Support
Thank you for selecting NETGEAR products.
After installing your device, locate the serial number on the label of your product and use it to register your product at https://my.netgear.com. You must register your product before you can use NETGEAR telephone support. NETGEAR recommends registering your product through the NETGEAR website. For product updates and web support, visit http://support.netgear.com.
Phone (US & Canada only): 1-888-NETGEAR.
Phone (Other Countries): Check the list of phone numbers at http://support.netgear.com/general/contact/default.aspx.

Compliance
For regulatory compliance information, visit http://www.netgear.com/about/regulatory.
See the regulatory compliance document before connecting the power supply.

Trademarks
NETGEAR, the NETGEAR logo, and Connect with Innovation are trademarks and/or registered trademarks of NETGEAR, Inc. and/or its subsidiaries in the United States and/or other countries. Information is subject to change without notice. © NETGEAR, Inc. All rights reserved.

Hardware Setup

Getting to know your router

The NETGEAR R6300v2 Smart WiFi Router with AC1750 dual band delivers the world's faster WiFi. With AC1750 WiFi and Gigabit Ethernet speeds, this router offers ultimate performance in wireless coverage for large homes. The R6300v2 comes with a dual-core 800 MHz processor with enough processing power to provide you with the best performance, and comes with two USB ports for connecting a hard drive or printer; including one USB 3.0 port that provides access speeds up to 10 times faster.

Compatible with next-generation WiFi devices and backward compatible with 802.11 a/b/g/n devices, it enables HD streaming throughout your home. With up to 450\(1+1300\) Mbps speed and simultaneous dual band WiFi technology, the R6300v2 avoids wireless interference, ensuring top WiFi speeds and reliable connections especially for dual band wireless devices like iPad and iPhone5.

In addition, Beamforming+ technology boosts speed, reliability and range of WiFi connections. The router automatically uses NETGEAR Beamforming+ technology to enhance WiFi performance with 802.11ac WiFi devices. Because it’s automatic, you don’t have to turn on Beamforming+ or configure it. When you connect to the WiFi network, Beamforming+ focuses on your location for even better WiFi performance and speed. Beamforming+ locks onto your laptop, tablet, or smartphone, and follows as you move from place to place, so you keep your optimal WiFi connection.

If you already set up your router, you can skip this chapter. If you have not done that yet, this chapter covers the hardware setup. Chapter 2, Getting Started, explains how to access your router to view or change its settings.

This chapter contains the following sections:

- Unpack Your Router
- Hardware Features
- Position Your Router

For more information about the topics covered in this manual, visit the support website at http://support.netgear.com.

---

1. Maximum wireless signal rate derived from IEEE standard 802.11 specifications. Actual data throughput and wireless coverage will vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, lower actual data throughput rate and wireless coverage. NETGEAR makes no express or implied representations or warranties about this product's compatibility with any future standards. 802.11ac 1300 Mbps is approximately 3x faster than 802.11n 450 Mbps.

2. Up to 1300 Mbps wireless speeds achieved when you connect to other 802.11ac 1300 Mbps devices.
Unpack Your Router

Open the box and remove the router, cables, and installation guide.

![Smart WiFi Router](image)

**Ethernet cable with internal shielding**

**Power adapter**

**Figure 1. Check the package contents**

Your box contains these items:
- R6300v2 Smart WiFi Router
- AC power adapter (plug varies by region)
- Category 5 (Cat 5) Ethernet cable with internal shielding
- Installation guide

If any parts are incorrect, missing, or damaged, contact your NETGEAR dealer. Keep the carton and original packing materials, in case you return the product for repair.

Hardware Features

Before you cable your router, take a moment to become familiar with the front, side, and back panels and the label. Pay particular attention to the LEDs on the front panel.
Front and Side Panels

The router front panel has the status LEDs and icons shown in the following figure.

![Router front and side view](image)

**Figure 2. Router front and side view**

**Table 1. Front panel LED descriptions**

<table>
<thead>
<tr>
<th>LED</th>
<th>Description</th>
</tr>
</thead>
</table>
| Power | • **Solid amber.** The router is starting up.  
      | • **Blinking amber.** The firmware is upgrading, or the Reset button was pressed.  
      | • **Solid green.** The router is ready.  
      | • **Blinking green.** The firmware is corrupted. Visit [www.netgear.com/support](http://www.netgear.com/support).  
      | • **Off.** Power is not supplied to the router. |
| Internet | • **Solid green.** The Internet connection is ready.  
           | • **Solid amber.** The Ethernet cable connection to the modem has been detected.  
           | • **Off.** No Ethernet cable is connected to the modem. |
| Wireless | • **Solid blue.** The wireless radio is operating in either 2.4 GHz or 5 GHz mode.  
           | • **Blinking.** A wireless computer or device is using WPS to join the network.  
           | • **Off.** The wireless radios are off for both 2.4 GHz and 5 GHz. |
| USB | • **Solid blue.** The router has accepted the USB device. The USB device is ready to be used.  
     | • **Blinking blue.** A USB device is plugged in and is trying to connect.  
     | • **Off.** No USB device is connected or someone clicked the Safely Remove Hardware button, and it is now safe to remove the attached USB device. |

The WiFi and WPS buttons toggle the WiFi and WPS functions on and off.

- **WiFi On/Off button.** Pressing and holding this button for two seconds turns on and off the 2.4 GHz and 5 GHz wireless radios. If the Wireless LED is lit, the wireless radios are
on. If this LED is off, the wireless radios are turned off and you cannot connect wirelessly to the router.

- **WPS button.** You can use this button to use WPS to add a wireless device or computer to your wireless network. The Wireless LED blinks blue when the router is trying to add the wireless device or computer. The LED stays solid blue when wireless security is enabled in the router.

**Rear Panel**

The rear panel has the connections and buttons shown in the following figure.

![Router rear panel diagram](image)

**Figure 3. Router rear panel**

The Reset button restores the factory settings. See *Factory Settings* on page 131.

**Label**

The label on the bottom of the router shows the login information, MAC address, and serial number.

![Label diagram](image)

**Figure 4. The label shows unique information about your router**
Position Your Router

The router lets you access your network from anywhere within the operating range of your wireless network. However, the operating distance or range of your wireless connection can vary significantly depending on the physical placement of your router. For example, the thickness and number of walls the wireless signal passes through can limit the range. For best results, place your router:

• Near the center of the area where your computers and other devices operate, and preferably within line of sight to your wireless devices.
• So it is accessible to an AC power outlet and near Ethernet cables for wired computers.
• In an elevated location such as a high shelf, keeping the number of walls and ceilings between the router and your other devices to a minimum.
• Away from electrical devices that are potential sources of interference. Equipment that might cause interference includes ceiling fans, home security systems, microwaves, computers, the base of a cordless phone, or a 2.4 GHz cordless phone.
• Away from any large metal surfaces, such as a solid metal door or aluminum studs. Large expanses of other materials such as glass, insulated walls, fish tanks, mirrors, brick, and concrete can also affect your wireless signal.
Getting Started

Connecting to the router

This chapter explains how to use NETGEAR genie to set up your router after you complete cabling as described in the installation guide.

This chapter contains the following sections:

- Router Setup Preparation
- Login and Access
- NETGEAR genie Setup
- Use NETGEAR genie after Installation
- Upgrade the Firmware
- Dashboard (BASIC Home Screen)
- Join Your Wireless Network
- Access the Router with NETGEAR genie Apps
Router Setup Preparation

You can set up your router with the NETGEAR genie automatically, or you can use the genie menus and screens to set up your router manually. Before you start the setup process, get your ISP information and make sure the computers and devices in the network have the settings described here.

Use Standard TCP/IP Properties for DHCP

If you set up your computer to use a static IP address, change the settings so that it uses Dynamic Host Configuration Protocol (DHCP).

Gather ISP Information

If you have DSL broadband service, you might need the following information to set up your router and to check that your Internet configuration is correct. When your Internet service starts, your Internet service provider (ISP) typically gives you all the information needed to connect to the Internet. If you cannot locate this information, ask your ISP to provide it. When your Internet connection is working, you no longer need to launch the ISP login program on your computer to access the Internet. When you start an Internet application, your router automatically logs you in.

- The ISP configuration information for your DSL account
- ISP login name and password
- Fixed or static IP address settings (special deployment by ISP; this setting is rare)

Wireless Devices and Security Settings

Make sure that the wireless device or computer that you are using supports WPA or WPA2 wireless security, which is the wireless security that the router uses.

Login and Access

Separate types of logins have different purposes. It is important that you understand the difference so that you know which login to use when.

- **Router login.** The user name admin logs you in to the router interface. For details about this login, see *Use NETGEAR genie after Installation* on page 15.

- **ISP login.** The login that your ISP provided logs you in to your Internet service. Your service provider has provided you with this login information in a letter or some other way. If you cannot find this login information, contact your service provider.

- **Wireless network key or password.** Your router is preset with a unique wireless network name (SSID) and password for wireless access. This information is on the label on your router.
NETGEAR genie Setup

NETGEAR genie runs on any device with a web browser. Installation with basic setup takes about 15 minutes to complete.

➢ To use NETGEAR genie to set up your router:

1. Turn the router on by pressing the On/Off button.
2. Make sure that your computer or wireless device is connected to the router with an Ethernet cable (wired) or wirelessly with the preset security settings listed on the label.
3. Launch your Internet browser.
   • The first time you set up the Internet connection for your router, the browser goes to http://www.routerlogin.net, and the NETGEAR genie screen displays.
   • If you already used the NETGEAR genie, type http://www.routerlogin.net in the address field for your browser to display the NETGEAR genie screen. See Use NETGEAR genie after Installation on page 15.
4. Follow the onscreen instructions.
   NETGEAR genie guides you through connecting the router to the Internet.

If the browser cannot display the web page:

• Make sure that the computer is connected to one of the four LAN Ethernet ports or wirelessly to the router.
• Make sure that the router has full power, and that its WiFi LED is lit.
• Close and reopen the browser or clear the browser cache.
• Browse to http://www.routerlogin.net.
• If the computer is set to a static or fixed IP address (this setting is uncommon), change it to obtain an IP address automatically from the router.
If the router does not connect to the Internet:

1. Review your settings. Make sure that you have selected the correct options and typed everything correctly.
2. Contact your ISP to verify that you have the correct configuration information.
3. Read Chapter 10, Troubleshooting. If problems persist, register your NETGEAR product and contact NETGEAR technical support.

Use NETGEAR genie after Installation

When you first set up your router, NETGEAR genie automatically starts when you launch an Internet browser on a computer that is connected to the router. If you want to view or change settings for the router, you can use genie again.

1. Launch your browser from a computer or wireless device that is connected to the router.
   A login screen displays.
3. Enter admin for the router user name and password for the router password, both in lowercase letters.

   Note: The router user name and password are different from the user name and password for logging in to your Internet connection. For more information, see Login and Access on page 13.

Upgrade the Firmware

When you set up your router and connect to the Internet, the router automatically checks to see if newer firmware is available. If it is, a message is displayed on the top of the screen.

➢ To upgrade the firmware:
   1. Click the message that tells you new firmware is available.
      During the firmware upgrade, you cannot access the Internet.
   2. Click the Yes button to upgrade the router with the latest firmware.

   ! WARNING:

   To avoid the risk of corrupting the firmware, do not interrupt the upgrade. For example, do not close the browser, click a link, or load a new page. Do not turn off the router.

After the upgrade, the router restarts.

For more information, see Upgrade the Router Firmware on page 87.
Dashboard (BASIC Home Screen)

The router BASIC Home screen has a dashboard that lets you see the status of your Internet connection and network at a glance. You can click any of the six sections of the dashboard to view and change the settings. The left column has menus. You can use the ADVANCED tab to access more menus and screens.

![Figure 5. BASIC Home screen with dashboard, language, and online help](image)

- **Home.** This dashboard screen displays when you log in to the router.
- **Internet.** Set, update, and check the ISP settings of your router.
- **Wireless.** View or change the wireless settings for your router.
- **Attached Devices.** View the devices connected to your network.
- **Parental Controls.** Download and set up parental controls to prevent objectionable content from reaching your computers.
- **ReadySHARE.** If you connected a USB storage device to the router, then it is displayed here.
- **Guest Network.** Set up a guest network to allow visitors to use your router’s Internet connection.
- **ADVANCED tab.** Set the router up for unique situations such as when remote access by IP or by domain name from the Internet is needed. See Chapter 9, Advanced Settings. You need a solid understanding of networking to use this tab.
- **Help & Support.** Visit the NETGEAR support site for information, help, and product documentation. These links work once you have an Internet connection.
Join Your Wireless Network

You can use the manual or the WPS method to join your wireless network. For information about how to set up a guest network, see Set Up a Guest Network on page 25.

Manual Method

With the manual method, choose the network that you want and type its password to connect.

➢ To connect manually:

1. On your computer or wireless device, open the software that manages your wireless connections.
   
   This software scans for all wireless networks in your area.

2. Look for your network and select it.
   
   The unique WiFi network name (SSID) and password are on the router label. If you changed these settings, look for the network name that you used.

3. Enter the router password and click Connect.

Wi-Fi Protected Setup Method

Wi-Fi Protected Setup (WPS) lets you connect to a secure WiFi network without typing its password. Instead, press a button or enter a PIN. NETGEAR calls WPS Push 'N' Connect.

Some older WiFi equipment is not compatible with WPS. WPS works only with WPA2 or WPA wireless security.

➢ To use WPS to join the wireless network:

1. Press the WPS button on the side of the router.

2. Within two minutes, press the WPS button on your wireless device, or follow the WPS instructions that came with the device.
   
   The WPS process automatically sets up your wireless computer with the network password and connects you to the wireless network.

Access the Router with NETGEAR genie Apps

The genie app is the easy dashboard for managing, monitoring, and repairing your home network. The genie app can help you with the following:

- Automatically repair common wireless network problems.
- Easily manage router features like Live Parental Controls, guest access, Internet traffic meter, speed test, and more.
To use the genie app to access the router:

2. Follow the onscreen instructions to install the app on your smartphone, tablet, or computer.
3. Launch the genie app.
   The genie app dashboard screen displays.
NETGEAR genie Basic Settings

Your Internet connection and WiFi network

This chapter contains the following sections:

• Internet Setup
• Basic Wireless Settings
• Basic Wireless Settings
• Set Up a Guest Network
• View Attached Devices

For information about the ReadySHARE feature on the BASIC Home tab, see Chapter 5, USB Storage and Chapter 6, ReadySHARE Printer.
Internet Setup

The Internet Setup screen is where you view or change basic ISP information.

**Note:** You can use the Setup Wizard to detect the Internet connection and automatically set up the router. See *Internet Connection Setup Wizard* on page 29.

To view or change the basic Internet setup:

1. From the Home screen, select *Internet*.

The fields that display in the Internet Setup screen depend on whether your Internet connection requires a login.

2. Select the **Yes** or **No** radio button.
   - **Yes.** Select the encapsulation method and enter the login name. If you want to change the login time-out, enter a new value in minutes.
   - **No.** Enter the account and domain names, only if needed.

3. Enter the settings for the IP address and DNS server.
   The default settings usually work fine. If you have problems with your connection, check the ISP settings.

4. Click the **Apply** button.
   Your settings are saved.

5. Click **Test** to test your Internet connection.
   If the NETGEAR website does not display within 1 minute, see *Chapter 10, Troubleshooting*. 
Internet Setup Screen Fields

The following descriptions explain all of the possible fields in the Internet Setup screen. The fields that display in this screen depend on whether an ISP login is required.

**Does Your Internet connection require a login?** Select either Yes or No.

These fields display when no login is required:

- **Account Name (If required)**. Enter the account name provided by your ISP. This might also be called the host name.
- **Domain Name (If required)**. Enter the domain name provided by your ISP.

