Getting Started

1

The Web Management Interface is a device management tool for NETGEAR XCM8800 Series Chassis switches. The Web Management Interface is launched as a Web page on the device. The client, loaded onto the Web browser, uses SOAP over HTTP to communicate with the device using XML APIs. The Web Management Interface provides a graphical user interface for the more commonly used CLI commands, with focus on the statistics and monitoring commands.

Note: The screens shown in this chapter were captured from a variety of switches. In some cases the information displayed on the screen varies depending on the switch being used.

This chapter describes the Web Management Interface and contains the following sections:

- Setting Up the Web Management Interface on page 5
- Dashboard on page 6

Setting Up the Web Management Interface

This section describes the setup process required to use the Web Management Interface with the switch and includes the following topics:

- HTTP and HTTPS Setup on page 5
- Client Setup on page 6
- Launching the Web Management Interface on page 6

HTTP and HTTPS Setup

Before you can launch the Web Management Interface, you must enable the web server on the switch. You can use either HTTP or HTTPS to access the Web Management Interface.

Note: You must assign an IP address to a VLAN for management access to the switch.

Web Access Using HTTP

To enable HTTP web access, enter the following command:

XCM8806.1 # enable web http

The switch is now ready for web access using HTTP at the URL http://<switch_ip>.

Web Access Using HTTPS

To enable HTTPS Web access, first check to see if the SSL module is installed. Enter the following command:

XCM8806.1 # show ssl

If the following displays, the SSL module is not installed:

SSL Module: Not Installed

XCM8806.2 #

The SSL module has to be installed to enable HTTPS Web access. (See the *NETGEAR* 8800 Series Chassis Switch User Manual "Secure Socket Layer" in the Security chapter and "Guidelines for Activating SSL" in the Software Upgrade and Boot Options appendix.)

After the SSL module is installed, create a certificate by entering the following command:

XCM8806.2 # configure ssl certificate privkeylen 1024 country us organization netgear common-name name1

To enable HTTPS Web access, enter the following command:

8806.1 # enable web https

The switch is now ready for Web access using HTTPS at the URL https://<switch_ip>.

Client Setup

You need a standard Internet browser such as Mozilla Firefox (version 1.0 or greater) or Internet Explorer (version 6.0 or greater) with the Adobe Flash Player 9 plug-in installed.

Note: The Web Management Interface supports up to six concurrent sessions.

Launching the Web Management Interface

To launch the Web Management Interface, enter the URL of the switch in the address window of your browser. The login prompt displays, as shown in the following figure.

O Please (enter username and pass	word
Switch	66.166.147.252	
User name		
a summer of	-	Login

Figure 1. Login prompt

The login screen displays the switch IP address. You enter a user name and password for access. The user name and password are the same that you use to access the CLI from a Telnet or SSH session.

Dashboard

Next, the Dashboard screen displays. The dashboard is the home screen, or opening screen. This screen provides you with a one-glance-snapshot of switch status, inventory, and management details.

The dashboard is divided into three information panes as shown in the following figure and described in this section.

Inte Contraction of the Contract	Welcome admin Logged in since: Fri Feb Device IP: 66.166.147.2 Current time: Fri Feb 11	12

Figure 2. Dashboard details

- 1. Switch Summary. Contains summary information about the switch, including:
 - The switch name, location, system type, MAC address, and boot version.
 - Hardware information, such as the number of slots, fan trays, and power modules in the switch as well as the status of those elements. Click items in this pane to see more detailed information about the items. For example, clicking a slot provides you with such slot information as its state, serial number, and temperature. Refer to *Figure 3, Unit Information screen*.

This pane remains consistent across all views.

- 2. Header. Displays information about the current session including:
 - The logged in user, the date and time when the user logged in, the switch IP address, and the current date and time.
 - A standard menu bar. Refer to *Menu Bar* for additional details.

This pane remains consistent across all views.

3. Work space. Displays the information and work area for the different Web Management Interface features. All features are accessed via the menu bar with any subordinate

functions, usually available through tabs. Each work area is described in the following sections.

