Open or Short.</td>
</tr>
<tr>
<td></td>
<td>• Normal: the cable is working correctly:</td>
</tr>
<tr>
<td></td>
<td>• Open: the cable is disconnected or there is a faulty connector.</td>
</tr>
<tr>
<td></td>
<td>• Short: there is an electrical short in the cable.</td>
</tr>
<tr>
<td></td>
<td>• Cable Test Failed: The cable status could not be determined. The cable may in fact be working.</td>
</tr>
<tr>
<td>Cable Length</td>
<td>The estimated length of the cable in meters. The length is displayed as a range between the shortest estimated length and the longest estimated length. Unknown is displayed if the cable length could not be determined. The Cable Length is only displayed if the cable status is Normal.</td>
</tr>
<tr>
<td>Failure Location</td>
<td>The estimated distance in meters from the end of the cable to the failure location. The failure location is only displayed if the cable status is Open or Short.</td>
</tr>
</tbody>
</table>

**Logs**

The switch may generate messages in response to events, faults, or errors occurring on the platform as well as changes in configuration or other occurrences. These messages are stored locally and can be forwarded to one or more centralized points of collection for monitoring purposes or long term archival storage. Local and remote configuration of the logging capability includes filtering of messages logged or forwarded based on severity and generating component.

The **Monitoring > Logs** tab contains links to the following folders:

- **Buffered Logs** on page 469
- **Command Log Configuration** on page 470
- **Console Log Configuration** on page 471
- **SysLog Configuration** on page 471
- **Trap Logs** on page 472
- **Event Logs** on page 474
- **Persistent Logs** on page 476
**Buffered Logs**

To access the Buffered Logs page, click Monitoring > Logs > Buffered Logs.

---

**Buffered Log Configuration**

This log stores messages in memory based upon the settings for message component and severity. On stackable systems, this log exists only on the top of stack platform. Other platforms in the stack forward their messages to the top of stack log.

1. **A log that is “Disabled” shall not log messages. A log that is “Enabled” shall log messages. Enable or Disable logging by selecting the corresponding radio button.**

2. **Behavior Indicates the behavior of the log when it is full. It can either wrap around or stop when the log space is filled.**

3. **Click REFRESH to refresh the web page to show the latest messages in the log.**

4. **Click CLEAR to clear the buffered log in the memory.**

**Message Log**

This help message applies to the format of all logged messages which are displayed for the message log, persistent log or console log.
Format of the messages

Messages logged to a collector or relay via syslog have an identical format of either type:

If system is not stacked

• <15>Aug 24 05:34:05 STK0 MSTP[2110]: mspt_api.c(318) 237 %% Interface 12 transitioned to root state on message age timer expiry.

The above example indicates a message with severity 7 (15 mod 8) (debug) on a system that is not stack and generated by component MSTP running in thread id 2110 on Aug 24 05:34:05 by line 318 of file mstp_api.c. This is the 237th message logged.

If the system is stacked

• <15>Aug 24 05:34:05 0.0.0.0-1 MSTP[2110]: mspt_api.c(318) 237 %% Interface 12 transitioned to root state on message age timer expiry.

The above example indicates a message with severity 7 (15 mod 8) (debug) on a system that is stacked and generated by component MSTP running in thread id 2110 on Aug 24 05:34:05 by line 318 of file mstp_api.c. This is the 237th message logged with system IP 0.0.0.0 and task-id 1.

Format of the messages

• <15>Aug 24 05:34:05 STK0 MSTP[2110]: mspt_api.c(318) 237 %% Interface 12 transitioned to root state on message age timer expiry.

The above example indicates a user-level message (1) with severity 7 (debug) on a system that is not stack and generated by component MSTP running in thread id 2110 on Aug 24 05:34:05 by line 318 of file mstp_api.c. This is the 237th message logged. Messages logged to a collector or relay via syslog have an identical format to the above message.

• Total number of Messages: For the message log, only the latest 200 entries are displayed on the page

Command Log Configuration

To access the Command Log Configuration page, click Monitoring > Logs > Command Log Configuration.

Command Log Configuration

1. Use Admin Mode to enable/disable the operation of the CLI Command logging by selecting the corresponding radio button.
Console Log Configuration

This allows logging to any serial device attached to the host.

To access the Console Log Configuration page, click Monitoring > Logs > Console Log Configuration.

1. A log that is “Disabled” shall not log messages. A log that is “Enabled” shall log messages. Enable or Disable logging by selecting the corresponding radio button.

2. **Severity Filter.** A log records messages equal to or above a configured severity threshold. Select the severity option by selecting the corresponding line on the pull-down entry field. These severity levels have been enumerated below:
   - Emergency (0) - system is unusable
   - Alert (1) - action must be taken immediately
   - Critical (2) - critical conditions
   - Error (3) - error conditions
   - Warning (4) - warning conditions
   - Notice(5) - normal but significant conditions
   - Informational(6) - informational messages
   - Debug(7) - debug-level messages

SysLog Configuration

To access the SysLog Configuration page, click Monitoring > Logs > Sys Log Configuration.
1. Use **Admin Status** to enable/disable logging to configured syslog hosts. Setting this to disable stops logging to all syslog hosts. Disable means no messages will be sent to any collector/relay. Enable means messages will be sent to configured collector/relays using the values configured for each collector/relay. Enable/Disable the operation of the syslog function by selecting the corresponding radio button.

2. Use **Local UDP Port** to specify the port on the local host from which syslog messages are sent. The default port is 514. Specify the local port in the text field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messages Relayed</td>
<td>The count of syslog messages relayed.</td>
</tr>
<tr>
<td>Messages Ignored</td>
<td>The count of syslog messages ignored.</td>
</tr>
</tbody>
</table>

**Trap Logs**

This screen lists the entries in the trap log. The information can be retrieved as a file by using System Utilities, Upload File from Switch.

To access the Trap Logs page, click **Monitoring > Logs> Trap Logs**.
The following table describes the Trap Log information displayed on the screen.

The page also displays information about the traps that were sent.

Click **Clear Counters** to clear all the counters. This resets all statistics for the trap logs to the default values.
### Event Logs

This panel displays the event log, which contains error messages from the system. Event log is not cleared on a system reset.

To access the Event Log page, click **Monitoring > Logs > Event Logs**.
The following table describes the Event Log information displayed on the screen.

Use the buttons at the bottom of the page to perform the following actions:

- Click **CLEAR** to clear the messages out of the Event Log.
- Click **REFRESH** to refresh the data on the screen and display the most current information.
Persistent Logs

A persistent log is a log that is stored in persistent storage. Persistent storage survives across platform reboots. The first log type is the system startup log. The system startup log stores the first N messages received after system reboot. The second log type is the system operation log. The system operation log stores the last N messages received during system operation.

To access the Persistent Logs page, click Monitoring > Logs > Persistent Logs.

1. A log that is “Disabled” shall not log messages. A log that is “Enabled” shall log messages. Enable or Disable logging by selecting the corresponding line on the pull-down entry field.

2. Behavior. A log records messages equal to or above a configured severity threshold. Select the severity option by selecting the corresponding line on the pull-down entry field. These severity levels have been enumerated below:
   - Emergency (0) - system is unusable
   - Alert (1) - action must be taken immediately
   - Critical (2) - critical conditions
• Error (3) - error conditions
• Warning (4) - warning conditions
• Notice(5) - normal but significant conditions
• Informational(6) - informational messages
• Debug(7) - debug-level messages

3. Click REFRESH to refresh the web page to show the latest messages in the persistent log.

Format of the messages

• Total number of Messages: Number of persistent log messages displayed on the switch.
• <15>Aug 24 05:34:05 STK0 MSTP[2110]: mspt_api.c(318) 237 %% Interface 12 transitioned to root state on message age timer expiry

The above example indicates a user-level message (1) with severity 7 (debug) on a system that is not stack and generated by component MSTP running in thread id 2110 on Aug 24 05:34:05 by line 318 of file mstp_api.c. This is the 237th message logged. Messages logged to a collector or relay via syslog have an identical format to the above message.

Port Mirroring

The page under the Mirroring link allows you to view and configure port mirroring on the system.

Multiple Port Mirroring

Port mirroring selects the network traffic for analysis by a network analyzer. This is done for specific ports of the switch. As such, many switch ports are configured as source ports and one switch port is configured as a destination port. You have the ability to configure how traffic is mirrored on a source port. Packets that are received on the source port, that are transmitted on a port, or are both received and transmitted, can be mirrored to the destination port.

The packet that is copied to the destination port is in the same format as the original packet on the wire. This means that if the mirror is copying a received packet, the copied packet is VLAN tagged or untagged as it was received on the source port. If the mirror is copying a transmitted packet, the copied packet is VLAN tagged or untagged as it is being transmitted on the source port.
Use the Multiple Port Mirroring page to define port mirroring sessions.
To access the Multiple Port Mirroring page, click Monitoring > Mirroring > Port Mirroring.