These fields display when your ISP requires a login:

- **Internet Service Provider**. PPPoE or PPPoA.
- **Login**. The login name provided by your ISP. This login name is often an email address.
- **Password**. The password that you use to log in to your ISP.
- **Service Name (if Required)**. If your ISP provided a service name, enter it here.
- **Connection Mode**. Always On, Dial on Demand, or Manually Connect.
- **Idle Timeout (In minutes)**. If you want to change the login time-out, enter a new value in minutes. This setting determines how long the router keeps the Internet connection active when there is no Internet activity from the LAN. A value of 0 (zero) means never log out.

**Internet IP Address**.

- **Get Dynamically from ISP**. Your ISP uses DHCP to assign your IP address. Your ISP automatically assigns these addresses.
- **Use Static IP Address**. Enter the IP address, IP subnet mask, and the gateway IP address that your ISP assigned. The gateway is the ISP router to which your router connects.

**Domain Name Server (DNS) Address**. The DNS server is used to look up site addresses based on their names.

- **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
- **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

**NAT (Network Address Translation)**. NAT allows computers on your home network to share the router Internet connection. NAT is enabled by default because it is needed in most situations. The following settings are available:

- Enable
- Disable

**Router MAC Address**. The Ethernet MAC address that the router uses on the Internet port. Some ISPs register the MAC address of the network interface card in your computer when
your account is first opened. They accept traffic only from the MAC address of that computer. This feature allows your router to use your computer’s MAC address (also called cloning).

- **Use Default Address.** Use the default MAC address.
- **Use Computer MAC Address.** The router captures and uses the MAC address of the computer that you are now using. You have to use the one computer that the ISP allows.
- **Use This MAC Address.** Enter the MAC address that you want to use.

### Basic Wireless Settings

The Wireless Settings screen lets you view or configure the wireless network setup.

The router comes with preset security. This means that the Wi-Fi network name (SSID), network key (password), and security option (encryption protocol) are preset in the factory. You can find the preset SSID and password on the bottom of the unit.

---

**Note:** The preset SSID and password are uniquely generated for every device to protect and maximize your wireless security.

---

*NETGEAR recommends that you do not change your preset security settings.* If you change your preset security settings, make a note of the new settings and store it in a safe place where you can easily find it.

If you use a wireless computer to change the wireless network name (SSID) or other wireless security settings, you are disconnected when you click Apply. To avoid this problem, use a computer with a wired connection to access the router.
To view or change basic wireless settings:

1. Select BASIC > Wireless.

The screen sections, settings, and procedures are explained in the following sections.

2. Change the settings as needed.

3. Click the Apply button.

Your settings are saved.

If you were connected wirelessly to the router and you changed the SSID or wireless security, you are disconnected from the network.

4. If you changed the settings, make sure that you can connect wirelessly to the network with its new settings.

If you cannot connect wirelessly, check the following:

- Is your computer or wireless device connected to another wireless network in your area? Some wireless devices automatically connect to the first open network (without wireless security) that they discover.
- Is your computer or wireless device trying to connect to your network with its old settings (before you changed the settings)? If so, update the wireless network selection in your computer or wireless device to match the current settings for your network.

Wireless Settings Screen Fields

You can use this screen to view or change the wireless network settings and the security option.
Enable SSID Broadcast. This feature allows the router to broadcast its SSID so wireless stations can see this wireless name (SSID) in their scanned network lists. This check box is selected by default. To turn off the SSID broadcast, clear this check box, and click Apply.

Name (SSID). The SSID is also known as the wireless network name. Enter a 32-character (maximum) name in this field. This field is case-sensitive. The default SSID is randomly generated, and NETGEAR strongly recommends that you do not change this setting.

Region. The location where the router is used. Select from the countries in the list. In the United States, the region is fixed to United States and is not changeable.

Channel. The wireless channel the router uses. For 2.4 GHz, select a value from 1 through 13. (For products in the North America market, only Channels 1 through 11 can be operated.) Do not change the channel unless you experience interference (shown by lost connections or slow data transfers). If this happens, experiment with different channels to see which is the best.

When you use multiple access points, it is better if adjacent access points use different radio frequency channels to reduce interference. The recommended channel spacing between adjacent access points is four channels (for example, use Channels 1 and 5, or 6 and 10).

Mode. For 2.4 GHz, Up to 217 Mbps is the default setting, which allows 802.11n and 802.11g wireless devices to join the network. The other settings are Up to 54 Mbps, and Up to 450 Mbps.

At 5 GHz, Up to 1300 Mbps is the default setting, which allows 802.11ac and 802.11a wireless devices to join the network. The other settings are Up to 600 Mbps and 289 Mbps.

Security Options. The router comes with unique preset wireless security. These settings are on the product label. NETGEAR recommends that you use preset security so that you can refer to the label if you forget the WiFi password. However, you can change the security option and passphrase.

Wireless Security Options
A security option is the type of security protocol applied to your wireless network. The security protocol in force encrypts data transmissions and ensures that only trusted devices receive authorization to connect to your network. Wi-Fi Protected Access (WPA) has several options including pre-shared key (PSK) encryption.

WPA encryption is built into all hardware that has the Wi-Fi-certified seal. This seal means that the product is authorized by the Wi-Fi Alliance (http://www.wi-fi.org/) because it complies with the worldwide single standard for high-speed wireless local area networking.

WPA uses a passphrase for authentication and to generate the initial data encryption keys. Then it dynamically varies the encryption key. WPA-PSK uses Temporal Key Integrity Protocol (TKIP) data encryption, implements most of the IEEE 802.11i standard, and works with all wireless network interface cards, but not all wireless access points.

WPA2-PSK is stronger than WPA-PSK. It is advertised to be theoretically indecipherable due to the greater degree of randomness in encryption keys that it generates. WPA2-PSK gets higher speed because it is implemented through hardware, while WPA-PSK is implemented
through software. WPA2-PSK uses a passphrase to authenticate and generate the initial data encryption keys. Then it dynamically varies the encryption key.

WPA-PSK + WPA2-PSK Mixed Mode can provide broader support for all wireless clients. WPA2-PSK clients get higher speed and security, and WPA-PSK clients get decent speed and security. For help with WPA settings on your wireless computer or device, see the instructions that came with your product.

**Change the Wireless Security Option**

NETGEAR recommends that you do not disable security.

➢ **To change the WPA settings:**

1. Select **BASIC > Wireless Settings**.
2. Under Security Options, select the WPA option you want.

<table>
<thead>
<tr>
<th>Security Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
</tr>
<tr>
<td>WPA-PSK [TKIP]</td>
</tr>
<tr>
<td>WPA2-PSK [AES]</td>
</tr>
<tr>
<td>WPA-PSK [TKIP] + WPA2-PSK [AES]</td>
</tr>
<tr>
<td>WPA/WPA2 Enterprise</td>
</tr>
</tbody>
</table>

3. In the Passphrase field that displays when you select a WPA security option, enter the network key (password) that you want to use. It is a text string from 8 to 63 characters.
4. Write down the new password and keep it in a secure place for future reference.
5. Click the **Apply** button.

   Your changes are saved.

**Set Up a Guest Network**

A guest network allows visitors at your home to use the Internet without using your wireless security key. You can add a guest network to each wireless network: 2.4 GHz b/g/n and 5.0 GHz a/n.
To set up a guest network:

1. Select **BASIC > Guest Network**.

2. Select any of the following wireless settings:
   - **Enable Guest Network**. When this check box is selected, the guest network is enabled, and guests can connect to your network using the SSID of this profile.
   - **Enable SSID Broadcast**. If this check box is selected, the wireless access point broadcasts its name (SSID) to all wireless stations. Stations with no SSID can adopt the correct SSID for connections to this access point.
   - **Allow guest to access My Local Network**. If this check box is selected, anyone who connects to this SSID has access to your local network, not just Internet access.

3. Give the guest network a name.
   - The guest network name is case-sensitive and can be up to 32 characters. You then manually configure the wireless devices in your network to use the guest network name in addition to the main SSID.

4. Select a security option from the list.
   - The security options are described in *Wireless Security Options* on page 24.

5. Click the **Apply** button.
   - Your settings are saved.
View Attached Devices

You can view all computers or devices that are currently connected to your network.

➢ To go to the Attached Devices screen:

1. From the BASIC Home screen, select **Attached Devices**.

[Attached Devices screen]

Wired devices are connected to the router with Ethernet cables. Wireless devices have joined the wireless network. The following information is displayed:

- **# (number)**. The order in which the device joined the network.
- **IP Address**. The IP address that the router assigned to this device when it joined the network. This number can change if a device is disconnected and rejoins the network.
- **MAC Address**. The unique MAC address for each device does not change. The MAC address is typically shown on the product label.
- **Device Name**. If the device name is known, it is shown here.

2. Click **Refresh** to update this screen.
NETGEAR genie ADVANCED Home

Specifying custom settings

This chapter contains the following sections:

• NETGEAR genie ADVANCED Home Screen
• Internet Connection Setup Wizard
• WAN Setup
• LAN Setup
• WPS Wizard for WiFi Connections
• Quality of Service (QoS) Setup
• Enable Facebook WiFi

Some selections on the ADVANCED Home screen are described in separate chapters:

• USB Storage. See Chapter 5, USB Storage.
• Administration. See Chapter 8, Administration.
• ADVANCED Setup. See Chapter 9, Advanced Settings.
NETGEAR genie ADVANCED Home Screen

The genie ADVANCED Home dashboard presents status information. The content is the same as what is on the Router Status screen available from the Administration menu. See View Router Status on page 88.

Internet Connection Setup Wizard

You can use the Setup Wizard to detect your Internet settings and automatically set up your router. The Setup Wizard is not the same as the genie screens that display the first time you connect to your router to set it up.

➢ To use the Setup Wizard:

1. Select ADVANCED > Setup Wizard.

   ![Setup Wizard screenshot]

2. Select Yes.

   If you select No, you are taken to the Internet Setup screen (see Internet Setup on page 20).

3. Select your location.

4. Click Next.
The Setup Wizard searches your Internet connection for servers and protocols to determine your ISP configuration.

WAN Setup

The WAN Setup screen lets you configure a DMZ (demilitarized zone) server, change the maximum transmit unit (MTU) size, and enable the router to respond to a ping on the WAN (Internet) port.

➢ To view or change the WAN settings:

1. Select ADVANCED > Setup > WAN Setup.

2. Specify the following settings:
   • **Disable Port Scan and DoS Protection.** DoS protection protects your LAN against denial of service attacks such as Syn flood, Smurf Attack, Ping of Death, Teardrop Attack, UDP Flood, ARP Attack, Spoofing ICMP, Null Scan, and many others. This feature should be disabled only in special circumstances.
   • **Default DMZ Server.** This feature is sometimes helpful when you are playing online games or videoconferencing. Be careful when using this feature because it makes the firewall security less effective. See the following section, *Default DMZ Server.*
   • **Respond to Ping on Internet Port.** If you want the router to respond to a ping from the Internet, select this check box. Use this feature only as a diagnostic tool because...
it allows your router to be discovered. Do not select this check box unless you have a specific reason.

- **Disable IGMP Proxying.** IGMP proxying allows a computer on the local area network (LAN) to receive the multicast traffic it is interested in from the Internet. If you do not need this feature, you can select this check box to disable it.

- **MTU Size (in bytes).** The normal MTU (maximum transmit unit) value for most Ethernet networks is 1500 bytes, or 1492 bytes for PPPoE connections. For some ISPs, you might need to reduce the MTU. Reduce the MTU only if you are sure that it is necessary for your ISP connection. See Change the MTU Size on page 32.

- **NAT Filtering.** Network Address Translation (NAT) determines how the router processes inbound traffic. Secured NAT provides a secured firewall to protect the computers on the LAN from attacks from the Internet, but might prevent some Internet games, point-to-point applications, or multimedia applications from functioning. Open NAT provides a much less secured firewall, but allows almost all Internet applications to function.

3. Click the Apply button.

Your changes are saved.

**Default DMZ Server**

The default DMZ server feature is helpful when you are using some online games and videoconferencing applications that are incompatible with Network Address Translation (NAT). The router is programmed to recognize some of these applications and to work correctly with them, but other applications might not function well. In some cases, one local computer can run the application correctly if the IP address for that computer is entered as the default DMZ server.

**WARNING:**

DMZ servers pose a security risk. A computer designated as the default DMZ server loses much of the protection of the firewall and is exposed to exploits from the Internet. If compromised, the DMZ server computer can be used to attack other computers on your network.

The router usually detects and discards incoming traffic from the Internet that is not a response to one of your local computers or a service that you have configured in the Port Forwarding/Port Triggering screen. Instead of discarding this traffic, you can have the router forward the traffic to one computer on your network. This computer is called the default DMZ server.

➢ **To set up a default DMZ server:**

1. Select ADVANCED > Setup > WAN Setup.
2. Select the Default DMZ Server check box.
3. Type the IP address.
4. Click the Apply button.
   Your change takes effect.

Change the MTU Size

The maximum transmission unit (MTU) is the largest data packet a network device transmits. When one network device communicates across the Internet with another, the data packets travel through many devices along the way. If a device in the data path has a lower MTU setting than the other devices, the data packets have to be split or “fragmented” to accommodate the device with the smallest MTU.

The best MTU setting for NETGEAR equipment is often just the default value. In some situations, changing the value fixes one problem but causes another. Leave the MTU unchanged unless one of these situations occurs:

- You have problems connecting to your ISP or other Internet service, and the technical support of either the ISP or NETGEAR recommends changing the MTU setting. These web-based applications might require an MTU change:
  - A secure website that does not open, or displays only part of a web page
  - Yahoo email
  - MSN portal
  - America Online’s DSL service
- You use VPN and have severe performance problems.
- You used a program to optimize MTU for performance reasons, and now you have connectivity or performance problems.

Note: An incorrect MTU setting can cause Internet communication problems. For example, you might not be able to access certain websites, frames within websites, secure login pages, or FTP or POP servers.

If you suspect an MTU problem, a common solution is to change the MTU to 1400. If you are willing to experiment, you can gradually reduce the MTU from the maximum value of 1500 until the problem goes away. The following table describes common MTU sizes and applications.

Table 2. Common MTU sizes

<table>
<thead>
<tr>
<th>MTU</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500</td>
<td>The largest Ethernet packet size. This setting is typical for connections that do not use PPPoE or VPN, and is the default value for NETGEAR routers, adapters, and switches.</td>
</tr>
<tr>
<td>1492</td>
<td>Used in PPPoE environments.</td>
</tr>
</tbody>
</table>
To change the MTU size:

1. Select ADVANCED > Setup > WAN Setup.
2. In the MTU Size field, enter a value from 64 to 1500.
3. Click the Apply button.

Your change is saved.

### LAN Setup

The LAN Setup screen allows configuration of LAN IP services such as Dynamic Host Configuration Protocol (DHCP) and Routing Information Protocol (RIP).

The router is shipped preconfigured to use private IP addresses on the LAN side and to act as a DHCP server. The router’s default LAN IP configuration is:

- LAN IP address. **192.168.1.1**
- Subnet mask. **255.255.255.0**

These addresses are part of the designated private address range for use in private networks and are suitable for most applications. If your network requires a different IP addressing scheme, you can change these settings in the LAN Setup screen.

---

**Note:** If you change the LAN IP address of the router while connected through the browser, you are disconnected. If you want to continue to use the router menus, open a new connection to the new IP address and log in again.
To change the LAN settings:

1. Select ADVANCED > Setup > LAN Setup.

2. Enter the settings that you want to customize.
   These settings are described in the following section, LAN Setup Screen Settings.

3. Click the Apply button.
   Your changes are saved.

LAN Setup Screen Settings

LAN TCP/IP Setup

- **IP Address**. The LAN IP address of the router.
- **IP Subnet Mask**. The LAN subnet mask of the router. Combined with the IP address, the IP subnet mask allows a device to know which other addresses are local to it, and which have to be reached through a gateway or router.
- **RIP Direction**. Router Information Protocol (RIP) allows a router to exchange routing information with other routers. This setting controls how the router sends and receives RIP packets. Both is the default setting. With the Both or Out Only setting, the router broadcasts its routing table periodically. With the Both or In Only setting, the router incorporates the RIP information that it receives.
- **RIP Version**. This setting controls the format and the broadcasting method of the RIP packets that the router sends. It recognizes both formats when receiving. By default, the RIP function is disabled.
  - RIP-1 is universally supported. It is adequate for most networks, unless you have an unusual network setup.

