Contents

Chapter 1 Overview
- LEDs ........................................................................................................6
- Side and bottom panels .......................................................................8
- When to use your extender .................................................................9
- How the extender works ....................................................................9

Chapter 2 Get started
- Install your extender in extender mode ...........................................11
  - Place the extender and apply power ........................................11
  - Connect the extender to an existing WiFi network ..................11
    - Connect with WPS ................................................................11
    - Connect with the NETGEAR installation assistant ..............13
- Install your extender in access point mode ....................................14
- Connect a device to the extender network .....................................16
  - Connect a device to the extender network using WiFi ..........17
  - Connect an Ethernet-enabled device to the extender ..........18
    - Connect a device to the extender network using WPS .......18
- Log in to the extender after installation ........................................19
- Run the Smart Setup installation ......................................................19

Chapter 3 Maintain and monitor the extender
- Change the extender login user name and password ..................22
- Turn password protection off and on ............................................23
- Recover a forgotten user name or password ...............................24
- Automatically adjust for daylight saving time ..............................25
- Manually set the extender clock ......................................................25
- Back up and manage the extender configuration .........................26
  - Back up the configuration settings ...........................................27
    - Restore the configuration settings ........................................28
- Return the extender to its factory default settings .......................29
  - Use the Reset button .................................................................29
    - Log in and reset the extender to factory settings .................29
- Update the extender firmware ........................................................31
  - Check for new firmware and update the extender .................31
    - Manually upload firmware to the extender .........................32
- Restart the extender from the extender web interface .................33
Chapter 4 Extender Network Settings

Enable or disable One WiFi Name...................................................36
Enable or disable smart connect......................................................37
View connected devices.................................................................38
View WiFi settings........................................................................39
Change the WiFi network name.....................................................40
Turn off the SSID broadcast to create a hidden network..............41
Disable or enable the WiFi radios..................................................42
Change the WiFi speed..................................................................43
Use WPS to add a computer to the extender’s WiFi network.......44
  Use WPS with the push button method......................................44
  Use WPS with the PIN method..................................................45
Deny access to a computer or WiFi device....................................47
Set up an access schedule...............................................................48
Change the extender’s device name..............................................49
Set up the extender to use a static IP address...............................50
Configure a router with advanced MAC settings to work with your
  extender.......................................................................................51
Boost your video streaming with FastLane technology...............52
Enable or disable 20/40 MHz coexistence.....................................54

Chapter 5 FAQs and troubleshooting

FAQs...............................................................................................57
Find the extender’s IP address.........................................................58
Cannot connect to the extender.....................................................59
Cannot join a WiFi network and receive an error message.........59
Cannot access mywifiext.net.......................................................60

Chapter 6 Supplemental information

Factory default settings.................................................................63
Technical and environmental specifications.............................64
1

Overview

The WiFi Range Extender boosts your existing network range and speed, delivering tri-band WiFi.

This chapter covers the following topics:

- **LEDs**
- **Side and bottom panels**
- **When to use your extender**
- **How the extender works**

**Note:** For more information about the topics covered in this manual, visit the support website at support.netgear.com.
LEDs

The following table describes the LEDs on the extender.

Table 1. LED descriptions

<table>
<thead>
<tr>
<th>LED</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router Link LED</td>
<td>This LED indicates the WiFi connection between the extender and the router.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Solid white</strong>. Best connection.</td>
</tr>
<tr>

</table>
Side and bottom panels

A switch and buttons are located on the side panel. An Ethernet port is located on the bottom panel.

Figure 2. Side and bottom panel

The side panel contains the following components:

- **Factory Reset button.** Pressing this button resets the extender. If the Factory Reset button is pressed for at least seven seconds, the Power LED blinks amber, and the extender returns to its factory settings.

- **Power On/Off button.** Press the Power On/Off button to provide power to the extender. The Power LED lights green when the extender is ready.

- **WPS button.** Use this button to connect WPS-enabled devices to the extender.

- **Access Point/Extender switch.** Use this switch to set your extender in access point mode or extender mode. To use your extender in access point mode, set the switch to Access Point. To use your extender in extender mode, set the switch to Extender.

- **Ethernet port.** Use an Ethernet cable to connect a router or Ethernet-enabled device to the Ethernet port on the extender.
When to use your extender

We recommend that you connect through the extender network only when your WiFi device is in a “dead zone” where connection from the existing network is poor or nonexistent. Data traffic routed through the extender is inherently slower than traffic routed directly from the network.

How the extender works

The extender works like a bridge between a WiFi router (or a WiFi access point) and a WiFi-enabled device outside the range of the WiFi router. The extender performs two main jobs:

- The extender connects to a working WiFi network.
  When the extender connects over WiFi to an existing network, it functions as a network client, similar to how a WiFi-enabled device connects to a network.

- The extender acts as an access point for WiFi-enabled devices.
  The extender broadcasts its own WiFi network that WiFi devices can join. In its role as an access point, the extender performs tasks that WiFi routers do, such as broadcasting its network name (SSID).

The extender must do each of these jobs so that both ends of the bridge are in place.
Get started

This chapter covers the following topics:

- Install your extender in extender mode
- Install your extender in access point mode
- Connect a device to the extender network
- Log in to the extender after installation
- Run the Smart Setup installation
Install your extender in extender mode

To install your extender in extender mode, you must set the Access Point/Extender switch to Extender.

Place the extender and apply power

To place the extender and apply power:
1. Set the Access Point/Extender switch to Extender.
2. For the initial setup, place your extender in the same room as your WiFi router.
3. Plug the extender into an electrical outlet.
4. Wait for the Power LED to light amber and then turn green.
   This might take up to two minutes. If the Power LED does not light, press the Power On/Off button on the extender.

Connect the extender to an existing WiFi network

To extend the range of your WiFi network, you must connect the extender to your existing WiFi network.

Note: If your router’s WiFi security is set to WPA enterprise or WPA2 enterprise, your extender can’t connect to your router. You must change your router’s WiFi security setting.

You can connect the extender in one of two ways:

• Connect with WPS. For more information, see Connect with WPS on page 11.

  Note: WPS does not support WEP network security or a hidden SSID network. If your router WiFi network uses WEP security or its SSID is hidden, follow the instructions in Connect with the NETGEAR installation assistant on page 13.

• Connect with web browser setup. For more information, see Connect with the NETGEAR installation assistant on page 13.

Connect with WPS

Wi-Fi Protected Setup (WPS) lets you join a secure WiFi network without typing the network name and password. For help with the WPS button on your WPS-enabled
device, check the instructions or online help that came with that device. Some older equipment cannot use WPS.