To configure Port Mirroring:

1. Select the check box next to each port to configure as a source port.
2. Use Source Port to specify the configured port(s) as mirrored port(s). Traffic of the configured port(s) is sent to the probe port.
3. In the Destination Port field, specify the port to which port traffic is be copied. Use the unit/slot/port format to specify the port. You can configure only one destination port on the system. Acts as a probe port and will receive all the traffic from configured mirrored port(s). Default value is blank.
4. From the Session Mode menu, select the mode for port mirroring on the selected port:
   • Enable - Multiple Port Mirroring is active on the selected port.
   • Disable - Port mirroring is not active on the selected port, but the mirroring information is retained.
5. Direction - Specifies the direction of the Traffic to be mirrored from the configured mirrored port(s). Default value is Tx and Rx.
6. Click APPLY to apply the settings to the system. If the port is configured as a source port, the Mirroring Port field value is Mirrored.
7. To delete a mirrored port, select the check box next to the mirrored port, and then click DELETE.
8. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

sFlow

sFlow® is a standard for monitoring high-speed switched and routed networks. sFlow technology is built into network equipment and gives complete visibility into network activity, enabling effective management and control of network resources.

The sFlow monitoring system consists of an sFlow Agent (embedded in a switch or router or in a standalone probe) and a central sFlow Collector. The sFlow Agent uses sampling technology to capture traffic statistics from the device it is monitoring. sFlow datagrams are used to immediately forward the sampled traffic statistics to an sFlow Collector for analysis.

The sFlow Agent uses two forms of sampling: statistical packet-based sampling of switched or routed Packet Flows, and time-based sampling of counters.

From the sFlow link under the Monitoring tab, you can access the following pages:

- **Basic** on page 479
- **Advanced** on page 480

**Basic**

From the Basic link, you can access the following pages:

- **sFlow Agent** on page 479

**sFlow Agent**

Packet Flow Sampling and Counter Sampling are performed by sFlow Instances associated with individual Data Sources within the sFlow Agent. Packet Flow Sampling and Counter Sampling are designed as part of an integrated system. Both types of samples are combined in sFlow datagrams. Packet Flow Sampling will cause a steady, but random, stream of sFlow datagrams to be sent to the sFlow Collector. Counter samples may be taken opportunistically in order to fill these datagrams.

In order to perform Packet Flow Sampling, an sFlow Sampler Instance is configured with a Sampling Rate. The Packet Flow sampling process results in the generation of Packet Flow Records. In order to perform Counter Sampling, the sFlow Poller Instance is configured with a Polling Interval. The Counter Sampling process results in the generation of Counter Records. The sFlow Agent collects Counter Records and Packet Flow Records and sends them in the form of sFlow datagrams to sFlow Collectors.
To display the sFlow Agent page, click Monitoring > sFlow > Basic > sFlow Agent.

### sFlow Agent Information

<table>

| Agent Version    | Uniquely identifies the version and implementation of this MIB. The version string must have the following structure: MIB Version;Organization;Software Revision where:  
|                  | • MIB Version: '1.3', the version of this MIB.                                                                                               |
|                  | • Organization: NETGEAR Inc.                                                                                                                  |
|                  | • Revision: 1.0                                                                                                                                |
| Agent Address    | The IP address associated with this agent.                                                                                                    |

Click REFRESH to refresh the web page to show the latest sFlow agent information.

### Advanced

From the Advanced link, you can access the following pages:

- sFlow Agent on page 479
- sFlow Receiver Configuration on page 481
- sFlow Interface Configuration on page 482
sFlow Receiver Configuration

Use the sFlow Receiver Configuration page to configure the sFlow Receiver.

To display the sFlow Receiver Configuration page, click Monitoring > sFlow > Advanced > sFlow Receiver Configuration.

1. **Receiver Index**. Selects the receiver for which data is to be displayed or configured. Allowed range is 1 to 8.
2. **Use Receiver Owner** to specify the entity making use of this sFlowRcvrTable entry. The empty string indicates that the entry is currently unclaimed and the receiver configuration is reset to default values. An entity wishing to claim an sFlowRcvrTable entry must ensure that the entry is unclaimed before trying to claim it. The entry is claimed by setting the owner string. The entry must be claimed before any changes can be made to other sampler objects.
3. **Use Receiver Timeout** to specify the time (in seconds) remaining before the sampler is released and stops sampling. A management entity wanting to maintain control of the sampler is responsible for setting a new value before the old one expires. Allowed range is 0 to 4294967295 secs. A value of zero sets the selected receiver configuration to its default values.
4. **Use Maximum Datagram Size** to specify the maximum number of data bytes that can be sent in a single sample datagram. The manager should set this value to avoid fragmentation of the sFlow datagrams. Default Value: 1400. Allowed range is 200 to 9116.
5. **Use Receiver Address** to specify the IP address of the sFlow collector. If set to 0.0.0.0, no sFlow datagrams will be sent.
6. **Use Receiver Port** to specify the destination port for sFlow datagrams. Allowed range is 1 to 65535.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Datagram Version</td>
<td>The version of sFlow datagrams that should be sent.</td>
</tr>
</tbody>
</table>
sFlow Interface Configuration

sFlow agent collects statistical packet-based sampling of switched flows and sends them to the configured receivers. A data source configured to collect flow samples is called a sampler. sFlow agent also collects time-based sampling of network interface statistics and sends them to the configured sFlow receivers. A data source configured to collect counter samples is called a poller.

To display the sFlow Interface Configuration page, click Monitoring > sFlow > Advanced > sFlow Interface Configuration.

1. **Interface** - The interface for this flow poller and sampler. This Agent will support Physical ports only.

2. **Use Receiver Index** to specify the allowed range for the sFlow Receiver associated with this counter poller. Allowed range is 1 to 8.

3. **Use Poller Interval** to specify the maximum number of seconds between successive samples of the counters associated with this data source. A sampling interval of 0 disables counter sampling. Allowed range is 0 to 86400 secs.

4. **Use Receiver Index** to specify the sFlow Receiver for this flow sampler. If set to 0, the sampler configuration is set to default and the sampler is deleted. Only active receivers can be set. If a receiver expires then all samplers associated with the receiver will also expire. Allowed range is 1 to 8.

5. **Use Sampling Rate** to specify the statistical sampling rate for packet sampling from this source. A sampling rate of 1 counts all packets. A sampling rate of 0 disables sampling. Allowed range is 1024 to 65536.

6. **Use Maximum Header Size** to specify the maximum number of bytes that should be copied from a sampled packet. Allowed range is 20 to 256.
Use the features available from the Maintenance tab to help you manage the switch. The Maintenance tab contains links to the following features:

- **Save Configuration** on page 483
- **Reset** on page 485
- **Upload File From Switch** on page 487
- **Download File To Switch** on page 490
- **File Management** on page 495
- **Troubleshooting** on page 497

### Save Configuration

The **Save Configuration** menu contains links to the following options:

- **Save Configuration** on page 483
- **Auto Install Configuration** on page 484

### Save Configuration

To access the Save Configuration page, click **Maintenance > Save Configuration**.

Select the check box and click the **APPLY** button to have configuration changes you have made saved across a system reboot. All changes submitted since the previous save or system reboot will be retained by the switch.
Auto Install Configuration

The AutoInstall feature enables the configuration of a switch automatically when the device is turned on and, during the boot process, no configuration file is found in device storage. By communicating with a DHCP server, AutoInstall obtains an IP address for the switch and an IP address for a TFTP server. AutoInstall attempts to download a configuration file from the TFTP server and install it on the switch.

- The DHCP server that the switch communicates with must provide the following information:
  - The IP address and subnet mask (option 1) to be assigned to the switch.
  - The IP address of a default gateway (option 3), if needed for IP communication.
  - The identification of the TFTP server from which to obtain the boot file. This is given by any of the following fields, in the priority shown (highest to lowest):
    - The sname field of the DHCP reply.
    - The hostname of the TFTP server (option 66). Either the TFTP address or name is specified—not both—in most network configurations. If a TFTP hostname is given, a DNS server is required to translate the name to an IP address.
    - The IP address of the TFTP server (option 150).
    - The address of the TFTP server supplied in the siaddr field.
    - The name of the configuration file (boot file or option 67) to be downloaded from the TFTP server. The boot file name must have a file type of ".cfg."
  - The IP addresses of DNS name servers (option 6). The IP addresses of DNS name servers should be returned from the DHCP server only if the DNS server is in the same LAN as the switch performing AutoInstall. A DNS server is needed to resolve the IP address of the TFTP server if only the "sname" or option 66 values are returned to the switch.

After obtaining IP addresses for both the switch and the TFTP server, the AutoInstall feature attempts to download a host-specific configuration file using the boot file name specified by the DHCP server. If the switch fails to obtain the file, it will retry indefinitely.

To access the Auto Install Configuration page, click Maintenance > Save Config > Auto Install Configuration.
To configure the auto install settings:

1. Use **Auto Install** to enable/disable start/stop auto install mode on the switch.
2. Select the **Auto Save** check box and click the **APPLY** button to have configuration changes you have made saved across a system reboot. All changes submitted since the previous save or system reboot will be retained by the switch.
3. Use **Auto Install Retry Count** to specify the number of times the unicast TFTP tries should be made for the DHCP specified file before falling back for broadcast TFTP tries.