### Use Router as DHCP Server

For most home networks, this check box is selected so that the router acts as a Dynamic Host Configuration Protocol (DHCP) server.

- **Starting IP Address.** Specify the start of the range for the pool of IP addresses in the same subnet as the router.
- **Ending IP Address.** Specify the end of the range for the pool of IP addresses in the same subnet as the router.

### Address Reservation

When you specify a reserved IP address for a computer on the LAN, that computer receives the same IP address each time it accesses the router’s DHCP server. Assign reserved IP addresses to servers that require permanent IP settings. See Set Up Address Reservation on page 36.

### Role of the Router as a DHCP Server

By default, the router acts as a DHCP server. The router assigns IP, DNS server, and default gateway addresses to all computers connected to the LAN. The assigned default gateway address is the LAN address of the router. The router assigns IP addresses to the attached computers from a pool of addresses specified in the LAN Setup screen. Each pool address is tested before it is assigned to avoid duplicate addresses on the LAN. For most applications, the default DHCP and TCP/IP settings of the router are satisfactory.

You can specify the pool of IP addresses that the router assigns by setting the starting IP address and ending IP address. These addresses should be part of the same IP address subnet as the router’s LAN IP address. Using the default addressing scheme, define a range between 192.168.1.2 and 192.168.1.254, although you might want to save part of the range for devices with fixed addresses.

The router delivers the following parameters to any LAN device that requests DHCP:

- An IP address from the range that you have defined
- Subnet mask
- Gateway IP address (the router’s LAN IP address)
- DNS server IP address (the router’s LAN IP address)

You can use another device on your network as the DHCP server, or specify the network settings of all of your computers.

- **To disable the DHCP server feature in the router:**
  1. Select ADVANCED > Setup > LAN Setup.
  2. Clear the Use Router as DHCP Server check box.
3. Click the Apply button.
4. (Optional) If this service is disabled and no other DHCP server is on your network, set your computer IP addresses manually so that they can access the router.

**Set Up Address Reservation**

When you specify a reserved IP address for a computer on the LAN, that computer always receives the same IP address each time it accesses the router’s DHCP server. Assign reserved IP addresses to computers or servers that require permanent IP settings.

➢ **To reserve an IP address:**

1. Select ADVANCED > Setup > LAN Setup.
2. In the Address Reservation section of the screen, click the Add button.
3. In the IP Address field, type the IP address to assign to the computer or server. Choose an IP address from the router’s LAN subnet, such as 192.168.1.x.
4. Type the MAC address of the computer or server.

   **Tip:** If the computer is already on your network, you can copy its MAC address from the Attached Devices screen and paste it here.

5. Click the Apply button.
   
The reserved address is entered into the table.

The reserved address is not assigned until the next time the computer contacts the router’s DHCP server. Reboot the computer, or access its IP configuration and force a DHCP release and renew.

➢ **To edit or delete a reserved address entry:**

1. Select the radio button next to the reserved address you want to edit or delete.
2. Click Edit or Delete.

**WPS Wizard for WiFi Connections**

The WPS Wizard helps you add a wireless computer or device to your WiFi network without typing the WiFi password.

➢ **To use the WPS Wizard:**

1. Select ADVANCED > WPS Wizard.
2. Click Next.

3. Select the radio button for the setup method that you want to use, and follow the steps.
   • Push Button.
     a. Either click the WPS button on this screen, or press the WPS button on the router.
     b. Within two minutes, go to the wireless client and press its WPS button to join the network without entering a password.
   • PIN Number. The screen adjusts.
     a. Enter the client security PIN.
     b. Click Next.
     c. Within two minutes, go to the client device and use its WPS software to join the network without entering a password.

   The router WiFi LED \( \text{on} \) blinks. The WPS process sets up your wireless computer with the network password and connects it to the wireless network. When that happens, the WiFi LED lights solid and the router WPS screen displays a confirmation message.

Quality of Service (QoS) Setup

Quality of Service (QoS) is an advanced feature that can be used to prioritize some types of traffic ahead of others. The router can provide QoS prioritization over the wireless link and on the Internet connection.

WMM QoS for Wireless Multimedia Applications

The router supports Wi-Fi Multimedia Quality of Service (WMM QoS) to prioritize wireless voice and video traffic over the wireless link. WMM QoS provides prioritization of wireless data packets from different applications based on four access categories: voice, video, best effort, and background. For an application to receive the benefits of WMM QoS, both it and
the client running that application have to have WMM enabled. Legacy applications that do not support WMM and applications that do not require QoS, are assigned to the best effort category, which receives a lower priority than voice and video. WMM QoS is enabled by default.

➢ To disable WMM QoS:

1. Select ADVANCED > Setup > QoS Setup.

![QoS Setup](image)

2. Clear the Enable WMM check box.
3. Click the Apply button.

Set Up QoS for Internet Access

You can give prioritized Internet access to the following types of traffic:

- Specific applications
- Specific online games
- Individual Ethernet LAN ports of the router
- A specific device by MAC address

To specify prioritization of traffic, create a policy for the type of traffic and add the policy to the QoS Policy table in the QoS Setup screen. For convenience, the QoS Policy table lists many common applications and online games that can benefit from QoS handling.

QoS for Applications and Online Gaming

➢ To create a QoS policy for applications and online games:

1. Select ADVANCED > Setup > QoS Setup.
2. Select the Turn Internet Access QoS On check box.
3. Click the Setup QoS rule button.
The QoS Priority Rule list displays.

4. To add a priority rule, scroll down to the bottom of the QoS Setup screen and click the Add Priority Rule button.

5. In the QoS Policy for field, type the name of the application or game.

6. In the Priority Category list, select either Applications or Online Gaming. A list of applications or games displays.

7. Scroll and select Add a New Application, or Add a New Game, as applicable.

8. If prompted, in the Connection Type list, select either TCP, UDP, or (TCP/UDP both). Specify the port number or range of port numbers that the application or game uses.

9. From the Priority list, select the priority for Internet access for this traffic relative to other applications and traffic. The options are Low, Normal, High, and Highest.

10. Click the Apply button.

   The rule is saved in the QoS Policy list.

   The QoS Setup screen displays.
QoS for a Router LAN Port

➢ To create a QoS policy for a device connected to one of the router’s LAN ports:
  1. Select ADVANCED > Setup > QoS Setup.
  2. Select the Turn Internet Access QoS On check box.
  3. Click the Setup QoS Rule button.
  4. Click the Add Priority Rule button.
  5. From the Priority Category list, select Ethernet LAN Port.
  6. From the QoS Policy list, select the LAN port.
  7. From the Priority list, select the priority for Internet access for this port’s traffic relative to other applications. The options are Low, Normal, High, and Highest.
  8. Click the Apply button.
     The rule is saved in the QoS Policy list.
     The QoS Setup screen displays.
  9. Click the Apply button.

QoS for a MAC Address

➢ To create a QoS policy for traffic from a specific MAC address:
  1. Select ADVANCED > Setup > QoS Setup.
  2. Click the Setup QoS Rule button.
     The QoS Setup screen displays.
  3. Click the Add Priority Rule button.
4. From the Priority Category list, select **MAC Address**.

5. If the device to be prioritized appears in the MAC Device List, select its radio button.

   The information from the MAC Device List populates the policy name, MAC Address, and Device Name fields. If the device does not appear in the MAC Device List, click **Refresh**. If it still does not appear, fill in these fields.

6. From the Priority list, select the priority for Internet access for this device’s traffic relative to other applications and traffic. The options are Low, Normal, High, and Highest.

7. Click the **Apply** button.

   This rule is saved in the QoS Policy list.

   The QoS Setup screen displays.

8. Select the **Turn Internet Access QoS On** check box.

9. Click the **Apply** button.

**Edit or Delete an Existing QoS Policy**

- To edit or delete a QoS policy:
  1. Select **ADVANCED > Setup > QoS Setup**.
  2. Select the radio button next to the QoS policy that you want to edit or delete, and do one of the following:
     - Click **Delete** to remove the QoS policy.
     - Click **Edit** to edit the QoS policy and change the policy settings.
  3. Click the **Apply** button.

   Your changes are saved in the QoS Setup screen.
Bandwidth Control

Bandwidth control lets you set a limit to the bandwidth that is available for traffic from the router to the Internet.

To set the maximum uplink bandwidth:

1. Launch an Internet browser from a computer or wireless device that is connected to the network.
   A login screen displays.
3. Enter the router user name and password.
   The user name is `admin`. The default password is `password`. The user name and password are case-sensitive.
   The BASIC Home screen displays.
   The QoS Setup screen displays:

![QoS Setup Screen]

5. Select the Turn Internet Access QoS On check box.
6. Specify the maximum uplink bandwidth for your Internet connection:
   - If you know what your uplink bandwidth is, select the Uplink bandwidth Maximum radio button, enter the maximum uplink bandwidth in the field, and select either Kbps or Mbps from the drop-down list.
   - If you are not sure, select the Automatically check Internet Uplink bandwidth button and click the Check button.
     The router detects the Internet uplink bandwidth. The Uplink bandwidth Maximum field displays the result of the test.

7. Click the Apply button.
   Your changes are saved.
Enable Facebook WiFi

If you have a small business, you can set up Facebook WiFi on your router so that customers can access your business WiFi by checking in to your Facebook business page. Before you enable Facebook WiFi, you must set up a guest network. For more information, see Set Up a Guest Network on page 25.

➢ To enable Facebook WiFi:

1. Launch an Internet browser from a computer or wireless device that is connected to the network.
   A login screen displays.
3. Enter the router user name and password.
   The user name is admin. The default password is password. The user name and password are case-sensitive.
   The BASIC Home screen displays.
4. Set up a guest network.
   For more information, see Set Up a Guest Network on page 25.
5. Select ADVANCED > Advanced Setup > Facebook Wi-Fi.
   The Facebook Wi-Fi screen displays:

6. Select the Enable Facebook Wi-Fi check box.
7. Click the Apply button.
8. Click the Configure button.
   The Facebook Login screen displays.
9. Log in to your Facebook business account.
The Facebook Wi-Fi Configuration screen displays:

10. Select a Facebook business page from the Select a Page drop-down list.

11. If you want to allow customers to skip check-in, select the Skip check-in link radio button.

   If you select this radio button, customers will have the option to check in to your Facebook business page or skip the check-in.

12. If you want to allow customers to access your business WiFi by entering a WiFi code, select the Require Wi-Fi code radio button and type a WiFi code in the field that displays.

   If you select this radio button, customers will have the option to check in to your Facebook business page or skip the check-in by using the WiFi code.

   **Note:** The WiFi code is different from your guest network passphrase. If you select this radio button, you must give customers the WiFi code for them to use your business WiFi.

13. From the Session Length drop-down list, select a length of time you want to allow your customers to have access to your business WiFi after they check in.

14. If you want to add terms of service to your Facebook check-in screen, select the Terms of Service check box and type your terms of service.

15. Click the Save Settings button.
Facebook WiFi is enabled.
USB Storage

Accessing and Configuring a USB Storage Device

This chapter describes how to access and configure a USB storage drive attached to your router. The USB port on the router can be used only to connect USB storage devices like flash drives or hard drives, or a printer. Do not connect computers, USB modems, CD drives, or DVD drives to the router USB port.

This chapter contains the following sections:

- **USB Drive Requirements**
- **Connect a USB Storage Device to the Router**
- **Safely Remove a USB Drive**
- **Access the USB Storage Device**
- **Share Files**
- **View a USB Device Attached to the Router**
- **USB Storage Device Network and Access Settings**
- **Available Network Folders**
- **Specify Approved USB Devices**
- **Media Server Settings**
- **TiVo Support**

For information about using the ReadySHARE Printer feature, see Chapter 6, ReadySHARE Printer.

For more about ReadySHARE features, visit [www.netgear.com/readyshare](http://www.netgear.com/readyshare).
USB Drive Requirements

The router works with most USB-compliant external flash and hard drives. For the most up-to-date list of USB drives that the router supports, go to:

http://kbserver.netgear.com/readys hare

---

**Note:** Some USB external hard drives and flash drives require you to load the drivers onto the computer before the computer can access the USB device. Such USB devices do not work with the router.

The router supports the following file system types for full read/write access:

- FAT16
- FAT32
- NTFS
- NTFS with compression format enabled
- EXT2
- EXT3
- XFS
- HFS
- HFS+

---

**Note:** HFS+ Journal is read only because Time Machine is not supported in this router. For more information about Time Machine, visit [www.netgear.com/readys hare](http://www.netgear.com/readys hare) or see your Mac’s documentation.

Connect a USB Storage Device to the Router

ReadySHARE lets you access and share a USB drive connected the router USB port. If your USB device has special drivers, it is not compatible.
To connect a USB storage device:

1. Insert your USB storage device into the USB 3.0 port on the back of the router.

For best USB hard drive access speed, use the blue USB 3.0 port on the back of the router. If you want to share a USB printer, connect it to the USB 2.0 port on the side of the router.

2. If your USB device has a power supply, you must use it when you connect the USB device to the router.

   It might take up to two minutes before the USB device is ready for sharing.

Safely Remove a USB Drive

If you want to physically disconnect a USB drive from the router USB port, first, log in to the router and safely remove it.

To remove a USB disk drive safely:

1. Select USB Storage > Basic Settings.
2. Click the Safely Remove USB Device button.
   This takes the drive offline.
3. Physically disconnect the USB drive.

Access the USB Storage Device

When you connect the USB device to the router USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

To access the USB device from a Mac:

1. Select Go > Connect to Server.
2. Enter smb://readyshare as the server address.
3. Click Connect.
To access the USB device from a Windows computer:

Use any of these methods:

- Select **Start > Run.** Enter `\readyshare` in the dialog box and click **OK.**
- Open a browser and enter `\readyshare` in the address bar.
- Open **My Network Places** and enter `\readyshare` in the address bar.

To map the USB device to a Windows network drive:

2. In the ReadySHARE USB Storage Access pane, click **PC Utility.**
3. Follow the onscreen instructions to download and unzip the `readyshareconnect.exe` file.
4. Launch `readyshareconnect.exe`.
5. Select the drive letter that you want to map to the network folder.
6. (Optional) If you want to connect to the USB drive as a different user, select the **Connect using different credentials** check box.
   a. Type the user name and password that you want to use.
   b. Click **OK.**
7. Click **Finish.**
   The USB drive is mapped to the drive letter that you specified.

To access the USB drive from a remote computer:

1. Launch a web browser.
2. Connect using the router’s Internet port IP address.
   If you are using Dynamic DNS, you can type the DNS name, rather than the IP address. You can view the router’s Internet IP address on the BASIC Home screen (see *Dashboard (BASIC Home Screen)* on page 16).
To access the USB drive with FTP from a remote computer:

1. Make sure that the FTP check box is selected in the Access Method section of the USB Storage (Advanced Settings) screen (see USB Storage Device Network and Access Settings on page 52).

2. Launch a web browser.

3. Type ftp:// and the Internet port IP address in the address field of the browser.

   For example, type ftp://10.1.65.4.

   If you are using Dynamic DNS, you can type the DNS name rather than the IP address.

4. Type the account name and password for the account that has access rights to the USB drive.

   The user name (account name) for All – no password is guest.

   The directories of the USB drive that your account has access to display. For example, you could see: share/partition1/directory1. You can now read and copy files from the USB directory.

Share Files

You can share files on the USB drive for a wide variety of business and recreational purposes. The files can be any Windows, Mac, or Linux file type including text, Word, PowerPoint, Excel, MP3, pictures, and multimedia files. USB drive applications include:

- Sharing multimedia with friends and family such as MP3 files, pictures, and other multimedia with local and remote users.

- Sharing resources on your network. You can store files in a central location so that you do not have to power up a computer to perform local sharing. In addition, you can share files between Macintosh, Linux, and Windows computers by using the USB drive as a go-between across the systems.