**Note:** WPS does not support WEP network security or a hidden SSID network. If your existing WiFi network uses WEP security or its SSID is hidden, follow the instructions in Connect with the NETGEAR installation assistant on page 13.

**To use WPS to connect the extender to your WiFi router:**

1. Press the **WPS** button on the extender.
   The WPS LED blinks.

2. Within two minutes, press the **WPS** button on your router or access point.
   When the extender connects to your existing WiFi network, the WPS LED on the extender lights solid white and the Router Link LED lights.

   If the Router Link LED lights solid green, the connection between your router and extender is good. If the Router Link LED doesn’t light, move the extender closer to the router and try again.

   If it still does not light, see Connect with the NETGEAR installation assistant on page 13.

   **Note:** If your router supports the 5 GHz band and your extender didn’t connect to that band, repeat the WPS process.

3. Unplug the extender and move it to a new location that is about halfway between your router and the area with a poor router WiFi signal.

   The location that you choose must be within the range of your existing WiFi router network.

4. Plug the extender into an electrical outlet and wait for the Power LED to light green.

5. Use the Router Link LED to help you choose a spot where the extender-to-router connection is optimal.

6. If the Router Link LED doesn’t light amber or green, move the extender closer to the router and try again.
   Keep moving the extender closer to the router until the Router Link LED lights amber or green.
7. Connect your WiFi-enabled computer or mobile device to the extended network. Your extender uses the same WiFi name as your router, based on the WiFi band that it connects to first.

<table>

**Connect with the NETGEAR installation assistant**

You can use the NETGEAR installation assistant to connect your extender to your existing WiFi router network. To use the NETGEAR installation assistant, you must launch a web browser on your computer or mobile device.

**To use the NETGEAR installation assistant to connect the extender to your WiFi router:**

1. Make sure that your computer or mobile device is set up to obtain an IP address automatically from a DHCP server.

2. Connect a computer or mobile device to the extender using a WiFi or Ethernet connection:

   - **WiFi.** On your WiFi-enabled computer or mobile device, open the WiFi connection manager and locate and connect to the extender network called NETGEAR_EXT. When your WiFi-enabled computer or mobile device is connected to the extender, the Client LED lights solid white.

   - **Ethernet.** Use an Ethernet cable to connect the Ethernet port on your extender to an Ethernet port on your computer.

3. Launch web browser.

   The NETGEAR installation assistant displays.

5. Follow the prompts to connect your extender to your existing WiFi network.
6. Unplug the extender and move it to a new location about halfway between your router and the area with a poor WiFi signal.

7. Use the Router Link LED to help you choose a spot where the extender-to-router connection is optimal.

8. If the Router Link LED doesn’t light amber or green, move the extender closer to the router and try again.
   Keep moving the extender closer to the router until the Router Link LED lights amber or green.

9. Reconnect your computer or mobile device to the new extender WiFi network.

Install your extender in access point mode

You can use the extender as a WiFi access point, which creates a new WiFi hotspot by using a wired Ethernet connection. The following instructions assume that this is the first time you’re setting up the extender.

To install your extender in access point mode:

1. Make sure that your computer or mobile device is set up to obtain an IP address automatically from a DHCP server.

2. Set the Access Point/Extender switch to Access Point.

3. Plug the extender into an electrical outlet.

4. Wait for the Power LED to light amber and then turn green.
This might take up to two minutes. If the Power LED does not light, press the **Power On/Off** button on the extender.

5. Connect a computer or mobile device to the extender using a WiFi or Ethernet connection:

   • **WiFi connection to the extender.** Connect your computer to your extender with a WiFi connection.
     a. On your WiFi-enabled computer or mobile device, open the WiFi connection manager and connect to the extender network called NETGEAR_EXT. When your WiFi-enabled computer or mobile device is connected to the extender, the Client LED lights solid green.
     b. Launch a web browser and visit [www.mywifiext.net](http://www.mywifiext.net). When you join the network, the Client Link LED lights to show that you are connected. The NETGEAR installation assistant displays.
     c. Use an Ethernet cable to connect your router to an Ethernet port on the extender.

       **Note:** Do not connect your extender directly to your DSL or cable modem. The extender does not function as a router. If your network includes a DHCP server, you can connect the extender to a switch or hub that is connected to the DHCP server.

     d. Return to the NETGEAR installation assistant and follow the prompts to finish setting up your extender as an access point.

   • **Ethernet connection directly to the extender.** You can connect your computer directly to your extender using an Ethernet connection. When the setup is complete, you must disconnect the Ethernet cable that is connected to your computer so that your extender can connect to your router with an Ethernet connection.
     a. Use an Ethernet cable to connect your computer’s Ethernet port to your extender’s Ethernet port.
     b. Launch a web browser and visit [www.mywifiext.net](http://www.mywifiext.net). The NETGEAR installation assistant displays.
     c. Follow the prompts to set up your extender in access point mode. At the end of the installation, the NETGEAR installation assistant displays the extender’s WiFi network credentials.
d. Connect your computer to the extender using the extender’s WiFi credentials that display in the NETGEAR installation assistant.

e. Disconnect the Ethernet cable from your computer and connect the Ethernet cable to your router.

Your router and extender are connected using an Ethernet connection, and your computer and extender are connected using a WiFi connection.

**Note:** Do not connect your extender directly to your DSL or cable modem. The extender does not function as a router. If your network includes a DHCP server, you can connect the extender to a switch or hub that is connected to the DHCP server.

**• Ethernet connection to the extender using a router.** You can connect both your computer and extender to your router with an Ethernet connection.

**Note:** Do not connect your extender directly to your DSL or cable modem. The extender does not function as a router. If your network includes a DHCP server, you can connect the extender to a switch or hub that is connected to the DHCP server.

a. Use an Ethernet cable to connect your computer’s Ethernet port to an Ethernet port on your router.

b. Use another Ethernet cable to connect your extender’s Ethernet port to another Ethernet port on your router.

c. Launch a web browser and visit [www.mywifiext.net](http://www.mywifiext.net). The NETGEAR installation assistant displays.

d. Follow the prompts to set up your extender in access point mode.

At the end of the installation, the NETGEAR installation assistant displays the extender’s WiFi network credentials. Use the extender’s WiFi credentials to connect your WiFi-enabled devices to the extender network.

