Support
Thank you for selecting NETGEAR products.
After installing your device, locate the serial number on the label of your product and use it to register your product at https://my.netgear.com. You must register your product before you can use NETGEAR telephone support. NETGEAR recommends registering your product through the NETGEAR website. For product updates and web support, visit http://support.netgear.com.
Phone (US & Canada only): 1-888-NETGEAR.
Phone (Other Countries): Check the list of phone numbers at http://support.netgear.com/general/contact/default.aspx.

Appendix E  Notification of Compliance
Getting Started

This manual describes how to configure and operate the GS752TXS and GS728TXS Smart Switches by using the web-based graphical user interface (GUI). The manual describes the software configuration procedures and explains the options available within those procedures.

Note: For information about issues and workarounds, see the release notes for the GS752TXS and GS728TXS Smart Switches.

Getting Started with the GS752TXS and GS728TXS Smart Switches

This chapter provides an overview of starting your NETGEAR GS752TXS/GS728TXS Smart Switch and accessing the user interface. It also leads you through the steps to use the Smart Control Center utility. This chapter contains the following sections:

- Switch Management Interface
- Connect the Switch to the Network
- Discover a Switch in a Network with a DHCP Server
- Discover a Switch in a Network without a DHCP Server
- Configure the Network Settings on the Administrative System
- Access the Management Interface from a Web Browser
- Understand the User Interfaces
- Interface Naming Convention
- Online Help
- Registration
Switch Management Interface

The NETGEAR GS752TXS and GS728TXS Smart Switches contain an embedded web server and management software for managing and monitoring switch functions. The GS752TXS/GS728TXS functions as a simple switch without the management software. However, you can use the management software to configure more advanced features that can improve switch efficiency and overall network performance.

Web-based management lets you monitor, configure, and control your switch remotely using a standard web browser instead of using expensive and complicated SNMP software products. From your web browser, you can monitor the performance of your switch and optimize its configuration for your network. You can configure all switch features, such as VLANs, QoS, and ACLs by using the web-based management interface.

NETGEAR provides the Smart Control Center utility with this product. This program runs under Microsoft Windows XP, Windows 2000, or Windows Vista and provides a front end that discovers the switches on your network segment (L2 broadcast domain). When you power up your switch for the first time, use the Smart Control Center to discover the switch and view the network information that has been automatically assigned to the switch by a DHCP server; or, if no DHCP server is present on the network, use the Smart Control Center to discover the switch and assign static network information.

In addition to enabling NETGEAR switch discovery, the Smart Control Center provides several utilities to help you maintain the NETGEAR switches on your network, such as password management, firmware upgrade, and configuration file backup. For more information, see Appendix A, Smart Control Center Utilities.

Connect the Switch to the Network

To enable remote management of the switch through a web browser or SNMP, you must connect the switch to the network and configure it with network information (an IP address, subnet mask, and default gateway). The switch has a default IP address of 192.168.0.239 and a default subnet mask of 255.255.255.0.

To change the default network information on the switch, use one of the following three methods:

- **Dynamic assignment through DHCP.** DHCP is enabled by default on the switch. If you connect the switch to a network with a DHCP server, the switch obtains its network information automatically. You can use the Smart Control Center to discover the automatically assigned network information. For more information, see Discover a Switch in a Network with a DHCP Server on page 11.

- **Static assignment through the Smart Control Center.** If you connect the switch to a network that does not have a DHCP server, you can use the Smart Control Center to assign a static IP address, subnet mask, and default gateway. For more information, see Discover a Switch in a Network without a DHCP Server on page 12.

- **Static assignment by connecting from a local host.** If you do not want to use the Smart Control Center to assign a static address, you can connect to the switch from a
host (administrative system) in the 192.168.0.0/24 network and change the settings by using the web management interface on the switch. For information about how to set the IP address on the administrative system so it is in the same subnet as the default IP address of the switch, see Configure the Network Settings on the Administrative System on page 14.

Discover a Switch in a Network with a DHCP Server

This section describes how to set up your switch in a network that has a DHCP server. The DHCP client on the switch is enabled by default. When you connect it to your network, the DHCP server will automatically assign an IP address to your switch. Use the Smart Control Center to discover the IP address automatically assigned to the switch.

➢ To install the switch in a network with a DHCP server:

1. Connect the switch to a network with a DHCP server.
2. Power on the switch by connecting its power cord.
3. Install the Smart Control Center on your computer.
4. Start the Smart Control Center.
5. Click Discover for the Smart Control Center to find your switch.

A screen similar to the one shown in the following figure displays.
6. Make a note of the displayed IP address assigned by the DHCP server.
   You will need this value to access the switch directly from a web browser (without using the Smart Control Center).

7. Select your switch by clicking the line that displays the switch, then click the **Web Browser Access** button.
   The Smart Control Center displays a login window.

   ![Login Window](image)

   Use your web browser to manage your switch. The default password is **password**. Use this screen to manage your switch. For more information, see *Use the Web Interface* on page 18.

**Discover a Switch in a Network without a DHCP Server**

This section describes how to use the Smart Control Center to set up your switch in a network without a DHCP server. If your network has no DHCP service, you must assign a static IP address to your switch. If you choose, you can assign it a static IP address, even if your network has DHCP service.

➢ **To assign a static IP address:**

1. Connect the switch to your existing network.
2. Power on the switch by connecting its power cord.
3. Install the Smart Control Center on your computer.
4. Start the Smart Control Center.
5. Click **Discover** for the Smart Control Center to find your GS752TXS/GS728TXS switch.
   The utility broadcasts Layer 2 discovery packets within the broadcast domain to discover the switch.
6. Select the switch, then click **Configure Device**.

   The screen expands to display additional fields at the bottom.

7. Select the **Disabled** radio button to disable DHCP.

8. Enter the static switch IP address, gateway IP address, and subnet mask for the switch, and then type your password.

   **Tip:** You must enter the current password every time you use the Smart Control Center to update the switch setting. The default password is **password**.

9. Click **Apply** to configure the switch with the network settings.

   Ensure that your computer and the switch are in the same subnet. Make a note of these settings for later use.
Configure the Network Settings on the Administrative System

If you choose not to use the Smart Control Center to configure the network information on the switch, you can connect directly to the switch from an administrative system, such as a computer or laptop. The IP address of the administrative system must be in the same subnet as the default IP address on the switch. For most networks, this means you must change the IP address of the administrative system to be on the same subnet as the default IP address of the switch (192.168.0.239).

The method to change the IP address on an administrative system varies depending on the operating system version. You need Windows Administrator privileges to change these settings. The following procedures show how to change the static IP address on a computer running a Microsoft Windows 7.

➢ To modify the network settings on your administrative system:

1. Open the Control Panel and click Network and Sharing Center.
2. Click the Local Area Connection link.
3. In the Local Area Connection Status window, click **Properties**.
   The Local Area Connection Properties window displays.

4. Select the **Internet Protocol Version 4 (TCP/IPv4)** option, and then click **Properties**.
5. Select **Use the following IP address** and set the IP address of the administrative system to an address in the 192.168.0.0 network, such as 192.168.0.200.

The IP address must be different from that of the switch but within the same subnet.

**WARNING:**

When you change the IP address of your administrative system, you lose your connection to the rest of the network. Be sure to write down your current network address settings before you change them.

6. Click **OK**.

➢ **To configure a static address on the switch:**

1. Use a straight-through cable to connect the Ethernet port on the administrative system directly to any port on the GS752TXS/GS728TXS.

2. Open a web browser on your computer and connect to the management interface.

   For more information, see *Access the Management Interface from a Web Browser* on page 17.

3. Change the network settings on the switch to match those of your network.

   For more information, see *IP Configuration* on page 33.

After you change the network settings on the switch, return the network configuration on your administrative system to the original settings.
Access the Management Interface from a Web Browser

You must be able to ping the IP address of the switch web management interface from your administrative system for web access to be available. If you used the Smart Control Center to set up the IP address and subnet mask, either with or without a DHCP server, use that IP address in the address field of your web browser. If you did not change the IP address of the switch from the default value, enter 192.168.0.239 in the address field.

To access the switch management interface, use one of the following methods:

- From the Smart Control Center, select the switch and click **Web Browser Access**.
- Open a web browser and enter the IP address of the switch in the address field.

To access the management interface from a web browser:

1. Open a web browser.
   
   The utility discovers all switches in the same Layer 2 domain as the administrative system.

2. Select the switch to access.

3. Click **Web Browser Access**.

A web browser launches and opens to the switch Login screen.
To access the management interface from the Smart Control Center:

1. Open a web browser.
2. Enter the IP address of the switch in the address field of the browser.

Understand the User Interfaces

The GS752TXS and GS728TXS Smart Switches software includes a set of comprehensive management functions for configuring and monitoring the system by using one of the following methods:

- Web user interface
- Simple Network Management Protocol (SNMP)

Each of the standards-based management methods allows you to configure and monitor the components of the GS752TXS and GS728TXS Smart Switches software. The method you use to manage the system depends on your network size and requirements, and on your preference.

This manual describes how to use the web interface to manage and monitor the system.

Use the Web Interface

To access the switch by using a web browser, the browser must meet the following software requirements:

- HTML version 4.0, or later
- HTTP version 1.1, or later
- Java Runtime Environment 1.6 or later

To log on to the web interface:

1. Open a web browser and enter the IP address of the switch in the web browser address field.
   The login screen displays.
2. Type the password in the Password field.
   The factory default password is **password**. Passwords are case-sensitive.
3. Click **Login**.
   After the system authenticates you, the System Information screen displays.
The following figure shows the layout of the Smart Switch web interface.

![Smart Switch Web Interface Diagram]

**Figure 1. Smart Switch Web Interface**

**Navigation Tabs, Configuration Menus, and Links**

The navigation tabs along the top of the web interface give you quick access to the various switch functions. The tabs are always available and remain constant, regardless of which feature you configure.

When you select a tab, the features for that tab appear as links directly under the tabs. The configuration menu links in the blue bar change according to the navigation tab that is selected.

The configuration screens for each feature are available as links in the menu on the left side of the screen. Some items in the menu expand to reveal multiple submenu links, as **Figure 2 on page 20** shows. When you click a link that includes multiple submenu links, the item is preceded by a down arrow symbol and expands to display the additional screens.
Configuration and Status Options

The area directly under the configuration menus and to the right of the links displays the configuration information or status for the screen you select. On screens that contain configuration options, you can input information into fields or select options from drop-down lists.

Each screen contains access to the HTML-based help that explains the fields and configuration options for the screen. Each screen also contains command buttons.

The following table shows the command buttons that are used throughout the screens in the web interface:

**Table 1. Command buttons**

<table>
<thead>
<tr>
<th>Button</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add</td>
<td>Places the new item configured in the heading row of a table.</td>
</tr>
<tr>
<td>Apply</td>
<td>Sends the updated configuration to the switch. Configuration changes take effect immediately.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Abandons the configuration changes on the screen and resets the data to the previous values.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the selected item.</td>
</tr>
<tr>
<td>Refresh</td>
<td>Refreshes the screen with the latest information from the device.</td>
</tr>
<tr>
<td>Logout</td>
<td>Ends the session.</td>
</tr>
<tr>
<td>Clear</td>
<td>Clears all information and returns the switch to its default settings.</td>
</tr>
</tbody>
</table>
Device View

The Device View is a Java applet that displays the ports on the switch. This graphic provides an alternate way to navigate to configuration and monitoring options. The graphic also provides information about device ports, current configuration and status, table information, and feature components.

The Device View is available by selecting System > Device View.

Depending upon the status of the port, the port color in Device View is either red, green, gray, or black. Green indicates that the port is enabled. Red indicates that an error has occurred on the port or that the port is administratively disabled. Gray is applicable for stack ports and indicates that the port is working in stack mode. Black indicates that no link is present. When a link is present, the color of the port speed LED is either green or yellow.

A green LED indicates operational ports at the following link speed:

- **Copper ports.** 1000 Mbps
- **Fiber SFP+ ports.** 10 Gbps

A yellow LED indicates operational ports at the following link speed:

- **Copper ports.** 10/100 Mbps
- **Fiber SFP+ ports.** 1000 Mbps

The System LEDs are located on the left side of the front panel.

Power/Status LED

The Power LED is a bicolor LED that serves as an indicator of power and diagnostic status. The following indications are given by the following LED states:

- A solid green LED indicates that the power is supplied to the switch and operating normally.
- A solid yellow LED indicates that system is in the boot-up stage.
- No lit LED indicates that power is disconnected.

FAN Status LED

FAN status is indicated as follows:

- A solid yellow LED indicates that the fan is faulty.
- No lit LED indicates that the fan is operating normally.

Stack Master LED

The Stack Master LED is lit if there is an active stack link and the unit is in stack mode.

- A solid green LED indicates that the switch acts as a master unit in a stack of switches.
- No lit LED indicates that the switch acts as a slave member in a stack of switches.
Seven-Segment LED for the Stacking ID

A solid green LED displays the stack ID (1–6).

The following image shows the Device View of the GS728TXS.

![Device View of GS728TXS](image)

Figure 4. GS728TSX

Click the port you want to view or configure to see a menu that displays statistics and configuration options. Select the menu option to access the screen that contains the configuration or monitoring options.

**Note:** The following device view figures show the GS752TXS device.
If you click the graphic, but do not click a specific port, the main menu displays, as the following figure shows. This menu contains the same options as the navigation tabs at the top of the screen.

**Help Access**

Every screen contains a button to launch online help, which contains information to assist in configuring and managing the switch. The online help screens are context-sensitive. For example, if the IP Addressing screen is open, the help topic for that screen displays if you click Help.