- Sharing files such as Word documents, PowerPoint presentations, and text files with remote users.

A few common uses are described in the following sections.

Share Photos

You can create your own central storage location for photos and multimedia. This method eliminates the need to log in to (and pay for) an external photo-sharing site.

To share files with your friends and family:

1. Insert your USB drive into the USB port on the router either directly or with a USB cable.

   Computers on your local area network (LAN) can automatically access this USB drive using a web browser or Microsoft Networking.
2. If you want to specify read-only access or to allow access from the Internet, see USB Storage Device Network and Access Settings on page 52.

Store Files in a Central Location for Printing

This scenario is for a family that has one high-quality color printer directly attached to a computer, but not shared on the local area network (LAN). This family does not have a print server.

• One family member has photos on a Macintosh computer that she wants to print.
• The photo-capable color printer is directly attached to a Windows computer, but not shared on the network.
• The Mac and the Windows computer are not visible to each other on the network.

➢ To print photos from a Mac on the printer attached to a Windows computer:

• On a Mac, access the USB drive by typing \readyshare in the address field of a web browser. Then copy the photos to the USB drive.
• On a Window computer, use a web browser or Microsoft Networking to copy the files from the USB drive to the computer. Then print the files.

Share Large Files over the Internet

Sending files that are larger than 5 MB can pose a problem for many email systems. The router allows you to share large files such as PowerPoint presentations or .zip files over the Internet. FTP can be used to download shared files from the router.

Sharing files with a remote colleague involves the following considerations:

• There are two user accounts: admin and guest. The password for admin is the same one that you use to access the router. By default, it is password. The guest user account has no password.
• On the FTP site, the person receiving the files uses the guest user account and enters the password. (FTP requires that you type something in the password field.)
• Be sure to select the FTP (via Internet) check box in the USB Storage (Advanced Settings) screen. This option supports both downloading and uploading of files.

Note: You can enable the HTTP (via Internet) option on the USB Storage (Advanced Settings) screen to share large files. This option supports downloading files only.
View a USB Device Attached to the Router

To view basic information about the USB storage device:

1. Select BASIC > ReadySHARE.

By default, the Basic radio button is selected, and the screen displays a USB storage device if it is attached to the router USB port.

If you logged in to the router before you connected your USB device, you might not see your USB device in this screen. If this happens, log out and then log back in.

2. (Optional) To view the files and folders on the USB device, click the network device name or the share name.

3. (Optional) To view more detail or to change the USB device settings, click Edit.

The USB Storage (Advanced Settings) screen displays. See USB Storage Device Network and Access Settings on page 52.

USB Storage Device Network and Access Settings

You can set up the device name, workgroups, and network folders for your USB device.
To view or change the USB storage advanced settings:

1. Select ADVANCED > USB Storage > Advanced Settings.

2. Specify access to the USB storage device.
   - **Network Device Name.** The default name is readyshare. This name is used to access the USB device connected to the router.
   - **Workgroup.** If you are using a Windows workgroup rather than a domain, the workgroup name is displayed here. The name works only in an operating system that supports NetBIOS, such as Microsoft Windows.
   - **Access Method.** Select the check boxes for the access methods that you want.
     - **Network Neighborhood/MacShare.** Enabled by default.
     - **HTTP.** Enabled by default. You can type http://readyshare.routerlogin.net/shares to access the USB drive.
     - **HTTP (via Internet).** Disabled by default. If you enable this feature, remote users can type http://<public IP address/shares> (for example, http://1.1.10.102/shares) or a URL domain name to access the USB drive over the Internet. This feature supports file uploading only.
     - **FTP.** Disabled by default.
     - **FTP (via Internet).** Disabled by default. If you select this check box, remote users can access the USB drive through FTP over the Internet. This feature supports both downloading and uploading of files.

3. If you changed the settings, click **Apply**.
   
   Your changes are saved.
Available Network Folders

You can view or change the network folders on the USB storage device.

➢ To view network folders:

1. Select ADVANCED > USB Storage > Advanced Settings.

2. Scroll down to the Available Networks Folder section of the screen.
   • **Share Name.** If only one device is connected, the default share name is USB_Storage. (Some router models have more than one USB port.)
     You can click the name, or you can type it in the address field of your web browser. If Not Shared is shown, the default share has been deleted, and no other share for the root folder exists. Click the link to change this setting.
   • **Read Access and Write Access.** Show the permissions and access controls on the network folder: All — no password (the default) allows all users to access the network folder. The password for admin is the same one that you use to log in to the router.
   • **Folder Name.** Full path of the network folder.
   • **Volume Name.** Volume name from the storage device (either USB drive or HDD).
   • **Total Space and Free Space.** Show the current utilization of the storage device.

➢ To add a network folder:

1. Select ADVANCED > ReadySHARE.
2. Click Edit.
3. Click **Create Network Folder**.

If the Add a Network Folder screen does not display, your web browser might be blocking pop-ups. If it is, change the browser settings to allow pop-ups.

4. In the Folder field, browse and select the folder.

5. Fill in the Share Name field.

6. In the Read Access list and the Write Access list, select the settings that you want.

   The user name (account name) for All – no password is guest. The password for admin is the same one that is used to log in to the router. By default, it is password.

7. Click the **Apply** button.

   The folder is added on the USB device.

➢ **To edit a network folder:**

1. Select **ADVANCED > ReadySHARE**.

2. Click the **Edit** button.

   The Edit Network Folder screen displays the same settings shown in the Add a Network Folder screen.

3. Change the settings in the fields as needed.

4. Click the **Apply** button.

   Your changes are saved.
Specify Approved USB Devices

For more security, you can set up the router to share only approved USB devices.

➢ **To set up approved USB devices:**

1. Select **ADVANCED > Advanced Setup > USB Settings.**

2. Click the **Approved Devices** button.

   ![USB Settings](image)

   This screen shows the approved USB devices and the available USB devices. You can remove or add approved USB devices.

3. In the Available USB Devices list, select the drive that you want to approve.
4. Click the **Add** button.
5. Select the **Allow only approved devices** check box.
6. Click the **Apply** button.

Your change takes effect.

If you want to work with another USB device, first click the **Safely Remove USB Device** button for the currently connected USB device. Connect the other USB device, and repeat this process.
Media Server Settings

By default, the router acts as a ReadyDLNA media server, which lets you view movies and photos on DLNA/UPnP AV-compliant media players, such as Xbox360, Playstation, and NETGEAR media players. The router serves media in DLNA compatible form to DLNA/UPnP AV-compliant media players.

➢ To specify the media server settings:
1. Select ADVANCED > USB Storage > Media Server.

![Media Server Settings](image)

By default, the Enable Media Server check box and the Automatic (when new files are added) radio button are selected. When these options are selected, the router scans for media files whenever new files are added to the ReadySHARE USB hard drive.

2. Specify the settings that you want to use:
   • **Enable Media Server.** Select this check box to enable this device to act as a media server.
   • **Enable TiVo support.** Select this check box if you want to play ReadyNAS media on your TiVo device. See the following section.
   • **Media Server Name.** Specify the name of the media server.
   • **Automatic (when new files added).** When this radio button is selected, the router automatically scans for media files whenever new files are added to the ReadySHARE USB storage. Only shared folders with All – no password in the Read Access list can be scanned for media files.

3. Click the **Apply** button.
   Your changes take effect.
TiVo Support

You can set up your TiVo to access media files stored on a USB device that is connected to your router. The TiVo must be on the same network as the router. This feature supports the following file formats:

- **Video.** See and play mpeg1, and mpeg2 files.
- **Music.** See and play MP3 files.
- **Pictures.** View images in jpg format.

Use ReadyDLNA to Play Media from Your Network on TiVo

You can use the TiVo (Series 2 and up) Home Media Option to play photos and music on your Windows computer or Mac right in your TiVo user interface.

- **To set up the router to work with TiVo:**
  1. Select ADVANCED > USB Storage > Media Server.
  2. Make sure that the Enable TiVo support check box is selected.

- **To play videos:**
  1. On the TiVo, select TiVo Central > My Shows.
  2. Go to the bottom of the list to find and select the R6300v2.
➢ To play music or view photos:

1. On the TiVo, select TiVo Central > Music, Photos, & Showcases.

![TiVo Central](image)

2. Select what you want to play or watch.

![Music, Photos, & Showcases](image)

➢ To copy TiVo Files onto a computer:

Use the TiVo Desktop accessory available at https://www3.tivo.com/store/accessories-software.do.

![Software](image)
ReadySHARE Printer

The ReadySHARE Printer utility lets you share a USB printer that is connected to the USB port on your router. You can share this USB printer among the Windows and Mac computers on your network.

This chapter contains the following sections:

- Install the Printer Driver and Cable the Printer
- Download the ReadySHARE Printer Utility
- Install the ReadySHARE Printer Utility
- Use the Shared Printer
- View or Change the Status of a Printer
- Use the Scan Feature of a Multifunction USB Printer
- Change NETGEAR USB Control Center Settings
Install the Printer Driver and Cable the Printer

Some USB printer manufacturers (for example, HP and Lexmark) request that you do not connect the USB cable until the installation software prompts you to do so.

➢ To install the driver and cable the printer:

1. On each computer on your network that shares the USB printer, install the driver software for the USB printer.
   If you do not have the printer driver, contact the printer manufacturer.

2. Use a USB printer cable to connect the USB printer to the router USB port.

Download the ReadySHARE Printer Utility

The utility works on Windows and Mac computers.

➢ To download the utility:

2. Scroll down to the Print From the Comfort of Your Home Network section at the bottom of the screen.

3. Click one of the following links:
   • Download PC installer and get started. This is the utility for Windows computers.
   • Download Mac installer and get started. This is the utility for MAC computers.
   • Download the genie App and get started. This is the utility for smartphones and tablets.

4. Follow the onscreen instructions to download the ReadySHARE Printer utility setup file.
Install the ReadySHARE Printer Utility

You must install the ReadySHARE Printer utility on each computer that will share the printer. After you install it, the utility displays as NETGEAR USB Control Center on your computer.

➢ To install the utility:

1. Double-click the ReadySHARE Printer utility setup file that you downloaded.
   The InstallShield wizard displays.

2. Follow the wizard instructions to install NETGEAR USB Control Center.
   After the InstallShield Wizard completes the installation, the NETGEAR USB Control Center prompts you to select a language:

3. Select a language from the list and click the OK button.
The NETGEAR USB Control Center displays the main screen.

![NETGEAR USB Control Center](image)

Some firewall software, such as Comodo, blocks NETGEAR USB Control Center from accessing the USB printer. If you do not see the USB printer displayed in the screen, you can disable the firewall temporarily to allow the utility to work.

4. Select the printer and click the **Connect** button.
   
The printer status changes to Manually connected by *Mycomputer*. Now, only your computer can use the printer.

5. Click the **Disconnect** button.
   
The status changes to Available. Now all computers on the network can use the printer.

6. To exit the utility, select **System > Exit**.

**Use the Shared Printer**

For each computer, after you click the **Connect** and **Disconnect** buttons once, the utility automatically manages the printing queue and handling. By default, the utility starts automatically whenever you log on to Windows and runs in the background.

➢ **To manually connect and print:**

1. Click the **NETGEAR USB Control Center** icon.
   
The main screen displays.

2. Click the **Connect** button.
   
The printer status changes to Manually connected by *Mycomputer*. Now, only the computer you are using can use this printer.

3. Use the print feature in your application to print your document.

4. To release the printer so that all computers on the network can use it, click the **Disconnect** button.
To print and release the printer to any computer on the network:

1. To print your document, use the print feature in your application.
   The NETGEAR USB Control Center automatically connects your computer to the USB printer and prints the document. If another computer is already connected to the printer, your print job goes into a queue to wait to be printed.
2. If your document does not print, use the NETGEAR USB Control Center to check the status. See View or Change the Status of a Printer.

View or Change the Status of a Printer

To view or change the status:

1. Click the NETGEAR USB Control Center icon.
   The main screen displays.

   ![NETGEAR USB Control Center window]

   The Status column shows the status for each device:
   - **Available.** No print jobs are in process. You can use the USB printer from any computer in the network.
   - **Connected.** Your computer is connected to the printer and will be released when your print job is done.
   - **Manually Connected by.** Only the connected computer can use the printer.
   - **Waiting to Connect.** Your computer is not connected to the shared printer yet.

2. To print from your computer when the status shows Manually connected by another computer, click the Disconnect button.
   The printer is released from the connection and the status changes to Available.

3. To print from your computer when the status shows Waiting to Connect:
   a. Click the Connect button.
      The printer status changes to Manually connected by Mycomputer. Now, only your computer can use the printer.
   b. To allow the printer to be shared, click the Disconnect button.
      The printer is released from the connection and the status changes to Available.
Use the Scan Feature of a Multifunction USB Printer

If your USB printer supports scanning, you can also use the USB printer for scanning. For example, the USB printer displayed in the Windows Printers and Faxes window is ready for print jobs.

To use the scan feature of a multifunction USB printer:

1. Click the **NETGEAR USB Control Center** icon.

   The main screen displays.

2. Make sure that the printer status shows as Available.

3. Click the **Network Scanner** button.

   The scanner screen displays so that you can use the USB printer for scanning.
Change NETGEAR USB Control Center Settings

You can stop the NETGEAR USB Control Center from starting automatically when you log in to Windows. You can also change the language and specify the time-out to release the printer connection.

➢ To turn off automatic NETGEAR USB Control Center startup:

1. Click the NETGEAR USB Control Center icon.

   The main screen displays.

2. Select Tools > Configuration.

3. Clear the Automatically execute when logging on Windows check box.
4. Click the OK button.

   Your change is saved.

➢ To change the language:

1. Select Tools > Configuration.
2. In the Language list, select a language.
3. Click the OK button.

   The next time NETGEAR USB Control Center starts, the language changes.
➢ To specify the time-out:

1. Select **Tools > Configuration**.
2. In the **Timeout** field, type the number of minutes.
   The time-out is the number of minutes that a computer holds its connection to the printer when the connection isn’t being used.
3. Click the **OK** button.
   Your change is saved.
Security

Customizing the firewall settings

This chapter explains how to use the basic firewall features of the router to prevent objectionable content from reaching the computers and devices on your network.

This chapter includes the following sections:

• Set Up Parental Controls
• Keyword Blocking of HTTP Traffic
• Block Services (Port Filtering)
• Port Triggering to Open Incoming Ports
• Port Forwarding to Permit External Host Communications
• How Port Forwarding Differs from Port Triggering
• Set Up Port Forwarding to Local Servers
• Set Up Port Triggering
• Schedule Blocking
• Set Up Security Event Email Notifications

For information about Live Parental Controls, see Basic Wireless Settings on page 22.
Set Up Parental Controls

The first time that you select Parental Controls from the BASIC Home screen, your browser goes to the Parental Controls website, where you can learn more about Parental Controls. To set up Parental Controls, you must download the genie app.

➢ To set up Parental Controls:

1. Launch an Internet browser from a computer or WiFi device that is connected to the network.
2. Type http://www.routerlogin.net.
   
   A login screen displays.
3. Enter the user name and password for the router.
   
   The user name is admin. The default password is password. The user name and password are case-sensitive.
4. Click the OK button.
   
   The BASIC Home screen displays.
5. Select Parental Controls.
   
   The Parental Controls website opens.
6. Click the button for the genie app or version that you want to download and use.
7. Follow the onscreen instructions to download and install the genie app.
8. Open the genie app and select Parental Controls.
   
   Live Parental Controls automatically starts.

9. Click the Next button, read the note, and click the Next button again.
Because Live Parental Controls uses free OpenDNS accounts, you are prompted to log in or create a free account.

10. Select a radio button as follows:
   • If you already own an OpenDNS account, leave the Yes radio button selected.
   • If you did not yet create an OpenDNS account, select the No radio button.

   If you are creating an account, the following screen displays.

   a. Complete the fields.
   b. Click the Next button.
After you log on or create your account, the filtering level screen displays.