**Connect a device to the extender network**

After you complete the setup process, you can connect all your devices to the new extender network using a WiFi, wired, or WPS connection.
Connect a device to the extender network using WiFi

If you enabled the One WiFi Name feature, your extender uses the same WiFi network name and password as your router. The following is an example of what your WiFi network names might look like if One WiFi Name is enabled:

- **Router 2.4 GHz WiFi network name.** MyWiFiExample
- **Router 5 GHz WiFi network name.** MyWiFiExample-5G
- **Extended 2.4 GHz WiFi network name.** MyWiFiExample
- **Extended 5 GHz WiFi network name.** MyWiFiExample-5G

If you set up your extender using WPS, your extender uses the same WiFi network settings as your router for its 2.4 GHz and 5 GHz extended networks. For example, if your extender connects to the router’s 2.4 GHz WiFi band, your extender uses your router’s 2.4 GHz WiFi settings for both its networks:

- **Router 2.4 GHz WiFi network name.** MyWiFiExample
- **Router 5 GHz WiFi network name.** MyWiFiExample-5G
- **Extended 2.4 GHz WiFi network name.** MyWiFiExample
- **Extended 5 GHz WiFi network name.** MyWiFiExample

If your extender connects to the router’s 5 GHz WiFi band, your extender uses your router’s 5 GHz WiFi settings for both its networks:

- **Router 2.4 GHz WiFi network name.** MyWiFiExample
- **Router 5 GHz WiFi network name.** MyWiFiExample-5G
- **Extended 2.4 GHz WiFi network name.** MyWiFiExample-5G
- **Extended 5 GHz WiFi network name.** MyWiFiExample-5G

Since your router and extended networks share the same WiFi network name, only one WiFi network name is broadcast.

**To connect to the extender WiFi network:**

1. On your WiFi-enabled computer or mobile device, open the WiFi connection manager that manages your WiFi connections. The WiFi connection manager scans for WiFi networks in your area.

2. Find and select your WiFi network name (SSID) and enter your WiFi password. This is the SSID and password that you set up during the installation process.
Connect an Ethernet-enabled device to the extender

After the extender is connected to your existing WiFi network, you can connect a wired device to the extender using an Ethernet cable.

![Figure 4. Ethernet LAN port](image)

Connect a device to the extender network using WPS

For help with the **WPS** button on your WPS-enabled device, check the instructions or online help that came with that device. Some older equipment cannot use WPS.

**To connect to the extender using a WPS connection:**

1. Press the **WPS** button on the extender.
   The WPS LED blinks white.

2. Within two minutes, press the **WPS** button on your WPS-enabled device.
   If your WPS enabled device successfully connects to extender, the WiFi connection manager on your device will show connection status.
Log in to the extender after installation

After installation, you can log in to the extender to view or change the extender’s settings.

**To log in to the extender:**
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifieext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifieext/` or `http://mywifieext.local/`
     - **Mac computers and iOS devices.** `http://mywifieext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)

For more information about how to find your extender’s IP address, see *Find the extender’s IP address* on page 58.

Run the Smart Setup installation

You can use the Smart Setup to change the extender settings. This is an easy way to connect the extender to a different router or to change the extender WiFi network name (SSID) or WiFi password.

**To run the Smart Setup:**
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifieext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifieext/` or `http://mywifieext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifieext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)

For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button. The Status page displays.

4. Click the **SMART SETUP** button.

5. Follow the prompts.
3

Maintain and monitor the extender

This chapter covers the following topics:

• Change the extender login user name and password
• Turn password protection off and on
• Recover a forgotten user name or password
• Automatically adjust for daylight saving time
• Manually set the extender clock
• Back up and manage the extender configuration
• Return the extender to its factory default settings
• Update the extender firmware
• Restart the extender from the extender web interface
Change the extender login user name and password

You can change the admin user name and password that you use to log in to the extender.

**To change the extender's login user name and password:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifiext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifiext/` or `http://mywifiext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifiext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon, click it.
   The extender menu displays.

5. Select **Settings > Password**.
   The Password Settings page displays.

6. To change the admin user name, enter a new user name in the **New User Name** field.
   Your admin user name can be a name or email address.

7. To change the admin password, enter a new password in the **New Password** field and the **Verify Password** field.

8. Select questions and enter the answers.
9. Click the **SAVE** button.  
Your settings are saved.

### Turn password protection off and on

We recommend that you leave password protection on to help keep your network secure. You can turn password protection off and on.

**To turn password protection off or on:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter [http://mywifiext.local/](http://mywifiext.local/) in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Mac computers, iOS devices, and Linux devices.** [http://mywifiext.local/](http://mywifiext.local/)
     - **Android devices.** [http://<extender’s IP address>/](http://<extender’s IP address>/) (for example, [http://192.168.1.3/](http://192.168.1.3/))
     For more information about how to find your extender’s IP address, see **Find the extender’s IP address** on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.  
The Status page displays.

4. If your browser displays the **Menu** icon `☰`, click it.  
The extender menu displays.

5. Select **Settings > Password**.  
The Password Settings page displays.

6. Select the **Password Off** or **Password On** radio button.

7. Click the **SAVE** button.  
Your settings are saved.
Recover a forgotten user name or password

If you changed the password that you use to access the extender and you set up password recovery, you can recover your password if you lose it.

To recover your password that you use to access the extender:

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifieext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - Mac computers, iOS devices, and Linux devices. `http://mywifieext.local/`

     For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

     A login page displays.

3. Click the Username & Password Help link.

   A page displays requesting the answers to your security questions.

   If you forgot the answers to your security questions, restore the extender’s factory settings and set up your login credentials again. See Return the extender to its factory default settings on page 29.

4. Enter the saved answers to your security questions.

5. Click the NEXT button.

   Your admin user name address and password are displayed.

6. Click the BACK button.

   A login page displays.

7. Log in to the extender.
Automatically adjust for daylight saving time

To set up the extender to automatically adjust for daylight saving time:
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifieext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - Mac computers, iOS devices, and Linux devices. http://mywifieext.local/
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.
   A login page displays.
3. Enter your admin user name and password and click the LOG IN button.
   The Status page displays.
4. If your browser displays the Menu icon, click it.
   The extender menu displays.
5. Select Do More > Access Schedule. 
   The Access Schedule page displays.
6. Select the Automatically adjust for daylight savings time check box.
7. Click the SAVE button.
   Your settings are saved.

Manually set the extender clock

If you turned on the access schedule, you can set the extender clock. The extender clock makes sure that the WiFi access schedules are accurate.
To manually set the extender clock:
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifiext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.
   
   A login page displays.
3. Enter your admin user name and password and click the LOG IN button. The Status page displays.
4. If your browser displays the Menu icon, click it. The extender menu displays.
6. In the Extender Clock section, select the Manual radio button.
7. To specify the time, complete the fields or click the Sync Clock button to synchronize the extender time to the time on the computer or mobile device that you are using.
8. Click the SAVE button. Your settings are saved.