**User-Defined Fields**

User-defined fields can contain 1 to 159 characters, unless otherwise noted in the field label on the configuration screen. All alphanumeric and special characters can be used except for the following (unless specifically noted for that feature):

<table>
<thead>
<tr>
<th>Character</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>\</td>
<td>Backslash</td>
</tr>
<tr>
<td>/</td>
<td>Forward slash</td>
</tr>
<tr>
<td>*</td>
<td>Asterisk</td>
</tr>
<tr>
<td>?</td>
<td>Question mark</td>
</tr>
<tr>
<td>&lt;</td>
<td>Less than</td>
</tr>
<tr>
<td>&gt;</td>
<td>Greater than</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Use SNMPv3

The GS752TXS and GS728TXS Smart Switches software supports the configuration of SNMP groups and users that can manage traps that the SNMP agent generates.

The GS752TXS and GS728TXS Smart Switches use both standard public MIBs for standard functionality and private MIBs that support additional switch functionality. All private MIBs begin with a hyphen (-) prefix. The main object for interface configuration is in -SWITCHING-MIB, which is a private MIB. Some interface configurations also involve objects in the public MIB, IF-MIB.

SNMP is enabled by default. The System Information screen, which is the screen that displays after a successful login, displays the information you need to configure an SNMP manager to access the switch. To configure information for SNMPv1 or SNMPv2, see SNMPV1/V2 on page 57.

Any user can connect to the switch using the SNMPv3 protocol, but for authentication and encryption, the switch supports only one user which is admin; therefore there is only one profile that can be created or modified.

To configure authentication and encryption settings for the SNMPv3 admin profile by using the web interface:

1. Select System > SNMP > SNMPv3 > User Configuration.

   The User Configuration screen displays.

   ![User Configuration Screen]

   The SNMPv3 Access Mode is a read-only field that shows the access privileges for the user account. The admin account always has Read/Write access, and all other accounts have Read Only access.

2. To enable authentication, select an Authentication Protocol option.

   If the authentication protocol is MD5 or SHA, the user login password will be used as SNMPv3 authentication password. To configure the login password, see Change Password on page 189.

3. To enable encryption:

   a. In the Encryption Protocol field, select the DES option to encrypt SNMPv3 packets using the DES encryption protocol.

   b. In the Encryption Key field, enter an encryption code of eight or more alphanumeric characters.

4. Click Apply.
Interface Naming Convention

The GS752TXS and GS728TXS Smart Switches support physical and logical interfaces. Interfaces are identified by their type and the interface number. All the physical ports are as follows:

- **GS752TXS.** 1–48 are gigabit ports and Port 49–52 are SFP+ ports that support both 10G and 1000M mode.
- **GS728TXS.** 1–24 are gigabit ports and Port 25–28 are SFP+ ports that support both 10G and 1000M mode.

The number of the port is identified on the front panel. You can configure the logical interfaces by using the software. The following table describes the naming convention for all interfaces available on the switch.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical</td>
<td>The physical ports include gigabit ports and are numbered sequentially starting from one using the following format: X/gY or X/xgY. X for the unit ID, g is for a 1G port, xg is for a 10G port, and Y is the port number.</td>
<td>1/g1, 1/g2, 2/g3</td>
</tr>
<tr>
<td>Link aggregation group (LAG)</td>
<td>LAG interfaces are logical interfaces that are only used for bridging functions.</td>
<td>l1, l2, l3</td>
</tr>
<tr>
<td>CPU management interface</td>
<td>This is the internal switch interface responsible for the switch base MAC address. This interface is not configurable and is always listed in the MAC Address Table.</td>
<td>c1</td>
</tr>
</tbody>
</table>
Online Help

The Help main navigation tab of the web management interface provides access to the menus that are described in the following sections:

- **Support**
- **User Guide**

Support

The Support screen provides access to the NETGEAR support website at [support.netgear.com](http://support.netgear.com).

➢ To access the support website from the web management interface:

1. Select **Help > Support**.

   The Support screen displays.

2. Click **Apply** to access the NETGEAR support site for the switch.

User Guide

The **GS752TXS and GS728TXS Smart Switches Software Administration Manual** (the guide you are now reading) is available at the NETGEAR download center at [downloadcenter.netgear.com](http://downloadcenter.netgear.com).

➢ To access the reference manual online from the web management interface:

1. Select **Help > User Guide**.

2. Click **Apply** to access the NETGEAR download center.

3. Enter the model number of the switch.

4. Locate the **GS752TXS and GS728TXS Smart Switches Software Administration Manual** on the product support web screen.
Registration

To qualify for product updates and product warranty, NETGEAR encourages you to register your product. The first time that you connect to the switch while it is connected to the Internet, you have the option to register your product. At any time, you can register your product from the web management interface, or you can visit the NETGEAR website for registration at https://my.netgear.com/registration/login.aspx.

➢ To register the switch with NETGEAR:

1. Select Help > Register.
   The Registration screen displays.

2. Click Register.
   A pop-up window opens and displays the NETGEAR product registration web screen.
3. Complete the registration form.
4. Click Submit.
Configure System Information

Use the features you access from the System navigation tab to define the switch's relationship to its environment. The System navigation tab provides access to the configuration menus described in the following sections:

- Management
- SNMP
- LLDP
- Services—DHCP Snooping

Management

This section describes how to display the switch status and specify some basic switch information, such as the management interface IP address, system clock settings, and DNS information. From the Management configuration menu, you can access the following links:

- System Information
- Slot Information
- IP Configuration
- IPv6 Network Configuration
- IPv6 Network Neighbor
- Time
- Denial of Service
- DNS
- Green Ethernet
System Information

After a successful login, the System Information screen displays. Use this screen to configure and view general device information.

➢ To define a system name, location, and contact:

1. Select System > Management > System Information.

   The System Information screen displays.

   ![System Information Screen]

2. Define the following fields:
   - **System Name**: Enter the name you want to use to identify this switch. You can use up to 255 alphanumeric characters. The factory default is blank.
   - **System Location**: Enter the location of this switch. You can use up to 255 alphanumeric characters. The factory default is blank.
   - **System Contact**: Enter the contact person for this switch. You can use up to 255 alphanumeric characters. The factory default is blank.

3. Click **Apply**.

   The system parameters are applied, and the device is updated.
The following table describes the status information the System Information screen displays.

**Table 4. System Information screen status fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product Name</td>
<td>The product name that describes the switch.</td>
</tr>
<tr>
<td>Serial Number</td>
<td>The serial number of the switch.</td>
</tr>
<tr>
<td>System Object ID</td>
<td>The base object ID for the switch’s enterprise MIB.</td>
</tr>
<tr>
<td>Date &amp; Time</td>
<td>The current date and time.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>Displays the number of days, hours, and minutes since the last system restart.</td>
</tr>
<tr>
<td>Base MAC Address</td>
<td>The universally assigned network address.</td>
</tr>
<tr>
<td>Model Name</td>
<td>The model name of the switch.</td>
</tr>
<tr>
<td>Temperature Status</td>
<td>This table shows temperature of different system sensors. The temperature is instant and can be refreshed when the REFRESH button is pressed. The maximum temperature of CPU and MACs depends on the actual hardware.</td>
</tr>
<tr>
<td>Fan Status</td>
<td>The screen shows the status of the fans. These fans remove the heat generated by the power, CPU and other chipsets, make chipsets work normally. Fan status has three possible values: OK, Failure, Not Present.</td>
</tr>
<tr>
<td>Boot Version</td>
<td>The boot code version of the switch.</td>
</tr>
<tr>
<td>Software Version</td>
<td>The software version of the switch.</td>
</tr>
</tbody>
</table>
Slot Information

Use this screen to display details of the different slots in the different units in the stack.

To display the Slot Information screen, select **System > Management > Slot Information**. A screen similar to the following displays.

![Slot Information Screen](image)

Click **Refresh** to refresh the screen with most recent data.
The following table describes the status information the Slot Information displays.

**Table 5. Slot Information status fields**

<table>
<thead>
<tr>
<th>Field</th>

</table>
IP Configuration

Use the IP Configuration screen to configure network information for the management interface, which is the logical interface used for in-band connectivity with the switch through any of the switch's front-panel ports. The configuration parameters associated with the switch’s network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

To configure the network information for the management interface:

1. Select System > Management > IP Configuration.

   The IP Configuration screen displays.

2. Select the appropriate radio button to determine how to configure the network information for the switch management interface:
   - **Dynamic IP Address (DHCP)**. Specifies that the switch must obtain the IP address through a DHCP server.
   - **Dynamic IP Address (BOOTP)**. Specifies that the switch must obtain the IP address through a BootP server.
   - **Static IP Address**. Specifies that the IP address, subnet mask, and default gateway must be manually configured. Enter this information in the fields below this radio button.

3. If you selected the Static IP Address option, configure the following network information:
   - **IP Address**. The IP address of the network interface. The factory default value is 192.168.0.239. Each part of the IP address must start with a number other than zero. For example, IP addresses 001.100.192.6 and 192.001.10.3 are not valid.
   - **Subnet Mask**. The IP subnet mask for the interface. The factory default value is 255.255.255.0.
   - **Default Gateway**. The default gateway for the IP interface. The factory default value is 192.168.0.254.
4. Specify the VLAN ID for the management VLAN.

**Note:** Make sure that the VLAN to be configured as the management VLAN exists. And make sure that the PVID of at least one port that is a port of the VLAN is the same as the management VLAN ID. For information about creating VLANs and configuring the PVID for a port, see *VLANs* on page 102.

The management VLAN is used to establish an IP connection to the switch from a workstation that is connected to a port in the same VLAN. If not specified, the active management VLAN ID is 1 (default), which allows an IP connection to be established through any port.

When the management VLAN is set to a different value, an IP connection can be made only through a port that is part of the management VLAN. It is also mandatory that the port VLAN ID (PVID) of the port to be connected in that management VLAN be the same as the management VLAN ID.

The management VLAN has the following requirements:

- Only one management VLAN can be active at a time.
- When a new management VLAN is configured, connectivity through the existing management VLAN is lost.
- The management station should be reconnected to the port in the new management VLAN.

5. Click **Apply**.
IPv6 Network Configuration

Use the IPv6 Network Configuration screen to configure the IPv6 network interface, which is the logical interface used for in-band connectivity with the switch through all of the switch's front panel ports. The configuration parameters associated with the switch's network interface do not affect the configuration of the front panel ports through which traffic is switched or routed.

To access the switch over a IPv6 network, you must initially configure the switch with IPv6 information (IPv6 prefix, prefix length, and default gateway). IPv6 can be configured using any of the following options:

- IPv6 Auto Configuration
- DHCPv6

When in-band connectivity is established, IPv6 information can be changed using any of the following:

- SNMP-based management
- Web-based management

To configure the network information for an IPv6 network:

   A screen similar to the following displays.

   ![IPv6 Network Interface Configuration](image)

2. Next to the Admin Mode field, ensure the Enable radio button is selected.

3. Determine how the switch acquires an IPv6 address:
   - IPv6 Address Auto Configuration Mode. When enabled, the network interface can acquire an IPv6 address through IPv6 Neighbor Discovery Protocol (NDP) and through the use of Router Advertisement messages. When disabled, the network interface will not use the native IPv6 address auto configuration features to acquire an IPv6 address. Auto configuration can be enabled only when DHCPv6 is not enabled on any of the management interfaces.
   - DHCPv6. Next to the Current Network Configuration Protocol field, select DHCPv6 to enable the DHCPv6 client on the interface. The switch attempts to acquire network
information from a DHCPv6 server. Selecting None disables the DHCPv6 client on the network interface. When DHCPv6 is enabled, the DHCPv6 Client DUID field displays the client identifier used by the DHCPv6 client (if enabled) when sending messages to the DHCPv6 server.

4. In the IPv6 Gateway field, specify the default gateway for the IPv6 network interface. The gateway address is in IPv6 global or link-local address format.

5. Optionally, configure one or more static IPv6 addresses for the management interface.
   a. In the IPv6 Prefix/Prefix Length field, specify the static IPv6 prefix and prefix to the IPv6 network interface. The address is in the global address format.
   b. In the EUI64 field, select True to enable the Extended Universal Identifier (EUI) flag for IPv6 address, or select False to omit the EUI flag.
   c. Click Add.

6. Click Apply.

IPv6 Network Neighbor

Use the IPv6 Network Neighbor screen to view information about the IPv6 neighbors the device has discovered through the network interface by using the Neighbor Discovery Protocol (NDP).

To access the screen, select System > Management > IPv6 Network Neighbor. A screen similar to the following displays.

![IPv6 Network Interface Neighbor Table](image)

**Table 6. IPv6 neighbor table fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6 Address</td>
<td>The IPv6 address of the neighbor.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address associated with an interface.</td>
</tr>
<tr>
<td>IsRtr</td>
<td>Indicates whether the neighbor is a router. If the neighbor is a router, the value is True. If the neighbor is not a router, the value is False.</td>
</tr>
</tbody>
</table>
Table 6. IPv6 neighbor table fields (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighbor State</td>
<td>The state of the neighbor cache entry. The following are the states for dynamic entries in the IPv6 neighbor discovery cache:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Reach.</strong> The neighbor is reachable through the network interface.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Stale.</strong> The neighbor is not known to be reachable, and the switch will begin the process to reach the neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Delay.</strong> The neighbor is not known to be reachable, and upper-layer protocols are attempting to provide reachability information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Probe.</strong> The neighbor is not known to be reachable, and the device is attempting to probe for this neighbor.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Unknown.</strong> The reachability status cannot be determined.</td>
</tr>
<tr>
<td>Last Updated</td>
<td>The amount of time that has passed since the neighbor entry was last updated.</td>
</tr>
</tbody>
</table>

**Time**

The switch supports the Simple Network Time Protocol (SNTP). You can also set the system time manually.