At the top of the pane is a status bar that displays the current activity or condition, such as, Successfully Fetched SNMP Details! Or an error message, such as C unknown tag "test3".mismatched

From the device dashboard, you can navigate to any other portion of the interface. The functions available in the Web Management Interface are divided into three major categories:

- Configuration, which covers configuration of ports, VLANs, stacking, SNMP and dynamic ACLs. See *Chapter 2, Port Configuration*.
- Statistics and Monitoring, which provides you with the capability to generate event logs, monitor and generate statistics on ports, and perform QoS monitoring. See *This chapter provides an overview of the three statistics and monitoring panes available through the Web Management Interface:* on page 25.
- Administration, which allows you to perform administrative tasks on user accounts and user sessions and to issue CLI commands. See *CLI Shell* on page 35.

Main Functions

This section describes those functions that are displayed in all of the main workspaces (Dashboard, Configuration, Statistics & Monitoring and Administration). These include the following topics:

- Menu Bar
- Dashboard Switch Summary Icons on page 10
- Configuring the Refresh, Timeout, and CLI Settings on page 10
- Customizing and Capturing the Tables on page 11

Menu Bar

This section lists and describes the menu and submenu elements.

Dashboard

The opening screen that provides a one-glance snapshot of switch details, inventory, and management details. Refer to *Dashboard* on page 6.

Configuration

- **Ports**. Lists and describes the ports. A Port Details panel provides the capability to make certain modifications to the port configuration.
- VLANs. Lists and describes the VLANs. You can use the VLAN Details panel to modify the VLAN configuration.
- **Stacking**. Displays the stacking topology diagram and stacking configuration details. This submenu is enabled only on switches that support stacking.

- **SNMP**. Lists SNMP settings, statistics, users and trap receivers.
- **Dynamic ACLs**. Lists the dynamic ACLs on the switch. Provides the capability to create, edit and apply an ACL to an interface.

Statistics and Monitoring

- **Event Log**. Provides an event log of the activity on the switch, showing date, time, and type of event.
- **Ports**. Provides port statistics and utilization details in tables and charts.
- **QoS**. Displays QoS (Quality of Service) profile information for each port.

Administration

- User Accounts. Lists user account information and provides the capability to create and modify the settings locally and with RADIUS and TACACS.
- User Sessions. Lists information on the current session and provides a history of recent session activity.
- **CLI Shell**. Provides the capability to issue CLI commands from within the application.

Help

- Services & Technical Support. Opens the Services and Support page on NETGEAR website at *http://support.netgear.com*.
- **Command Reference Guide**. Links to the NETGEAR 8800 Series Chassis Switch documentation.
- User Guide. Links to the NETGEAR 8800 Series Chassis Switch documentation.
- **About**. Displays client environment information.

Logout

Exits the Web Management Interface.

Save Config

A command button used to save configuration changes. When changes have been made, the button turns orange indicating that a saving action is required to permanently change the configuration.

Dashboard Switch Summary Icons

The following table lists and describes the icons used on the Dashboard Switch Summary pane.

Icon			Description
	-		Slot - Operational, Failed, and Empty.
÷	್ಲಿ		Fan Tray - Operational and Empty.
0	0	0	Power Supply - Powered on, Failed, and Empty.

Point to an icon to show the unit type and state. Click the icon to show additional inventory information. The following figure shows two examples of the content.

t Information		Powersupply Info	mation
lot-1		PowerSupply 1	I

Figure 3. Unit Information screen

Configuring the Refresh, Timeout, and CLI Settings

Following are the defaults for the following refresh, timeout and CLI settings:

- General Refresh Interval. The default is 15 seconds.
- Web Service Timeout. The default is 45 seconds.
- Idle Timeout. The default is 10 minutes. (A warning is given one minute before.)
- **CLI Shell Background**. Select a color from the color pallet. The default is white.
- **CLI Shell Foreground**. Select a color from the color pallet. The default is black.
- CLI Shell Port. Specify a port.

To reset these settings:

- 1. Right-click almost any part of the window to display one of two menus that have a Show Console choice.
- 2. From the menu choose Show Console. A console pane is displayed at the bottom of the Dashboard, Configuration, Statistics & Monitoring, or Administration screens.
- 3. Click the Configuration tab as shown in the following figure.