Back up and manage the extender configuration

When the extender works correctly after initial setup, we recommend that you back up the extender configuration settings. After you back up the settings, if you change the
extender configuration settings but are not content with the new settings, you can restore the extender configuration to the backed-up settings.

Back up the configuration settings

You can back up the configuration file of the extender.

**To back up the extender configuration settings:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifiext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifiext/` or `http://mywifiext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifiext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.
4. If your browser displays the **Menu** icon  
   click it.
   The extender menu displays.
5. Select **Settings > Other.**
   The Other Settings page displays.
6. Click the **BACKUP** button.
   Your browser extracts the configuration file from the extender. The backup file uses a `.cfg` extension.
7. If your browser is not set up to save downloaded files automatically, locate where you want to save the file.
8. Click the **OK** button.
   The extender configuration settings are backed up.
Restore the configuration settings

You can restore the configuration settings of the extender to a previously saved configuration file.

**To restore the extender configuration settings:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifieext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers**: `http://mywifieext/` or `http://mywifieext.local/`
     - **Mac computers, iOS devices, and Linux devices**: `http://mywifieext.local/
     - **Android devices**: `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
     For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.
4. If your browser displays the **Menu** icon , click it.
   The extender menu displays.
5. Select **Settings > Other**.
   The Other Settings page displays.
6. Click the **BROWSE** button.
7. Locate and select the previously saved backup file.
   The backup file uses a `.cfg` extension.
   
   **Caution:** After you click the **RESTORE** button, do not try to go online, turn off the extender, shut down the computer, or do anything else to the extender until it finishes restarting.
8. Click the **RESTORE** button.
A confirmation pop-up window opens.

9. Confirm your decision.
   The extender configuration is restored and the extender restarts. This process takes about one minute.

Return the extender to its factory default settings

Under some circumstances (for example, if you lose track of the changes that you made to the extender settings), you might want to erase the configuration and reset the extender to factory default settings.

To reset the extender to factory default settings, you can either use the Reset button on the back panel or log in to the extender and reset it.

Use the Reset button

Caution: This process erases any settings that you configured in the extender.

To use the Reset button to return the extender to its factory default settings:
1. Insert a straightened paper clip into the hole of the Reset button and hold it for about seven seconds.
2. Release the button.
   Caution: Do not try to go online, turn off the extender, shut down the computer, or do anything else to the extender until it finishes restarting!

   The extender resets and restarts. This process takes about one minute.

Log in and reset the extender to factory settings

Caution: This process erases any settings that you configured in the extender.
To log in to the extender and reset the extender’s factory settings:
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter www.mywififiext.net in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - Mac computers, iOS devices, and Linux devices. http://mywififiext.local
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the LOG IN button.
   The Status page displays.
4. If your browser displays the Menu icon, click it.
   The extender menu displays.
5. Select Settings > Other.
   The Other Settings page displays.

   **Caution:** After you click the RESET button, do not try to go online, turn off the extender, shut down the computer, or do anything else to the extender until it finishes restarting.
6. Click the RESET button.
   A confirmation pop-up window opens.
7. Confirm your decision.
   The extender returns to its factory settings and restarts. This process takes about one minute.
Update the extender firmware

You can log in to the extender and check to see if new firmware is available, or you can manually load a specific firmware version to your extender.

Check for new firmware and update the extender

Unless you changed the settings in the Firmware Update page previously, the extender is set up to check for new firmware automatically at login.

To check manually for new firmware and, if available, update the firmware:

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   • If you did not enable the One WiFi Name feature, enter http://mywifiext.local/ in the address field of the browser.
   • If you enabled the One WiFi Name feature, enter one of the following URLs:
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.
3. Enter your admin user name and password and click the LOG IN button.
   The Status page displays.
4. If your browser displays the Menu icon , click it.
   The extender menu displays.
5. Select Firmware Update.
   The Firmware Update page displays.
6. Click the CHECK ONLINE button.
7. If new firmware is available, follow the onscreen prompts to update the firmware.
Manually upload firmware to the extender

If you want to upload a specific firmware version, follow these instructions.

**To manually upload a firmware file to your extender:**

1. Download the firmware file for your extender from the NETGEAR Download Center, save it to your desktop, and unzip the file if needed.

   **Note:** The correct firmware file uses an `.img` extension.

2. Launch a web browser from a computer or mobile device that is connected to your extender network.

3. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifiext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifiext/` or `http://mywifiext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifiext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
     For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

4. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

5. If your browser displays the **Menu** icon `☰`, click it.
   The extender menu displays.

6. Select **Firmware Update**.
   The Firmware Update page displays.

7. Click the **BROWSE** button.

8. Locate and select the new firmware file.
The firmware file name ends with a .img extension.

9. Click the **UPLOAD** button.

**Caution:** After you click the **UPLOAD** button, do not try to go online, turn off the extender, shut down the computer, or do anything else to the extender until it finishes restarting.

The firmware update starts and the extender restarts. The firmware update process takes about two minutes.

### Restart the extender from the extender web interface

You can log in to the extender and restart it. When the extender restarts, all computers and WiFi devices that are connected to its WiFi network are automatically disconnected.

**To restart the extender from the extender web interface:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifiiext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifiiext/` or `http://mywifiiext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifiiext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button. The Status page displays.

4. If your browser displays the **Menu** icon , click it. The extender menu displays.
5. Select **Settings > Other**. The Other Settings page displays.

6. Click the **RESTART** button and click the **Yes** button to confirm. The extender restarts, which takes about two minutes.
This chapter covers the following topics:

- Enable or disable One WiFi Name
- Enable or disable smart connect
- View connected devices
- View WiFi settings
- Change the WiFi network name
- Turn off the SSID broadcast to create a hidden network
- Disable or enable the WiFi radios
- Change the WiFi speed
- Use WPS to add a computer to the extender’s WiFi network
- Deny access to a computer or WiFi device
- Set up an access schedule
- Change the extender’s device name
- Set up the extender to use a static IP address
- Configure a router with advanced MAC settings to work with your extender
- Boost your video streaming with FastLane technology
- Enable or disable 20/40 MHz coexistence
Enable or disable One WiFi Name

The One WiFi Name feature enables your extender to use the same WiFi network settings as your router.

If you enabled the One WiFi Name feature, your extender uses the same WiFi network name and password as your router.