SNTP assures accurate network device clock time synchronization up to the millisecond. Time synchronization is performed by a network SNTP server. The switch software operates only as an SNTP client and cannot provide time services to other systems.

Time sources are established by stratum levels. Stratums define the accuracy of the reference clock. The higher the stratum (where zero is the highest), the more accurate the clock. The device receives time from stratum 1 and above since it is itself a stratum 2 device.

Information received from SNTP servers is evaluated based on the time level and server type. SNTP time definitions are assessed and determined by the following time levels:

- **T1**: Time at which the original request was sent by the client.
- **T2**: Time at which the original request was received by the server.
- **T3**: Time at which the server sent a reply.
- **T4**: Time at which the client received the server’s reply.

The device can poll Unicast server types for the server time.

Polling for unicast information is used for polling a server for which the IP address is known. SNTP servers that have been configured on the device are the only ones that are polled for synchronization information. T1 through T4 are used to determine server time. This is the preferred method for synchronizing device time because it is the most secure method. If this method is selected, SNTP information is accepted only from SNTP servers defined on the device using the SNTP Server Configuration screen.

The device retrieves synchronization information, either by actively requesting information or at every poll interval.
Time Configuration

Use the Time Configuration screen to view and adjust date and time settings.

➢ To manually configure the time:

1. Select System > Management > Time > Time Configuration.
   The Time Configuration screen displays.

2. Next to the Clock Source field, select Local.
3. In the Date field, enter the date in the DD/MM/YYYY format.
4. In the Time field, enter the time in HH:MM:SS format.

   **Note:** If you do not enter a date and time, the switch will calculate the date and time using the CPU’s clock cycle.

5. Click Apply.

➢ To configure the time by using SNTP:

1. Select System > Management > Time > Time Configuration.
2. Next to the Clock Source field, select SNTP.
   The screen refreshes, and additional fields appear.
3. Next to the Client Mode field, select Unicast or Broadcast:
   - **Unicast.** SNTP operates in a point-to-point fashion. A unicast client sends a request to a designated server at its unicast address and expects a reply from which it can determine the time and, optionally the round-trip delay and local clock offset relative to the server.
   - **Broadcast.** SNTP operates in the same manner as multicast mode but uses a local broadcast address instead of a multicast address. The broadcast address has a single subnet scope while a multicast address has Internet-wide scope.

4. Optionally, configure the following settings to non default values:
   - **Port.** The local UDP port to listen for responses/broadcasts.
   - **Unicast Poll Interval.** The interval, in seconds, between unicast poll requests expressed as a power of two when configured in unicast mode.
   - **Broadcast Poll Interval.** The interval, in seconds, between broadcast poll requests expressed as a power of two when configured in broadcast mode. Broadcasts received prior to the expiry of this interval are discarded.
   - **Unicast Poll Timeout.** The timeout value, in seconds, to wait for an SNTP response when configured in unicast mode.
   - **Unicast Poll Retry.** The number of times to retry a request to an SNTP server after the first time-out before attempting to use the next configured server when configured in unicast mode.
• **Time Zone Name.** The acronym that represents the time zone. This field is not validated against an official list of time zone acronyms.

• **Hours Offset.** The number of hours the system clock is offset from UTC, which is also known as Greenwich Mean Time (GMT).

• **Minutes Offset.** The number of minutes the system clock is offset from UTC.

5. **Click Apply.**

6. **Use the SNTP Server Configuration screen to configure the SNTP server settings, as described in **SNTP Server Configuration** on page 41.**

The SNTP Global Status table on the Time Configuration screen displays information about the system's SNTP client. The following table describes the SNTP Global Status fields.

**Table 7. Time Configuration status fields**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>Specifies the SNTP Version the client supports.</td>
</tr>
<tr>
<td>Supported Mode</td>
<td>Specifies the SNTP modes the client supports. Multiple modes can be supported by a client.</td>
</tr>
<tr>
<td>Last Update Time</td>
<td>Specifies the local date and time (UTC) the SNTP client last updated the system clock.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>Specifies the local date and time (UTC) of the last SNTP request or receipt of an unsolicited message.</td>
</tr>
<tr>
<td>Last Attempt Status</td>
<td>Specifies the status of the last SNTP request or unsolicited message for both unicast and broadcast modes. If no message has been received from a server, a status of Other is displayed. These values are appropriate for all operational modes:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Other.</strong> None of the following enumeration values.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Success.</strong> The SNTP operation was successful and the system time was updated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Request Timed Out.</strong> A directed SNTP request timed out without receiving a response from the SNTP server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Bad Date Encoded.</strong> The time provided by the SNTP server is not valid.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Version Not Supported.</strong> The SNTP version supported by the server is not compatible with the version supported by the client.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Server Unsynchronized.</strong> The SNTP server is not synchronized with its peers. This is indicated via the 'leap indicator' field on the SNTP message.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Server Kiss Of Death.</strong> The SNTP server indicated that no further queries were to be sent to this server. This is indicated by a stratum field equal to 0 in a message received from a server.</td>
</tr>
<tr>
<td>Server IP Address</td>
<td>Specifies the IP address of the server for the last received valid packet. If no message has been received from any server, an empty string is shown.</td>
</tr>
<tr>
<td>Address Type</td>
<td>Specifies the address type of the SNTP Server address for the last received valid packet.</td>
</tr>
<tr>
<td>Server Stratum</td>
<td>Specifies the claimed stratum of the server for the last received valid packet.</td>
</tr>
</tbody>
</table>
SNTP Server Configuration

Use the SNTP Server Configuration screen to view and modify information for adding and modifying Simple Network Time Protocol SNTP servers.

To configure a new SNTP server:

2. From the Server Type list, select the type of SNTP address to enter in the Address field, which is either an IP address (IPv4) or hostname (DNS).

3. Under the Address field, specify the IP address or the host name of the SNTP server.

4. If the UDP port on the SNTP server to which SNTP requests are sent is not the standard port (123), specify the port number.

5. Under the Priority field, specify the order in which to query the servers.

The SNTP client on the device continues sending SNTP requests to different servers until a successful response is received or all servers are exhausted. The request is sent to an SNTP server with a priority value of 1 first, then to a server with a priority value of 2, and so on. If more than one server has the same priority, the SNTP client contacts the servers in the order that they appear in the table.
6. Under the Version field, specify the NTP version running on the server.
7. Click Add.
8. Repeat the previous steps to add additional SNTP servers. You can configure up to three SNTP servers.

To remove an SNTP server:
1. Select the check box next to the configured server to remove.
2. Click Delete.

To change the settings for an existing SNTP server:
1. Select the check box next to the configured server.
2. Specify new values in the available fields.
3. Click Apply.

The SNTP Server Status table displays status information about the SNTP servers configured on your switch. The following table describes the SNTP Global Status fields.

Table 8. SNTP server status fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>Specifies all the existing Server Addresses. If no Server configuration exists, a message saying &quot;No SNTP server exists&quot; flashes on the screen.</td>
</tr>
<tr>
<td>Last Update Time</td>
<td>Specifies the local date and time (UTC) that the response from this server was used to update the system clock.</td>
</tr>
<tr>
<td>Last Attempt Time</td>
<td>Specifies the local date and time (UTC) that this SNTP server was last queried.</td>
</tr>
<tr>
<td>Last Attempt Status</td>
<td>Specifies the status of the last SNTP request to this server. If no packet has been received from this server, a status of Other is displayed:</td>
</tr>
<tr>
<td></td>
<td>• Other. None of the following enumeration values.</td>
</tr>
<tr>
<td></td>
<td>• Success. The SNTP operation was successful and the system time was updated.</td>
</tr>
<tr>
<td></td>
<td>• Request Timed Out. A directed SNTP request timed out without receiving a response from the SNTP server.</td>
</tr>
<tr>
<td></td>
<td>• Bad Date Encoded. The time provided by the SNTP server is not valid.</td>
</tr>
<tr>
<td></td>
<td>• Version Not Supported. The SNTP version supported by the server is not compatible with the version supported by the client.</td>
</tr>
<tr>
<td></td>
<td>• Server Unsynchronized. The SNTP server is not synchronized with its peers. This is indicated via the 'leap indicator' field on the SNTP message.</td>
</tr>
<tr>
<td></td>
<td>• Server Kiss Of Death. The SNTP server indicated that no further queries were to be sent to this server. This is indicated by a stratum field equal to 0 in a message received from a server.</td>
</tr>
</tbody>
</table>
Summer Time Configuration

Use the Summer Time Configuration screen to configure settings for summer time, which is also known as daylight saving time. Used in some countries around the world, summer time is the practice of temporarily advancing clocks during the summer months. Typically clocks are adjusted forward one or more hours near the start of spring and are adjusted backward in autumn.

To configure the summer time settings:

2. Next to the Summer Time field, select one of the following options:
   - Recurring. Summer time occurs at the same time every year. The start and end times and dates for the time shift must be manually configured.
   - Recurring EU. The system clock uses the standard recurring summer time settings used in countries in the European Union. When this field is selected, the rest of the applicable fields on the screen are automatically populated and cannot be edited.
   - Recurring USA. The system clock uses the standard recurring daylight saving time settings used in the United States. When this field is selected, the rest of the applicable fields on the screen are automatically populated and cannot be edited.
   - Non Recurring. Summer time settings are in effect only between the start date and end date of the specified year. When this mode is selected, the summer time settings do not repeat on an annual basis.

3. If the selected summer time mode is Recurring or Non Recurring, set the start and end times for the time shift:
• **Begins At**: From the appropriate lists, select the date and time on which summer time begins.
• **Ends At**: From the appropriate lists, select the date and time on which summer time ends.

4. Next to the Offset field, specify the number of minutes to shift the summer time from the standard time.
5. Next to the Zone field, specify the acronym associated with the time zone when summer time is in effect.
   
   This field is not validated against an official list of time zone acronyms.

6. Click **Apply**.

The Summer Time Status table shows information about the summer time settings and whether the time shift for summer time is currently in effect.

### Denial of Service

Use the Denial of Service (DoS) feature to configure DoS control. The switch software provides support for classifying and blocking specific types of DoS attacks.

**Configure Auto-DoS**

The Auto-DoS Configuration screen lets you automatically enable all the DoS features available on the switch, except for the L4 Port attack. For information about the types of DoS attacks the switch can monitor and block, see *Configure Denial of Service* on page 45.

➢ **To enable the Auto-DoS feature:**

1. Select **System > Management > Denial of Service > Auto-DoS Configuration**.
   
   The Auto-DoS Configuration screen displays.

   ![Auto-DoS Configuration](image)

2. Next to the Auto-DoS Mode field, select Enable.

   When an attack is detected, a warning message is logged to the buffered log and is sent to the Syslog server. At the same time, the port is shut down and can be enabled only manually by the admin user.

3. Click **Apply**.
Configure Denial of Service

The Denial of Service Configuration screen lets you to select which types of DoS attacks for the switch to monitor and block.

➢ To configure individual DoS settings:

1. Select System > Management > Denial of Service > Denial of Service Configuration.
   The Denial of Service Configuration screen displays.

2. Select the types of DoS attacks for the switch to monitor and block and configure any associated values:
   - **Denial of Service Min TCP Header Size**: Specify the minimum TCP header size allowed. If DoS TCP Fragment is enabled, the switch will drop packets that have a TCP header smaller than the configured value.
   - **Denial of Service ICMPv4**: Enabling ICMPv4 DoS prevention causes the switch to drop ICMPv4 packets that have a type set to ECHO_REQ (ping) and a size greater than the configured ICMPv4 Pkt Size. The factory default is disabled.
   - **Denial of Service Max ICMPv4 Packet Size**: Specify the maximum ICMPv4 packet size allowed. If ICMPv4 DoS prevention is enabled, the switch will drop IPv4 ICMP ping packets that have a size greater than the configured value.
   - **Denial of Service ICMPv6**: Enabling ICMPv6 DoS prevention causes the switch to drop ICMPv6 packets that have a type set to ECHO_REQ (ping) and a size greater than the configured ICMPv6 Pkt Size.
• **Denial of Service Max ICMPv6 Packet Size**: Specify the Max IPv6 ICMP packet size allowed. If ICMPv6 DoS prevention is enabled, the switch will drop IPv6 ICMP ping packets that have a size greater than this configured Max ICMPv6 Pkt Size.

• **Denial of Service First Fragment**: Enabling First Fragment DoS prevention causes the switch to check DoS options on first fragment IP packets when switch are receiving fragmented IP packets. Otherwise, switch ignores the first fragment IP packages.

• **Denial of Service ICMP Fragment**: Enabling ICMP Fragment DoS prevention causes the switch to drop ICMP Fragmented packets.

• **Denial of Service SIP=DIP**: Enabling SIP=DIP DoS prevention causes the switch to drop packets that have a source IP address equal to the destination IP address.

• **Denial of Service SMAC=DMAC**: Enabling SMAC=DMAC DoS prevention causes the switch to drop packets that have a source MAC address equal to the destination MAC address.

• **Denial of Service TCP FIN&URG&PSH**: Enabling TCP FIN & URG & PSH DoS prevention causes the switch to drop packets that have TCP Flags FIN, URG, and PSH set and TCP Sequence Number equal to 0.

• **Denial of Service TCP Flag&Sequence**: Enabling TCP Flag DoS prevention causes the switch to drop packets that have TCP control flags set to 0 and TCP sequence number set to 0.

• **Denial of Service TCP Fragment**: Enabling TCP Fragment DoS prevention causes the switch to drop packets that have a TCP payload where the IP payload length minus the IP header size is less than the minimum allowed TCP header size.

• **Denial of Service TCP Offset**: Enabling TCP Offset DoS prevention causes the switch to drop packets that have a TCP header Offset set to 1.