![Live Parental Controls: choose a filtering level for your network](image)

1. Select a radio button for a filtering level and click the **Next** button.

![Setup is complete!](image)

- You have successfully setup NETGEAR Live Parental Controls Powered by OpenDNS. Next time you run the Management Utility it will take you to the status screen where you can:
  - check whether Live Parental Controls are enabled
  - disable or enable Live Parental Controls
  - modify basic settings
  - change custom settings such as per-user and time-of-day based Live Parental Controls
12. Click the Take me to the status screen button.

Parental Controls are now set up for the router.

13. To enable Parental Controls, click the Enable Live Parental Controls button.

Keyword Blocking of HTTP Traffic

Use keyword blocking to prevent certain types of HTTP traffic from accessing your network. The blocking can be always or according to a schedule.

➢ To set up keyword blocking:

2. Select one of the keyword blocking options:
   • Per Schedule. Turn on keyword blocking according to the Schedule screen settings. (See Schedule Blocking on page 83.)
   • Always. Turn on keyword blocking all the time, independent of the Schedule screen.
3. In the Keyword field, enter a keyword or domain, click the Add Keyword button, and click the Apply button.

   The Keyword list supports up to 32 entries. Here are some sample entries:
   - Specify .com if you want to allow only sites with domain suffixes such as .edu or .gov.
   - Enter a period (.) to block all Internet browsing access.

➢ To delete a keyword or domain:
   1. Select the keyword you want to delete from the list.
   2. Click Delete Keyword.
   3. Click the Apply button.

➢ To specify a trusted computer:
   You can exempt one computer from blocking. This computer must have a fixed IP address.
   1. In the Trusted IP Address field, enter the IP address.
   2. Click the Apply button.

**Block Services (Port Filtering)**

Services are functions that server computers perform at the request of client computers. For example, web servers serve web pages, time servers serve time and date information, and game hosts serve data about other players’ moves. When a computer on the Internet sends a request for service to a server computer, the requested service is identified by a service or port number. This number appears as the destination port number in the transmitted IP packets. For example, a packet that is sent with the destination port number 80 is an HTTP (web server) request.

The service numbers for many common protocols are defined by the Internet Engineering Task Force (IETF at [http://www.ietf.org/](http://www.ietf.org/)) and published in RFC1700, “Assigned Numbers.” Service numbers for other applications are typically chosen from the range 1024 - 65535 by the authors of the application. Although the router already holds a list of many service port numbers, you are not limited to these choices. You can often determine port number information by contacting the publisher of the application, by asking user groups or newsgroups, or by searching.

The Block Services screen lets you add and block specific Internet services by computers on your network. This is called service blocking or port filtering. To add a service for blocking, first determine which port number or range of numbers the application uses.
To block services:

2. Select either Per Schedule or Always.

3. If you selected Per Schedule, specify a time period in the Schedule screen.

4. Click the Add button.

The Block Services Setup screen displays:

5. From the Service Type list, select the application or service to allow or block.
   
   The list displays several common services, but you are not limited to these choices. To add any additional services or applications that do not already appear, select User Defined.

6. If you know that the application uses either TCP or UDP, select the appropriate protocol. If you are not sure, select TCP/UDP (Both).

7. Enter the starting and ending port numbers.
   
   If the application uses a single port number, enter that number in both fields.

8. Select the radio button for the IP address configuration you want to block, and enter the IP addresses.
You can block the specified service for a single computer, a range of computers with consecutive IP addresses, or all computers on your network.

9. Click the Add button.
Your changes are saved.

Port Triggering to Open Incoming Ports

Some application servers (such as FTP and IRC servers) send replies to multiple port numbers. Using the port triggering function of your router, you can tell the router to open more incoming ports when a particular outgoing port originates a session.

An example is Internet Relay Chat (IRC). Your computer connects to an IRC server at destination port 6667. The IRC server not only responds to your originating source port, but also sends an “identify” message to your computer on port 113. Using port triggering, you can tell the router, “When you initiate a session with destination port 6667, you have to also allow incoming traffic on port 113 to reach the originating computer.” Using steps similar to the preceding example, the following sequence shows the effects of the port triggering rule you have defined:

1. You open an IRC client program to start a chat session on your computer.
2. Your IRC client composes a request message to an IRC server using a destination port number of 6667, the standard port number for an IRC server process. Your computer then sends this request message to your router.
3. Your router creates an entry in its internal session table describing this communication session between your computer and the IRC server. Your router stores the original information, performs Network Address Translation (NAT) on the source address and port, and sends this request message through the Internet to the IRC server.
4. Noting your port triggering rule and having observed the destination port number of 6667, your router creates an additional session entry to send any incoming port 113 traffic to your computer.
5. The IRC server sends a return message to your router using the NAT-assigned source port (for example, port 33333) as the destination port. The IRC server also sends an “identify” message to your router with destination port 113.
6. Upon receiving the incoming message to destination port 33333, your router checks its session table to determine whether a session is active for port number 33333. Finding an active session, the router restores the original address information replaced by NAT and sends this reply message to your computer.
7. Upon receiving the incoming message to destination port 113, your router checks its session table and finds an active session for port 113 associated with your computer. The router replaces the message’s destination IP address with your computer’s IP address and forwards the message to your computer.
8. When you finish your chat session, your router eventually senses a period of inactivity in the communications. The router then removes the session information from its session table, and incoming traffic is no longer accepted on port numbers 33333 or 113.
To configure port triggering, you need to know which inbound ports the application needs. Also, you need to know the number of the outbound port that you want to trigger the opening of the inbound ports. You can usually determine this information by contacting the publisher of the application or the relevant user groups or news groups.

Only one computer at a time can use the triggered application.

**Port Forwarding to Permit External Host Communications**

In both of the preceding examples, your computer initiates an application session with a server computer on the Internet. However, you might need to allow a client computer on the Internet to initiate a connection to a server computer on your network. Normally, your router ignores any inbound traffic that is not a response to your own outbound traffic. You can configure exceptions to this default rule by using the port forwarding feature.

A typical application of port forwarding can be shown by reversing the client-server relationship from the previous web server example. In this case, a remote computer’s browser needs to access a web server running on a computer in your local network. Using port forwarding, you can tell the router, “When you receive incoming traffic on port 80 (the standard port number for a web server process), forward it to the local computer at 192.168.1.123.” The following sequence shows the effects of the port forwarding rule you have defined:

1. The user of a remote computer opens a browser and requests a web page from www.example.com, which resolves to the public IP address of your router. The remote computer composes a web page request message with the following destination information:

   **Destination address.** The IP address of www.example.com, which is the address of your router.

   **Destination port number.** 80, which is the standard port number for a web server process.

   The remote computer then sends this request message through the Internet to your router.

2. Your router receives the request message and looks in its rules table for any rules covering the disposition of incoming port 80 traffic. Your port forwarding rule specifies that incoming port 80 traffic should be forwarded to local IP address 192.168.1.123. Therefore, your router modifies the destination information in the request message:

   The destination address is replaced with 192.168.1.123.

   Your router then sends this request message to your local network.

3. Your web server at 192.168.1.123 receives the request and composes a return message with the requested web page data. Your web server then sends this reply message to your router.

4. Your router performs Network Address Translation (NAT) on the source IP address, and sends this request message through the Internet to the remote computer, which displays the web page from www.example.com.
To configure port forwarding, you need to know which inbound ports the application needs. You usually can determine this information by contacting the publisher of the application or the relevant user groups or news groups.

**How Port Forwarding Differs from Port Triggering**

The following points summarize the differences between port forwarding and port triggering:

- Any computer on your network can use port triggering, although only one computer can use it at a time.
- Port forwarding is configured for a single computer on your network.
- With port triggering, the router does not need to know the computer’s IP address in advance. The IP address is captured automatically.
- Port forwarding requires that you specify the computer’s IP address during configuration, and the IP address can never change.
- Port triggering requires specific outbound traffic to open the inbound ports, and the triggered ports are closed after a period of no activity.
- Port forwarding is always active and does not need to be triggered.

**Set Up Port Forwarding to Local Servers**

The port forwarding feature lets you allow certain types of incoming traffic to reach servers on your local network. For example, you might want to make a local web server, FTP server, or game server visible and available to the Internet.

Use the Port Forwarding/Port Triggering screen to configure the router to forward specific incoming protocols to computers on your local network. In addition to servers for specific applications, you can also specify a default DMZ server to which all other incoming protocols are forwarded.

Before you start, determine which type of service, application, or game you want to provide, and the local IP address of the computer that will provide the service. The server computer has to always have the same IP address.

To ensure that your server computer always has the same IP address, use the reserved IP address feature of your product. See *Set Up Address Reservation* on page 36.
To forward specific incoming protocols:

1. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.

2. Leave the Port Forwarding radio button selected as the service type.
3. Click the Add button.

A list of services displays. If the service that you want to add is not in the list, see Add a Custom Service on page 80.

4. Fill in the Server IP Address field.
5. Click the Add button.

The service appears in the list on the Port Forwarding/Port Triggering screen.
Add a Custom Service

To define a service, game, or application that does not appear in the Service Name list, first determine which port number or range of numbers the application uses. You can usually determine this information by contacting the publisher of the application or user groups or news groups. When you have the port number information, follow these steps.

➢ **To add a custom service:**

1. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
2. Select the **Port Forwarding** radio button as the service type.
3. Click the **Add Custom Service** button.

4. In the Service Name field, enter a descriptive name.
5. In the Service Type field, select the protocol. If you are unsure, select **TCP/UDP**.
6. In the External Starting Port field, enter the beginning port number.
   - If the application uses a single port, enter the same port number in the External Ending Port field.
   - If the application uses a range of ports, enter the ending port number of the range in the External Ending Port field.
7. Specify the internal ports by one of these methods:
   - Leave the **Use the same port range for Internal port** check box selected.
   - Fill in the Internal Starting Port and Internal Ending Port fields.
8. Fill in the Internal IP address field, or select the radio button for an attached device listed in the table.
9. Click the **Apply** button.

   The service appears in the list in the Port Forwarding/Port Triggering screen.
Edit or Delete a Port Forwarding Entry

To edit or delete a port forwarding entry:

1. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
2. Select the Port Forwarding radio button as the service type.
3. In the table, select the radio button next to the service name.
4. Click Edit Service or Delete Service.

Application Example: Make a Local Web Server Public

If you host a web server on your local network, you can use port forwarding to allow web requests from anyone on the Internet to reach your web server.

To make a local web server public:

1. Assign your web server either a fixed IP address or a dynamic IP address using DHCP address reservation.
   In this example, your router always gives your web server an IP address of 192.168.1.33.
2. In the Port Forwarding/Port Triggering screen, configure the router to forward the HTTP service to the local address of your web server at 192.168.1.33.
   HTTP (port 80) is the standard protocol for web servers.
3. (Optional) Register a host name with a Dynamic DNS service, and configure your router to use the name.
   To access your web server from the Internet, a remote user has to know the IP address that your ISP assigned. However, if you use a Dynamic DNS service, the remote user can reach your server by a user-friendly Internet name, such as mynetgear.dyndns.org.

Set Up Port Triggering

Port triggering is a dynamic extension of port forwarding that is useful in these cases:

- More than one local computer needs port forwarding for the same application (but not simultaneously).
- An application needs to open incoming ports that are different from the outgoing port.

When port triggering is enabled, the router monitors outbound traffic looking for a specified outbound “trigger” port. When the router detects outbound traffic on that port, it remembers the IP address of the local computer that sent the data. The router then temporarily opens the specified incoming port or ports and forwards incoming traffic on the triggered ports to the triggering computer.

Port forwarding creates a static mapping of a port number or range to a single local computer. Port triggering can dynamically open ports to any computer that needs them and can close the ports when they are no longer needed.
Note: If you use applications such as multiplayer gaming, peer-to-peer connections, real-time communications such as instant messaging, or remote assistance (a feature in Windows XP), you should also enable Universal Plug and Play (UPnP). See Universal Plug and Play on page 108.

To configure port triggering, you need to know which inbound ports the application needs, and the number of the outbound port that will trigger the opening of the inbound ports. You can usually determine this information by contacting the publisher of the application or user groups or news groups.

➢ To enable port triggering:
  1. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
  2. Select the Port Triggering radio button.
  3. Clear the Disable Port Triggering check box.

Note: If the Disable Port Triggering check box is selected after you configure port triggering, port triggering is disabled. However, any port triggering configuration information you added to the router is retained even though it is not used.

  4. In the Port Triggering Timeout field, enter a value up to 9999 minutes.
     This value controls the inactivity timer for the designated inbound ports. The inbound ports close when the inactivity time expires. This timeout is required because the router cannot detect when the application has terminated.

➢ To add a port triggering service:
  1. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
  2. Select the Port Triggering radio button
3. Click the **Add Service** button.

![Port Triggering Services](image)

4. In the Service Name field, type a descriptive service name.

5. In the Service User list, select **Any**, or select **Single address** and enter the IP address of one computer.
   - **Any** (the default), allows any computer on the Internet to use this service.
   - **Single address** restricts the service to a particular computer.

6. Select the service type, either **TCP** or **UDP** or **TCP/UDP (both)**. If you are not sure, select **TCP/UDP**.

7. In the Triggering Port field, enter the number of the outbound traffic port that will open the inbound ports.

8. Enter the inbound connection port information in the Connection Type, Starting Port, and Ending Port fields.

9. Click the **Apply** button.

   The service appears in the Port Triggering Portmap table.

10. Make sure that you enable port triggering so that the service that you added will be used.

### Schedule Blocking

You can specify the days and time that you want to block Internet access.
To schedule blocking:

1. Select ADVANCED > Security > Schedule.

   ![Schedule Page]

2. Set up the schedule for blocking keywords and services.
   - **Days to Block.** Select days on which you want to apply blocking by selecting the appropriate check boxes, or select **Every Day** to select the check boxes for all days.
   - **Time of Day to Block.** Select a start and end time in 24-hour format, or select **All Day** for 24-hour blocking.

3. Select your time zone from the list. If you use daylight savings time, select the **Automatically adjust for daylight savings time** check box.

4. Click the **Apply** button.
   
   Your settings are saved.

**Set Up Security Event Email Notifications**

To receive logs and alerts by email, provide your email information in the E-mail screen, and specify which alerts you want to receive and how often.
To set up email notifications:

1. Select **ADVANCED > Security > E-mail.**

2. Select the **Turn E-mail Notification On** check box.

3. In the **Your Outgoing Mail Server** field, enter the name of your ISP’s outgoing (SMTP) mail server (such as mail.myISP.com).

   You might be able to find this information in the configuration screen of your email program. If you leave this field blank, log and alert messages are not sent.

4. Enter the email address to which logs and alerts are sent in the **Send to This E-mail Address** field.

   This email address is also used for the From address. If you leave this field blank, log and alert messages are not sent.

5. If your outgoing email server requires authentication, select the **My Mail Server requires authentication** check box. Fill in the **User Name** and **Password** fields for the outgoing email server.

6. (Optional) Select the **Send Alerts Immediately** check box.

   Email alerts are sent immediately when someone attempts to visit a blocked site.

7. (Optional) Fill in the fields in the Send logs according to this schedule section of the screen.

   Logs are sent automatically. If the log fills up before the specified time, the log is emailed. After the log is sent, the log is cleared from the router memory. If the router cannot email the log file, the log buffer might fill up. In this case, the router overwrites the log and discards its contents.

8. Click the **Apply** button.

   Your settings are saved.
Administration

Managing your network

This chapter describes the router settings for administering and maintaining your router and home network.

This chapter includes the following sections:

• Turn Off or Turn On NETGEAR Logo LED
• Upgrade the Router Firmware
• View Router Status
• View Logs of Web Access or Attempted Web Access
• Manage the Configuration File
• Change the Password
• Password Recovery

For information about upgrading or checking the status of your router over the Internet, see Remote Management on page 107. For information about monitoring Internet traffic, see Traffic Meter on page 118.
Turn Off or Turn On NETGEAR Logo LED

You can turn off or turn on the NETGEAR Logo LED on the router.