The following is an example of what your WiFi network names might look like if One WiFi Name is enabled:

• **Router 2.4 GHz WiFi network name.** MyWiFiExample
• **Router 5 GHz WiFi network name.** MyWiFiExample-5G
• **Extended 2.4 GHz WiFi network name.** MyWiFiExample
• **Extended 5 GHz WiFi network name.** MyWiFiExample-5G

**Note:** If you enable the One WiFi Name feature and your router’s 2.4 GHz and 5 GHz networks use different network names, you cannot enable the Smart Connect feature.

**To enable or disable the One WiFi Name feature:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   • If you did not enable the One WiFi Name feature, enter `http://mywifiext.local/` in the address field of the browser.
   • If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifiext/` or `http://mywifiext.local/
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifiext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.
4. If your browser displays the Menu icon, click it. The extender menu displays.

6. To enable the One WiFi name feature, select the Yes radio button. If this is the first time you’re enabling the One WiFi Name feature, you must run the Smart Setup. Go to the Status page and click the SMART SETUP button to run the Smart Setup.

7. To disable the One WiFi Name feature, select the No radio button. If you disable this feature, you can set a new SSID and password for the extender’s 2.4 GHz and 5 GHz networks in the Network Name (SSID) and WiFi Password fields on this page.

8. Click the SAVE button. Your settings are saved.

Enable or disable smart connect

The Smart Connect feature selects the fastest WiFi band for your WiFi devices to connect to. To enable the Smart Connect feature, your extender’s 2.4 GHz and 5 Ghz networks must use the same network name and password.

**Note:** If you enabled the One WiFi Name feature and your router’s 2.4 GHz and 5 GHz networks use different network names, you cannot enable Smart Connect. You can only enable Smart Connect if your extender’s 2.4 GHz and 5 GHz WiFi networks use the same network name.

**To enable or disable the Smart Connect feature:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifieext.local/ in the address field of the browser.
• If you enabled the One WiFi Name feature, enter one of the following URLs:
  - **Windows-based computers**. http://mywifiext/ or http://mywifiext.local/
  - **Mac computers, iOS devices, and Linux devices**. http://mywifiext.local/
  - **Android devices**. http://<extender’s IP address>/ (for example, http://192.168.1.3/)

For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon 💙, click it.
   The extender menu displays.

5. Select **Settings > Wireless**.
   The Wireless page displays.

6. To enable the Smart Connect feature, select the **Yes** radio button.

   **Note**: For you to use this feature, the 2.4 GHz and 5 GHz networks must use the same SSID and password.

7. To disable the Smart Connect feature, select the **No** radio button.
   If you disable this feature, you can set a new SSID and password for the extender’s 2.4 GHz and 5 GHz networks in the **Network Name (SSID)** and **WiFi Password** fields on this page.

8. Click the **SAVE** button.
   Your settings are saved.

**View connected devices**

You can view a list of devices that are connected to the extender network.
To view connected devices:
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifietext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** http://mywifietext/ or http://mywifietext.local/
     - **Mac computers, iOS devices, and Linux devices.** http://mywifietext.local/
     - **Android devices.** http://<extender’s IP address>/ (for example, http://192.168.1.3/)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.
3. Enter your admin user name and password and click the LOG IN button.
The Status page displays.
4. If your browser displays the Menu icon, click it.
The extender menu displays.
5. Select **Settings > Connected Devices.**
The Connected Devices page displays. The devices connected to the extender displays on the page.

View WiFi settings

To view the WiFi settings:
1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifietext.local/ in the address field of the browser.
• If you enabled the One WiFi Name feature, enter one of the following URLs:
  - **Windows-based computers.** http://mywifiext/ or http://mywifiext.local/
  - **Mac computers, iOS devices, and Linux devices.** http://mywifiext.local/
  - **Android devices.** http://<extender’s IP address>/ (for example, http://192.168.1.3/)
For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
The Status page displays.

4. If your browser displays the **Menu** icon , click it.
The extender menu displays.

5. Select **Settings > Wireless.**
The Wireless page displays the WiFi settings.

### Change the WiFi network name

**To change the WiFi network name:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter **http://mywifiext.local/** in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** http://mywifiext/ or http://mywifiext.local/
     - **Mac computers, iOS devices, and Linux devices.** http://mywifiext.local/
     - **Android devices.** http://<extender’s IP address>/ (for example, http://192.168.1.3/)
For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.
3. Enter your admin user name and password and click the **LOG IN** button. The Status page displays.

4. If your browser displays the **Menu** icon, click it. The extender menu displays.

5. Select **Settings > Wireless**. The Wireless page displays.

6. In the 2.4 GHz or 5 GHz **Network Name (SSID)** field, type a new network name.

7. Click the **SAVE** button. Your settings are saved.

**Turn off the SSID broadcast to create a hidden network**

By default, the extender broadcasts its WiFi signal so that its WiFi network names (SSIDs) are easy for you to find and connect to from your computer, tablet, or smartphone. You can turn off the SSID broadcast to create a hidden WiFi network. To connect to a hidden network you must know its SSID and password and manually enter them.

**To turn off the SSID broadcast to create a hidden network:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifieext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifieext/` or `http://mywifieext.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifieext.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the LOG IN button. The Status page displays.

4. If your browser displays the Menu icon ☰, click it. The extender menu displays.

6. Clear the Broadcast the Network Name (SSID) check box.

7. Click the SAVE button. Your settings are saved.

**Disable or enable the WiFi radios**

By default, the extender’s WiFi radios broadcast signals in the 2.4 GHz and 5 GHz bands. If you disable the WiFi radios, then no one can connect with WiFi to the extender.

**To enable or disable the WiFi radios:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter <http://mywifieExt.local/> in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** <http://mywifieExt/> or <http://mywifieExt.local/>
     - **Mac computers, iOS devices, and Linux devices.** <http://mywifieExt.local/>
     - **Android devices.** <http://<extender’s IP address>/> (for example, <http://192.168.1.3/>)
       
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the LOG IN button. The Status page displays.

4. If your browser displays the Menu icon ☰, click it.
The extender menu displays.

5. Select **Settings > Wireless**.
   
   The Wireless page displays.

6. Select or clear the **Enable 2.4 GHz WiFi** check box.
7. Select or clear the **Enable 5 GHz WiFi** check box.
8. Click the **SAVE** button.
   
   Your settings are saved.

### Change the WiFi speed

The extender’s 2.4 GHz network WiFi speed is set to a specific speed after it connects to the router. You can change only the 5 GHz WiFi speed.

**To change the WiFi speed:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   
   • If you did not enable the One WiFi Name feature, enter **http://mywifiext.local/** in the address field of the browser.
   