**Reset**

The **Reset** menu contains links to the following options:

- *Device Reboot* on page 485
- *Factory Default* on page 486
- *Password Reset* on page 486

**Device Reboot**

Use the Device Reboot page to reboot ProSafe.

To access the Device Reboot page, click **Maintenance > Reset > Device Reboot**.

![Device Reboot](image)

To reboot the switch:

1. Use **Reboot Unit No** to select the unit to reset. Select all to run reset for all units.
2. Select the **Save prior to reboot** radio button and click the **APPLY** button to reboot the switch. Prior to rebooting the unit, the current configuration will be saved first.
3. Select the **Don't save prior to reboot** radio button and click the **APPLY** button to reboot the switch. This option permits the user to reboot the unit without saving the current configuration.
Factory Default

Use the Factory Default page to reset the system configuration to the factory default values.

---

**Note:** If you reset the switch to the default configuration, the IP address is reset to 192.168.1.1, and the DHCP client is enabled. If you lose network connectivity after you reset the switch to the factory defaults, see *Web Access* on page 9.

---

To access the Factory Defaults page, click **Maintenance > Reset > Factory Default**.

To reset the switch to the factory default settings, select the check box and click the **APPLY** button to have all configuration parameters reset to their factory default values. All changes you have made will be lost, even if you have issued a save. You will be shown a confirmation screen after you select the button.

Password Reset

Use the Password Reset page to reset all user passwords to defaults.

To access the Password Reset page, click **Maintenance > Reset > Password Reset**.

Select the check box and click the **APPLY** button to have all user passwords reset to their factory default values. All changes you have made will be lost, even if you have issued a save.
Upload File From Switch

Use the File Upload page to upload configuration (ASCII), log (ASCII), and image (binary) files from the switch to the TFTP server.

The Upload menu contains links to the following options:

- File Upload on page 487
- HTTP File Upload on page 488
- USB File Upload on page 489

File Upload

To display the File Upload page, click Maintenance > Upload > File Upload.

To upload a file from the switch to the TFTP server:

1. Use File Type to specify what type of file you want to upload:
   - Archive - Specify archive (STK) code when you want to retrieve from the operational flash:
     - Image1 - Specify the code image1 when you want to retrieve.
     - Image2 - Specify the code image2 when you want to retrieve.
   - CLI Banner - Specify CLI Banner when you want to retrieve the CLI banner file.
   - Startup Configuration - Specify configuration when you want to retrieve the stored configuration.
   - Text Configuration - Specify configuration in text mode when you want to retrieve the stored configuration.
   - Script File - Specify script file when you want to retrieve the stored configuration.
   - Error Log - Specify error log to retrieve the system error (persistent) log, sometimes referred to as the event log.
   - Buffered Log - Specify buffered log to retrieve the system buffered (in-memory) log.
   - Trap Log - Specify trap log to retrieve the system trap records.
• **Tech Support** - Specify Tech Support to retrieve the switch information needed for trouble-shooting.

  The factory default is Archive.

2. Use **Transfer Mode** to specify what protocol to use to transfer the file:
   - **TFTP** - Trivial File Transfer Protocol
   - **SFTP** - Secure File Transfer Program
   - **SCP** - Secure Copy

3. Use **Server Address Type** to specify either IPv4 or IPv6 to indicate the format of the Server Address field. The factory default is IPv4.

4. Use **Server Address** to enter the IP address of the server in accordance with the format indicated by the Server Address Type. The factory default is the IPv4 address 0.0.0.0.

5. Use **Remote File Name** to enter the name of the file you want to download from the server. You may enter up to 32 characters. The factory default is blank.

6. Use **User Name** to enter the user name for remote login to SFTP/SCP server where the file will be sent. This field is visible only when SFTP or SCP transfer modes are selected.

7. Use **Password** to enter the password for remote login to SFTP/SCP server where the file will be sent. This field is visible only when SFTP or SCP transfer modes are selected.

8. The last row of the table is used to display information about the progress of the file transfer.

### HTTP File Upload

To display the HTTP File Upload page, click **Maintenance > Upload > HTTP File Upload**.

1. Use **File Type** to specify what type of file you want to upload:
   - **Archive** - Specify archive (STK) code when you want to retrieve from the operational flash:
     - **Image1** - Specify the code image1 when you want to retrieve.
     - **Image2** - Specify the code image2 when you want to retrieve.
   - **CLI Banner** - Specify CLI Banner when you want retrieve the CLI banner file.
   - **Startup Configuration** - Specify configuration when you want to retrieve the stored configuration.
   - **Text Configuration** - Specify configuration in text mode when you want to retrieve the stored configuration.
   - **Script File** - Specify script file when you want to retrieve the stored configuration.
• **Error Log** - Specify error log to retrieve the system error (persistent) log, sometimes referred to as the event log.

• **Trap Log** - Specify trap log to retrieve the system trap records.

• **Buffered Log** - Specify buffered log to retrieve the system buffered (in-memory) log.

• **Tech Support** - Specify Tech Support to retrieve the switch information needed for troubleshooting.

The factory default is Archive.

2. Use **Local File Name** to specify the local script file name you want to upload.

### USB File Upload

Use this menu to upload a file from the switch to USB device.

To display the HTTP File Upload page, click **Maintenance > Upload > USB File Upload**.

1. Use **File Type** to specify what type of file you want to upload:
   - **Archive** - Specify archive (STK) code when you want to retrieve from the operational flash:
     - **Image1** - Specify the code image1 when you want to retrieve.
     - **Image2** - Specify the code image2 when you want to retrieve.
   - **Text Configuration** to specify configuration in text mode when you want to retrieve the stored configuration. The factory default is **Archive**.

2. Use **USB File** to give a name along with path for the file you want to upload. You may enter up to 32 characters. The factory default is blank.

3. Click **CANCEL** to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

4. Click **APPLY** to send the updated configuration to the switch. Configuration changes take effect immediately.
Download File To Switch

The switch supports system file downloads from a remote system to the switch by using either TFTP or HTTP.

The Download menu contains links to the following options:

- **File Download** on page 490
- **HTTP File Download** on page 492
- **USB File Download** on page 494

File Download

To display the File Download page, click **Maintenance > Download > File Download**.

1. Use **File Type** to specify what type of file you want to transfer.
   - **Archive** - Specify archive (STK) code when you want to upgrade the operational flash:
     - **Image1** - Specify the code image1 you want to download.
     - **Image2** - Specify the code image2 you want to download.
   - **CLI Banner** - Specify CLI Banner when you want a banner to be displayed before the login prompt.
   - **Configuration** - Specify configuration when you want to update the switch's configuration. If the file has errors the update will be stopped.
   - **Text Configuration** - Specify configuration in text mode when you want to update the switch's configuration. If the file has errors the update will be stopped.
   - Use **Config Script** to specify script configuration file.
   - Use **SSH-1 RSA Key File** to specify SSH-1 Rivest-Shamir-Adleman (RSA) Key File.
   - Use **SSH-2 RSA Key PEM File** to specify SSH-2 Rivest-Shamir-Adleman (RSA) Key File (PEM Encoded).
   - Use **SSH-2 DSA Key PEM File** to specify SSH-2 Digital Signature Algorithm (DSA) Key File (PEM Encoded).
• Use **SSL Trusted Root Certificate PEM File** to specify SSL Trusted Root Certificate File (PEM Encoded).

• Use **SSL Server Certificate PEM File** to specify SSL Server Certificate File (PEM Encoded).

• Use **SSL DH Weak Encryption Parameter PEM File** to specify SSL Diffie-Hellman Weak Encryption Parameter File (PEM Encoded).

• Use **SSL DH Strong Encryption Parameter PEM File** to specify SSL Diffie-Hellman Strong Encryption Parameter File (PEM Encoded).

The factory default is Image1.

---

**Note:** To download SSH key files, SSH must be administratively disabled and there can be no active SSH sessions.

---

**Note:** To download SSL PEM files SSL must be administratively disabled and there can be no active SSH sessions.

---

2. Use **Transfer Mode** to specify what protocol to use to transfer the file:
   - **TFTP** - Trivial File Transfer Protocol
   - **SFTP** - Secure File Transfer Program
   - **SCP** - Secure Copy

3. Use **Server Address Type** to specify either IPv4 or IPv6 to indicate the format of the TFTP/SFTP/SCP Server Address field. The factory default is IPv4.

4. Use **Server Address** to enter the IP address of the server in accordance with the format indicated by the Server Address Type. The factory default is the IPv4 address 0.0.0.0.

5. Use **Remote File Name** to enter the name of the file you want to download from the server. You may enter up to 32 characters. The factory default is blank.

6. Use **User Name** to enter the user name for remote login to SFTP/SCP server where the file resides. This field is visible only when SFTP or SCP transfer modes are selected.