Trace Console Configuration Me	mory Usage					
General					Restor	e Defaults
General Refresh Interval (in seconds)	15 🛛 🗸	Veb Service Timeout (in seconds)	45 🛛 🗸	Idle Timeout (in minutes)	10 🗸 🗸	
CLI Shell Background		LI Shell Foreground		CLI Shell Port	23	

Figure 4. Console - Configuration tab

4. From the appropriate drop-down list, choose another setting for any or all of the first five selections or enter a port number in the CLI Shell Port text box.

To restore the original default settings, click the **Restore Defaults** command button.

Customizing and Capturing the Tables

You can customize the format of a table and then print it or copy it to another application such as MS Excel.

- Resize the column width using standard column resizing bars between the heading cells.
- Sort rows by clicking in a table heading cell to display an up or down arrow tip.
- Remove columns by clicking the hide icon i and in the displayed Select Columns box, clear the check marks for the unwanted column names.
- Select specific row entries by typing the relevant text into the search field . Entries that do not include the text are hidden.
- Print an original or modified table by clicking the print icon 🚔 located just above the table. A standard print box opens. This icon prints the specific table only and prints it as it appears on the screen. If any cell contents are hidden on the screen they are hidden on the printed copy. To print the entire screen, use the browser print command.
- Copy the table to another application by clicking the copy icon in , opening the target application, and pasting in the table.

Dashboard Work Space

The Dashboard work space contains three segments: Inventory Information, Management, and Switch Details. These are shown in the following figure and are described in this section.

nventory Informatio	n										-
Q									21 rows	retrieved. 🚔

Figure 5. Dashboard

The following screens/panes are available:

- **Inventory Information**. Provides information about the hardware units: the type of system, the running temperature with a colored indicator, and the total number of days that the switch has been in service. Click the different unit to display additional information, examples of which are shown in *Figure 3, Unit Information screen*. Allows for customizing and capture of the table.
- **Management.** Displays the availability/status of configuration elements: license level, Telnet access, SSH access, SNMP access, and authentication server.
- **Switch Details**. Describes the current condition of the switch including its location, software version, state, and configuration. Allows for the modification of the switch name, location and contact.

Port Configuration

2

This feature allows you to view and modify some of the basic configurations of the ports on the device. The topics available through the ports configuration screen are:

- Port list
- Port details
- Enabling and disabling ports
- Basic port set operations

You can use the Web Management Interface to perform device-level configuration tasks. This section provides an overview of the five configuration panes available:

- Modify Single Ports on page 14
- VLAN Configuration on page 17
- SNMP Configuration on page 20
- SNMP Configuration on page 20
- Dynamic ACL Configuration on page 22

Modify Single Ports

To display the Port Details screen, select **Configuration > Ports**, and click one of the ports in the Port List. Port Details information is displayed under four tabs. The General details tab information is displayed here, and the other Port Details tabs follow.

Figure 6. Ports Configuration screen with single port details

- **Port List**. Lists the ports and their respective flags (see *Figure 11, Flags Legend Configuration*), Port State, Link State, Link Speed, Duplex Mode, Auto Negotiation, Jumbo frames and Load Master. You can customize the table and capture it. You can use the command buttons to enable or disable ports.
- **Port Details**. Displays details for the port that is selected from the Port List.
- **General tab**. Displays the port number and type, settings for the virtual router, port state, link state, link counter, ELSM, EDP and auto polarity. You can modify auto negotiation, config speed, config duplex, Jumbo Frame, preferred medium and force preferred medium.

Port Details QoS Tab

The QoS tab displays the QoS profile name, and shows the Explicit CoS Traffic Grouping Configuration and Egress Traffic Rate Limiting. You can use the radio buttons to enable or disable ingress and egress settings. The following figure shows the QoS details tab.