   • If you enabled the One WiFi Name feature, enter one of the following URLs:
     
     - **Windows-based computers.** http://mywifiext/ or http://mywifiext.local/
     
     - **Mac computers, iOS devices, and Linux devices.** http://mywifiext.local/
     
     - **Android devices.** http://<extender’s IP address>/ (for example, http://192.168.1.3/)
       
       For more information about how to find your extender’s IP address, see **Find the extender’s IP address** on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   
   The Status page displays.

4. If your browser displays the **Menu** icon ☑, click it.
   
   The extender menu displays.

5. Select **Settings > Wireless**.
The Wireless page displays.

6. In the 5 GHz network **WiFi Speed** menu, select a speed.
7. Click the **SAVE** button.
   Your settings are saved.

### Use WPS to add a computer to the extender’s WiFi network

WPS (WiFi Protected Setup) lets you connect a computer or WiFi device to the extender’s network without entering the WiFi network passphrase or key. Instead, you use a **WPS** button or enter a PIN to connect.

If you use the push button method, the WiFi device that you are trying to connect must include a physical button or a software button. If you use the PIN method, you must know the PIN of the WiFi device that you are trying to connect.

WPS supports WPA and WPA2 WiFi security. If your extender network is open (no WiFi security is set), connecting with WPS automatically sets WPA + WPA2 WiFi security on the extender network and generates a random passphrase. You can view this passphrase on the WiFi Settings page (for more information, see [View WiFi settings](#) on page 39).

### Use WPS with the push button method

For you to use the push button method to connect a WiFi device to the extender’s WiFi network, the WiFi device that you are trying to connect must include a physical **WPS** button or an onscreen **WPS** button that you can click.

**To use WPS to add a WPS-enabled device to the extender’s WiFi network:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   
   - If you did not enable the One WiFi Name feature, enter [http://mywifext.local/](http://mywifext.local/) in the address field of the browser.
If you enabled the One WiFi Name feature, enter one of the following URLs:

- **Mac computers, iOS devices, and Linux devices.** [http://mywifiext.local/](http://mywifiext.local/)
- **Android devices.** [http://<extender’s IP address>/](http://<extender’s IP address>/) (for example, [http://192.168.1.3/](http://192.168.1.3/))

For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon, click it.
   The extender menu displays.

5. Select **Settings > Do More > Connect Devices (WPS)**.
   The Connected Devices (WPS) page displays.

6. Leave the **Push Button (recommended)** radio button selected.

7. Click the **WPS** button.
   For two minutes, the extender attempts to add the computer or WiFi device to its WiFi network.

8. Within two minutes, go to the computer WiFi device and press or click its **WPS** button.

9. To verify that the WiFi device is connected to the extender’s WiFi network, select **Settings > Connected Devices**.
   The WiFi device displays onscreen.

**Use WPS with the PIN method**

To use the PIN method to connect a WiFi device to the extender’s WiFi network, you must know the PIN of the WiFi device that you are trying to connect.
To add a computer or WiFi device to the extender’s WiFi network:

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifieext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - Mac computers, iOS devices, and Linux devices. http://mywifieext.local/
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the LOG IN button.
   The Status page displays.

4. If your browser displays the Menu icon, click it.
   The extender menu displays.

   The Connect Devices (WPS) page displays.

6. Select the PIN Number radio button.
   The page adjusts.

7. Type the PIN of the WiFi device in the field.

8. Click the NEXT button.
   For four minutes, the extender attempts to find the computer or WiFi device.

9. Within four minutes, go to the WiFi device and use its WPS software to join the WiFi network.

10. To verify that the WiFi device is connected to the extender’s WiFi network, select Settings > Connected Devices.
    The WiFi device displays onscreen.
Deny access to a computer or WiFi device

By default, access control is disabled so that it is easy for you to connect to the extender’s WiFi networks.

You can deny network access to specific computers and WiFi devices based on their MAC addresses. Each network device is assigned a MAC address, which is a unique 12-character physical address, containing the hexadecimal characters 0–9, a–f, or A–F only, and separated by colons (for example, 00:09:AB:CD:EF:01). Typically, the MAC address is on the label of the WiFi device. If you cannot access the label, you can display the MAC address using the network configuration utilities of the computer. You might also find the MAC addresses on the Connected Devices page (see View connected devices on page 38).

To use WiFi access control to deny access:

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifieext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - Mac computers, iOS devices, and Linux devices. http://mywifieext.local/
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the LOG IN button. The Status page displays.
4. If your browser displays the Menu icon, click it. The extender menu displays.
6. In the WiFi Devices section, select the Enable Access Control check box.
The WiFi devices table displays the names and MAC addresses of WiFi devices that are connected to the extender.

7. Select the **Deny** check box for the device.

8. Click the **SAVE** button.
   Your settings are saved and that device cannot connect to the extender’s WiFi network.

## Set up an access schedule

You can control access by all users during specific periods of the day. You can set up an access schedule that prevents the extender’s wireless or wired connection to the router based on the times that you set.

**To set up an access schedule:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifie.x.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifie.x/` or `http://mywifie.x.local/
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifie.x.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon, click it.
   The extender menu displays.

5. Select **Do More > Access Schedule.**
   The Access Schedule page displays.
6. Select the **Access Schedule On** radio button.  
The page adjusts.

7. In the **Days** menu and the **Time** menu, select the day and time when you want to disable the extender's wireless or wired connection to the router.

8. Click the **Add Time** button to add the time that you specified to the Scheduled Times table.

9. Click the **SAVE** button.  
Your settings are saved.

---

**Change the extender’s device name**

The default device name is the extender's model number.

**To change the extender’s device name:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter **http://mywifieext.local/** in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Mac computers, iOS devices, and Linux devices.** [http://mywifieext.local/](http://mywifieext.local/)
     - **Android devices.** [http://<extender’s IP address>/](http://<extender’s IP address>/) (for example, [http://192.168.1.3/](http://192.168.1.3/))  
       For more information about how to find your extender’s IP address, see **Find the extender’s IP address** on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.  
The Status page displays.

4. If your browser displays the **Menu** icon  
   click it.  
The extender menu displays.

5. Select **Settings > Wireless.**  
The Wireless page displays.
6. Scroll down and click the **IP Address** heading.
   The page expands.

7. In the **Device Name** field, type a name.

8. Click the **SAVE** button.
   Your settings are saved.

---

Set up the extender to use a static IP address

The extender comes set up to use a dynamic IP address, which is the correct setting for most home networks.