• **Denial of Service TCP Port**: Enabling TCP Port DoS prevention causes the switch to drop packets that have TCP source port equal to TCP destination port.

• **Denial of Service TCP SYN**: Enabling TCP SYN DoS prevention causes the switch to drop packets that have TCP Flags SYN set.

• **Denial of Service TCP SYN&FIN**: Enabling TCP SYN & FIN DoS prevention causes the switch to drop packets that have TCP Flags SYN and FIN set.

3. Click **Apply**.
DNS

You can use these screens to configure information about DNS servers the network uses and how the switch operates as a DNS client.

Configure DNS

Use this screen to configure global DNS settings and DNS server information.

➢ To configure the global DNS settings:

1. Select System > Management > DNS > DNS Configuration.

   The DNS Configuration screen displays.

2. Specify whether to enable or disable the administrative status of the DNS Client.
   • Enable: Allow the switch to send DNS queries to a DNS server to resolve a DNS domain name. The DNS is enabled by default.
   • Disable: Prevent the switch from sending DNS queries.

3. Enter the DNS default domain name to include in DNS queries.

   When the system is performing a lookup on an unqualified host name, this field is provided as the domain name (for example, if default domain name is netgear.com and the user enters test, then test is changed to test.netgear.com to resolve the name).

4. Under the DNS Server field, specify the IPv4 address to which the switch sends DNS queries.

5. Click Add.

   You can specify up to eight DNS servers. The Preference field displays the server preference order. The preference is set in the order created.

6. Click Apply to send the updated configuration to the switch. Configuration changes take effect immediately.
Configure and View Host Name-to-IP Address Information

Use this screen to manually map host names to IP addresses or to view dynamic DNS mappings.

➢ To add a static entry to the local DNS table:

1. Select **System > Management > DNS > Host Configuration**.
2. The DNS Host Configuration screen displays.

3. Under the Host Name field, specify the static host name to add.
4. Under the IPv4/IPv6 Address field, specify the IP address to associate with the host name.
5. Click **Add**.

➢ To remove an entry from the static DNS table:

1. Select the check box next to the entry to remove.
2. Click **Delete**.

➢ To change the host name or IP address in an entry:

1. Select the check box next to the entry to update.
2. Enter the new information in the appropriate field.
3. Click **Apply**.

The Dynamic Host Configuration table shows host name-to-IP address entries that the switch has learned. The following table describes the dynamic host fields:

<table>
<thead>

Click **Clear** to delete Dynamic Host Entries. The table will be repopulated with entries as they are learned.
Green Ethernet

Use this screen to configure Green Ethernet features. Using the Green Ethernet Configuration features allows for power consumption savings.

To configure the Green Ethernet settings:

1. Select **System > Management > Green Ethernet > Green Ethernet Configuration**.

   The Green Ethernet Configuration screen displays.

   ![Green Ethernet Configuration Screen](image)

2. Enable or disable the Auto Power Down Mode.
   - **Enable**. When the port link is down, the PHY will automatically go down for a short period of time and then wake up to check link pulses. This allows the port to continue to perform auto-negotiation while consuming less power when no link partner is present.
   - **Disable**. Provide full power to the PHY even if the port link is down.

3. Enable or disable the Short Cable Mode.
   - **Enable**. When the port link is up at 1 Gbps speed, the cable length test is performed, and if the length of the cable is <10m, then PHYs are put into the low power mode so only enough power is used to support a short cable.
   - **Disable**. Provide full power to the PHY regardless of cable length.

4. Enable or disable the EEE mode.
   - **Enable**. When the send and receive sides of a link are lightly loaded, the port can transition to low power mode to save power.
   - **Disable**. Provide full power to the PHY regardless of the link load.

5. Click **Apply**.

Green Ethernet Interface Configuration

Use this screen to configure per-port Green Ethernet settings.

To configure the Green Ethernet Interface settings:

1. Select **System > Management > Green Ethernet > Green Ethernet Interface Configuration**.

   The Green Ethernet Interface Configuration screen displays.
2. Select the port(s) to configure.
   - To configure a single port, select the check box associated with it, or type the port number in the Go To Interface field and click Go.
   - To configure multiple ports with the same settings, select the check box associated with each port to configure.
   - To configure all ports with the same settings, select the check box in the heading row.

3. Use the lists to enable or disable the Green Ethernet features for the selected ports:
   - **Auto Power Down Mode**: When this mode is enabled and a port link is down, the PHY will automatically go down for short period of time, and then wake up to check link pulses. This will allow performing auto-negotiation and saving power consumption when no link partner is present.
   - **Short Cable Mode**: When this mode is enabled and the port link is up and operating at the 1 Gbps speed, the cable length test is performed. If the length of the cable is less than 10m, PHYs are put into low power mode so enough power is used to support a short cable. The EEE and the Short Cable modes are not intended to be active simultaneously.
   - **EEE Mode**: When this mode is enabled and the send and receive sides of a link are lightly loaded, the port can transition to low power mode. The EEE and the Short Cable modes are not supposed to be active simultaneously.

4. Click Apply.

---

**Note**: Short cable mode is supported on the GS752TXS, but is not supported on the GS728TXS.
**Green Ethernet Detail**

Use this screen to view detailed per-port Green Ethernet information and to enable or disable Green Ethernet settings on a single port. Using the Green Ethernet features allows for power consumption savings.

> **To configure Green Ethernet mode settings for a port:**

1. Click System > Management > Green Ethernet > Green Ethernet Detail.

   The Port Green Mode Statistics screen displays.

2. From the Interface list, select the interface to configure.

3. Enable or disable the Green Ethernet features for the port:
   - **Auto Power Down Mode**: When this mode is enabled and a port link is down, the PHY will automatically go down for a short period of time, and then wake up to check link pulses. This will allow performing auto negotiation and saving power consumption when no link partner is present.
   - **Short Cable Mode**: When this mode is enabled and the port link is up and operating at the 1 Gbps speed, the cable length test is performed. If the length of the cable is less than 10m, PHYs are put into low power mode so enough power is used to support a short cable. The EEE and the Short Cable modes are not intended to be active simultaneously.
• **EEE Mode**: When this mode is enabled and the send and receive sides of a link are lightly loaded, the port can transition to low power mode. The EEE and the Short Cable modes are not supposed to be active simultaneously.

4. Click **Apply**.

The Local Device Information table displays information about the Green Ethernet status and statistics on the port.

**Table 10. Green Ethernet local device information**

<table>

Click **Refresh** to refresh the screen with the most current data from the switch.
View and Configure Green Ethernet LPI History

Use this screen to configure and view the Green Ethernet low power idle (LPI) history. Viewing the Green Ethernet LPI History feature allows you to view the Green Ethernet history of each stack.

To configure the LPI settings:

   The Port GreenMode EEE History screen displays

   2. Next to the Sampling Interval field, specify the frequency, in seconds, at which EEE LPI history entries are collected.

       This configuration is applied on all interfaces in the stack.

   3. Next to the Max Samples to keep field, specify the maximum number of LPI samples to keep in the history buffer.

       This configuration is applied on all interfaces in the stack.

   4. Click Apply.

To view per-interface LPI history information, select the interface with the information to view from the Interface list. The screen refreshes and displays the LPI history for the selected interface.

The following table describes the status fields on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage LPI time per Stack</td>
<td>The percentage of time spent in LPI mode for the stack.</td>
</tr>
<tr>
<td>Sample No.</td>
<td>The current sample number. When the number increases to the maximum it rolls over and begins at 1.</td>
</tr>
</tbody>
</table>
5. Click **Apply** to send the updated configuration to the switch. Configuration changes take effect immediately.

6. Click **Refresh** to refresh the screen with the most current data from the switch.

**SNMP**

This section describes how to configure the Simple Network Management Protocol (SNMP) version 1 and SNMP version 2 information on the switch. For information about configuring the SNMPv3 administrative profile, see *Use SNMPv3* on page 24.

**SNMPV1/V2**

The screens under the SNMPV1/V2 link allow you to configure SNMPv1/v2 community information, traps, and trap flags.

**Configure the SNMP Community**

By default, two SNMP Communities exist:

- Private, with Read/Write privileges and status set to **Enable**.
- Public, with Read Only privileges and status set to **Enable**.

These are well-known communities. Use this screen to change the defaults or to add other communities. Only the communities that you define using this screen will have access to the switch using the SNMPv1 and SNMPv2c protocols. Only those communities with read/write level access can be used to change the configuration using SNMP.

Use this screen when you are using the SNMPv1 and SNMPv2c protocol.

➢ **To add an SNMP community:**

1. Select **System > SNMP > SNMP V1/V2 > Community Configuration**.
The Community Configuration screen displays.

<table>
<thead>
<tr>
<th>Management Station IP</th>
<th>Management Station IP Mask</th>
<th>Community String</th>
<th>Access Mode</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>public</td>
<td>ReadOnly</td>
<td>Enable</td>
</tr>
<tr>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>private</td>
<td>ReadWrite</td>
<td>Enable</td>
</tr>
</tbody>
</table>

2. Next to Management Station IP, specify the IP address of the management station.

3. Next to Management Station IP Mask, specify the subnet mask to associate with the management station IP address.

Together, the Management Station IP and the Management Station IP Mask denote a range of IP addresses from which SNMP clients can use that community to access this device. If either (Management Station IP or Management Station IP Mask) value is 0.0.0.0, access is allowed from any IP address. Otherwise, every client’s address is ANDed with the mask, as is the Management Station IP Address; and, if the values are equal, access is allowed. For example, if the Management Station IP and Management Station IP Mask parameters are 192.168.1.0/255.255.255.0, then any client whose address is 192.168.1.0 through 192.168.1.255 (inclusive) will be allowed access. To allow access from only one station, use a Management Station IP Mask value of 255.255.255.255, and use that machine’s IP address for Client Address.

4. Next to Community String, specify a community name.

5. From the Access Mode list, select the access level for this community, which is either Read/Write or Read Only.

6. From the Status list, enable or disable the community.

   If you select Enable, the community name must be unique among all valid community names or the set request will be rejected. If you select Disable, the community name will become invalid.

7. Click Add.

   **To modify an existing community:**
   - 1. Select the check box next to the community.
   - 2. Update the desired fields.
   - 3. Click Apply.

   **To delete a community:**
   - 1. Select the check box next to the community to remove.
   - 2. Click Delete.
**Trap Configuration**

Use this screen to configure settings for each SNMPv1 or SNMPv2 management host that will receive notifications about traps generated by the device. The SNMP management host is also known as the SNMP trap receiver.

➤ **To add an SNMP trap receiver:**

1. Select **System > SNMP > SNMP V1/V2 > Trap Configuration**

   The Trap Configuration screen displays.

   ![Trap Configuration Screen](image)

2. Next to **Recipients IP**, specify the IP address in x.x.x.x format to receive SNMP traps from this device.

3. From the **Version** list, select the trap version to be used by the receiver from the menu.
   - **SNMP v1**: The switch uses SNMP v1 to send traps to the receiver.
   - **SNMP v2**: The switch uses SNMP v2 to send traps to the receiver.

4. Next to **Community String**, specify the name of the SNMP community that includes the SNMP management host and the SNMP agent on the device.

5. From the **Status** list, select Enable to send traps to the receiver.

6. Click **Add**.

➤ **To modify information about an existing SNMP recipient:**

1. Select the check box next to the recipient.

2. Update the desired fields.

3. Click **Apply**.

➤ **To delete an SNMP trap recipient:**

1. Select the check box next to the recipient to remove.

2. Click **Delete**.
**Trap Flags**

Use the Trap Flags screen to enable or disable traps the switch can send to an SNMP manager. When the condition identified by an active trap is encountered by the switch, a trap message is sent to any enabled SNMP Trap Receivers, and a message is written to the trap log.

To configure the trap flags:

1. Select **System > SNMP > SNMP V1/V2 > Trap Flags**.
   
The Trap Flag screen displays.

2. Enable or disable the following system traps:
   
   - **Authentication**. When enabled, SNMP traps are sent when events involving authentication occur, such as when a user attempts to access the device management interface and fails to provide a valid user name and password.
   
   - **Link Up/Down**. When enabled, SNMP traps are sent when the administrative or operational state of a physical or logical link changes.
   
   - **Spanning Tree**. When enabled, SNMP traps are sent when various spanning tree events occur.
   
   - **ACL**. When enabled, SNMP traps are sent when a packet matches a configured ACL rule that includes ACL logging.

3. Click **Apply**.

**SNMP Supported MIBS**

This screen displays a list of all MIBs supported by the switch.
LLDP

The IEEE 802.1AB-defined standard, Link Layer Discovery Protocol (LLDP), allows stations on an 802 LAN to advertise major capabilities and physical descriptions. This information is viewed by a network manager to identify system topology and detect bad configurations on the LAN.

From the LLDP configuration menu, you can access the following links:

- LLDP Configuration
- LLDP Port Settings
- LLDP-MED Network Policy
- LLDP-MED Port Settings
- Local Information
- Neighbors Information

LLDP is a one-way protocol; there are no request-response sequences. Information is advertised by stations implementing the transmit function, and is received and processed by stations implementing the receive function. The transmit and receive functions can be enabled/disabled separately per port. By default, both transmit and receive are enabled on all ports. The application is responsible for starting each transmit and receive state machine appropriately, based on the configured status and operational state of the port.

The Link Layer Discovery Protocol-Media Endpoint Discovery (LLDP-MED) is an enhancement to LLDP with the following features:

- Auto-discovery of LAN policies (such as VLAN, Layer 2 Priority, and DiffServ settings), enabling plug and play networking.
- Device location discovery for creation of location databases.
- Extended and automated power management of Power over Ethernet endpoints.
- Inventory management, enabling network administrators to track their network devices and determine their characteristics (manufacturer, software and hardware versions, serial/asset number).
LLDP Configuration

Use the LLDP Configuration screen to specify the global LLDP and LLDP-MED parameters that are applied to the switch.