To turn off or turn on the NETGEAR Logo LED:

1. Launch an Internet browser from a computer or wireless device that is connected to the network.
   A login screen displays.
3. Enter the router user name and password.
   The user name is admin. The default password is password. The user name and password are case-sensitive.
   The BASIC Home screen displays.
4. Select ADVANCED > Advanced Setup > LED Control Settings.
   The LED Control Settings screen displays.
5. To turn off the NETGEAR logo LED, select the Turn off NETGEAR logo LED radio button.
6. To turn on the NETGEAR logo LED, select the Turn on NETGEAR logo LED radio button.
7. Click the Apply button.
   Your changes take effect.

Upgrade the Router Firmware

The router firmware (routing software) is stored in flash memory. You can update the firmware from the Administration menu on the ADVANCED tab. You might see a message at the top of the genie screens when new firmware is available for your product.

You can use the Check button on the Router Update screen to check if new firmware is available, and to update your product.

To check for new firmware and update your router:

1. Select ADVANCED > Administration > Router Update.

2. Click Check.
   The router finds new firmware if it is available.
3. Click Yes.

The router locates an downloads the firmware and begins the update.

**WARNING:**

To avoid the risk of corrupting the firmware, do not interrupt the upgrade. For example, do not close the browser, click a link, or load a new page. Do not turn off the router.

When the upload is complete, your router restarts. The upgrade process typically takes about one minute. Read the new firmware release notes to find out if you need to reconfigure the router after upgrading.

**View Router Status**

➢ To view router status and usage information:

Select ADVANCED Home or select Administration > Router Status.

**Router Information**

**Hardware Version.** The router model.

**Firmware Version.** The version of the router firmware. It changes if you upgrade the router firmware.

**GUI Language Version.** The localized language of the user interface.

**LAN Port.**
- **MAC Address.** The Media Access Control address. This is the unique physical address used by the Ethernet (LAN) port of the router.
- **IP Address.** The IP address used by the Ethernet (LAN) port of the router. The default is 192.168.1.1.
- **DHCP.** Identifies whether the router’s built-in DHCP server is active for devices on the LAN.
- **Reboot.** You can click this button to reboot the router.

**Internet Port**

**MAC Address.** The Media Access Control address, which is the unique physical address used by the Internet (WAN) port of the router.

**IP Address.** The IP address used by the Internet (WAN) port of the router. If no address is shown or the address is 0.0.0, the router cannot connect to the Internet.

**Connection.** This shows if the router is using a fixed IP address on the WAN. If the value is DHCP Client, the router obtains an IP address dynamically from the ISP.

**IP Subnet Mask.** The IP subnet mask used by the Internet (WAN) port of the router.

**Domain Name Server.** The Domain Name Server addresses used by the router. A Domain Name Server translates human-language URLs such as www.netgear.com into IP addresses.

**Show Statistics Button**

➢ To view statistics:

1. Select **ADVANCED Home** or select **Administration > Router Status**.
2. In the Internet Port pane, click the **Show Statistics** button.

<table>
<thead>
<tr>
<th>System Up Time: 00:09:15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
</tr>
<tr>
<td>-------</td>
</tr>
<tr>
<td>WAN</td>
</tr>
<tr>
<td>LAN1</td>
</tr>
<tr>
<td>LAN2</td>
</tr>
<tr>
<td>LAN3</td>
</tr>
<tr>
<td>LAN4</td>
</tr>
<tr>
<td>2.4 GHz LAN b/g/n</td>
</tr>
<tr>
<td>5 GHz LAN ac/n/a</td>
</tr>
</tbody>
</table>

The following information is displayed:

**System Up Time.** The time elapsed since the router was last restarted.

**Port.** The statistics for the WAN (Internet) and LAN (Ethernet) ports. For each port, the screen displays:
• **Status.** The link status of the port.
• **TxPkts.** The number of packets transmitted on this port since reset or manual clear.
• **RxPkts.** The number of packets received on this port since reset or manual clear.
• **Collisions.** The number of collisions on this port since reset or manual clear.
• **Tx B/s.** The current transmission (outbound) bandwidth used on the WAN and LAN ports.
• **Rx B/s.** The current reception (inbound) bandwidth used on the WAN and LAN ports.
• **Up Time.** The time elapsed since this port acquired the link.
• **Poll Interval.** The interval at which the statistics are updated in this screen.

To change the polling frequency, enter a time in seconds in the Poll Interval field and click **Set Interval.**

To stop the polling entirely, click **Stop.**

**Connection Status Button**

➢ **To view the Internet connection status:**

1. Select **ADVANCED Home** or select **Administration > Router Status.**
2. In the Internet Port pane, click the **Connection Status** button.

<table>
<thead>
<tr>
<th>IP Address</th>
<th>10.1.10.16</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subnet Mask</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>10.1.10.1</td>
</tr>
<tr>
<td>DHCP Server</td>
<td>10.1.10.1</td>
</tr>
<tr>
<td>DNS Server</td>
<td>75.76.76.75</td>
</tr>
<tr>

<tr>
<td>Lease Obtained</td>
<td>7 days, 0 hours, 0 minutes</td>
</tr>
<tr>
<td>Lease Expires</td>
<td>6 days, 22 hours, 52 minutes</td>
</tr>
</tbody>
</table>

The following information displays:

• **IP Address.** The IP address that is assigned to the router.
• **Subnet Mask.** The subnet mask that is assigned to the router.
• **Default Gateway.** The IP address for the default gateway that the router communicates with.
• **DHCP Server.** The IP address for the Dynamic Host Configuration Protocol server that provides the TCP/IP configuration for all the computers that are connected to the router.
• **DNS Server.** The IP address of the Domain Name Service server that provides translation of network names to IP addresses.
• **Lease Obtained.** The date and time when the lease was obtained.

• **Lease Expires.** The date and time that the lease expires.

Click the Release button to return the status of all items to 0.

Click the Renew button to refresh the items.

Click the Close Window button to close the Connection Status screen.

**Wireless Settings (2.4 GHz and 5 GHz)**

The following settings are displayed:

**Name (SSID).** The wireless network name (SSID) that the router uses.

**Region.** The geographic region where the router is being used. It might be illegal to use the wireless features of the router in some parts of the world.

**Channel.** The operating channel of the wireless port being used. The default channel is Auto. When Auto is selected, the router finds the best operating channel available. Channels 1, 6, and 11 do not interfere with each other.

**Mode.** The wireless communication mode. At 2.4 GHz, 450 Mbps, 217 Mbps, or Up to 54 Mbps. At 5 GHz, 1300 Mbps, 600 Mbps, or Up to 289 Mbps.

**Wireless AP.** Indicates whether the radio feature of the router is enabled. If this feature is not enabled, the WiFi LED on the front panel is off.

**Broadcast Name.** Indicates whether the router is broadcasting its SSID.

**Wi-Fi Protected Setup.** Indicates whether WPS is configured for this network.

**View Logs of Web Access or Attempted Web Access**

The log is a detailed record of events. Up to 256 entries are stored in the log.
To view logs:

Select ADVANCED > Administration > Logs.

The log screen shows the following information:

- **Action.** Whether the access was blocked or allowed.
- **Source IP.** The IP address of the initiating device for this log entry.
- **Target address.** The name or IP address of the website or news group visited or to which access was attempted.
- **Date and time.** The date and time the log entry was recorded.

To refresh the log screen, click the **Refresh** button.
To clear the log entries, click the **Clear Log** button.
To email the log immediately, click the **Send Log** button.

**Manage the Configuration File**

The configuration settings of the router are stored within the router in a configuration file. You can back up (save) this file to your computer, restore it, or reset it to the factory default settings.
Back Up Settings

To back up the router’s configuration settings:
1. Select ADVANCED > Administration > Backup Settings.
2. Click Back Up.
3. Specify a location to store the .cfg file that is on a computer on your network.
   A copy of the current settings is saved.

Restore Configuration Settings

To restore configuration settings that you backed up:
1. Select ADVANCED > Administration > Backup Settings.
2. Click the Browse button and find and select the .cfg file.
3. Click the Restore button.
   The file is uploaded to the router, and the router reboots.

WARNING:
Do not interrupt the reboot process.
Erase the Current Configuration Settings

You can use the Erase button to erase the configuration and restore the factory default settings. You might want to erase the settings if you move the router to a different network. You can also use the Reset button on the back of the router to erase the configuration and restore the factory settings. (See Factory Settings on page 131).

To erase the configuration settings:

1. Select ADVANCED > Administration > Backup Settings.
2. Click the Erase button.
   
The factory default settings are restored. The user name is admin, the password to password, and the LAN IP address is 192.168.1.1. DHCP is enabled.

Change the Password

This feature lets you change the default password that is used to log in to the router with the user name admin.

Changing this password is not the same as changing the password for wireless access. The label on the bottom of your router shows your unique wireless network name (SSID) and password for wireless access (see Label on page 10).

To set the password for the user name admin:

1. Select ADVANCED > Administration > Set Password.
2. Type the old password, and type the new password twice.
3. If you want to be able to recover the password, select the Enable Password Recovery check box.
4. Click the Apply button.
   
   Your changes take effect.

Password Recovery

NETGEAR recommends that you enable password recovery if you change the password for the router user name admin. Then you can recover the password if it is forgotten. This
recovery process is supported in Internet Explorer, Firefox, and Chrome browsers, but not in the Safari browser.

➢ **To set up password recovery:**
  1. Select **ADVANCED > Administration > Set Password**.
  2. Select the **Enable Password Recovery** check box.
  3. Select two security questions, and provide answers to them.
  4. Click the **Apply** button.
     
     Your changes are saved.

➢ **To recover your password:**
  1. In the address field of your browser, type **www.routerlogin.net**.
     
     A login window displays.
  2. Click **Cancel**.
     
     If password recovery is enabled, you are prompted to answer two security questions.
  3. Enter the saved answers to the security questions.
Advanced Settings

Setting up unique situations

This chapter describes the advanced features of your router. Networking knowledge is needed to implement some of these features.

This chapter includes the following sections:

- Advanced Wireless Settings
- Wireless Access Point (AP)
- Set Up the Router in Bridge Mode
- Dynamic DNS
- Static Routes
- Remote Management
- Universal Plug and Play
- IPv6
- Traffic Meter

For information about approving a USB device, see Specify Approved USB Devices on page 56.
Advanced Wireless Settings

You can use this screen to turn the wireless radio on and off, to specify WPS settings, to use AP mode, and to set up a wireless access list.

The Fragmentation Length, CTS/RTS Threshold, and Preamble Mode options in this screen are reserved for wireless testing and advanced configuration only. Do not change these settings unless you have a specific reason to do so.

Control the Wireless Radio

By default, the wireless radio is enabled so that you can connect wirelessly to the router. You can turn the wireless radio on or off in the Advanced Wireless Settings screen or by using the WiFi On/Off button on the router side panel. When the wireless radio is off, you can still use an Ethernet cable for a LAN connection to the router.

➢ To turn the wireless radio on or off:

   ![Advanced Wireless Settings Screen]

By default, the Enable Wireless Router Radio check box is selected.

2. Select or clear the Enable Wireless Router Radio check box.

   Clearing this check box turns off the WiFi feature of the wireless router.

3. (Optional) Select the Turn off wireless signal by schedule check box and fill in the fields to specify the times when you do not need a wireless connection.

   For example, you could turn off the wireless signal for the weekend if you leave town.

4. Click the Apply button.

   Your changes take effect.
Set Up a Wireless Schedule

You can use this feature to turn off the wireless signal from your router at times when you do not need a wireless connection. For example, you could turn it off for the weekend if you leave town.

➢ To configure and enable the wireless schedule:
   The Advanced Wireless Settings screen displays.
2. Click the Add a new period button.
3. Use the drop-down lists, radio buttons, and check boxes to set up a period during which you want to turn off the wireless signal.
4. Click the Apply button.
   The Advanced Wireless Settings screen displays.
5. Select the Turn off wireless signal by schedule check box to activate the schedule.
6. Click the Apply button.

View or Change WPS Settings

➢ To specify WPS Settings:
   The Router’s PIN field displays the PIN that you use on a registrar (for example, from the Network Explorer on a Vista Windows computer) to configure the router’s wireless settings through WPS.
2. (Optional) Select or clear the Disable Router’s PIN check box.
   The PIN function might temporarily be disabled when the router detects suspicious attempts to break into the router’s wireless settings by using the router’s PIN through WPS. You can manually enable the PIN function by clearing the Disable Router’s PIN check box.
3. (Optional) Select or clear the **Keep Existing Wireless Settings** check box.

   By default, the Keep Existing Wireless Settings check box is selected. NETGEAR recommends that you leave this check box selected.

   If you clear this check box, the next time a new wireless client uses WPS to connect to the router, the router wireless settings change to an automatically generated random SSID and security key.

4. Click the **Apply** button.

   Your changes are saved.

---

**Set Up a Wireless Access List by MAC Address**

You can set up a list of computers and wireless devices that are allowed to join the wireless network. This list is based on the unique MAC address of each computer and device.

Each network device has a MAC address, which is a unique 12-character physical address, containing the hexadecimal characters 0–9, a–f, or A–F only, and separated by colons (for example, 00:09:AB:CD:EF:01). Typically, the MAC address is on the label of the wireless device or network interface device. If you do not have access to the label, you can display the MAC address using the network configuration utilities of the computer. You might also find the MAC addresses in the Attached Devices screen.

➢ **To restrict access based on MAC addresses:**

1. Select **ADVANCED > Advanced Setup > Wireless Settings**.
2. Click the **Setup Access List** button.

3. Click the **Add** button.

   The Wireless Card Access Setup screen opens and displays a list of currently active wireless cards and their Ethernet MAC addresses.

4. If the computer or device you want is in the Available Wireless Cards list, select that radio button; otherwise, type a name and the MAC address.

   You can usually find the MAC address on the bottom of the wireless device.

   **Tip:** You can copy and paste the MAC addresses from the Attached Devices screen into the MAC Address field of this screen. Use each wireless computer or device to join the wireless network. Then each is listed in the Attached Devices screen.
5. Click the **Add** button.
   The screen changes back to the list screen.

6. Add each computer or device you want to allow to connect wirelessly.

7. Select the **Turn Access Control On** check box.

8. Click the **Apply** button.

➢ **To edit a wireless device or delete it from the access list:**

1. Select **ADVANCED > Advanced Setup > Wireless Settings**.
   The Advanced Wireless Settings screen displays.

2. In the table, select the radio button next to the wireless device that you want to edit or delete.

3. Do one of the following:
   • Click the **Edit** button.
     The Edit Wireless Card screen displays.
     a. Edit the address information.
     b. Click the **Accept** button.
     c. Click the **Delete** button.
     The address is removed from the table.

### Wireless Access Point (AP)

You can set up the router to run as an access point (AP) on the same local network as another router.

**Note:** To avoid interference with other routers or gateways in your network, NETGEAR recommends that you use different wireless settings on the router in access point mode. You can also turn off the wireless radio on the other router or gateway.

➢ **To set up the router as an AP:**

1. Connect an Ethernet cable to the Internet port of this router and to a LAN port in the other router.
2. Select **ADVANCED > Wireless AP**.

3. Select the **Enable Access Point Mode** check box.
   
   The screen adjusts.

4. (Optional) If you want to manually assign a specific IP address to this router while it is in AP mode, select the **enable fixed IP setting on this device (not recommended)** check box.

5. Click the **Apply** button.
   
   The IP address of the router changes, and you are disconnected. To reconnect, close and restart your web browser, and type **http://www.routerlogin.net**.
Set Up the Router in Bridge Mode

You can use your R6300v2 Smart WiFi Router in bridge mode to connect multiple devices wirelessly at the faster 802.11ac speed. To do this, you need two WiFi routers: one set up as a router and the other set up as a bridge.

Installing your R6300v2 Smart WiFi Router as a bridge offers the following benefits:

- You can take advantage of gigabit WiFi speeds on current devices.
- Use gigabit WiFi for applications like video and gaming.
- Connect multiple devices like NAS, Smart TV, NeoTV, Blu-ray Player, and game consoles at gigabit WiFi speeds using a WiFi link.
- Avoid the need for separate WiFi adapters for each device.