**To set up the extender to use a static IP address:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:

   - If you did not enable the One WiFi Name feature, enter `http://mywifiext.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers**: `http://mywifiext/` or `http://mywifiext.local/`
     - **Mac computers, iOS devices, and Linux devices**: `http://mywifiext.local/`
     - **Android devices**: `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)

   For more information about how to find your extender’s IP address, see **Find the extender’s IP address** on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon 
   , click it.
   The extender menu displays.

5. Select **Settings > Wireless**.
   The Wireless page displays.

6. Scroll down and click the **IP Address** heading.
By default, the **Dynamically get IP Address from Router** radio button is selected.

7. Select the **Use Static IP Address** radio button.

8. Complete the fields to specify the IP network IP addresses.

9. Click the **SAVE** button.
   Your settings are saved.

**Configure a router with advanced MAC settings to work with your extender**

If you enabled a WiFi MAC filter, WiFi access control, or access control list (ACL) on your router, when a WiFi device connects through the extender to your router, the MAC address of the WiFi device shown on the router is translated to another MAC address.

If your router’s MAC filter, WiFi access control, or ACL is enabled, the WiFi device connects to the extender but cannot get an IP address from the extender and cannot access the Internet.

To allow the WiFi device to receive an IP address from the extender and access the Internet, you must provide translated MAC address to the router.

**To add a translated MAC address to your router and reserve an IP address for your extender**

1. Log in to your router and disable the MAC filter, WiFi access control, or ACL.
   For more information about how to disable your router’s MAC filter, WiFi access control, or ACL, see your router’s documentation.

2. Power on the extender and connect all of your WiFi devices to the extender.

3. Make sure that the Router Link LED remains lit.
4. Log in to your extender:
   a. Launch a web browser from a computer or mobile device that is connected to your extender network.
   b. Log in to your extender:
      • If you did not enable the One WiFi Name feature, enter http://mywifiext.local/ in the address field of the browser.
      • If you enabled the One WiFi Name feature, enter one of the following URLs:
      A login page displays.
   c. Enter your admin user name and password and click the LOG IN button. The Status page displays.

5. Select Settings > Connected Devices.
The Connected Devices page displays the MAC addresses and virtual MAC addresses for computers and WiFi devices that are connected to the extender network.

6. On the router, add the extender’s virtual MAC address and all the virtual MAC addresses connected to the extender network to your router’s MAC filter table.

   **Note:** To reserve a specific IP address for the extender, you must specify the first virtual MAC address that displays for your extender’s 2.4 GHz or 5 GHz network in your router’s IP reservation table. (The first virtual MAC address that displays for your extender’s 2.4 GHz and 5 GHz networks is the same.)

7. Enable the router’s MAC filter, wireless access control, or ACL.

**Boost your video streaming with FastLane technology**

Get the most out of your HD entertainment with FastLane technology. With FastLane technology, the extender connects to your router using one band and connects to your devices using another band. Because a band is dedicated to each function, performance is enhanced.
If all your devices and your WiFi router support only the 2.4 GHz band, or all your devices and your WiFi router support only the 5 GHz band, do not enable FastLane Technology. When you enable FastLane Technology, two options are available:

- Use the 2.4 GHz band to connect the extender to the WiFi devices and use the 5 GHz band to connect the extender to the WiFi router. Use this mode if your WiFi router supports the 5 GHz band but the devices that you want to use for gaming and streaming support the 2.4 GHz band.

- Use the 5 GHz band to connect the extender to the WiFi devices and use the 2.4 GHz band to connect the extender to the WiFi router. Use this mode if the devices that you want to use for gaming and streaming support the 5 GHz band but your WiFi router supports the 2.4 GHz band.

**To activate FastLane mode:**

1. Launch a web browser from a computer or mobile device that is connected to your extender network.

2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter `http://mywifilex.local/` in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
     - **Windows-based computers.** `http://mywifilex/` or `http://mywifilex.local/`
     - **Mac computers, iOS devices, and Linux devices.** `http://mywifilex.local/`
     - **Android devices.** `http://<extender’s IP address>/` (for example, `http://192.168.1.3/`)
     
     For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.

3. Enter your admin user name and password and click the **LOG IN** button.
   The Status page displays.

4. If your browser displays the **Menu** icon, click it.
   The extender menu displays.

5. Select **Do More > FastLane**.
   The FastLane Technology page displays.

6. Select the **FastLane Technology** radio button.
   The page adjusts and displays two more radio buttons.
7. Select a radio button:
   - Router-to-Extender in 2.4 GHz only and Extender-to-Device in 5 GHz only
   - Router to Extender in 5 GHz only and Extender-to-Device in 2.4 GHz only

8. Click the SAVE button.
   Your changes are saved.

Enable or disable 20/40 MHz coexistence

By default, 20/40 MHz coexistence is enabled to prevent interference between WiFi networks in your environment at the expense of the WiFi speed. If no other WiFi networks are present in your environment, you can clear the Enable 20/40 MHz Coexistence check box to increase the WiFi speed to the maximum supported speed.

To enable or disable 20/40 MHz coexistence:

1. Launch a web browser from a computer or mobile device that is connected to your extender network.
2. Log in to your extender:
   - If you did not enable the One WiFi Name feature, enter http://mywifiext.local/ in the address field of the browser.
   - If you enabled the One WiFi Name feature, enter one of the following URLs:
       For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

   A login page displays.
3. Enter your admin user name and password and click the LOG IN button.
   The Status page displays.
4. If your browser displays the Menu icon, click it.
   The extender menu displays.
5. Select Settings > Wireless.
   The Wireless page displays the WiFi settings.
6. Enable or disable 20/40 MHz coexistence:
   • To enable 20/40 MHz coexistence, select the **Enable 20/40 MHz Coexistence** check box.
   • To disable 20/40 MHz coexistence, clear the **Enable 20/40 MHz Coexistence** check box.

7. Click the **SAVE** button.
   Your settings are saved.
5 FAQs and troubleshooting

This chapter contains the following topics:

- FAQs
- Find the extender’s IP address
- Cannot connect to the extender
- Cannot join a WiFi network and receive an error message
- Cannot access mywifiext.net
FAQs

This section provides answers for difficulties you might experience with the extender.

The web browser setup keeps asking me for my network password (passphrase) or security key, and I am sure that I entered the correct password. What can I do?

The extender is probably placed at the borderline of the range covered by the router or access point. To improve your signal strength, move your extender closer to your router and make sure that the Router Link LED lights solid white or amber. The LED lights as follows:

- **Solid green.** Best connection
- **Solid amber.** Good connection
- **Solid red.** Poor connection
- **Off.** No connection

If you are using WEP security, make sure that you are typing the network password in the correct field.