To configure global LLDP settings:

1. Select System > LLDP > Basic > LLDP Configuration.

   The LLDP Configuration screen displays.

2. Optionally, configure non-default values for the following LLDP properties.
   - TLV Advertised Interval: The number of seconds between transmissions of LLDP advertisements.
   - Hold Multiplier: The Transmit Interval multiplier value, where Transmit Hold Multiplier \( \times \) Transmit Interval = the time to live (TTL) value the device advertises to neighbors.
   - Reinitializing Delay: The number of seconds to wait before attempting to reinitialize LLDP on a port after the LLDP operating mode on the port changes.
   - Transmit Delay: The minimum number of seconds to wait between transmissions of remote data change notifications to the SNMP trap receiver(s) configured on the device.

3. Optionally, configure a non-default value next to Fast Start Duration.

   This value sets the number of LLDP packets sent when the LLDP-MED Fast Start mechanism is initialized, which occurs when a new endpoint device links with the LLDP-MED network connectivity device.

4. Click Apply.
LLDP Port Settings

Use the LLDP Port Settings screen to specify per-interface LLDP settings.

To configure LLDP port settings:

1. Select System > LLDP > Advanced > LLDP Port Settings.
   The LLDP Port Settings screen displays.

2. Select the port(s) to configure.
   • To configure a single port, select the check box associated with it, or type the port number in the Go To Interface field and click Go.
   • To configure multiple ports with the same settings, select the check box associated with each port to configure.
   • To configure all ports with the same settings, select the check box in the heading row.

3. Use the lists to configure the LLDP settings for the selected ports:
   • **Admin Status**: Select the status for transmitting and receiving LLDP packets:
     - **Tx Only**: Enable only transmitting LLDP PDUs on the selected ports.
     - **Rx Only**: Enable only receiving LLDP PDUs on the selected ports.
     - **Tx and Rx**: Enable both transmitting and receiving LLDP PDUs on the selected ports.
     - **Disabled**: Do not transmit or receive LLDP PDUs on the selected ports.
   • **Management IP Address**: Choose whether to advertise the management IP address from the interface. The possible field values are:
     - **Stop Advertise**: Do not advertise the management IP address from the interface.
     - **Auto Advertise**: Advertise the current IP address of the device as the management IP address.
   • **Notification**: When notifications are enabled, LLDP interacts with the Trap Manager to notify subscribers of remote data change statistics. The default is Disabled.
• **Optional TLV(s):** Enable or disable the transmission of optional type-length value (TLV) information from the interface. The TLV information includes the system name, system description, system capabilities, and port description. To configure the System Name, see *Management* on page 28. To configure the Port Description, see *Ports* on page 95.

4. Click **Apply**.

## LLDP-MED Network Policy

This screen displays information about the LLPD-MED network policy TLV transmitted in the LLDP frames on the selected local interface.

➢ **To view LLDP-MED network policy information for an interface:**

1. Select **System > LLDP > Advanced > LLDP-MED Network Policy**.

   The LLDP-MED Network Policy screen displays.

<table>
<thead>
<tr>
<th>LLDP-MED Network Policy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
</tbody>
</table>

2. From the Interface list, select the interface with the information to view.

   **Note:** The list includes only the interfaces on which LLDP is enabled. If no interfaces are enabled for LLDP, the Interface list does not display.

The screen refreshes and displays the data transmitted in the Network Policy TLVs for the interface. The following table describes the LLDP-MED network policy information that displays on the screen.
Table 15. LLDP-MED network policy information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network Policy Number</td>
<td>The policy number.</td>
</tr>
</tbody>
</table>
| Application       | The media application type associated with the policy, which can be one of the following:  
                        • Unknown  
                        • Voice  
                        • Guest Voice  
                        • Guest Voice Signaling  
                        • Softphone Voice  
                        • Video Conferencing  
                        • Streaming Video  
                        • Video Signaling  
                        A port can receive multiple application types. The application information is displayed only if a network policy TLV has been transmitted from the port. |
| VLAN ID            | The VLAN ID associated with the policy.                                      |
| VLAN Type          | Indicates whether the VLAN associated with the policy is tagged or untagged. |
| User Priority      | The priority associated with the policy.                                    |
| DSCP               | The DSCP associated with a particular policy type.                          |

**LLDP-MED Port Settings**

Use this screen to enable LLDP-MED mode on an interface and configure its properties.

➢ To configure LLDP-MED settings for a port:

1. Select **System > LLDP > Advanced > LLDP-MED Port Settings**.
   The LLDP-MED Port Settings screen displays.

2. From the Port list, select the port to configure.
3. Use the lists to enable or disable the following LLDP-MED settings for the selected port:
   • **LLDP-MED Status.** The administrative status of LLDP-MED on the interface. When LLDP-MED is enabled, the transmit and receive function of LLDP is effectively enabled on the interface.
   • **Notification.** When enabled, the port sends a topology change notification if a device is connected or removed.
   • **Transmit Optional TLVs.** When enabled, the port transmits the following optional type length values (TLVs) in the LLDP PDU frames:
     - MED Capabilities
     - Network Policy
     - Location Identification
     - Extended Power via MDI: PSE
     - Extended Power via MDI: PD
     - Inventory

4. Click **Apply**.

**Local Information**

Use the LLDP Local Information screen to view the data that each port advertises through LLDP.

➢ **To view local LLDP information:**

1. Select **System > Advanced > LLDP > Local Information.**

   The Local Information screen displays.

   ![Device Information Table]

   ![Port Information Table]

2. View summary LLDP information for the switch and the LLDP-enabled ports.
**Note:** The list includes only the interfaces on which LLDP is enabled. If no interfaces are enabled for LLDP, the Interface list does not display.

The following table describes the LLDP device information and port summary information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
3. To view additional details about a port, click the name of the port in the Interface column of the Port Information table.

A popup window displays information for the selected port.

The following table describes the detailed local information that displays for the selected port.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Managed Address</td>
<td></td>
</tr>
<tr>
<td>Address SubType</td>

</tr>
<tr>
<td>Auto Negotiation Advertised Capabilities</td>
<td>The port speed auto negotiation capabilities such as 1000BASE-T half-duplex mode or 100BASE-TX full-duplex mode.</td>
</tr>
</tbody>
</table>
Use the LLDP Neighbors Information screen to view the data that a specified interface has received from other LLDP-enabled systems.

To view LLDP information received from a neighbor device:

1. Select **System > Advanced > LLDP > Neighbor Information**.
   
The Neighbor Information screen displays.

2. View summary LLDP information for the remote device.

**Note:** If no information has been received from a neighbor device, or if the link partner is not LLDP-enabled, no information displays.
The following table describes the information that displays for all LLDP neighbors that have been discovered.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSAP Entry</td>
<td>The Media Service Access Point (MSAP) entry number for the remote device.</td>

### Device Class

Displays the LLDP-MED endpoint device class. The possible device classes are:
- Endpoint Class 1 Indicates a generic endpoint class, offering basic LLDP services.
- Endpoint Class 2 Indicates a media endpoint class, offering media streaming capabilities as well as all Class 1 features.
- Endpoint Class 3 Indicates a communications device class, offering all Class 1 and Class 2 features plus location, 911, Layer 2 switch support and device information management capabilities.

### Hardware Revision

Displays the hardware version advertised by the remote device.

### Firmware Revision

Displays the firmware version advertised by the remote device.

### Software Revision

Displays the software version advertised by the remote device.

### Serial Number

Displays the serial number advertised by the remote device.

### Model Name

Displays the model name advertised by the remote device.

### Asset ID

Displays the asset ID advertised by the remote device.

DHCP Snooping is a useful feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall and that can cause traffic attacks within your network. The DHCP snooping binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and interface information that corresponds to the local untrusted interfaces of a switch. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall. A trusted interface is an interface that is configured to receive only messages from within the network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also provides way to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

From the Services configuration menu, you can access the following links:

- **Global Configuration**
- **Interface Configuration**
- **Binding Configuration**
- **Persistent Configuration**
- **Statistics**
Global Configuration

Use this screen to view and configure the global settings for DHCP Snooping.

➢ To configure DHCP snooping global settings:

1. Select System > Services > DHCP Snooping > Global Configuration.

The DHCP Snooping Global Configuration screen displays.

2. Next to DHCP Snooping Mode field enable the DHCP Snooping feature.

3. Optionally, next to MAC Address Validation enable the verification of the sender MAC address for DHCP snooping.

   When enabled, the device checks packets that are received on untrusted interface to verify that the MAC address and the DHCP client hardware address match. If the addresses do not match, the device drops the packet.

4. Click Apply.

➢ To enable DHCP snooping for all interfaces that are members of a VLAN:

1. Under VLAN ID, specify the VLAN on which DHCP snooping is enabled.

2. From the DHCP Snooping Mode list, select Enable.

3. Click Apply.
Interface Configuration

Use the DHCP Snooping Interface Configuration screen to view and configure each port as a trusted or untrusted port. Any DHCP responses received on a trusted port are forwarded. If a port is configured as untrusted, any DHCP (or BootP) responses received on that port are discarded.

➢ To configure DHCP snooping interface settings:

1. Select System > Services > DHCP Snooping > Interface Configuration.

The DHCP Snooping Interface Configuration screen displays.

2. Select the port(s) or LAG(s) to configure.

   • To configure a single port or LAG, type the port or LAG number in the Go To Interface field and click Go.

   • To configure a single port on a specific stack member, select the unit number of the stack member that includes the port, and then select the check box associated with the port.

   • To configure multiple ports on the same stack member with the same settings, select the check box associated with each port to configure.

   • To configure all ports on a stack member with the same settings, click the unit number and select the check box in the heading row.

   • To configure a single LAG, click LAGS and select the check box associated with the LAG to configure.

   • To configure multiple LAGs with the same settings, select the check box associated with each LAG to configure.

   • To configure all ports and LAGs with the same settings, click ALL and select the check box in the heading row.
3. From the Trust Mode list, select the desired trust mode.
   - **Disabled.** The interface is considered to be untrusted and could potentially be used to launch a network attack. DHCP server messages are checked against the bindings database. On untrusted ports, DHCP snooping enforces the following security rules:
     - DHCP packets from a DHCP server (DHCPOFFER, DHCPACK, DHCPNAK, DHCPRELEASEQUERY) are dropped.
     - DHCPRELEASE and DHCPDECLINE messages are dropped if the MAC address is in the snooping database but the binding's interface is other than the interface where the message was received.
     - DHCP packets are dropped when the source MAC address does not match the client hardware address if MAC Address Validation is globally enabled.
   - **Enabled.** The interface is considered to be trusted and forwards DHCP server messages without validation.

4. From the Logging Invalid Packets list, select the packet logging mode.
   When enabled, the DHCP snooping feature generates a log message when an invalid packet is received and dropped by the interface.

5. Next to Rate Limit (pps), specify the rate limit value for DHCP Snooping purpose.
   If the incoming rate of DHCP packets exceeds the value of this object for consecutively burst interval seconds, the port will be shut down. If this value is N/A, then burst interval has no meaning, and rate limiting is disabled.

6. Next to Burst Interval (secs), specify the burst interval value for rate limiting purpose on this interface.
   If the rate limit is N/A, then the burst interval has no meaning and it is N/A.

7. Click **Apply.**
Binding Configuration

Use this screen to view, add, and remove static bindings in the DHCP snooping bindings database and to view or clear the dynamic bindings in the bindings table.

To configure static DHCP bindings:
2. The DHCP Snooping Binding Configuration screen displays.

3. From the Interface list, select the interface on which the DHCP client is authorized.
4. Under MAC Address, specify the MAC address for the binding to be added.
   This is the key to the binding database.
5. From the VLAN ID list, field, select the ID of the VLAN the client is authorized to use.
6. Under IP Address, specify the IP address of the client.
7. Click Add to add the DHCP snooping binding entry into the database.

The DHCP Snooping Dynamic Binding Configuration table shows information about the DHCP bindings that have been learned on each interface on which DHCP snooping is enabled. The following table describes the dynamic bindings information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface on which the DHCP client message was received.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address associated with the DHCP client that sent the message. This is the Key to the binding database.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID of the client interface.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address assigned to the client by the DHCP server.</td>
</tr>
<tr>
<td>Lease Time</td>
<td>The remaining IP address lease time for the client.</td>
</tr>
</tbody>
</table>
Persistent Configuration

Use this screen to configure the persistent location of the DHCP snooping bindings database. The bindings database can be stored locally on the device or on a remote system somewhere else in the network. The device must be able to reach the IP address of the remote system to send bindings to a remote database.

To configure DHCP snooping persistent settings:

1. Select System > Services > DHCP Snooping > Persistent Configuration.

   The DHCP Snooping Persistent Configuration screen displays.

2. Specify where the DHCP snooping bindings database is located.
   - Local. The binding table will be stored locally on the switch.
   - Remote. The binding table will be stored on a remote TFTP server.

   If the database is stored on a remote server:
   a. Specify the IP address of the TFTP server.
   b. Specify the file name of the DHCP snooping bindings database in which the bindings are stored.

3. Next to Write Delay, specify the amount of time to wait between writing bindings information to persistent storage.

   The delay allows the device to collect as many entries as possible (new and removed) before writing them to the persistent file.

4. Click Apply.
Statistics

Use this screen to view and clear per-interface statistics about the DHCP messages filtered by the DHCP snooping feature on untrusted interfaces.

To view and clear the DHCP snooping statistics:

1. Select System > Services > DHCP Snooping > Statistics.

   The DHCP Snooping Statistics screen displays.