For example, you could install the first router in a room like a home office that has your Internet connection. Then set up the second router in bridge mode. Then place the router in bridge mode in a different room that has your home entertainment center. Cable the router in bridge mode to your Smart TV, DVR, game console or Blu-ray player, and use its 802.11ac WiFi connection to the first router.

➢ To set up bridge mode:

1. Make a note of the WiFi settings of the other router to which this router will connect:
   You need to know the SSID, WiFi security mode, wireless password, and operating frequency (either 2.4 GHz or 5 GHz).
2. On the router that will run in bridge mode, select ADVANCED > Advanced Setup > Wireless Settings.
3. Scroll down and select the **Use other operation mode** check box and the **Enable Bridge mode** radio button.

The screen adjusts.

![Wireless Settings](image)

4. Click the **setup bridge mode wireless settings** button.

![Wireless Settings](image)

5. Specify the settings of the other router.
   a. Select the wireless network frequency (2.4 GHz or 5 GHz).
      For 802.11ac mode, select 5 GHz.
   b. In the Name (SSID) field, enter the wireless network name (SSID).
   c. In the Security Option section, select a radio button.
   d. If prompted, type the passphrase (the WiFi password that you use to connect wirelessly to the other router).

6. Click the **Apply** button.

The settings for the other router are saved and the Advanced Wireless Settings screen displays.

7. Click the **Apply** button on the Advanced Wireless Settings screen.

Your changes take effect.
Dynamic DNS

If your Internet service provider (ISP) gave you a permanently assigned IP address, you can register a domain name and have that name linked with your IP address by public Domain Name Servers (DNS). However, if your Internet account uses a dynamically assigned IP address, you do not know your IP address in advance, and the address can change frequently. In this case, you can use a commercial Dynamic DNS service. This type of service lets you register your domain to their IP address and forwards traffic directed at your domain to your frequently changing IP address.

If your ISP assigns a private WAN IP address (such as 192.168.x.x or 10.x.x.x), the Dynamic DNS service does not work because private addresses are not routed on the Internet.

Your router contains a client that can connect to the Dynamic DNS service provided by Dyn. First visit their website at http://www.dyn.com and obtain an account and host name that you configure in the router. Then, whenever your ISP-assigned IP address changes, your router automatically contacts the Dynamic DNS service provider, logs in to your account, and registers your new IP address. If your host name is hostname, for example, you can reach your router at http://hostname.dyndns.org.

Set Up a New Dynamic DNS Account

To set up Dynamic DNS and register for a free NETGEAR account:

1. Launch an Internet browser from a computer or wireless device that is connected to the network.
3. Enter the router user name and password.
   The user name is admin. The default password is password. The user name and password are case-sensitive.
   The BASIC Home screen displays.
4. Select ADVANCED > Advanced Setup > Dynamic DNS.
   ![Dynamic DNS](image)
5. Select the Use a Dynamic DNS Service check box.
6. Select the URL of your Dynamic DNS service provider.
   For example, if your Dynamic DNS service provider is Dyn, select www.DynDNS.org.
7. Type the host name (or domain name) that your Dynamic DNS service provider gave you.
8. Type the user name for your Dynamic DNS account. This user name is the name that you use to log in to your account, not your host name.

9. Type the password (or key) for your Dynamic DNS account.

10. Click the **Apply** button. Your changes are saved.

## Change the Dynamic DNS Settings

- **To change your settings:**

  1. Launch an Internet browser from a computer or wireless device that is connected to the network.
  3. Enter the router user name and password. The user name is `admin`. The default password is `password`. The user name and password are case-sensitive.

- The BASIC Home screen displays.

  4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.
  5. Change your DDNS account settings as necessary.
  6. Click the **Apply** button. Your changes are saved.

## Static Routes

Static routes provide more routing information to your router. Typically, you do not need to add static routes. You have to configure static routes only for unusual cases such as multiple routers or multiple IP subnets on your network.

As an example of when a static route is needed, consider the following case:

- Your primary Internet access is through a cable modem to an ISP.
- You have an ISDN router on your home network for connecting to the company where you are employed. This router’s address on your LAN is 192.168.1.100.
- Your company’s network address is 134.177.0.0.

When you first configured your router, two implicit static routes were created. A default route was created with your ISP as the gateway, and a second static route was created to your local network for all 192.168.1.x addresses. With this configuration, if you attempt to access a device on the 134.177.0.0 network, your router forwards your request to the ISP. The ISP forwards your request to the company where you are employed, and the request is likely to be denied by the company’s firewall.
In this case you have to define a static route, telling your router that 134.177.0.0 should be accessed through the ISDN router at 192.168.1.100. In this example:

- The Destination IP Address and IP Subnet Mask fields specify that this static route applies to all 134.177.x.x addresses.
- The Gateway IP Address field specifies that all traffic for these addresses should be forwarded to the ISDN router at 192.168.1.100.
- A metric value of 1 works because the ISDN router is on the LAN.
- Private is selected only as a precautionary security measure in case RIP is activated.

➢ To set up a static route:

1. Select ADVANCED > Advanced Setup > Static Routes.
2. Click the Add button.
3. In the Route Name field, type a name for this static route (for identification purposes only.)
4. Select the Private check box if you want to limit access to the LAN only.
   If Private is selected, the static route is not reported in RIP.
5. To make this route effective, select the Active check box.
6. Type the IP address of the final destination.
7. Type the IP subnet mask for this destination. If the destination is a single host, type 255.255.255.255.
8. Type the gateway IP address, which has to be on the same LAN segment as the router.
9. Type a number from 1 through 15 as the metric value.
   This value represents the number of routers between your network and the destination. Usually, a setting of 2 or 3 works, but for a direct connection, set it to 1.
10. Click the Apply button.
   The static route is added.

➢ To edit or delete a static route:

1. Select ADVANCED > Advanced Setup > Static Routes.
   The Static Routes screen displays.
2. In the table, select the radio button next to the route that you want to edit or delete.
3. Do one of the following:
   • Click the Edit button.
      The Static Routes screen adjusts.
   a. Edit the route information.
   b. Click the Apply button.
   • Click the Delete button.
      The route is removed from the table.

Remote Management

The remote management feature lets you access your router over the Internet to view or change its settings.

**Note:** Be sure to change the router default login password to a secure password. The ideal password contains no dictionary words from any language and contains uppercase and lowercase letters, numbers, and symbols. It can be up to 30 characters. See Change the Password on page 94.

➢ To set up remote management:
1. Select ADVANCED > Advanced Setup > Remote Management.

2. Select the Turn Remote Management On check box.
3. Specify the external IP addresses from which you want to allow access the router’s remote management.

**Note:** For enhanced security, restrict access to as few external IP addresses as practical.
Under Allow Remote Access By, select one of the following:

- For a single IP address on the Internet, select **Only This Computer**. Enter the IP address.
- For a range of IP addresses on the Internet, select **IP Address Range**. Enter a beginning and ending IP address to define the allowed range.
- For access from any IP address on the Internet, select **Everyone**.

4. Specify the port number for accessing the web management interface.
   
   Normal web browser access uses the standard HTTP service port 80. For greater security, enter a custom port number for the remote web management interface. Choose a number from 1024 to 65535, but do not use the number of any common service port. The default is 8080, which is a common alternate for HTTP.

5. Click the **Apply** button.
   
   Your changes take effect.

6. When you access your router from the Internet, type your router’s WAN IP address into your browser’s address or location field followed by a colon (:) and the custom port number.
   
   For example, if your external address is 134.177.0.123 and you use port number 8080, enter **http://134.177.0.123:8080** in your browser.

### Universal Plug and Play

Universal Plug and Play (UPnP) helps devices, such as Internet appliances and computers, access the network and connect to other devices as needed. UPnP devices can automatically discover the services from other registered UPnP devices on the network.

If you use applications such as multiplayer gaming, peer-to-peer connections, or real-time communications such as instant messaging or remote assistance (a feature in Windows XP), you should enable UPnP.

➢ **To turn on Universal Plug and Play:**

1. Select **ADVANCED > Advanced Setup > UPnP**.
   
   The UPnP screen displays.

2. Select the **Turn UPnP On** check box.
R6300v2 Smart WiFi Router

By default, this check box is selected. UPnP for automatic device configuration can be enabled or disabled. If the Turn UPnP On check box is cleared, the router does not allow any device to automatically control the resources, such as port forwarding (mapping), of the router.

3. Type the advertisement period in minutes.

The advertisement period specifies how often the router broadcasts its UPnP information. This value can range from 1 to 1440 minutes. The default period is 30 minutes. Shorter durations ensure that control points have current device status at the expense of more network traffic. Longer durations can compromise the freshness of the device status, but can significantly reduce network traffic.

4. Type the advertisement time to live in hops.

The time to live for the advertisement is measured in hops (steps) for each UPnP packet sent. Hops are the steps a packet takes between routers. The number of hops can range from 1 to 255. The default value for the advertisement time to live is 4 hops, which should be fine for most home networks. If you notice that some devices are not being updated or reached correctly, it might be necessary to increase this value.

5. Click the **Apply** button.

The UPnP Portmap table displays the IP address of each UPnP device that is accessing the router and which ports (internal and external) that device has opened. The UPnP Portmap table also displays what type of port is open and whether that port is still active for each IP address.

6. (Optional) To refresh the information in the UPnP Portmap table, click the **Refresh** button.

**IPv6**

You can use this feature to set up an IPv6 Internet connection type if genie does not detect it automatically.

➢ **To set up an IPv6 Internet connection type:**

1. Select **ADVANCED > Advanced Setup > IPv6**.

2. In the Internet Connection Type list, select the IPv6 connection type. Your Internet service provider (ISP) can provide this information.
   - If your ISP did not provide details, you can select **IPv6 Tunnel**.
• If you are not sure, select **Auto Detect** so that the router detects the IPv6 type that is in use.

• If your Internet connection does not use PPPoE, DHCP, or fixed, but is IPv6, select **Auto Config**.

For more information about Internet connection types, see the following sections.

3. Click the **Apply** button.

Your changes take effect.

**Requirements for Entering IPv6 Addresses**

IPv6 addresses are denoted by eight groups of hexadecimal quartets that are separated by colons. Any four-digit group of zeroes within an IPv6 address can be reduced to a single zero or altogether omitted.

The following errors invalidate an IPv6 address:

• More than eight groups of hexadecimal quartets
• More than four hexadecimal characters in a quartet
• More than two colons in a row

**Auto Detect**

➢ **To set up an IPv6 Internet connection through auto detection:**

1. Select **ADVANCED > Advanced Setup > IPv6**.

   The IPv6 screen displays.

2. In the Internet Connection Type list, select **Auto Detect**.

   The screen adjusts:

   The router automatically detects the information in the following fields:

   • **Connection Type**. This field indicates the connection type that is detected.
• **Router's IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

• **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

3. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:
   • **Use DHCP Server.** This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
   • **Auto Config.** This is the default setting.

4. (Optional) Select the **Use This Interface ID** check box, and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.
   
   If you do not specify an ID here, the router generates one automatically from its MAC address.

5. Click the **Apply** button.

**IPv6 Auto Config**

➢ To set up an IPv6 Internet connection through auto configuration:

1. Select **ADVANCED > Advanced Setup > IPv6.**
   
   The IPv6 screen displays.

2. In the Internet Connection Type list, select **Auto Config.**
   
   The screen adjusts:

   ![IPv6 Auto Config Screen](image)

   The router automatically detects the information in the following fields:
R6300v2 Smart WiFi Router

- **Router's IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router's IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

3. (Optional) In the DHCP User Class (If Required) field, enter a host name.
   Most people do not need to fill in this field, but if your ISP has given you a specific host name, enter it here.

4. (Optional) In the Domain Name (If Required) field, enter a domain name.
   You can type the domain name of your IPv6 ISP. (Do not enter the domain name for the IPv4 ISP here.) For example, if your ISP’s mail server is mail.xxx.yyy.zzz, you would type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. (For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.)

5. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:
   - **Use DHCP Server.** This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.

6. (Optional) Select the **Use This Interface ID** check box, and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.
   If you do not specify an ID here, the router generates one automatically from its MAC address.

7. Click the **Apply** button.

**IPv6 6to4 Tunnel**

The remote relay router is the router to which your router creates the 6to4 tunnel. Make sure that the IPv4 Internet connection is working before you apply the 6to4 tunnel settings for the IPv6 connection.

➢ **To set up an IPv6 Internet connection by using a 6to4 tunnel:**

1. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 screen displays.

2. In the Internet Connection Type list, select **6to4 Tunnel**.
The screen adjusts:

The router automatically detects the information in the following fields:

- **Router’s IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router’s IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

3. Configure the remote 6to4 relay router settings by selecting one of the following buttons:
   - **Auto**. Your router uses any remote relay router that is available on the Internet. This is the default setting.
   - **Static IP Address**. Enter the static IPv4 address of the remote relay router. This address is usually provided by your IPv6 ISP.

4. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:
   - **Use DHCP Server**. This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config**. This is the default setting.

5. (Optional) Select the **Use This Interface ID** check box, and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.
   
   If you do not specify an ID here, the router generates one automatically from its MAC address.

6. Click the **Apply** button.
IPv6 Pass Through

In pass-through mode, the router works as a Layer 2 Ethernet switch with two ports (LAN and WAN Ethernet ports) for IPv6 packets. The router does not process any IPv6 header packets.

➢ To set up a pass-through IPv6 Internet connection:

   The IPv6 screen displays.

2. In the Internet Connection Type list, select Pass Through.
   The screen adjusts, but no additional fields display.

3. Click the Apply button.

IPv6 Fixed

➢ To set up a fixed IPv6 Internet connection:

   The IPv6 screen displays.

2. In the Internet Connection Type list, select Fixed.
   The screen adjusts:

3. Configure the fixed IPv6 addresses for the WAN connection:

   • IPv6 Address/Prefix Length. The IPv6 address and prefix length of the router WAN interface.

   • Default IPv6 Gateway. The IPv6 address of the default IPv6 gateway for the router’s WAN interface.

   • Primary DNS Server. The primary DNS server that resolves IPv6 domain name records for the router.
• **Secondary DNS Server.** The secondary DNS server that resolves IPv6 domain name records for the router.

*Note:* If you do not specify the DNS servers, the router uses the DNS servers that are configured for the IPv4 Internet connection on the Internet Setup screen. (See *Internet Setup* on page 20.)

4. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:
   - **Use DHCP Server.** This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.

5. In the IPv6 Address/Prefix Length fields, specify the static IPv6 address and prefix length of the router’s LAN interface.
   - If you do not specify an ID here, the router generates one automatically from its MAC address.

6. Click the **Apply** button.

### IPv6 DHCP

➢ **To set up an IPv6 Internet connection with a DHCP server:**

1. Select **ADVANCED > Advanced Setup > IPv6.**
   - The IPv6 screen displays.

2. In the Internet Connection Type list, select **DHCP.**
   - The screen adjusts:

   ![IPv6 DHCP Screen](image)

   The router automatically detects the information in the following fields:

   - **Router’s IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the
length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router's IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

3. (Optional) In the DHCP User Class (If Required) field, enter a host name.

   Most people do not need to fill in this field, but if your ISP has given you a specific host name, enter it here.

4. (Optional) In the Domain Name (If Required) field, enter a domain name.

   You can type the domain name of your IPv6 ISP. (Do not enter the domain name for the IPv4 ISP here.) For example, if your ISP’s mail server is mail.xxx.yyy.zzz, you would type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. (For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.)

5. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:

   - **Use DHCP Server**. This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config**. This is the default setting.

6. (Optional) Select the **Use This Interface ID** check box, and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.

   If you do not specify an ID here, the router generates one automatically from its MAC address.

7. Click the **Apply** button.

**IPv6 PPPoE**

➢ **To set up a PPPoE IPv6 Internet connection:**

1. Select **ADVANCED > Advanced Setup > IPv6**.

   The IPv6 screen displays.