7. Use **Password** to enter the password for remote login to SFTP/SCP server where the file resides. This field is visible only when SFTP or SCP transfer modes are selected.

8. The last row of the table is used to display information about the progress of the file transfer. The screen will refresh automatically until the file transfer completes.
HTTP File Download

Use the HTTP File Download page to download files of various types to the switch using an HTTP session (for example, via your Web browser).

To display this page, click Maintenance > Download > HTTP File Download.

To download a file to the switch by using HTTP:

1. Use **File Type** to specify what type of file you want to transfer:
   - **Archive** - Specify archive (STK) code when you want to upgrade the operational flash:
     - **Image1** - Specify the code image1 you want to download.
     - **Image2** - Specify the code image2 you want to download.
   - **CLI Banner** - Specify CLI Banner when you want a banner to be displayed before the login prompt.
   - **Configuration** - Specify configuration when you want to update the switch's configuration. If the file has errors the update will be stopped.
   - **Text Configuration** - Specify configuration in text mode when you want to update the switch's configuration. If the file has errors the update will be stopped.
   - Use **Config Script** to specify script configuration file.
   - Use **SSH-1 RSA Key File** to specify SSH-1 Rivest-Shamir-Adleman (RSA) Key File.
   - Use **SSH-2 RSA Key PEM File** to specify SSH-2 Rivest-Shamir-Adleman (RSA) Key File (PEM Encoded)
   - Use **SSH-2 DSA Key PEM File** to specify SSH-2 Digital Signature Algorithm (DSA) Key File (PEM Encoded)
   - Use **SSL Trusted Root Certificate PEM File** to specify SSL Trusted Root Certificate File (PEM Encoded)
   - Use **SSL Server Certificate PEM File** to specify SSL Server Certificate File (PEM Encoded)
   - Use **SSL DH Weak Encryption Parameter PEM File** to specify SSL Diffie-Hellman Weak Encryption Parameter File (PEM Encoded)
   - Use **SSL DH Strong Encryption Parameter PEM File** to specify SSL Diffie-Hellman Strong Encryption Parameter File (PEM Encoded)

The factory default is Archive.
2. If you are downloading a GSM7352Sv1 or GSM7352Sv2 image (Archive), select the image on the switch to overwrite. This field is only visible when Archive is selected as the File Type.

   **Note:** It is recommended that you not overwrite the active image. The system will display a warning that you are trying to overwrite the active image.

3. Click **BROWSE** to open a file upload window to locate the file you want to download.
4. Click **CANCEL** to cancel the operation on the screen and reset the data on the screen to the latest value of the switch.
5. Click the **APPLY** button to initiate the file download.

   **Note:** After a file transfer is started, please wait until the page refreshes. When the page refreshes, the **Select File** option will be blanked out. This indicates that the file transfer is done.

   **Note:** To download SSH key files SSH must be administratively disabled and there can be no active SSH sessions.

   **Note:** To download SSL PEM files SSL must be administratively disabled and there can be no active SSH sessions.

6. Use **Select File** to browse/give name along with path for the file you want to download. You may enter up to 80 characters. The factory default is blank.

7. **Download Status** - Displays the status during transfer file to the switch.
USB File Download

Use this menu to download a file from the switch to USB device.

To display the HTTP File Upload page, click Maintenance > Download > USB File Upload.

1. Use File Type to specify what type of file you want to upload:
   - Archive - Specify archive (STK) code when you want to retrieve from the operational flash:
     - Image1 - Specify the code image1 when you want to retrieve.
     - Image2 - Specify the code image2 when you want to retrieve.
   - Text Configuration to specify configuration in text mode when you want to retrieve the stored configuration. The factory default is Archive.

2. Use USB File to give a name along with path for the file you want to upload. You may enter up to 32 characters. The factory default is blank.

3. Click CANCEL to cancel the configuration on the screen and reset the data on the screen to the latest value of the switch.

Click APPLY to send the updated configuration to the switch. Configuration changes take effect immediately.
File Management

The system maintains two versions of the ProSafe software in permanent storage. One image is the active image, and the second image is the backup image. The active image is loaded during subsequent switch restarts. This feature reduces switch down time when upgrading or downgrading the ProSafe software.

The File Management menu contains links to the following options:

- Copy on page 495
- Dual Image Configuration on page 496

Copy

To display the Copy page, click Maintenance > File Management > Copy.

1. Use Source Image to select the image1 or image2 as source image when copy occurs.
2. Use Stack member to select the destination unit to which you are going to copy from master.
3. Use Destination Image to select the image1 or image2 as destination image when copy occurs.
Dual Image Configuration

The Dual Image feature allows switch to retain two images in permanent storage. The user designates one of these images as the active image to be loaded during subsequent switch restarts. This feature reduces switch down time when upgrading / downgrading the image.

To display the Dual Image Configuration page, click **Maintenance > File Management > Dual Image Configuration**.

Troubleshooting

The **Troubleshooting** menu contains links to the following options:

- **Ping IPv4** on page 497
- **Ping IPv6** on page 498
- **Traceroute IPv4** on page 499
- **Traceroute IPv6** on page 500

**Ping IPv4**

Use this screen to tell the switch to send a Ping request to a specified IP address. You can use this to check whether the switch can communicate with a particular IP station. Once you click the APPLY button, the switch will send specified number of ping requests and the results will be displayed.

If a reply to the ping is not received, you will see:

- Tx = Count, Rx = 0 Min/Max/Avg RTT = 0/0/0 msec

If a reply to the ping is received, you will see:

- Received response for Seq Num 0 Rtt xyz usec
- Received response for Seq Num 1 Rtt abc usec
- Received response for Seq Num 2 Rtt def usec
- Tx = Count, Rx = Count Min/Max/Avg RTT = xyz/abc/def msec.

To access the Ping IPv4 page, click **Maintenance > Troubleshooting > Ping IPv4**.

To configure the settings and ping a host on the network:

1. Use IP **Address/Host Name** to enter the IP address or Hostname of the station you want the switch to ping. The initial value is blank. The IP Address or Hostname you enter is not retained across a power cycle.
2. Optionally, configure the following settings:
• **Count** - Enter the number of echo requests you want to send. The initial value is default value. The Count you enter is not retained across a power cycle.

• **Interval (secs)** - Enter the Interval between ping packets in seconds. initial value is default value. The Interval you enter is not retained across a power cycle.

• **Datagram Size** - Enter the Size of ping packet. initial value is default value. The Size you enter is not retained across a power cycle.

3. **PING** displays the result after the switch sends a Ping request to the specified address.

4. Click **CANCEL** to cancel the operation on the screen and reset the data on the screen to the latest value of the switch.

5. Click **APPLY** to send the ping. The switch sends the number of pings specified in the Count field, and the results are displayed below the configurable data in the Ping area.

**Ping IPv6**

This screen is used to send a Ping request to a specified Hostname or IPv6 address. You can use this to check whether the switch can communicate with a particular IPv6 station. Once you click the **APPLY** button, the switch will send three pings and the results will be displayed below the configurable data. The output will be Send count=3, Receive count=n from (IPv6 Address). Average round trip time = n ms.

To access the Ping IPv6 page, click **Maintenance** > **Troubleshooting** > **Ping IPv6**.

1. Use **Ping** to select either global IPv6 Address, Hostname, or Link Local Address to ping.

2. Use **IPv6 Address/Hostname** to enter the IPv6 address or Hostname of the station you want the switch to ping. The initial value is blank. The IPv6 Address or Hostname you enter is not retained across a power cycle.

3. Use **Datagram Size** to enter the datagram size. The valid range is (48 to 2048).

4. **Result** - Displays the result after the switch send a Ping IPv6 request to the specified IPv6 address.
Traceroute IPv4

Use this screen to tell the switch to send a TraceRoute request to a specified IP address or Hostname. You can use this to discover the paths packets take to a remote destination. Once you click the APPLY button, the switch will send traceroute and the results will be displayed below the configurable data.

If a reply to the traceroute is received, you will see:

- 1 x.y.z.w 9869 usec 9775 usec 10584 usec
- 2 0.0.0.0 0 usec * 0 usec * 0 usec *
- 3 0.0.0.0 0 usec * 0 usec * 0 usec *
- Hop Count = w Last TTL = z Test attempt = x Test Success = y.

To display the Traceroute IPv4 page, click Maintenance > Troubleshooting > Traceroute IPv4.

To configure the Traceroute settings and send probe packets to discover the route to a host on the network:

1. Use IP Address/Hostname to enter the IP address or Hostname of the station you want the switch to discover path. The initial value is blank. The IP Address or Hostname you enter is not retained across a power cycle.

2. Optionally, configure the following settings:
   - **Probes Per Hop** - Enter the number of probes per hop. The initial value is default. The Probes per Hop you enter is not retained across a power cycle.
   - **MaxTTL** - Enter the maximum TTL for the destination. The initial value is default value. The MaxTTL you enter is not retained across a power cycle.
• **InitTTL** - Enter the initial TTL to be used. The initial value is default value. The InitTTL you enter is not retained across a power cycle.