2. Click Clear to clear all interfaces statistics.

The following table describes the DHCP snooping statistics.

Table 17. DHCP Snooping statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface associated with the rest of the data in the row.</td>
</tr>
<tr>
<td>MAC Verify Failures</td>
<td>The number of DHCP messages that were dropped because the source MAC address and client hardware address did not match. MAC address verification is performed only if it is globally enabled.</td>
</tr>
<tr>
<td>Client Ifc Mismatch</td>
<td>The number of packets that were dropped by DHCP snooping because the interface and VLAN on which the packet was received does not match the client's interface and VLAN information stored in the binding database.</td>
</tr>
<tr>
<td>DHCP Server Msgs</td>
<td>The number of DHCP server messages ((DHCPoffer, DHCPACK, DHCPNAK, DHCPRELEASEQUERY) that have been dropped on an untrusted port.</td>
</tr>
</tbody>
</table>
Stacking Overview

A stackable switch is a switch that is a fully functional operating standalone, but can also be set up to operate together with up to six switches, with this group of switches showing the characteristics of a single switch while having the port capacity of the sum of the combined switches.

One of the switches in the stack controls the operation of the stack. This switch is called the stack manager. The remaining switches in the stack are stack members. The stack members use stacking technology to behave and work together as a unified system. Layer 2 and above protocols present the entire switch stack as a single entity to the network.

The stack manager is the single point of stack-wide management. From the stack manager, you configure the following:

- System-level (global) features that apply to all stack members
- Interface-level features for all interfaces on any stack member

A switch stack is identified in the network by its network IP address. The network IP address is assigned according to the MAC address of the stack manager. Every stack member is uniquely identified by its own stack member number.

All stack members are eligible stack managers. If the stack manager becomes unavailable, the remaining stack members participate in electing a new stack manager from among themselves. The following factors determine which switch is elected as the stack manager:

- The switch that is manager always has priority to retain the role of manager
- Assigned priority
- MAC address

All stack members must run the same software version to ensure compatibility between stack members. The software versions on all stack members, including the stack manager, must be the same. This helps ensure full compatibility in the stack protocol version among the stack members. If a stack member is running a software version that is not the same as the stack manager, then the stack member is not allowed to join the stack.

The stack manager contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level...
settings for all stack members. Each stack member retains a copy of the saved file for backup purposes.

If the manager is removed from the stack, another member will be elected manager, and will then run from that saved configuration.

The stack manager switch performs a consistency check to ensure that all units in the stack are running the same version of agent. Using the information gathered during topology discovery, the stack manager can determine whether all units are running the same version of agent. If the versions do not match, then the ports on the subordinate switch will not become valid for operation. This condition is known as the special stacking mode. You have the ability to synchronize the software on the stack unit with the software that is running on the stack manager. Normally, the software is automatically distributed to all units in the stack after downloading new code, but there can be instances when a unit with older code is plugged in to the stack. In this scenario, use the stack firmware synchronization feature to push the code from the stack manager to the stack members. This ensures that the stack members are in sync with the rest of the participating switches in the stack. For more information, see *Synchronize Stack Firmware* on page 94.

The stack manager will automatically distribute firmware to subordinate switches when you upgrade the firmware so that all stack members are synchronized when reloading the stack.

**Stack Features**

The primary stacking features are as follows:

- Up to 6 switches in a stack
- Single IP Address management through web and SCC
- Manager-member configuration
  - Configuration for all units is stored on the manager
  - Auto detection for new members, with synchronization of firmware (upgrade or downgrade as needed).
- Configuration updates download is supported across the stack through single operation.
- Automatic master fail-over. Fully resilient stack with chain and ring topology.
- Hot swappable (insertion and removal) of stack units
- Stack number information and automatic stacking set up options
Factory Defaults Reset Behavior

The configurations applied on GS752TXS/GS728TXS would be automatically saved to the flash. The stack manager automatically distributes the configuration to the stack members. If the stack manager becomes unavailable, a stack member can become the new stack manager and apply the configuration that was saved on the original stack manager.

The stack manager initializes the stack using the last saved system configuration that is stored in its local FLASH. When the stack manager is reset to the factory default settings, the stack manager applies default settings to all the stack members and resets the stack including the participating stack members.

Stack Manager Election and Reelection

The stack manager is elected or reelected based on one of these factors and in the order listed:

- The switch that is currently the stack manager
- The switch with the highest stack member priority value

  **Note:** NETGEAR recommends assigning the highest priority value to the switch that you prefer to be the stack manager. This ensures that the switch is reelected as stack manager if a re-election occurs.

- The switch with the higher MAC address

A stack manager retains its role unless one of these events occurs:

- The stack manager is removed from the switch stack
- The stack manager is reset or powered off
- The stack manager has failed
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks

In the case of a manager reelection, the new stack manager becomes available after a few seconds.

If a new stack manager is elected and the previous stack manager becomes available, the previous stack manager does not resume its role as stack manager.
Stack Configuration

Install a Stack

Use the following steps to connect a stack of switches:

1. Make sure there is a current software image on each unit.
   If the image does not exist or needs to be updated, use TFTP or HTTP to perform the update operation.

2. Identify the unit to be the manager and configure it with the highest priority value.
   a. On the stack manager, select **System > Stacking > Basic > Stack Configuration**.
      The Stack Configuration screen displays.

   b. In the Switch Priority list, select 15.
   c. In the Management Status list, select Management.

3. If desired, preconfigure other units to be added to the stack. See **Configure a Stack Member** on page 89.

4. Connect each switch to the stack by installing the stacking cables.
   The units are connected to the stack in the order in which you connect the cables. Fully connect all cables, including the redundant stack link. We highly recommend that a redundant link be installed because this provides stack resiliency.

5. Monitor the manager unit to see that each unit joins the stack.
   As each switch joins the stack, it displays in the Basic Stack Status table on the Stack Configuration screen.

6. If desired, renumber the stack units. See **Renumber a Stack Member** on page 86 for recommendations for renumbering stack members.
## Remove a Unit from the Stack

You do not need to power down the stack or any stack unit to remove a switch from the stack.

**To remove a switch from the stack:**

1. Make sure the redundant stack connection is in place and functional.
   *All stack members should be connected in a logical ring.*

2. Disconnect the stacking cables from the unit to be removed.
   Alternatively, you can reconfigure the stacking ports on the member as Ethernet ports,
   and then reload the unit. For more information, see *Configure the Stacking Ports as Ethernet Uplink Ports* on page 91.

3. If the unit is not to be replaced, reconnect the stack cable from the stack member above to the stack member below the unit being removed.

4. If desired, remove the unit from the configuration.
   a. Select System > Stacking > Basic > Stack Configuration.
   b. Select the check box next to the unit to remove.
   c. Click Delete.

## Add a Unit to an Operating Stack

You can add a new stack member to a stack as long as there are fewer than six units in the stack. These procedures assume the new unit is powered off until it is physically connected to the stack. Adding a powered-up standalone unit to an operational stack is similar to merging two operational stacks where the standalone unit is a stack of one unit. For more information, see *Merge Two Operational Stacks* on page 88.

**To add a switch to a stack of switches while the stack is running:**

1. Make sure that the redundant stack link is in place and functional.
   *All stack members should be connected in a logical ring.*

2. Optionally, use the manager to preconfigure the new unit. For more information, see *Configure a Stack Member* on page 89.

3. Disconnect the redundant stack cable that connects the last unit in the stack back up to the first unit in the stack at the new position in the ring where the new unit is to be inserted.

4. Connect this cable to the new unit, following the established order of connections.
   In other words, use the redundant stack cable to connect from the first switch in the stack to the last.

5. Power on the new unit.

6. Monitor the Basic Stack Status table on the Stack Configuration screen to make sure the new unit successfully joins the stack.
   The new unit should always join as a stack member rather than a stack manager; the existing manager of the stack should not change.
7. If the software version of the newly added member is not the same as the existing stack, update the software image. For more information, see *Synchronize Stack Firmware* on page 94.

**Renumber a Stack Member**

If particular numbering is required, we recommend that stack members be assigned specific numbers when they are first installed and configured in the stack, if possible. Renumbering a non-manager unit requires a unit reset for the renumbering to take effect. Renumbering a manager unit requires a reset of all the switches in the stack for the renumbering to take effect. If reassignment of multiple existing stack unit numbers is necessary, there are a number of implications in terms of mismatching of configuration. In this case, we recommend that all units except the manager be powered down and added back one at a time. For more information, see *Add a Unit to an Operating Stack* on page 85

➢ To change the unit ID numbers for stack members:

1. Select **System** > **Stacking** > **Basic** > **Stack Configuration**.

   The Stack Configuration screen displays.

2. Select the check box associated with the unit to renumber.

3. Under **Change Switch ID to**, specify the new unit number.

   **Note:** The unit number you configure must be unused. If the number is in use, you must remove the unit from the stack (or the preconfigured unit from the stack before its number can be assigned to another unit. For more information, see *Remove a Unit from the Stack* on page 85

4. Click **Apply**.
Move the Stack Manager Role to a Different Unit in the Stack

When you force a switch to become the new stack manager, the entire stack (including all interfaces in the stack) is unconfigured and reconfigured with the configuration on the new stack manager. After the reload is complete, all stack management must be performed on the new stack manager. To preserve the current configuration across a stack move, save the current configuration to the NVRAM before performing the stack move. A stack move causes all routes and layer 2 addresses to be lost.

➢ To change the stack manager from the current switch to a new switch in the stack:

1. Select System > Stacking > Basic > Stack Configuration.

The Stack Configuration screen displays.

2. Select the check box associated with the switch that will become the stack manager.

3. In the Switch Priority list, select 15.

4. In the Management Status list, select Management.

5. Confirm the move.

The operation can take three minutes or longer depending on the stack size and configuration.

6. Monitor the Stack Configuration screen to verify that all units have rejoined the stack.

7. Reboot the stack.
   a. Select Maintenance > Reset > Device Reboot.
   b. In the Reboot Unit No. list, select All.
   c. Select the check box.
   d. Click Apply.
Remove a Stack Manager from an Operating Stack

Use the procedures in this section to remove the stack manager from the stack.

➢ To remove the manager unit from the stack during operation:
  1. Move the designated manager to a different unit in the stack.
     See using the Move the Stack Manager Role to a Different Unit in the Stack on page 87.
  2. Remove the unit from the stack.
     See Remove a Unit from the Stack on page 85.

Merge Two Operational Stacks

NETGEAR recommends that you power down all units before merging two stacks. However, two operational stacks can also be merged by reconnecting stack cables without powering down all units in one stack. Connecting a powered-up standalone unit to an existing stack leads to same behavior as when merging two operational stacks. In such cases, the Manager reelection is done based on the rules listed in Stack Manager Election and Reelection on page 83. One of the two managers wins the election and the losing stack manager resets itself and all its member units. After the reset, all the losing stack members join the winning stack to form a single stack. The winning stack remains functional through the merge process. If the stack merge is performed in this way, then it is strongly recommended that the user set the priority of the desired winner stack manager to a higher value than the stack manager that should lose the election.

➢ To merge two operational stacks:
  1. Power off all units in one stack before connecting to another stack.
  2. Add the units as a group by unplugging one stacking cable in the operational stack and physically connecting all unpowered units.
  3. Completely cable the stacking connections, making sure the redundant link is also in place.
Configure a Stack Member

Before you add a switch to a stack, you can configure information about the new stack member, such as the unit ID and management priority. If you do not configure the unit before you add it to the stack, you can update the configuration at a later time.

All configuration on the stack, except unit numbers, is stored on the management unit. This means that a stack unit can be replaced with another device of the same type without having to reconfigure the switch. Unit numbers are stored independently on each switch, so that after power cycling or reloading the stack, the units always come back with the same unit numbers. The unit type associated with each unit number can be learned by the management unit automatically as the units are connected or preconfigured by the administrator.

This screen moves the Primary Management Unit functionality from one unit to another.

➢ To configure a new unit in the stack:

1. Select System > Stacking > Basic > Stack Configuration.

   The Stack Configuration screen displays.

2. In the Unit ID list, select the ID for the member to add.

3. In the Switch Type list, specify the type of switch hardware of the new member.

4. In the Switch Priority list, specify the priority for the new unit as a stack manager.

   If the preference level is set to zero, then the device cannot become a management unit. A higher value indicates a higher priority, the maximum value is 15.
5. In the Management Status list, select the role of the new unit within the stack.
   • **Management.** The unit is the stack manager. For a stack that already has a manager, see *Move the Stack Manager Role to a Different Unit in the Stack* on page 87.
   • **StandBy.** The unit is configured to take over as manager should the current manager fail.
   • **StackMember.** The unit is not a stack manager, but it has connectivity to the stack manager.

6. **Click Add.**

**View Stack Member Information**

The Stack Configuration screen displays information about the switches in the stack, including the preconfigured switches. The following table describes the status information on the Stack Configuration screen.

**Table 18. Stack configuration status**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>

Configure the Stacking Ports as Ethernet Uplink Ports

Port 51 and port 52 on the GS752TXS and ports 27 and 28 on the GS728TXS can be used as the stacking ports or as uplink ports. By default, the ports are configured for stacking. Use the Stack Port Configuration screen to configure the ports as Ethernet uplink ports for connectivity to network servers or other resources that require high throughput.

To configure stack ports as Ethernet ports:

1. Select System > Stacking > Advanced > Stack Port Configuration.

   The Stack Port Configuration screen displays.

   ![Stack Port Configuration Table]

2. From the Configured Stack Mode list, select Ethernet.
3. Click Apply.
4. Reboot the switch.
   a. Select Maintenance > Reset > Device Reboot.
   b. In the Reboot Unit No. list, select the unit number of the switch.
   c. Select the check box.
   d. Click Apply.
5. After the switch boots, log on and return to the Stack Port Configuration screen.
Monitor the port information to verify that the running stack mode is Ethernet.