2. In the Internet Connection Type list, select **PPPoE**.
R6300v2 Smart WiFi Router

The screen adjusts:

The router automatically detects the information in the following fields:

- **Router’s IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

3. In the Login field, enter the login information for the ISP connection.

   This is usually the name that you use in your email address. For example, if your main mail account is JerAB@ISP.com, then you would type JerAB in this field. Some ISPs (like Mindspring, Earthlink, and T-DSL) require that you use your full email address when you log in. If your ISP requires your full email address, type it in this field.

4. In the Password field, enter the password for the ISP connection.

5. In the Service Name name field, enter a service name.

   If your ISP did not provide a service name, leave this field blank.

   **Note:** The default setting of the Connection Mode field is Always On to provide a steady IPv6 connection. The router never terminates the connection. If the connection is terminated, for example, when the modem is turned off, the router attempts to reestablish the connection immediately after the PPPoE connection becomes available again.

6. Specify how the router assigns IPv6 addresses to the devices on your home network (the LAN) by selecting one of the following radio buttons:

   - **Use DHCP Server.** This method passes more information to LAN devices, but some IPv6 systems might not support the DHCv6 client function.
• **Auto Config.** This is the default setting.

7. (Optional) Select the **Use This Interface ID** check box, and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.

   If you do not specify an ID here, the router generates one automatically from its MAC address.

8. Click the **Apply** button.

### Traffic Meter

Traffic metering allows you to monitor the volume of Internet traffic that passes through the router Internet port. You can set limits for traffic volume.

➢ **To monitor Internet traffic:**

1. Click **ADVANCED > Advanced Setup > Traffic Meter**.

2. Select the **Enable Traffic Meter** check box.

3. (Optional) Control the volume of Internet traffic.

   You can use either the traffic volume control feature or the connection time control feature.

   - Select the **Traffic volume control by** radio button and then select one of the following options:
     - **No Limit.** No restriction is applied when the traffic limit is reached.
     - **Download only.** The restriction is applied to incoming traffic only.
     - **Both Directions.** The restriction is applied to both incoming and outgoing traffic.

   - Select the **Connection time control** radio button and enter the allowed hours in the **Monthly limit** field.
4. (Optional) If your ISP charges for extra data volume when you make a new connection, enter the extra data volume in MB in the Round up data volume for each connection by field.

5. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
   If you want the traffic counter to start immediately, click the **Restart Counter Now** button.

6. In the Traffic Control section, specify whether the router should issue a warning message before the monthly limit of Mbytes or hours is reached.
   By default, the value is 0 and no warning message is issued. You can select one of the following to occur when the limit is attained:
   - The Internet LED blinks green or amber.
   - The Internet connection is disconnected and disabled.

7. Click the **Apply** button.

The Internet Traffic Statistics section helps you to monitor the data traffic.

Click the **Refresh** button to update the Traffic Statistics section.

Click the **Traffic Status** button to display more information about the data traffic on your router and to change the poll interval.
This chapter provides information to help you diagnose and solve problems you might have with your router. If you do not find the solution here, check the NETGEAR support site at http://support.netgear.com for product and contact information.

This chapter contains the following sections:

- Quick Tips
- Troubleshoot with the LEDs
- Cannot Log In to the Router
- Cannot Access the Internet
- Changes Not Saved
- Wireless Connectivity
- Troubleshoot Your Network Using the Ping Utility
Quick Tips

This section describes tips for troubleshooting some common problems.

Sequence to Restart Your Network

When you need to restart your network, follow this sequence:

1. Turn off and unplug the modem.
2. Turn off the router.
3. Plug in the modem and turn it on. Wait two minutes.
4. Turn on the router and wait two minutes.

Wireless Settings

Make sure that the wireless settings in the computer and router match exactly.

- For a wirelessly connected computer, the wireless network name (SSID) and wireless security settings of the router and wireless computer need to match exactly.
- If you set up an access list in the Advanced Wireless Settings screen, you have to add each wireless computer’s MAC address to the router’s access list.

Network Settings

Make sure that the network settings of the computer are correct.

- Wired and wirelessly connected computers need to have network (IP) addresses on the same network as the router. The simplest way to do this is to use computers that obtain an IP address automatically with DHCP. Most computers are set up this way.
- Some cable modem service providers require you to use the MAC address of the computer initially registered on the account. You can view the MAC address in the Attached Devices screen.

Troubleshoot with the LEDs

After you turn on power to the router, the following sequence of events should occur:

1. When power is first applied, verify that the Power LED is lit.
2. Verify that the Power LED lights amber within a few seconds, indicating that the self-test is running.
3. After approximately 30 seconds, verify the following:
   - The Power LED is lit solid green.
   - The Internet LED is lit.
   - The Wireless LED is lit unless you turned off the wireless radio.
The LEDs on the front panel of the router can be used for troubleshooting.

**Power LED Is Off or Blinking**

- Make sure that the power cord is securely connected to your router and that the power adapter is securely connected to a functioning power outlet.
- Check that you are using the 12 VDC, 2.5A power adapter that NETGEAR supplied for this product.
- If the Power LED blinks slowly and continuously, the router firmware is corrupted. This can happen if a firmware upgrade is interrupted, or if the router detects a problem with the firmware. If the error persists, you have a hardware problem. For recovery instructions, or help with a hardware problem, contact technical support at [www.netgear.com/support](http://www.netgear.com/support).

**Power LED Stays Amber**

When the router is turned on, the Power LED lights amber for about 20 seconds and then lights green. If the LED does not light green, the router has a problem.

If the Power LED is lit amber one minute after you turn on power to the router:

1. Turn off the power and then turn it back on to see if the router recovers.
2. Press and hold the **Reset** button to return the router to its factory settings.

   See [*Troubleshoot Your Network Using the Ping Utility*](#) on page 128.

If the error persists, you might have a hardware problem. Contact technical support at [www.netgear.com/support](http://www.netgear.com/support).

**LEDs Never Turn Off**

When the router is turned on, the LEDs turn on for about 10 seconds and then turn off. If all the LEDs stay on, this indicates a fault within the router.

If all LEDs are still on one minute after power-up:

- Cycle the power to see if the router recovers.
- Press and hold the **Reset** button to return the router to its factory settings. For more information, see [*Troubleshoot Your Network Using the Ping Utility*](#) on page 128.

If the error persists, you might have a hardware problem. Contact technical support at [www.netgear.com/support](http://www.netgear.com/support).

**Internet LEDs Is Off**

If the Internet LED does not light when the router is turned on, check the following:

- Make sure that the cable connections are secure at the router and at the modem.
- Make sure that power is turned on to the connected modem.
• Be sure that you are using the correct cable.

When connecting the router’s Internet port to a cable or DSL modem, use the cable that was supplied with the cable or DSL modem.

**WiFi LED Is Off**

If the Wireless LED stays off, check to see if the WiFi On/Off button on the router has been pressed. This button turns the wireless radio in the router on and off. The Wireless LED lights when the wireless radio is turned on.

**Cannot Log In to the Router**

If you are unable to log in to the router from a computer on your local network, check the following:

• If you are using an Ethernet-connected computer, check the Ethernet connection between the computer and the router.

• Make sure that your browser has Java, JavaScript, or ActiveX enabled. If you are using Internet Explorer, click **Refresh** to be sure that the Java applet is loaded.

• Try quitting the browser and launching it again.

• Make sure that you are using the correct login information. The login name is **admin**, and the default password is **password**. Make sure that Caps Lock is off when you enter this information.

• If you are attempting to set up your router and there is another router in your network, make sure that you are using Bridge Mode. See *Set Up the Router in Bridge Mode* on page 102.

• If you want to set up your router as a replacement for an ADSL gateway in your network, the router cannot perform many gateway services. For example, the router cannot convert ADSL or cable data into Ethernet networking information. NETGEAR does not support such a configuration.

• If you specify IP addresses in your network:

  - Make sure that the IP address of your computer is on the same subnet as the router. If you are using the recommended addressing scheme, your computer’s address should be in the range of 192.168.1.2 to 192.168.1.254.

  - If your computer’s IP address is shown as 169.254.x.x, recent versions of Windows and Mac OS generate and assign an IP address if the computer cannot reach a DHCP server. These autogenerated addresses are in the range of 169.254.x.x. If your IP address is in this range, check the connection from the computer to the router, and reboot your computer.

  - If your router’s IP address was changed and you do not know the current IP address, clear the router’s configuration to its factory settings. This sets the router’s IP address to 192.168.1.1. For more information, see *Factory Settings* on page 131.
Cannot Access the Internet

If you can access your router but not the Internet, check to see if the router can obtain an IP address from your Internet service provider (ISP). Unless your ISP provides a fixed IP address, your router requests an IP address from the ISP. You can determine whether the request was successful using the Router Status screen.

➢ To check the WAN IP address:

1. Start your browser, and select an external site such as www.netgear.com.
2. Access the router interface at www.routerlogin.net.
4. Check that an IP address is shown for the Internet port. If 0.0.0.0 is shown, your router has not obtained an IP address from your ISP.

If your router cannot obtain an IP address from the ISP, you might need to force your cable or DSL modem to recognize your new router by restarting your network. For more information, see Sequence to Restart Your Network on page 121.

If your router is still unable to obtain an IP address from the ISP, the problem might be one of the following:

• Your Internet service provider (ISP) might require a login program.
  Ask your ISP whether they require PPP over Ethernet (PPPoE) or some other type of login.
• If your ISP requires a login, the login name and password might be set incorrectly.
• Your ISP might check for your computer’s host name.
  Assign the computer host name of your ISP account as the account name in the Internet Setup screen.
• Your ISP allows only one Ethernet MAC address to connect to Internet and might check for your computer’s MAC address. In this case, do one of the following:
  - Inform your ISP that you have bought a new network device, and ask them to use the router’s MAC address.
  - Configure your router to clone your computer’s MAC address.

If your router can obtain an IP address, but your computer is unable to load any web pages from the Internet:

• Your computer might not recognize any DNS server addresses.
  A DNS server is a host on the Internet that translates Internet names (such as www addresses) to numeric IP addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router’s configuration, reboot your computer, and verify the DNS address. You can configure your computer manually with DNS addresses, as explained in your operating system documentation.
• Your computer might not have the router configured as its TCP/IP gateway.
If your computer obtains its information from the router by DHCP, reboot the computer, and verify the gateway address.

- You might be running login software that is no longer needed.

If your ISP provided a program to log you in to the Internet (such as WinPoET), you no longer need to run that software after installing your router. You might need to go to Internet Explorer and select **Tools > Internet Options**, click the **Connections** tab, and select **Never dial a connection**.
Troubleshoot PPPoE

If you are using PPPoE, try troubleshooting your Internet connection.

➢ To troubleshoot a PPPoE connection:

1. Select Administration > Router Status.
2. Click Connection Status.
3. Check the Connection Status display.

If any of the fields on the Connection Status screen indicate Failed, you might be using an incorrect service name, user name, or password. There might also be a provisioning problem with your ISP.

________________________

Note: Unless you connect manually, the router does not authenticate using PPPoE until data is transmitted to the network.

________________________

Troubleshoot Internet Browsing

If your router can obtain an IP address but your computer is unable to load any web pages from the Internet, check the following:

• Your computer might not recognize any DNS server addresses. A DNS server is a host on the Internet that translates Internet names (such as www addresses) to numeric IP addresses.

Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router’s configuration, restart your computer.

Alternatively, you can configure your computer manually with a DNS address, as explained in the documentation for your computer.

• Your computer might not have the router configured as its default gateway.

Reboot the computer and verify that the router address (www.routerlogin.net) is listed by your computer as the default gateway address.

• You might be running login software that is no longer needed. If your ISP provided a program to log you in to the Internet (such as WinPoET), you no longer need to run that software after installing your router. You might need to go to Internet Explorer and select Tools > Internet Options, click the Connections tab, and select Never dial a connection.
Changes Not Saved

If the router does not save the changes you make in the router interface, check the following:

- When entering configuration settings, always click the Apply button before moving to another screen or tab, or your changes are lost.
- Click the Refresh or Reload button in the web browser. The changes might have occurred, but the old settings might be in the web browser’s cache.

Wireless Connectivity

If you are having trouble connecting wirelessly to the router, try to isolate the problem.

- Does the wireless device or computer that you are using find your wireless network?
  If not, check the WiFi LED on the front of the router. If it is off, you can press the WiFi On/Off button on the side of the router to turn the router wireless radios back on.
  If you disabled the router’s SSID broadcast, then your wireless network is hidden and does not show up in your wireless client’s scanning list. (By default, SSID broadcast is enabled.)
- Does your wireless device support the security that you are using for your wireless network (WPA or WPA2)?
- If you want to view the wireless settings for the router, use an Ethernet cable to connect a computer to a LAN port on the router. Then log in to the router, and select Wireless see (Basic Wireless Settings on page 22).

  Note: Be sure to click Apply if you change settings.

If your wireless device finds your network, but the signal strength is weak, check these conditions:

- Is your router too far from your computer, or too close? Place your computer near the router, but at least 6 feet (1.8 meters) away, and see whether the signal strength improves.
- Are objects between the router and your computer blocking the wireless signal?
Troubleshoot Your Network Using the Ping Utility

Most network devices and routers contain a ping utility that sends an echo request packet to the designated device. The device then responds with an echo reply. You can easily troubleshoot a network is easy using the ping utility in your computer or workstation.

Test the LAN Path to Your Router

You can ping the router from your computer to verify that the LAN path to your router is set up correctly.

➢ To ping the router from a Windows computer:

1. From the Windows toolbar, click Start and select Run.
2. In the field provided, type ping followed by the IP address of the router, as in this example:
   
   ping www.routerlogin.net

3. Click OK.
   
   You should see a message like this one:
   
   Pinging <IP address > with 32 bytes of data
   
   If the path is working, you see this message:
   
   Reply from < IP address >: bytes=32 time=NN ms TTL=xxx
   
   If the path is not working, you see this message:
   
   Request timed out

If the path is not functioning correctly, you could have one of the following problems:

• Wrong physical connections
  
  For a wired connection, make sure that the numbered LAN port LED is lit for the port to which you are connected.

  Check that the appropriate LEDs are on for your network devices. If your router and computer are connected to a separate Ethernet switch, make sure that the link LEDs are lit for the switch ports that are connected to your computer and router.

• Wrong network configuration
  
  Verify that the Ethernet card driver software and TCP/IP software are both installed and configured on your computer.

  Verify that the IP address for your router and your computer are correct and that the addresses are on the same subnet.
Test the Path from Your Computer to a Remote Device

After verifying that the LAN path works correctly, test the path from your computer to a remote device.

1. From the Windows toolbar, click the **Start** button and select **Run**.
2. In the Windows Run window, type:
   ```
   ping -n 10 <IP address>
   ```
   where `<IP address>` is the IP address of a remote device such as your ISP DNS server.

If the path is functioning correctly, replies like those shown in the previous section are displayed.

If you do not receive replies:

- Check that your computer has the IP address of your router listed as the default gateway. If the IP configuration of your computer is assigned by DHCP, this information is not visible in your computer Network Control Panel. Verify that the IP address of the router is listed as the default gateway.
- Check to see that the network address of your computer (the portion of the IP address specified by the subnet mask) is different from the network address of the remote device.
- Check that your cable or DSL modem is connected and functioning.
- If your ISP assigned a host name to your computer, enter that host name as the account name in the Internet Setup screen.
- Your ISP could be rejecting the Ethernet MAC addresses of all but one of your computers.

Many broadband ISPs restrict access by allowing traffic only from the MAC address of your broadband modem. Some ISPs additionally restrict access to the MAC address of a single computer connected to that modem. If so, configure your router to “clone” or “spoof” the MAC address from the authorized computer.
This appendix covers the following topics:

- Factory Settings
- Technical Specifications
## Factory Settings

You can return the router to its factory settings. Use the end of a paper clip or a similar object to press and hold the **Reset** button on the back of the router for at least 7 seconds. The router resets, and returns to the factory configuration settings shown in the following table.

### Table 3. Factory default settings