• **MaxFail** - Enter the maximum Failures allowed in the session. The initial value is default value. The MaxFail you enter is not retained across a power cycle.

• **Interval(secs)** - Enter the Time between probes in seconds. The initial value is default value. The Interval you enter is not retained across a power cycle.

• **Port** - Enter the UDP Dest port in probe packets. The initial value is default value. The port you enter is not retained across a power cycle.

• **Size** - Enter the Size of probe packets. The initial value is default value. The Size you enter is not retained across a power cycle.

3. Click **CANCEL** to cancel the operation on the screen and reset the data on the screen to the latest value of the switch.

4. Click **APPLY** to initiate the traceroute. The results display in the TraceRoute area.

### Traceroute IPv6

Use this screen to tell the switch to send a TraceRoute request to a specified IP address or Hostname. You can use this to discover the paths packets take to a remote destination. Once you click the **APPLY** button, the switch will send traceroute and the results will be displayed below the configurable data.

If a reply to the traceroute is received, you will see:

- 1 a:b:c:d:e:f:g 9869 usec 9775 usec 10584 usec

- 2 0:0:0:0:0:0:0:0 0 usec * 0 usec * 0 usec *

- Hop Count = w Last TTL = z Test attempt = x Test Success = y.

To display the Traceroute IPv6 page, click **Maintenance > Troubleshooting > Traceroute IPv6**.

1. Use **IPv6 Address/Hostname** to enter the IPv6 address or Hostname of the station you want the switch to discover path. The initial value is blank. The IPv6 Address or Hostname you enter is not retained across a power cycle.

2. Use **Port** to enter the UDP Dest port in probe packets. The initial value is default value. The port you enter is not retained across a power cycle.

3. Click **APPLY** to initiate the traceroute.
Use the features available from the Help tab to connect to online resources for assistance.

The Help tab contains a links to the following:

- Online Help on page 501
- Registration on page 503

### Online Help

The Online Help includes the following pages:

- Support on page 501
- User Guide on page 502

### Support

Use the Support page to connect to the Online Support site at netgear.com.

To access the Support page, click Help > Online Help > Support.

To connect to the NETGEAR support site for ProSafe, click APPLY.
User Guide

Use the User Guide page to access the Web Management User Guide (the guide you are now reading) that is available on the NETGEAR Website.

To access the User Guide page, click Help > Online Help > User Guide.

To access to the User Guide that is available online, click APPLY.
Registration

Use the Registration page to register your ProSafe M5300 switch. Completing the registration confirms your e-mail address, lowers technical support resolution time, and ensures your shipping address accuracy. NETGEAR, Inc. would also like to incorporate your feedback into future product development.

Note: NETGEAR will never sell or rent your e-mail address, and you may opt out of communications at any time.

To access the Registration page, click Help > Registration.

To register the switch, click Register. The switch attempts to contact the NETGEAR Registration Server.

For the product registration process to proceed, the administrative system running the browser must meet the following requirements:

- The administrative system must have Internet access.
- The browser must allow pop up windows.
- If the browser is Microsoft® Internet Explorer, ActiveX must be enabled.

If the switch successfully contacts the Registration Server, the NETGEAR Product Registration page opens in a new browser window. The product serial number and model number fields are pre populated. After you provide some basic information and click Register, the registration process is complete.
If you have not registered the product or have not disabled the registration reminders, the following pop-up window appears each time a user successfully logs on to the switch:

The registration pop-up window includes the following buttons:

- **TURN OFF.** Use this button to turn off the Product Registration feature and to prevent the registration reminder pop-up window from appearing on subsequent successful login sessions.
- **REMIND ME LATER.** The pop-up window is closed without taking any action, and the registration reminder pop-up appears on next successful login.
- **REGISTER NOW.** The NETGEAR Registration Server is contacted to initiate the registration process.
Default Settings

This appendix describes the default settings for many of the ProSafe M5300 Managed Switch software features.

This appendix contains information about how to configure the following features:

- Virtual Local Area Networks (VLANs) on page 509
- Access Control Lists (ACLs) on page 511
- Differentiated Services (DiffServ) on page 514
- 802.1X on page 518
- MSTP on page 521

**Virtual Local Area Networks (VLANs)**

A local area network (LAN) can generally be defined as a broadcast domain. Hubs, bridges, or switches in the same physical segment or segments connect all end node devices. End nodes can communicate with each other without the need for a router. Routers connect LANs together, routing the traffic to the appropriate port.

A virtual LAN (VLAN) is a local area network with a definition that maps workstations on some basis other than geographic location (for example, by department, type of user, or primary application). To enable traffic to flow between VLANs, traffic must go through a router, just as if the VLANs were on two separate LANs.

A VLAN is a group of PCs, servers, and other network resources that behave as if they were connected to a single network segment—even though they might not be. For example, all marketing personnel might be spread throughout a building. Yet if they are all assigned to a single VLAN, they can share resources and bandwidth as if they were connected to the same segment. The resources of other departments can be invisible to the marketing VLAN members, accessible to all, or accessible only to specified individuals, depending on how the IT manager has set up the VLANs.

VLANs have a number of advantages:

- It is easy to do network segmentation. Users that communicate most frequently with each other can be grouped into common VLANs, regardless of physical location. Each group’s traffic is contained largely within the VLAN, reducing extraneous traffic and improving the efficiency of the whole network.
They are easy to manage. The addition of nodes, as well as moves and other changes, can be dealt with quickly and conveniently from a management interface rather than from the wiring closet.

They provide increased performance. VLANs free up bandwidth by limiting node-to-node and broadcast traffic throughout the network.

They ensure enhanced network security. VLANs create virtual boundaries that can be crossed only through a router. So standard, router-based security measures can be used to restrict access to each VLAN.

Packets received by the switch are treated in the following way:

- When an untagged packet enters a port, it is automatically tagged with the port’s default VLAN ID tag number. Each port has a default VLAN ID setting that is user configurable (the default setting is 1). The default VLAN ID setting for each port can be changed in the Port PVID Configuration screen. See “Port PVID Configuration” on page 3-103.
- When a tagged packet enters a port, the tag for that packet is unaffected by the default VLAN ID setting. The packet proceeds to the VLAN specified by its VLAN ID tag number.
- If the port through which the packet entered does not have membership with the VLAN specified by the VLAN ID tag, the packet is dropped.
- If the port is a member of the VLAN specified by the packet’s VLAN ID, the packet can be sent to other ports with the same VLAN ID.
- Packets leaving the switch are either tagged or untagged, depending on the setting for that port’s VLAN membership properties. A U for a given port means that packets leaving the switch from that port are untagged. Inversely, a T for a given port means that packets leaving the switch from that port are tagged with the VLAN ID that is associated with the port.

The example given in this section comprises numerous steps to illustrate a wide range of configurations to help provide an understanding of tagged VLANs.

### VLAN Example Configuration

This example demonstrates several scenarios of VLAN use and describes how the switch handles tagged and untagged traffic.

In this example, you create two new VLANs, change the port membership for default VLAN 1, and assign port members to the two new VLANs:

1. In the Basic VLAN Configuration screen (see *VLAN Configuration* on page 120), create the following VLANs:
   - A VLAN with VLAN ID 10.
   - A VLAN with VLAN ID 20.

2. In the VLAN Membership screen (see *VLAN Configuration* on page 120) specify the VLAN membership as follows:
   - For the default VLAN with VLAN ID 1, specify the following members: port 7 (U) and port 8 (U).
• For the VLAN with VLAN ID 10, specify the following members: port 1 (U), port 2 (U), and port 3 (T).
• For the VLAN with VLAN ID 20, specify the following members: port 4 (U), port 5 (T), and port 6 (U).

3. In the Port PVID Configuration screen (see “Port PVID Configuration” on page 3-103), specify the PVID for ports g1 and g4 so that packets entering these ports are tagged with the port VLAN ID:
   • Port g1: PVID 10
   • Port g4: PVID 20

4. With the VLAN configuration that you set up, the following situations produce results as described:
   • If an untagged packet enters port 1, the switch tags it with VLAN ID 10. The packet has access to port 2 and port 3. The outgoing packet is stripped of its tag to leave port 2 as an untagged packet. For port 3, the outgoing packet leaves as a tagged packet with VLAN ID 10.
   • If a tagged packet with VLAN ID 10 enters port 3, the packet has access to port 1 and port 2. If the packet leaves port 1 or port 2, it is stripped of its tag to leave the switch as an untagged packet.
   • If an untagged packet enters port 4, the switch tags it with VLAN ID 20. The packet has access to port 5 and port 6. The outgoing packet is stripped of its tag to become an untagged packet as it leaves port 6. For port 5, the outgoing packet leaves as a tagged packet with VLAN ID 20.

Access Control Lists (ACLs)

ACLs ensure that only authorized users have access to specific resources while blocking off any unwarranted attempts to reach network resources.

ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and provide security for the network. ACLs are normally used in firewall routers that are positioned between the internal network and an external network, such as the Internet. They can also be used on a router positioned between two parts of the network to control the traffic entering or exiting a specific part of the internal network. The added packet processing required by the ACL feature does not affect switch performance. That is, ACL processing occurs at wire speed.

Access lists are a sequential collection of permit and deny conditions. This collection of conditions, known as the filtering criteria, is applied to each packet that is processed by the switch or the router. The forwarding or dropping of a packet is based on whether or not the packet matches the specified criteria.

Traffic filtering requires the following two basic steps:

1. Create an access list definition.

   The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. Additionally, you can assign traffic that matches the
criteria to a particular queue or redirect the traffic to a particular port. A default deny all rule is the last rule of every list.

2. APPLY the access list to an interface in the inbound direction.

ProSafe allow ACLs to be bound to physical ports and LAGs. The switch software supports MAC ACLs and IP ACLs.

**MAC ACL Example Configuration**

The following example shows how to create a MAC-based ACL that permits Ethernet traffic from the Sales department on specified ports and denies all other traffic on those ports.

1. From the MAC ACL screen, create an ACL with the name Sales_ACL for the Sales department of your network (See MAC ACL on page 437).

   By default, this ACL will be bound on the inbound direction, which means the switch will examine traffic as it enters the port.

2. From the MAC Rules screen, create a rule for the Sales_ACL with the following settings:
   - ID: 1
   - Action: Permit
   - Assign Queue ID: 0
   - Match Every: False
   - CoS: 0
   - Destination MAC: 01:02:1A:BC:DE:EF
   - Destination MAC Mask: 00:00:00:00:FF:FF
   - EtherType User Value:
   - Source MAC: 02:02:1A:BC:DE:EF
   - Source MAC Mask: 00:00:00:00:FF:FF
   - VLAN ID: 2

   For more information about MAC ACL rules, see MAC Rules on page 438.

3. From the MAC Binding Configuration screen, assign the Sales_ACL to the interface gigabit ports 6, 7, and 8, and then click APPLY (See MAC Binding Configuration on page 440).

   You can assign an optional sequence number to indicate the order of this access list relative to other access lists if any are already assigned to this interface and direction.

4. The MAC Binding Table displays the interface and MAC ACL binding information (See MAC Binding Table on page 441).

   The ACL named Sales_ACL looks for Ethernet frames with destination and source MAC addresses and MAC masks defined in the rule. Also, the frame must be tagged with VLAN ID 2, which is the Sales department VLAN. The CoS value of the frame must be 0, which is the default value for Ethernet frames. Frames that match this criteria are permitted on interfaces 6, 7, and 8 and are assigned to the hardware egress queue 0, which is the default queue. All other traffic is explicitly denied on these interfaces. To allow additional traffic to enter these
ports, you must add a new permit rule with the desired match criteria and bind the rule to interfaces 6, 7, and 8.

**Standard IP ACL Example Configuration**

The following example shows how to create an IP-based ACL that prevents any IP traffic from the Finance department from being allowed on the ports that are associated with other departments. Traffic from the Finance department is identified by each packet’s network IP address.

1. From the IP ACL screen, create a new IP ACL with an IP ACL ID of 1 (See IP ACL on page 442).
2. From the IP Rules screen, create a rule for IP ACL 1 with the following settings:  
   - Rule ID: 1  
   - Action: Deny  
   - Assign Queue ID: 0 (optional: 0 is the default value)  
   - Match Every: False  
   - Source IP Address: 192.168.187.0  
   - Source IP Mask: 255.255.255.0

   For additional information about IP ACL rules, see IP Rules on page 443.

3. Click ADD.
4. From the IP Rules screen, create a second rule for IP ACL 1 with the following settings:  
   - Rule ID: 2  
   - Action: Permit  
   - Match Every: True

5. Click ADD.
6. From the IP Binding Configuration page, assign ACL ID 1 to the interface gigabit ports 2, 3, and 4, and assign a sequence number of 1 (See IP Binding Configuration on page 453).

   By default, this IP ACL is bound on the inbound direction, so it examines traffic as it enters the switch.

7. Click APPLY.
8. Use the IP Binding Table screen to view the interfaces and IP ACL binding information (See MAC Binding Table on page 441).

The IP ACL in this example matches all packets with the source IP address and subnet mask of the Finance department's network and deny it on the Ethernet interfaces 2, 3, and 4 of the switch. The second rule permits all non-Finance traffic on the ports. The second rule is required because there is an explicit deny all rule as the lowest priority rule.
Differentiated Services (DiffServ)

Standard IP-based networks are designed to provide best effort data delivery service. Best effort service implies that the network deliver the data in a timely fashion, although there is no guarantee that it will. During times of congestion, packets may be delayed, sent sporadically, or dropped. For typical Internet applications, such as e-mail and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. However, any degradation of service has undesirable effects on applications with strict timing requirements, such as voice or multimedia.

Quality of Service (QoS) can provide consistent, predictable data delivery by distinguishing between packets that have strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given special treatment in a QoS-capable network. With this in mind, all elements of the network must be QoS-capable. If one node is unable to meet the necessary timing requirements, this creates a deficiency in the network path and the performance of the entire packet flow is compromised.

There are two basic types of QoS:

- **Integrated Services**: network resources are apportioned based on request and are reserved (resource reservation) according to network management policy (RSVP, for example).
- **Differentiated Services**: network resources are apportioned based on traffic classification and priority, giving preferential treatment to data with strict timing requirements.

Managed switch switches support DiffServ.

The DiffServ feature contains a number of conceptual QoS building blocks you can use to construct a differentiated service network. Use these same blocks in different ways to build other types of QoS architectures.

There are 3 key QoS building blocks needed to configure DiffServ:

- Class
- Policy
- Service (i.e., the assignment of a policy to a directional interface)

**Class**

You can classify incoming packets at layers 2, 3 and 4 by inspecting the following information for a packet:

- Source/destination MAC address
- EtherType
- Class of Service (802.1p priority) value (first/only VLAN tag)
- VLAN ID range (first/only VLAN tag)
- Secondary 802.1p priority value (second/inner VLAN tag)
- Secondary VLAN ID range (second/inner VLAN tag)
ProSafe M5300 Switch

- IP Service Type octet (also known as: ToS bits, Precedence value, DSCP value)
- Layer 4 protocol (TCP, UDP etc.)
- Layer 4 source/destination ports
- Source/destination IP address

From a DiffServ point of view, there are two types of classes:
- DiffServ traffic classes
- DiffServ service levels/forwarding classes

**DiffServ Traffic Classes**

With DiffServ, you define which traffic classes to track on an ingress interface. You can define simple BA classifiers (DSCP) and a wide variety of multi-field (MF) classifiers:
- Layer 2; Layers 3, 4 (IP only)
- Protocol-based
- Address-based

You can combine these classifiers with logical AND or OR operations to build complex MF-classifiers (by specifying a class type of *all* or *any*, respectively). That is, within a single class, multiple match criteria are grouped together as an AND expression or a sequential OR expression, depending on the defined class type. Only classes of the same type can be nested; class nesting does not allow for the negation (i.e., *exclude* option) of the referenced class.

To configure DiffServ, you must define service levels, namely the forwarding classes/PHBs identified by a given DSCP value, on the egress interface. These service levels are defined by configuring BA classes for each.

**Creating Policies**

Use DiffServ policies to associate a collection of classes that you configure with one or more QoS policy statements. The result of this association is referred to as a policy.

From a DiffServ perspective, there are two types of policies:
- **Traffic Conditioning Policy**: a policy applied to a DiffServ traffic class
- **Service Provisioning Policy**: a policy applied to a DiffServ service level

You must manually configure the various statements and rules used in the traffic conditioning and service provisioning policies to achieve the desired Traffic Conditioning Specification (TCS) and the Service Level Specification (SLS) operation, respectively.
Traffic Conditioning Policy

Traffic conditioning pertains to actions performed on incoming traffic. There are several distinct QoS actions associated with traffic conditioning:

- **Dropping** - Drop a packet upon arrival. This is useful for emulating access control list operation using DiffServ, especially when DiffServ and ACL cannot co-exist on the same interface.

- **Marking IP DSCP or IP Precedence** - Marking/re-marking the DiffServ code point in a packet with the DSCP value representing the service level associated with a particular DiffServ traffic class. Alternatively, the IP Precedence value of the packet can be marked/re-marked.

- **Marking CoS (802.1p)** - Sets the three-bit priority field in the first/only 802.1p header to a specified value when packets are transmitted for the traffic class. An 802.1p header is inserted if it does not already exist. This is useful for assigning a layer 2 priority level based on a DiffServ forwarding class (i.e., DSCP or IP Precedence value) definition to convey some QoS characteristics to downstream switches which do not routinely look at the DSCP value in the IP header.