Port Details - 7	Apply Reloa
General QoS FDB & VLAN Sharing & Redundancy	
QoS Profile none	Egress Traffic Rate Limiting
Explicit CoS Traffic Grouping Config	Egress Port rate No-Limit
Ingress IPTOS Examination Disabled	Max Burst Size 0 KB
Ingress 802.1p Examination 💿 Enabled 🔵 Disabled	Broadcast Rate No-Limit
Ingress 802.1p Inner Exam 🔵 Enabled 💿 Disabled	Multicast Rate No-Limit
Egress IPTOS Replacement 🔵 Enabled 💿 Disabled	Unknown Dest Mac Rate No-Limit
Egress 802.1p Replacement 🔵 Enabled 💿 Disabled	

Figure 7. Port Details QoS Tab

FDB & VLAN Tab

The FDB & VLAN tab displays the VLANs. You can use this tab to enable or disable the learning port, unicast flooding, multicast flooding, and broadcast flooding. The following figure shows the FDB & VLAN details tab:

Port Details - 1:2				Apply Reload
General QoS	FDB & VLAN	Sharing & F	Redundancy	
Learning Port	 Enabled 	🔵 Disabled	VLAN	
Flooding			Member VLAN(s)	Default
Unicast Flooding	💿 Enabled	🔵 Disabled		
Multicast Flooding	💽 Enabled	🔵 Disabled		
Broadcast Flooding	💿 Enabled	🔵 Disabled		

Figure 8. Port Details FDB & VLAN Tab

Port Details Sharing & Redundancy Tab

The Sharing & Redundancy tab displays Load Sharing: Load sharing/link aggregation algorithm, Master Port and Members. On modular switches, this tab displays Software-Controlled Redundancy, the Primary and Redundant Ports, and allows you to

enable or disable Smart Redundancy and Software Redundant Port Link. The following figure shows the Sharing & Redundancy details tab.

Port Details - 1:2				Apply Reload
General QoS FDB & VLAN Shar	ing & Redundancy			
Load Sharing		Software-Controlled Redunda	ncy	
Load Sharing Algorithm -		Smart Redundancy	💿 Enabled	🔵 Disabled
Master Port -		Primary Port	-	
Members -		Redundant Port	-	
		Software Redundant Port Link	🔵 Enabled	 Disabled

Figure 9. Port Details Sharing & Redundancy tab

Multiple Port Details

To show Port Details for multiple ports, control-click two or more ports in the port list. The resulting Port Details are shown in the following figure:

						En	able Disab		_

Figure 11. Flags Legend - Configuration

VLAN Configuration

VLAN configuration allows you to create, modify, and delete VLANs, add ports to VLANs and configure them. The topics available through the VLAN configuration screen are:

- VLAN list
- VLAN details (Click one of the VLANs in the list.)
- Enabling and disabling VLANs
- Basic VLAN configuration
- Port membership in VLANs

Click one of the VLANS in the VLAN List to show the VLAN Details information for it. The General tab is displayed in the following figure.

Figure 12. VLANs Configuration screen

The following screens/panes are available:

- VLAN List. Lists the VLANs and their respective names, Tags, Protocol Addresses, Flags, Protocol filters, Active and Total Ports, and Virtual Routers. In this screen you can create or delete VLANS, and enable or disable them. You can customize the table, capture the table, and manually refresh the screen.
- VLAN Details. Displays information for the VLAN selected from the VLAN List.
- **General**. Displays: Admin State, Tag Type, and the Active Ports. You can modify these settings: Name, Tagging, Virtual Router, Protocol filters, QoS Profile, Loopback Primary IP, Secondary IPv4, IPv6 Address and the UDP Profile.

VLAN Details DHCP Tab

The following figure displays the DHCP (Dynamic Host Configuration Protocol) tab:

Figure 14. VLAN Details Ports Tab

This screen displays the Flags assigned to the port. Refer to *Figure 11, Flags Legend -Configuration*. It allows ports to be added and removed, and tagged and untagged. In the Ports panel, point to a port number to display its Port Properties. In the Flags column, point to flag to display the Flags Legend.

VLAN Configuration Procedures

Following are common procedures for using VLAN Configuration functions.

To Create a VLAN:

- 1. From the VLAN List screen, click the Create command button. The New VLAN Details pane is displayed. (This pane matches that shown in *Figure 12, VLANs Configuration screen.*)
- 2. Type in the required information.