My router security is WEP, and I entered the wrong password or security key on the extender. I cannot access the extender anymore. What can I do?

The extender cannot check to see if the WEP password is correct. If you entered the wrong password, your WiFi-enabled computer or mobile device is not able to get the IP address from the extender. You must reset the extender to its factory default settings to get the IP address back.

Can I set up the extender in extender mode if I connect it to the router or access point with an Ethernet cable?

No. The extender is designed to connect wirelessly to the router or access point if it is in extender mode. If the extender is in access point mode, you can connect it to the router or access point with an Ethernet connection. For more information about access point mode, see Install your extender in access point mode on page 14.

I am connected to NETGEAR_EXT and launched a browser and I can't I see the web browser setup guide. What can I do?
Try these troubleshooting steps:

- Make sure that the Client Link LED is white and that you are using a valid IP address.
- Relaunch the web browser and enter www.mywifiext.net in the address field. Enter your admin user name and password and click the LOG IN button.
- If you are installing the extender as an access point, make sure that you are connecting your computer or WiFi device to the extender through a WiFi connection instead of an Ethernet connection.
- Make sure that your computer is set up to use DHCP (most are).

**I forgot my admin user name address and password. What can I do?**

On the login window, click the **Username & Password Help** link to answer the security questions that you set up during the initial setup. For more information, see Recover a forgotten user name or password on page 24.

**To restore factory settings:**

1. Use a sharp object such as a pen or paper clip to press and hold the **Reset** button on the extender for seven seconds until the Power LED lights amber.
2. Release the **Reset** button and wait for the extender to reboot. The extender resets and returns to the factory default settings.

**Find the extender’s IP address**

If your extender and router use the same WiFi network name (SSID) and you want to log in to your extender using an Android device, you must use the extender’s IP address. You can log in to your router to find your extender’s IP address. If you own a NETGEAR router, use the following procedure to find the extender’s IP address. If you do not own a NETGEAR router, see your router’s documentation.

**Note:** The following instructions might not apply to your NETGEAR router. For more information, see your NETGEAR router’s user manual.

**To log in to your extender and find your extender’s IP address:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**. A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

4. Select **Attached Devices**.
   A list of devices connected to your router displays.

5. Find your extender in the list and note your extender’s IP address.

**Cannot connect to the extender**

If you cannot connect to the extender, determine what prevents you from connecting:

- If you cannot access [www.mywifiest.net](http://www.mywifiest.net), see **Cannot access mywifiest.net** on page 60 for more information.
- If you forgot your user name or password, click the **Username & Password Help** link. For more information, see **FAQs** on page 57.
- If your browser displays an error page, include `http://` in the address field of your browser by typing `http://www.mywifiest.net`.
- If you already set up the extender but can no longer connect to it over WiFi, check to see if the Client Link LED is off.
- If you cannot get a WiFi connection working, you can use an Ethernet cable to connect your computer to the extender.

**Cannot join a WiFi network and receive an error message**

To join a WiFi network, you must know its network name (also called the SSID) so that you can select it. If the network is secure, you must know the passphrase or key. If the extender does not connect to the network that you select, the cause might be one of the following:

- It is possible that you typed the network name, passphrase, or key incorrectly. Use the Smart Setup (see **Run the Smart Setup installation** on page 19) to select a WiFi network and retype the passphrase or key. The passphrase or key is case-sensitive. For example, PASSWORD25 is not the same as Password25 or password25.
• If the extender cannot detect your WiFi network, check to see if your WiFi network is still working. Make sure that the WiFi router is turned on. If possible, move the extender closer to the WiFi router.

• If the extender Client Link LED is red, the WiFi connection between the WiFi router and the extender is poor. You can establish the best connection with a clear line of sight between the extender and the WiFi router. Make sure that no physical obstacles exist between the extender and the WiFi router, and try to move the extender closer to the WiFi router.

If you use the Smart Setup, and the extender does not connect to the WiFi router, does not connect to the Internet, or cannot get an IP address from the WiFi router, the Smart Setup displays a message to notify you that the extender is not configured.

To run the Smart Setup again, click the **YES** button. To manually configure the extender, click the **NO, CONFIGURE MANUALLY** button.

### Cannot access mywifiext.net

When you try to access [www.mywifiext.net](http://www.mywifiext.net) to set up your extender, you might receive an error message that says you are not connected to the extender’s WiFi network. This website is not a regular Internet website. It is a local web address used to log in to the extender web interface and view the extender’s settings.

Your computer or mobile device must be connected to your extender network to access [www.mywifiext.net](http://www.mywifiext.net).

Try these troubleshooting tips to connect to [www.mywifiext.net](http://www.mywifiext.net):

• If you’re trying to access [www.mywifiext.net](http://www.mywifiext.net) for the first time to set up your extender, see Connect with the NETGEAR installation assistant on page 13 and follow the instructions.

• After you connect your computer or mobile device to the extender network, make sure that the extender’s Client Link LED is solid white. If the Client Link LED is not lit, open your computer’s or mobile device’s WiFi connection manager and make sure that your device is still connected to the extender network.

• Launch a web browser and enter the extender’s default IP address, which is **192.168.1.250**.

If this IP address does not work, it is possible that your extender’s IP address might have changed. You can log in to your router to view your extender’s IP address. For more information, see Find the extender’s IP address on page 58.
• If your extender and router use the same WiFi network name (SSID), enter http://<extender’s IP address>/ (for example, http://192.168.1.3/). For more information about how to find your extender’s IP address, see Find the extender’s IP address on page 58.

• Clear your web browser’s cache and browsing history and try again. For more information, see the help content for your web browser.

• Try using another web browser.

• Assign a static IP address to your computer. Before you change any network settings, note your current Default gateway (Windows) or Router (Mac) address. Use the IP address 192.168.1.249 and the subnet mask 255.255.255.0. For more information, see your computer’s documentation.
Supplemental information

This appendix covers the following topics:

- Factory default settings
- Technical and environmental specifications
Factory default settings

To reset the extender to factory default settings, you can use the Factory Reset button on the side panel or you can log in and click the onscreen RESET button. For more information, see Return the extender to its factory default settings on page 29.

The following table shows the factory default settings.

Table 2. Factory default settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smart Setup</td>
<td>Enabled</td>
</tr>
<tr>
<td>WiFi communication</td>
<td>Enabled</td>
</tr>
<tr>
<td>WiFi network name (SSID)</td>
<td>NETGEAR_EXT</td>
</tr>
<tr>
<td>Security</td>
<td>Disabled</td>
</tr>
<tr>
<td>Transmission speed</td>
<td>Auto¹</td>