- **Policing** - A method of constraining incoming traffic associated with a particular class so that it conforms to the terms of the TCS. Special treatment can be applied to out-of-profile packets that are either in excess of the conformance specification or are non-conformant. The DiffServ feature supports the following types of traffic policing treatments (actions):
  - drop - The packet is dropped
  - mark cos - The 802.1p user priority bits are (re)marked and forwarded
  - mark dscp - The packet DSCP is (re)marked and forwarded
  - mark prec - The packet IP Precedence is (re)marked and forwarded
  - send: the packet is forwarded without DiffServ modification

**Color Mode Awareness** - Policing in the DiffServ feature uses either *color blind* or *color aware* mode. Color blind mode ignores the coloration (marking) of the incoming packet. Color aware mode takes into consideration the current packet marking when determining the policing outcome. An auxiliary traffic class is used in conjunction with the policing definition to specify a value for one of the 802.1p, Secondary 802.1p, IP DSCP, or IP Precedence fields designating the incoming color value to be used as the conforming color. The color of exceeding traffic may be optionally specified as well.

- **Counting** - Updating octet and packet statistics to keep track of data handling along traffic paths within DiffServ. In this DiffServ feature, counters are not explicitly configured by the user, but are designed into the system based on the DiffServ policy being created. See the Statistics section of this document for more details.

- **Assigning QoS Queue** - Directs traffic stream to the specified QoS queue. This allows a traffic classifier to specify which one of the supported hardware queues are used for handling packets belonging to the class.

- **Redirecting** - Forces classified traffic stream to a specified egress port (physical or LAG). This can occur in addition to any marking or policing action. It may also be specified along with a QoS queue assignment.
DiffServ Example Configuration

To create a DiffServ Class/Policy and attach it to a switch interface, follow these steps:

1. From the QoS Class Configuration screen, create a new class with the following settings:
   - Class Name: Class1
   - Class Type: All
   For more information about this screen, see Class Configuration on page 343.

2. Click the Class1 hyperlink to view the DiffServ Class Configuration screen for this class.

3. Configure the following settings for Class1:
   - Protocol Type: UDP
   - Source IP Address: 192.12.1.0
   - Source Mask: 255.255.255.0
   - Source L4 Port: Other, and enter 4567 as the source port value
   - Destination IP Address: 192.12.2.0
   - Destination Mask: 255.255.255.0
   - Destination L4 Port: Other, and enter 4568 as the destination port value
   For more information about this screen, see Class Configuration on page 343.

4. Click APPLY.

5. From the Policy Configuration screen, create a new policy with the following settings:
   - Policy Selector: Policy1
   - Member Class: Class1
   For more information about this screen, see Policy Configuration on page 348.

6. Click ADD to add the new policy.

7. Click the Policy1 hyperlink to view the Policy Class Configuration screen for this policy.

8. Configure the Policy attributes as follows:
   - Assign Queue: 3
   - Policy Attribute: Simple Policy
   - Color Mode: Color Blind
   - Committed Rate: 1000000 Kbps
   - Committed Burst Size: 128 KB
   - Confirm Action: Send
   - Violate Action: Drop
   For more information about this screen, see Class Configuration on page 343.

9. From the Service Configuration screen, select the check box next to interfaces g7 and g8 to attach the policy to these interfaces, and then click APPLY (See Service Interface Configuration on page 351).
All UDP packet flows destined to the 192.12.2.0 network with an IP source address from the 192.12.1.0 network that have a Layer 4 Source port of 4567 and Destination port of 4568 from this switch on ports 7 and 8 are assigned to hardware queue 3.

On this network, traffic from streaming applications uses UDP port 4567 as the source and 4568 as the destination. This real-time traffic is time sensitive, so it is assigned to a high-priority hardware queue. By default, data traffic uses hardware queue 0, which is designated as a best-effort queue.

Also the confirmed action on this flow is to send the packets with a committed rate of 1000000 Kbps and burst size of 128 KB. Packets that violate the committed rate and burst size are dropped.

802.1X

Local Area Networks (LANs) are often deployed in environments that permit unauthorized devices to be physically attached to the LAN infrastructure, or permit unauthorized users to attempt to access the LAN through equipment already attached. In such environments, it may be desirable to restrict access to the services offered by the LAN to those users and devices that are permitted to use those services.

Port-based network access control makes use of the physical characteristics of LAN infrastructures in order to provide a means of authenticating and authorizing devices attached to a LAN port that has point-to-point connection characteristics and of preventing access to that port in cases in which the authentication and authorization process fails. In this context, a port is a single point of attachment to the LAN, such as ports of MAC bridges and associations between stations or access points in IEEE 802.11 Wireless LANs.

The IEEE 802.11 standard describes an architectural framework within which authentication and consequent actions take place. It also establishes the requirements for a protocol between the authenticator (the system that passes an authentication request to the authentication server) and the supplicant (the system that requests authentication), as well as between the authenticator and the authentication server.

The managed switch switches support a guest VLAN, which allows unauthenticated users to have limited access to the network resources.

**Note:** You can use QoS features to provide rate limiting on the guest VLAN to limit the network resources the guest VLAN provides.

Another 802.1X feature is the ability to configure a port to Enable/Disable EAPoL packet forwarding support. You can disable or enable the forwarding of EAPoL when 802.1X is disabled on the device.

The ports of an 802.1X authenticator switch provide the means in which it can offer services to other systems reachable via the LAN. Port-based network access control allows the
operation of a switch’s ports to be controlled in order to ensure that access to its services is only permitted by systems that are authorized to do so.

Port access control provides a means of preventing unauthorized access by supplicants to the services offered by a system. Control over the access to a switch and the LAN to which it is connected can be desirable in order to restrict access to publicly accessible bridge ports or to restrict access to departmental LANs.

Access control is achieved by enforcing authentication of supplicants that are attached to an authenticator's controlled ports. The result of the authentication process determines whether the supplicant is authorized to access services on that controlled port.

A Port Access Entity (PAE) is able to adopt one of two distinct roles within an access control interaction:

1. **Authenticator**: A Port that enforces authentication before allowing access to services available via that Port.
2. **Supplicant**: A Port that attempts to access services offered by the Authenticator.

Additionally, there exists a third role:

3. **Authentication server**: Performs the authentication function necessary to check the credentials of the Supplicant on behalf of the Authenticator.

All three roles are required in order to complete an authentication exchange.

managed switch switches support the Authenticator role only, in which the PAE is responsible for communicating with the Supplicant. The Authenticator PAE is also responsible for submitting the information received from the Supplicant to the Authentication Server in order for the credentials to be checked, which will determine the authorization state of the Port. The Authenticator PAE controls the authorized/unauthorized state of the controlled Port depending on the outcome of the RADIUS-based authentication process.
802.1X Example Configuration

This example shows how to configure the switch so that 802.1X-based authentication is required on the ports in a corporate conference room (1/0/5 - 1/0/8). These ports are available to visitors and need to be authenticated before granting access to the network. The authentication is handled by an external RADIUS server. When the visitor is successfully authenticated, traffic is automatically assigned to the guest VLAN. This example assumes that a VLAN has been configured with a VLAN ID of 150 and VLAN Name of Guest.

1. From the Port Authentication screen, select ports 1/0/5, 1/0/6, 1/0/7 and 1/0/8.

2. From the Port Control menu, select Unauthorized.
   The Port Control setting for all other ports where authentication is not needed should Authorized. When the Port Control setting is Authorized, the port is unconditionally put in a force-Authorized state and does not require any authentication. When the Port Control setting is Auto, the authenticator PAE sets the controlled port mode

3. In the Guest VLAN field for ports 1/0/5 - 1/0/8, enter 150 to assign these ports to the guest VLAN.
   You can configure additional settings to control access to the network through the ports. See Port Security Configuration on page 399 for information about the settings.

4. Click APPLY.

5. From the 802.1X Configuration screen, set the Port Based Authentication State and Guest VLAN Mode to Enable, and then click APPLY (See 802.1X Configuration on page 387).
   This example uses the default values for the port authentication settings, but there are several additional settings that you can configure. For example, the EAPOL Flood Mode field allows you to enable the forwarding of EAPoL frames when 802.1X is disabled on the device.

6. From the RADIUS Server Configuration screen, configure a RADIUS server with the following settings:
   • Server Address: 192.168.10.23
   • Secret Configured: Yes
   • Secret: secret123
   • Active: Primary
   For more information, see RADIUS on page 359.

7. Click ADD.

8. From the Authentication List screen, configure the default List to use RADIUS as the first authentication method (See Authentication List Configuration on page 366).
   This example enables 802.1X-based port security on ProSafe and prompts the hosts connected on ports g5-g8 for an 802.1X-based authentication. The switch passes the authentication information to the configured RADIUS server.
MSTP

Spanning Tree Protocol (STP) runs on bridged networks to help eliminate loops. If a bridge loop occurs, the network can become flooded with traffic. IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) supports multiple instances of Spanning Tree to efficiently channel VLAN traffic over different interfaces. Each instance of the Spanning Tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree, with slight modifications in the working but not the end effect (chief among the effects is the rapid transitioning of the port to the Forwarding state).