- 3. To save the configuration, click the **Save** command button. The VLAN is saved to the switch.
- 4. Click the Save Config command button to permanently save the new VLAN.

To Delete a VLAN:

- 1. From the VLAN List screen, click the name of the VLAN to be deleted. The VLAN Details pane is displayed for the selected VLAN.
- 2. Click the **Delete** command button. The VLAN is deleted and the action is confirmed.

SNMP Configuration

This feature allows you to view the SNMP configuration on the switch. The information provided is useful to view the settings that are used by an SNMP client communicating with the switch. The tool allows you to view and manipulate the following SNMP features:

- SNMP settings
- SNMP v1 and v2c communities
- SNMP v3 users
- SNMP trap receivers
- SNMP statistics

There are no capabilities to make changes to the SNMP configuration in this release. This section shows two SNMP configuration screens that display the content under all the tabs.

Figure 16. SNMP Configuration screen, example 2

The following screens/panes are available:

- **SNMP Settings**. Displays SNMP configuration settings and access status.
- **SNMP Statistics**. Displays SNMP statistics. Move the cursor over each item in the list to show a tool tip with additional explanation of each. Clicking the Delta view box, starts a count up of new actions beginning from the time the box is checked. The start time is displayed.
- **SNMP V1/V2c Communities**. Lists the community strings and the type of access. Click the entries in the Read View and Write View columns to see the MIB Object Identifiers (OIDs) that are included and excluded. Allows for customizing and capture of the table, and a manual Refresh function.
- SNMP V3 Users. Lists the users, authentication method, privacy status, and type of access. Click the entries in the Read View and Write View columns to see the MIB OIDs that are included and excluded. Allows for customizing and capture of the table, and a manual Refresh function.
- **Trap Receivers**. Lists the trap receiver IP addresses, Port, number of retries, Timeout, and the Modes (enhanced or standard). Allows for customizing and capture of the table.

Dynamic ACL Configuration

This feature allows you to manage dynamic ACLs. It provide a process that is easier than the long command line syntax from the CLI. The following functionality is included.

- Displays the ACLs currently existing on the switch
- Creates and edits ACLs
- Applies a completed ACL to an interface.

The following figure shows a dynamic ACL screen:

Name XCM8810	ACLs retrieved.				
Location	Description of the		Refres		
SystemType XCM8810	Dynamic ACLs	Create Dynamic ACL	Application Cli	Create Delete Sind ACL Persistent? Save ACL	Unbind ACL

Figure 17. Creating a Dynamic ACL

These screens/panes are available:

- **ACLs on device**. Displays the ACLs that are currently available on the switch.
- **Create Dynamic ACL**. Displays an template on which to create an ACL. (See the following procedures.)
- **Help**. Contains interactive lists of Match Conditions, Actions and Action Modifiers used to create an ACL. The Help menu includes the following functions:
 - Services and Technical Support opens the Services and Support page on the NETGEAR website.
 - Command Reference Guide links to NETGEAR 8800 Series Chassis Switch product documentation.
 - User Guide links to NETGEAR 8800 Series Chassis Switch documentation.
 - About opens a standard information screen.

Dynamic ACL Procedures

Following are common procedures for using Dynamic ACL functions.

To create an ACL:

- 1. Click the **Create** command button to display a new ACL template in the **Create Dynamic ACL** pane.
- 2. Replace <ACLrulename> with a name.
- **3.** In the template, click in <match-conditions> and then click one of the March Conditions listed in the **Help** pane. The selection is inserted into the template.
- 4. Repeat for the other elements as necessary.
- 5. Click the **Save ACL** button. The new ACL is saved and added to the **ACLs on device** pane.

To apply an ACL to an interface:

- 1. In the ACLs on device pane, click the ACL to be applied. The Bind ACL command button is enabled.
- Click the Bind ACL command button. The Apply <ACL name> on interface pane is displayed.
- Click one of the three interface radio buttons (Any, Ports or VLANs). The appropriate fields for the particular interface are displayed and enabled. (See *Figure 18, Applying an ACL to an Interface* below)
 - Clicking **Any** disables the other controls in the pane.
 - Clicking **Ports** displays a list of all ports on the device. You can choose one or more ports.
 - Clicking VLANs displays a text box. Enter a VLAN name in the box.