The following table describes port status fields on the Stack Port Configuration screen.

View Stack Port Diagnostic Information

Use the Stack Port Diagnostics screen to view diagnostic information about stack ports. The screen displays three text fields that are populated by the driver and contain debug and status information. Each text field supports a string of up to 80 characters. The following abbreviations are used in the information messages:

- RBYT: Received bytes (including CRC)
- RPKT: Received packets
- TBYT: Transmit bytes
- TPKT: Transmit packets
- RFCS: Receive FCS (CRC) error packet counter
- RFRG: Fragmented packets received (undersized packets with invalid CRC)
- RJBR: Oversized packets with invalid CRC
- RUND: Undersized packets (contains a valid CRC)
- ROVR: Oversized packets with no errors
- TFCS: Transmit FCS (CRC) error packet counter
- TERR: Number of transmission errors

To view the Stack Port Diagnostics screen, select System > Stacking > Advanced > Stack Port Diagnostics.

The following table describes the Stack Port Diagnostics fields.

<table>
<thead>
<tr>

Synchronize Stack Firmware

Stack firmware Synchronization (SFS) provides the ability to automatically synchronize firmware for all stack members. If a unit joins the stack and its firmware version is different from the version running on the stack manager, the SFS feature can either upgrade or downgrade the firmware on the mismatched stack member. There is no attempt to synchronize the stack to the latest firmware of a member that joins the stack.

To configure stack firmware synchronization:

1. Select System > Stacking > Advanced > Stack Firmware Synchronization. The Stack Firmware Synchronization screen displays.

2. In the Stack Firmware Auto Upgrade list, choose whether to enable or disable automatic firmware upgrades for new stack members.

   Enabling the feature allows the stack manager to automatically upgrade the firmware version of a unit that joins the stack if the firmware version on the new stack member is older than the firmware version on the stack manager.

3. In the Traps list, enable or disable sending of SNMP traps during SFS start, failure, or finish.

4. In the Allow Downgrade list, choose whether to allow the stack manager to downgrade the firmware image on a new stack member if the firmware version on the manager is older than the firmware version on the new stack member.

   When Enable is selected, the stack manager can downgrade the firmware on the new stack member.

5. Click Apply.
Configuring Switching

Use the features you access from the Switching tab to define Layer 2 features. The Switching tab contains links to the features described in the following sections.

- **Ports**
- **Link Aggregation Groups**
- **VLANs**
- **Auto-VoIP Configuration**
- **Spanning Tree Protocol**
- **Multicast**
- **Forwarding Database**

### Ports

The screens you access from the Ports menu allow you to view and monitor the physical port information for the ports available on the switch. The Ports menu contains links described in the following sections.

- **Port Configuration**
- **Flow Control**

### Port Configuration

Use the Port Configuration screen to configure the physical interfaces on the switch.

➢ **To configure port settings:**

1. Select **Switching > Ports > Port Configuration**.
   
   The Port Configuration screen displays.
2. Select the interfaces for which you want to configure the port settings:
   - To configure settings for ports on a specific stack member, click the unit ID of the member.
   - To configure settings for a Link Aggregation Group (LAG), click LAGS.
   - To configure settings for both physical ports and LAGs, click ALL.

3. Select the check box next to the port(s) or LAG(s) to configure.
   You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

4. Configure or view the settings:
   - **Description.** Enter the description string to be attached to a port. The string can be up to 64 characters in length.
   - **Port Type.** For most ports this field is blank. Otherwise, the possible values are:
     - **Trunk Member.** The port is a member of a Link Aggregation trunk.
     - **Mirrored.** The port is a Mirrored port.
     - **Probe.** The port is a Monitoring port.
   - **Admin Mode.** Use the menu to select the port control administration state, which can be one of the following:
     - **Enable.** The port can participate in the network (default).
     - **Disable.** The port is administratively down and does not participate in the network.
   - **Port Speed.** Use the menu to select the port’s speed and duplex mode. If you select Auto, the duplex mode and speed will be set by the auto negotiation process. The port’s maximum capability (full duplex and 1000 Mbps) will be advertised. Otherwise, your selection will determine the port’s duplex mode and transmission rate. The factory default is Auto.
   - **Physical Status.** Indicates the physical port’s speed and duplex mode
   - **Link Status.** Indicates whether the Link is up or down.
• **Link Trap.** This object determines whether or not to send a trap when link status changes. The factory default is Enable.
  - **Enable.** Specifies that the system sends a trap when the link status changes.
  - **Disable.** Specifies that the system does not send a trap when the link status changes.

• **Maximum Frame Size.** Specifies the maximum Ethernet frame size the interface supports. The size includes the Ethernet header, CRC, and payload. Any change to the maximum frame size is immediately applied to all interfaces.

• **MAC Address.** Displays the physical address of the specified interface.

• **PortList Bit Offset.** Displays the bit offset value which corresponds to the port when the MIB object type PortList is used to manage in SNMP.

• **ifIndex.** The ifindex of the interface table entry associated with this port. If the interface field is set to All, this field is blank.

5. Click **Apply.**

### Flow Control

IEEE 802.3x flow control works by pausing a port when the port becomes oversubscribed and dropping all traffic for small bursts of time during the congestion condition. This can lead to high-priority and network control traffic loss. When IEEE 802.3x flow control is enabled, lower speed switches can communicate with higher speed switches by requesting that the higher speed switch refrains from sending packets. Transmissions are temporarily halted to prevent buffer overflows.

➢ **To configure global flow control settings:**

1. Select **Switching > Ports > Flow Control.**

   The Flow Control screen displays.

2. Next to Global Flow Control (IEEE 802.3x) Mode, enable or disable IEEE 802.3x flow control on the system. The factory default is Disable.

   • **Enable:** The switch sends pause packets if the port buffers become full.
   
   • **Disable:** The switch does not send pause packets if the port buffers become full.

3. Click **Apply.**
Link Aggregation Groups

Link aggregation groups (LAGs), which are also known as port channels, allow you to combine multiple full-duplex Ethernet links into a single logical link. Network devices treat the aggregation as if it were a single link, which increases fault tolerance and provides load sharing. You assign the LAG VLAN membership after you create a LAG. The LAG by default becomes member of default management VLAN (i.e., 1).

A LAG interface can be either static or dynamic, but not both. All members of a LAG must participate in the same protocols. A static port-channel interface does not require a partner system to be able to aggregate its member ports.

Static LAGs are supported. When a port is added to a LAG as a static member, it neither transmits nor receives LAGPDUs. The switch supports eight LAGs.

The LAGs menu contains links described in the following sections.

- LAG Configuration
- LAG Membership
- LACP Configuration
- LACP Port Configuration

LAG Configuration

Use the LAG (Port Channel) Configuration screen to group one or more full-duplex Ethernet links to be aggregated together to form a link aggregation group, which is also known as a port channel. The switch treats the LAG as if it were a single link.

To configure LAG settings:

1. Select Switching > LAG > Basic > LAG Configuration.

2. Select the check box next to the LAG to configure.

You can select multiple LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.
3. Configure or view the following settings:

   **Note:** Click current members in the list to see existing member ports in that LAG.

   - **LAG Name.** Specify the name you want assigned to the LAG. You can enter any string of up to 15 alphanumeric characters. A valid name has to be specified in order to create the LAG.
   - **Description.** Specify the Description string to be attached to a LAG. It can be up to 64 characters in length.
   - **LAG ID.** Displays the number assigned to the LAG. This field is read-only.
   - **Link Trap.** Specify whether you want to have a trap sent when link status changes. The factory default is Disable, which will cause the trap to be sent.
   - **Admin Mode.** Select Enable or Disable from the menu. When the LAG (port channel) is disabled, no traffic will flow and LAGPDUs will be dropped, but the links that form the LAG (port channel) will not be released. The factory default is Enable.
   - **STP Mode.** Select the Spanning Tree Protocol Administrative Mode associated with the LAG.
   - **LAG Type.** Specifies whether the LAG is configured as a Static or LACP port. When the LAG is static, it does not transmit or process received LAGPDUs, for example the member ports do not transmit LAGPDUs and all the LAGPDUs it can receive are dropped. The default is Static.
   - **Active Ports.** A listing of the ports that are actively participating members of this Port Channel. A maximum of 8 ports can be assigned to a port channel.
   - **LAG State.** Indicates whether the link is Up or Down.
   - **Local Preference Mode.** Enables or disables the LAG interface's Local Preference Mode.

4. Click Apply.
LAG Membership

Use the LAG Membership screen to select two or more full-duplex Ethernet links to be aggregated together to form a link aggregation group (LAG), which is also known as a port channel. The switch can treat the port channel as if it were a single link.

➢ To create a LAG:

1. Select Switching > LAG > Basic > LAG Membership.

2. From the LAG ID list, select the LAG to configure.

3. Next to LAG Name, enter the name you want assigned to the LAG.
   You can enter any string of up to 15 alphanumeric characters. A valid name has to be specified to create the LAG.

4. Click the unit name in the orange bar to display the ports.

5. Click the box below each port to include in the LAG.

6. Click Apply.

7. To verify the configuration and view the ports that are members of the selected LAG, click Current Members.
LACP Configuration

The LACP configuration screen is used to set the LACP system priority.

- **To configure LACP:**
  1. Select **Switching** > **LAG** > **Advanced** > **LACP Configuration**.

![LACP Configuration](image)

2. From the LACP System Priority field, specify the device’s link aggregation priority relative to the devices at the other ends of the links on which link aggregation is enabled.
   
   A higher value indicates a lower priority. You can change the value of the parameter globally by specifying a priority from 1–65535 The default value is 32768.

3. Click **Apply**.

LACP Port Configuration

The LACP port configuration screen is used to configure the LACP priority value for the selected port and the administrative LACP Timeout value.

- **To configure LACP port priority settings:**
  1. Select **Switching** > **LAG** > **Advanced** > **LACP Port Configuration**.

![LACP Port Configuration](image)

2. Select the port(s) to configure:
   - To configure a single port, select the check box associated with it, or type the port number in the Go To Interface field and click **Go**.
   - To configure multiple ports with the same settings, select the check box associated with each port to configure.
   - To configure all ports with the same settings, select the check box in the heading row.
3. Configure the LACP Priority value for the selected port(s).
   It specifies the device’s link aggregation priority relative to the devices at the other ends of the links on which link aggregation is enabled. A higher value indicates a lower priority. The field range is 1–65535. Default value is 128.

4. Configure the administrative LACP Timeout value.
   - **Long.** Specifies a long timeout value.
   - **Short.** Specifies a short timeout value.

5. Click **Apply**.

**VLANs**

Adding Virtual LAN (VLAN) support to a Layer 2 switch offers some of the benefits of both bridging and routing. Like a bridge, a VLAN switch forwards traffic based on the Layer 2 header, which is fast, and like a router, it partitions the network into logical segments, which provides better administration, security and management of multicast traffic.

By default, all ports on the switch are in the same broadcast domain. VLANs electronically separate ports on the same switch into separate broadcast domains so that broadcast packets are not sent to all the ports on a single switch. When you use a VLAN, users can be grouped by logical function instead of physical location.

Each VLAN in a network has an associated VLAN ID, which displays in the IEEE 802.1Q tag in the Layer 2 header of packets transmitted on a VLAN. An end station can omit the tag, or the VLAN portion of the tag, in which case the first switch port to receive the packet can either reject it or insert a tag using its default VLAN ID. A given port can handle traffic for more than one VLAN, but it can only support one default VLAN ID.

The VLAN menu contains links described in the following sections.

- Basic VLAN Configuration
- VLAN Membership Configuration
- VLAN Status
- Port VLAN ID Configuration
- MAC Based VLAN
- Protocol Based VLAN Group Configuration
- Protocol Based VLAN Group Membership
- Voice VLAN
Basic VLAN Configuration

Use the VLAN Configuration screen to define VLAN groups stored in the VLAN membership table. The GS752TXS/GS728TXS supports up to 256 VLANs. The Default VLAN (1), Voice VLAN (2) and Auto-Video VLAN (3) are created by default, and all ports are untagged members. When you create a VLAN on this screen, its type will always be Static.

➢ To add a VLAN:

1. Select **Switching > VLAN > Basic > VLAN Configuration**.

   ![VLAN Configuration](image)

2. Under VLAN ID, specify the VLAN Identifier for the new VLAN.
3. Optionally, under VLAN Name, specify a name to help identify the VLAN.
4. Click **Add**.

➢ To delete a one or more VLANs:

1. Select the check box next to each VLAN to delete.

   **Note:** You cannot delete VLANs 1, 2, or 3, which are created by default.

2. Click **Delete**.

➢ To modify the VLAN name:

1. Select the check box next to the VLAN to modify.
2. Under VLAN Name, specify the new name.
3. Click **Apply**.

➢ To reset the VLAN settings on the switch to the factory defaults:

1. Select the Reset Configuration check box.
2. Click **OK** in the popup message to confirm the action.

   If the Management VLAN is set to a non-default VLAN (VLAN 1), it is automatically set to 1 after a the VLAN configuration is reset.
VLAN Membership Configuration

Use this screen to configure VLAN Port Membership for a particular VLAN. You can select the Group operation through this screen.

➢ To configure VLAN membership for individual ports and LAGs:

1. Select Switching > VLAN > Advanced > VLAN Membership.

2. From the VLAN ID field, select the VLAN to which you want to add ports.

3. Click the orange bar below the VLAN Type field to display the physical ports on the switch.

4. Click the lower orange bar to display the LAGs on the switch.

5. To select the port(s) or LAG(s) to add to the VLAN, click the square below each port or LAG. You can add each interface as a tagged (T) or untagged (U) VLAN member. A blank square means that the port is not a member of the VLAN.