The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full duplex connectivity and ports that are connected to end stations, resulting in rapid transitioning of the port to the Forwarding state and the suppression of Topology Change Notification. These features are represented by the parameters pointtopoint and edgeport. MSTP is compatible to both RSTP and STP. It behaves appropriately to STP and RSTP bridges.

A MSTP bridge can be configured to behave entirely as a RSTP bridge or a STP bridge. So, an IEEE 802.1s bridge inherently also supports IEEE 802.1w and IEEE 802.1D.

The MSTP algorithm and protocol provides simple and full connectivity for frames assigned to any given VLAN throughout a Bridged LAN comprising arbitrarily interconnected networking devices, each operating MSTP, STP or RSTP. MSTP allows frames assigned to different VLANs to follow separate paths, each based on an independent Multiple Spanning Tree Instance (MSTI), within Multiple Spanning Tree (MST) Regions composed of LANs and or MSTP Bridges. These Regions and the other Bridges and LANs are connected into a single Common Spanning Tree (CST). [IEEE DRAFT P802.1s/D13]

MSTP connects all Bridges and LANs with a single Common and Internal Spanning Tree (CIST). The CIST supports the automatic determination of each MST region, choosing its maximum possible extent. The connectivity calculated for the CIST provides the CST for interconnecting these Regions, and an Internal Spanning Tree (IST) within each Region. MSTP ensures that frames with a given VLAN ID are assigned to one and only one of the MSTIs or the IST within the Region, that the assignment is consistent among all the networking devices in the Region and that the stable connectivity of each MSTI and IST at the boundary of the Region matches that of the CST. The stable active topology of the Bridged LAN with respect to frames consistently classified as belonging to any given VLAN thus simply and fully connects all LANs and networking devices throughout the network, though frames belonging to different VLANs can take different paths within any Region, per IEEE DRAFT P802.1s/D13.

All bridges, whether they use STP, RSTP or MSTP, send information in configuration messages via Bridge Protocol Data Units (BPDUs) to assign port roles that determine each port’s participation in a fully and simply connected active topology based on one or more spanning trees. The information communicated is known as the spanning tree priority vector. The BPDU structure for each of these different protocols is different. A MSTP bridge will transmit the appropriate BPDU depending on the received type of BPDU from a particular port.
An MST Region comprises of one or more MSTP Bridges with the same MST Configuration Identifier, using the same MSTIs, and which have no Bridges attached that cannot receive and transmit MSTP BPDUs. The MST Configuration Identifier has the following components:

1. Configuration Identifier Format Selector
2. Configuration Name
3. Configuration Revision Level
4. Configuration Digest: 16-byte signature of type HMAC-MD5 created from the MST Configuration Table (a VLAN ID to MSTID mapping)

As there are Multiple Instances of Spanning Tree, there is a MSTP state maintained on a per-port, per-instance basis (or on a port per VLAN basis: as any VLAN can be in one and only one MSTI or CIST). For example, port A can be forwarding for instance 1 while discarding for instance 2. The port states have changed since IEEE 802.1D specification.

To support multiple spanning trees, a MSTP bridge has to be configured with an unambiguous assignment of VLAN IDs (VIDs) to spanning trees. This is achieved by:

1. Ensuring that the allocation of VIDs to FIDs is unambiguous.
2. Ensuring that each FID supported by the Bridge is allocated to exactly one Spanning Tree Instance.

The combination of VID to FID and then FID to MSTI allocation defines a mapping of VIDs to spanning tree instances, represented by the MST Configuration Table.

With this allocation we ensure that every VLAN is assigned to one and only one MSTI. The CIST is also an instance of spanning tree with a MSTID of 0.

An instance may occur that has no VIDs allocated to it, but every VLAN must be allocated to one of the other instances of spanning tree.

The portion of the active topology of the network that connects any two bridges in the same MST Region traverses only MST bridges and LANs in that region, and never Bridges of any kind outside the Region, in other words connectivity within the region is independent of external connectivity.
MSTP Example Configuration

This example shows how to create an MSTP instance from the GSM7352Sv1 or GSM7352Sv2 switch. The example network has three different ProSafe that serve different locations in the network. In this example, ports 1/0/1-1/0/5 are connected to host stations, so those links are not subject to network loops. Ports 1/0/6 - 1/0/8 are connected across switches 1, 2 and 3.

Perform the following procedures on each switch to configure MSTP:

1. Use the VLAN Configuration screen to create VLANs 300 and 500 (see VLAN Configuration on page 120).
2. Use the VLAN Membership screen to include ports 1/0/1 - 1/0/8 as tagged (T) or untagged (U) members of VLAN 300 and VLAN 500 (see VLAN Configuration on page 120).
3. From the STP Configuration screen, enable the Spanning Tree State option (see STP Configuration on page 143).
   Use the default values for the rest of the STP configuration settings. By default, the STP Operation Mode is MSTP and the Configuration Name is the switch MAC address.
4. From the CST Configuration screen, set the Bridge Priority value for each of the three switches to force Switch 1 to be the root bridge:
   • Switch 1: 4096
   • Switch 2: 12288
   • Switch 3: 20480

Note: Bridge priority values are multiples of 4096.
If you do not specify a root bridge and all switches have the same Bridge Priority value, the switch with the lowest MAC address is elected as the root bridge (see CST Configuration on page 146).

5. From the CST Port Configuration screen, select ports 1/0/1 - 1/0/8 and select Enable from the STP Status menu (see CST Port Configuration on page 148).

6. Click APPLY.

7. Select ports 1/0/1 - 1/0/5 (edge ports), and select Enable from the Fast Link menu. Since the edge ports are not at risk for network loops, ports with Fast Link enabled transition directly to the Forwarding state.

8. Click APPLY.

You can use the CST Port Status screen to view spanning tree information about each port.

9. From the MST Configuration screen, create a MST instances with the following settings:
   • MST ID: 1
   • Priority: Use the default (32768)
   • VLAN ID: 300

   For more information, see MST Configuration on page 151.

10. Click ADD.

11. Create a second MST instance with the following settings
    • MST ID: 2
    • Priority: 49152
    • VLAN ID: 500

12. Click ADD.

In this example, assume that Switch 1 has become the Root bridge for the MST instance 1, and Switch 2 has become the Root bridge for MST instance 2. Switch 3 has hosts in the Sales department (ports 1/0/1, 1/0/2, and 1/0/3) and in the HR department (ports 1/0/4 and 1/0/5). Switches 1 and 2 also have hosts in the Sales and Human Resources departments. The hosts connected from Switch 2 use VLAN 500, MST instance 2 to communicate with the hosts on Switch 3 directly. Likewise, hosts of Switch 1 use VLAN 300, MST instance 1 to communicate with the hosts on Switch 3 directly.

The hosts use different instances of MSTP to effectively use the links across the switch. The same concept can be extended to other switches and more instances of MSTP.
Notification of Compliance

NETGEAR Wired Products

Regulatory Compliance Information

This section includes user requirements for operating this product in accordance with National laws for usage of radio spectrum and operation of radio devices. Failure of the end-user to comply with the applicable requirements may result in unlawful operation and adverse action against the end-user by the applicable National regulatory authority.

This product's firmware limits operation to only the channels allowed in a particular Region or Country. Therefore, all options described in this user's guide may not be available in your version of the product.

FCC Requirements for Operation in the United States

FCC Information to User

This product does not contain any user serviceable components and is to be used with approved antennas only. Any product changes or modifications will invalidate all applicable regulatory certifications and approvals.

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

FCC Guidelines for Human Exposure

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance of 20 cm between the radiator and your body.

This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

FCC Declaration Of Conformity

We, NETGEAR, Inc., 350 East Plumeria Drive, San Jose, CA 95134, declare under our sole responsibility that the ProSafe M5300 Switch complies with Part 15 of FCC Rules.

Operation is subject to the following two conditions:

- This device may not cause harmful interference, and
• This device must accept any interference received, including interference that may cause undesired operation.

FCC Radio Frequency Interference Warnings & Instructions

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following methods:

• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and the receiver.
• Connect the equipment into an electrical outlet on a circuit different from that which the radio receiver is connected.
• Consult the dealer or an experienced radio/TV technician for help.

Modifications made to the product, unless expressly approved by NETGEAR, Inc., could void the user's right to operate the equipment.

Canadian Department of Communications Radio Interference Regulations

This digital apparatus, ProSafe M5300 Switch, does not exceed the Class B limits for radio-noise emissions from digital apparatus as set out in the Radio Interference Regulations of the Canadian Department of Communications.

This Class [B] digital apparatus complies with Canadian ICES-003.
Cet appareil numérique de la classe [B] est conforme à la norme NMB-003 du Canada

European Union

The ProSafe M5300 Switch complies with essential requirements of EU EMC Directive 2004/108/EC and Low Voltage Directive 2006/95/EC as supported by applying the following test methods and standards:

• EN55022: 2006 / A1: 2007
• EN60950-1: 2005 2nd Edition
• EN 61000-3-2:2006
• EN 61000-3-3:1995 w/A1: 2001+A2: 2005