If there are other ACLs applied to the chosen interface, you can apply the new ACL as either the "first" or "last" ACL or position it before or after an ACL that is already applied to the interface. If the ACL is already applied to the chosen port or VLAN, all controls are disabled.

4. Make the selections and **Save**. The ACL is applied to the interfaces and the details are displayed in the **Interfaces applied to** pane. Point to the ACL to display a tool tip showing the interface status.

To remove an ACL:

First unbind the ACL from the interface, if appropriate, then remove it from the device.

- In the ACLs on device pane, click the ACL to be removed. The interface details in the Interfaces applied to pane and displayed. Enable the Unbind ACL command button by clicking the interface details row.
 - You can choose multiple ports to unbind at the same time but only one VLAN.
 - To unbind all interfaces at once, click the **Select All** box.
 - Click Unbind ACL.

2. In the ACLs on device pane, click the ACL to be removed and then click the **Delete** command button.

Figure 18. Applying an ACL to an Interface

- Apply <ACLrulename> on interface. Allows you to choose the interface to which the dynamic ACL is to be applied as well as priority, direction, order, application, and zone.
- Interfaces applied to. Displays the interfaces to which the ACL selected in the ACLs on device pane is bound.

Statistics and Monitoring

This chapter provides an overview of the three statistics and monitoring panes available through the Web Management Interface:

- Event Log on page 26
- Port Statistics on page 27
- QoS Monitoring on page 30

Event Log

This feature provides you with a tabular event log of the activity on the switch. To view the event log, select **Statistics & Monitoring > Event Log**. The following figure shows the Event Log screen:

Figure 19. Event Log screen

The event log displays the date, time, and type of event. It allows for customizing and capture of the table and a manual Refresh function.

Port Statistics

This feature allows you to view the live statistics of the ports as various kinds of charts and tables. The charts and tables are viewed in the following tabbed screens:

- Utilization Chart
- Statistics Table
- Bandwidth Chart

The following figure shows the Utilization Chart tab information.

Figure 20. Port Statistics Utilization Chart screen

The Utilization Chart graphically displays port utilization, received and transmitted. The graph can be plotted in bytes per second, packets per second or as a percentage of bandwidth. You can point to any of the Port numbers to display a tool tip that shows the Port Properties: Display String and Link State. Point to one of the plot points for more information.

Statistics Table Screen

The following figure shows the Statistics Table tab information.

Figure 21. Statistics Table screen

The Statistics table lists the available ports and their link state, bandwidth utilization—as a number or percent—transmitted byte or packet count, received byte or packet count, received broadcast, received multicast, invalid frames received and transmitted. Use the radio buttons and check box to chose the display. This screen allows the table to be customized and captured.

Bandwidth Chart

The Bandwidth chart displays in a bar chart, the percentage of bandwidth being utilized for each port. Allows the range of ports to be selected. Point to a bar to display its port number and Rx or Tx utilization percentage. The following figure shows the Bandwidth Chart:

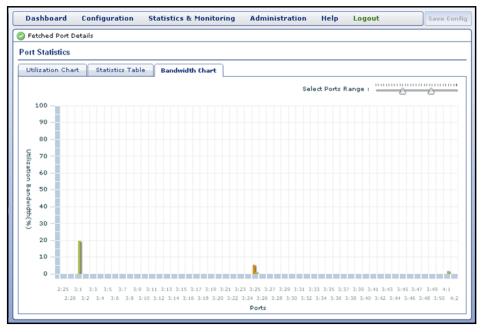

Figure 22. Port Statistics Bandwidth Chart screen

QoS Monitoring

This feature allows you to monitor QoS information on a port (both bytes and packets). The following figure shows the QoS monitoring screen:

Figure 23. QoS Monitor screen

The QoS Monitor screen displays the QoS profiles assigned to each port. Allows the table to be shown in terms of egress or ingress, packets (P) or bytes (B), and for the table to be customized and captured.

Administration

This chapter provides an overview of the administration panes available through the Web Management Interface:

- User Accounts on page 32
- User Sessions on page 34
- CLI Shell on page 35

User Accounts

This feature allows you to manage user accounts on a switch. This includes the ability to add, modify and delete user accounts local to the switch and to configure remote RADIUS AAA or TACACS servers.

Information on the user accounts screen is displayed under the following four tabs:

- Local Users
- Global Password Policy
- RADIUS
- TACACS

Local Users Tab

The Local Users tab displays the users and information about their accounts. You can create or delete a user account, unlock a user account, and change a password. You can customize the table and capture it. The User Detail pane displays information about the user selected in the Users List and allows setting some limitations on the account. The following figure shows the Local Users screen:

User Sessions

This feature shows the list of SSH, XML, and Telnet sessions on the switch. It includes the ability to view current and historical sessions and allow administrators to kill rogue sessions. The features available through the sessions management screen are:

- Monitor and manipulate active CLI and XML API sessions
- Clear selected session
- View session history

Dashboard Configuration Statistics & Monitoring Administration Help Logout Save Config Active Sessions List and Session History List Fetched Refresh Clear Active Se Active Sessions | 4 rows retrieved. | 🚔 🐚 🏢 ID Login Time Type Authentication CLI Auth User Location Fri Feb 11 07:28:42 2011 console_lo admin loca serial MSM-A Fri Feb 11 07:47:39 2011 admin telnet local disabled 64.94.70.253 Fri Feb 11 07:57:37 2011 admin xml local disabled 67.188.171.132 Fri Feb 11 08:02:34 2011 admin xml local disabled 64.94.70.253 Session History | 6 rows retrieved. | 🚊 🐚 9 Location User Type Login Time End Time admin console serial MSM-A Fri Feb 11 07:28:42 2011 Active 64.94.70.253 admir Fri Feb 11 07:38:25 2011 Fri Feb 11 08:02:16 2011 12.151.34.253 Fri Feb 11 07:46:08 2011 Fri Feb 11 07:46:14 2011 admir telnet 64.94.70.253 admir telnet Fri Feb 11 07:47:39 2011 Active admin **v**ml 67.188.171.132 Fri Feb 11 07:57:37 2011 Active admin vml 64.94.70.253 Fri Feb 11 08:02:34 2011 Active

The following figure shows the user sessions screen:

Figure 28. User Sessions screen

- Active Sessions. Displays session number, login time, user name, type of connection, authentication, type of authentication if enabled, and the IP address from which the user is logged in. Allows the current session to be cleared and the table to be customized and captured.
- **Session History**. Displays the history of sessions showing: user name, type of connection, IP address from which the user was logged in and the login and logout times. Allows the list to be customized and captured.

CLI Shell

This feature allows you to issue CLI commands from within the browser window without opening a Telnet client. The functionality includes:

- SSH Support
- Command Completion
- Command History

To use the CLI Shell, you must first download and install a CLI proxy installable service/daemon. CLIProxy_window can be found on the NETGEAR website.

The CLI Shell screen displays a CLI screen on which commands can be entered. You can change the appearance of the screen and the settings for the foreground and background colors as well. The following figure shows the CLI shell screen.

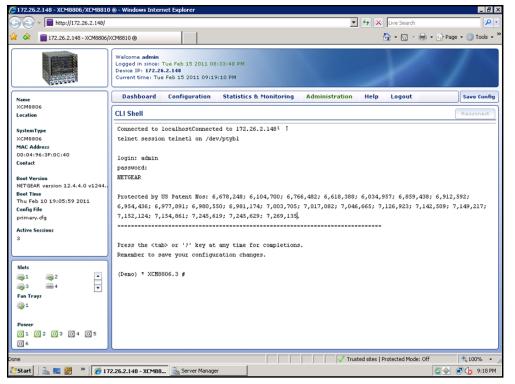

Figure 29. CLI Shell screen

The CLI Shell port can be reset, as shown in *Figure 4, Console - Configuration tab* on page 11.