   • **Tagged.** Frames transmitted from this port are tagged with the port VLAN ID.

   • **Untagged.** Frames transmitted from this port are untagged. Each port can be an untagged member of only one VLAN. By default, all ports are an untagged member of VLAN 1.
In the following figure, ports 6, 7, and 8 from Unit 1 are being added as tagged members to VLAN 2.

6. Click **Apply**.

➢ To configure the same VLAN membership settings for all ports and LAGs:

1. Select **Switching** > **VLAN** > **Advanced** > **VLAN Membership**.
2. In the VLAN ID list, select the VLAN to which you want to add ports.
3. In the Group Operations list, select one of the following options:
   • **Untag All**. All frames transmitted from this VLAN will be untagged. All the ports will be included in the VLAN.
   • **Tag All**. All frames transmitted for this VLAN will be tagged. All the ports will be included in the VLAN.
   • **Remove All**. Excluding all ports from the selected VLAN.
4. Click **Apply**.

**VLAN Status**

This VLAN Status screen displays the status of all currently configured VLANs.

➢ To view the current VLAN status:

1. Select **Switching** > **VLAN** > **Advanced** > **VLAN Status**.
2. View the following VLAN status information:
   - **VLAN ID.** The VLAN Identifier (VID) of the VLAN. The range of the VLAN ID is (1 to 4093)
   - **VLAN Name.** The name of the VLAN. VLAN ID 1 is always named Default.
   - **VLAN Type.** The VLAN type:
     - **Default** (VLAN ID = 1). always present.
     - **Static.** a VLAN you have configured.
     - **Dynamic.** The VLAN that is created by GVRP registration initially has a type of Dynamic (GVRP).

     The type of AUTO VoIP Vlan is Dynamic (AUTO VoIP). The VLAN that is created by MVRP registration initially has a type of Dynamic (MVRP). The VLAN that is created by L2 Tunnel has a type of Dynamic (L2 Tunnel). The VLAN that is created by IP VLAN has a type of Dynamic (IP VLAN). The VLAN that is created by DOT1x registration has a type of Dynamic (DOT1X). The VLAN that is created by open flow registration has a type of Dynamic (OPENFLOW). The type of Auto Video Vlan is Auto-Video.

   - **Routing Interface.** Displays the routing interface.
   - **Member Ports.** The ports that are included in the VLAN.

**Port VLAN ID Configuration**

The Port PVID Configuration screen lets you assign a port VLAN ID (PVID) to an interface. There are certain requirements for a PVID:

- All ports must have a defined PVID.
- If no other value is specified, the default VLAN PVID is used.
- If you want to change the port’s default PVID, you must first create a VLAN that includes the port as a member.
- Use the Port VLAN ID (PVID) Configuration screen to configure a virtual LAN on a port.
To configure PVID information:

1. Select Switching > VLAN > Advanced > Port PVID Configuration.

2. To configure PVID settings for a physical port, enter the interface and click Go to select that particular interface.

3. Select the interfaces for which you want to configure the PVID settings:
   - To configure PVID settings for a Link Aggregation Group (LAG), click LAGS.
   - To configure PVID settings for both physical ports and LAGs, click ALL.

4. Select the check box next to the interfaces to configure.
   You can select multiple interfaces to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

5. Configure the PVID to assign to untagged or priority tagged frames received on this port.

6. Specify how you want the port to handle untagged and priority tagged frames.
   Whichever you select, VLAN tagged frames will be forwarded in accordance with the IEEE 802.1Q VLAN standard. The factory default is Admit All.
   - VLAN Only. The port will discard any untagged or priority tagged frames it receives.
   - Admit All. Untagged and priority tagged frames received on the port will be accepted and assigned the value of the Port VLAN ID for this port.

7. Specify how you want the port to handle tagged frames:
   - Enable. A tagged frame is discarded if this interface is not a member of the VLAN identified by the VLAN ID in the tag. In an untagged frame, the VLAN is the Port VLAN ID specified for the port that received this frame.
   - Disable. All frames are forwarded in accordance with the 802.1Q VLAN bridge specification. The factory default is disabled.

8. Specify the default 802.1p priority assigned to untagged packets arriving at the port.
   Possible values are 0–7.

9. Click Apply.
MAC-Based VLAN

The MAC-based VLAN feature allows incoming untagged packets to be assigned to a VLAN based on the source MAC address of the packet.

A MAC to VLAN mapping is defined by configuring an entry in the MAC to VLAN table. An entry is specified via a source MAC address and the desired VLAN ID. The MAC to VLAN configurations are shared across all ports of the device (i.e. there is a system-wide table that has MAC address to VLAN ID mappings).

When untagged or priority tagged packets arrive at the switch and entries exist in the MAC to VLAN table, the source MAC address of the packet is looked up. If an entry is found the corresponding VLAN ID is assigned to the packet. If the packet is already priority tagged it will maintain this value, otherwise the priority will be set to zero. The assigned VLAN ID is verified against the VLAN table, if the VLAN is valid ingress processing on the packet continues, otherwise the packet is dropped. This implies that the user is allowed to configure a MAC address mapping to a VLAN that has not been created on the system.

➢ To configure a MAC-based VLAN:

1. Select Switching > VLAN > Advanced > MAC Based VLAN.

2. Under MAC Address, specify the source MAC address of the host to be bound to a VLAN ID.

   All untagged traffic that includes this address in the source MAC address field of the Ethernet frame is placed in the associated VLAN.

3. Enter the VLAN ID of the MAC-based VLAN.

   If an untagged frame received on any port or LAG matches the associated MAC address, it is tagged with this VLAN ID

4. Click Add.
Protocol-Based VLAN Group Configuration

Protocol-based VLAN can be used to define filtering criteria for untagged packets. By default, if you do not configure any port (IEEE 802.1Q) or protocol-based VLANs, untagged packets will be assigned to VLAN 1. You can override this behavior by defining either port-based VLANs or protocol-based VLANs, or both. Tagged packets are always handled according to the IEEE 802.1Q standard, and are not included in protocol-based VLANs.

If you assign a port to a protocol based VLAN for a specific protocol, untagged frames received on that port for that protocol will be assigned the protocol based VLAN ID. Untagged frames received on the port for other protocols will be assigned the Port VLAN ID, either the default PVID (1) or a PVID you have specifically assigned to the port using the Port VLAN Configuration screen.

You define a protocol based VLAN by creating a group. Each group has a one-to-one relationship with a VLAN ID, can include one to three protocol definitions, and can include multiple ports. When you create a group you will choose a name and a Group ID will be assigned automatically.

To configure a protocol based VLAN group:

1. Select Switching > VLAN > Advanced > Protocol Based VLAN Group Configuration.

2. Under Group ID, specify a unique number used to identify the group.

3. Under Group Name, specify a name to identify the group. You can enter up to 16 characters.

4. Under Protocol, specify the protocol or protocols to use as the match criteria to determine whether a particular packet belongs to the protocol-based VLAN.

   The protocols you specify are checked against the two-byte EtherType field of ingress Ethernet frames on the PVBLAN Group Interfaces. When adding a protocol, you can specify the EtherType hex value or (for IP, ARP, and IPX) the protocol keyword.

5. Under VLAN ID, specify the VLAN ID to associate with the protocol-based VLAN.

   All the ports in the group will assign this VLAN ID to untagged packets received for the protocols you included in this group.

   The Ports field displays all the member ports which belong to the group.

6. Click Add.
To modify protocol based VLAN information:
1. Select the check box next to the protocol-based VLAN to update.
2. Specify the desired value in the available fields.
3. Click Apply.

To delete a protocol based VLAN group:
1. Select the check box next to each protocol-based VLAN to remove.
2. Click Delete.

Protocol Based VLAN Group Membership

The protocol based VLAN group membership screen is used to define a protocol-based VLAN group.

To set up protocol-based VLAN group membership:
1. Select Switching > VLAN > Advanced > Protocol Based VLAN Group Membership.

2. Select the protocol-based VLAN Group ID for which you want to display or configure data in the Group ID drop-down menu.
3. Click the orange bar to display the port list. Use this port list to add the ports you selected to this Protocol Based VLAN Group.

   Note that a given interface can only belong to one group for a given protocol. If you have already added a port to a group for IP, you cannot add it to another group that also includes IP, although you could add it to a new group for IPX.

   The Group Name field identifies the name for the protocol-based VLAN you selected. It can be up to 16 alphanumeric characters long, including blanks.

4. Click Apply.
5. Click Current Members button to view the current members of the selected protocol-based VLAN Group.
Voice VLAN

Configure the Voice VLAN settings for ports that carry traffic from IP phones. The Voice VLAN feature can help ensure that the sound quality of an IP phone is safeguarded from deteriorating when the data traffic on the port is high.

➢ To configure the voice VLAN:

1. Select Switching > VLAN > Advanced > Voice VLAN Configuration.

2. Next to Admin Mode, globally enable the administrative mode for Voice VLAN on the switch.

3. Select the port(s) to configure:
   - To configure a single port, select the check box associated with it, or type the port number in the Go To Interface field and click Go.
   - To configure multiple ports with the same settings, select the check box associated with each port to configure.
   - To configure all ports with the same settings, select the check box in the heading row.

4. From the Interface Mode list, select one of the following options to determine how an IP phone connected to the selected port should send voice traffic:
   - **VLAN ID.** Forward voice traffic in the specified voice VLAN.
   - **Dot1p.** Tag voice traffic with the specified 802.1p priority value.
   - **None.** Use the settings configured on the IP phone to send untagged voice traffic.
• **Untagged.** Send untagged voice traffic.
• **Disable.** Operationally disables the Voice VLAN feature on the interface.

5. If the interface mode is VLAN ID or Dot1p, specify the VLAN ID or 802.1p priority value under Value.
   This field is valid only when VLAN ID or dot1p is selected as the interface mode.

6. From the CoS Override Mode list, specify the CoS override mode for the selected ports:
   • **Enabled.** The port ignores the 802.1p priority value in the Ethernet frames it receives from connected devices.
   • **Disabled.** The port trusts the priority value in the received frame.

7. Click **Apply**.

**Auto-VoIP Configuration**

Voice over Internet Protocol (VoIP) enables telephone calls over a data network. Because voice traffic is typically more time-sensitive than data traffic, the Auto VoIP feature helps provide a classification mechanism for voice packets so that they can be prioritized above data packets in order to provide better Quality of Service (QoS). With the Auto VoIP feature, voice prioritization is provided based on call-control protocols (SIP, SCCP, H.323) and/or OUI bits.

**Configure Protocol-Based Auto VoIP Settings**

To prioritize time-sensitive voice traffic over data traffic, protocol-based Auto VoIP checks for packets carrying the following VoIP protocols:

- Session Initiation Protocol (SIP)
- H.323
- Signalling Connection Control Part (SCCP)

VoIP frames that are received on ports that have the Auto VoIP feature enabled are marked with the specified CoS traffic class value.

➢ **To configure the protocol-based port settings:**

1. Select **Switching > Auto-VoIP > Protocol Based Port Settings.**
2. In the Prioritization Type list, select method used to prioritize VoIP traffic when a call-control protocol is detected, which is one of the following:
   - **Remark.** Remark the voice traffic with the specified 802.1p priority value at the ingress interface.
   - **Traffic Class.** Assign VoIP traffic to the specified traffic class when egressing the interface.

3. In the Class Value list, select the CoS tag value to be reassigned for packets received on the voice VLAN when Remark CoS is enabled.

4. Select the interface(s) to configure.

5. In the Auto VoIP Mode list, select Enable to enable Auto VoIP on the selected interfaces.
   The Operational Status field displays the current operational status of the interface.

6. Click **Apply**.
OUI-Based Properties

With Organizationally Unique Identifier (OUI)-based Auto VoIP, voice prioritization is provided based on OUI bits.

➢ To configure OUI-based properties:

1. Select **Switching > Auto-VoIP > OUI-based > Properties**.

2. In the VoIP VLAN ID list, select the VLAN to use to segregate VoIP traffic from other non-voice traffic.
   
   All VoIP traffic that matches a value in the known OUI list gets assigned to this VoIP VLAN. Elect the VoIP VLAN Id on the switch.

3. In the OUI-based priority list, select the 802.1p priority value to use for traffic that matches a value in the known OUI list.
   
   If the Auto VoIP mode is enabled and the interface detects an OUI match, the device assigns the traffic in that session to the traffic class mapped to this priority value. Traffic classes with a higher value are generally used for time-sensitive traffic.

4. Click **Apply**.
Port Settings

The port settings screen allows you to configure the OUI port settings.

➢ To configure OUI port settings:

1. Select Switching > Auto-VoIP > Advanced > Port Settings.

2. Select the interface(s) to configure.

3. In the Auto VoIP Mode list, select Enable to enable Auto VoIP on the selected interfaces.

   The Operational Status field displays the current operational status of the interface.

4. Click Apply.
OUI Table

Device hardware manufacturers can include an OUI in a network adapter to help identify a hardware device. The OUI is a unique 24-bit number assigned by the IEEE registration authority. The switch comes preconfigured with the following OUIs that identify the IP phone manufacturer:

- 00:01:E3: SIEMENS
- 00:03:6B: CISCO1
- 00:12:43: CISCO2
- 00:0F:E2: H3C
- 00:60:B9: NITSUKO
- 00:D0:1E: PINTEL
- 00:E0:75: VERILINK
- 00:E0:BB: 3COM
- 00:04:0D: AVAYA1
- 00:1B:4F: AVAYA2
- 00:04:13: SNOM

You can select an existing OUI or add a new OUI and description to identify the IP phones on the network.

➢ To add a new OUI prefix:

1. Select **Switching > Auto-VoIP > OUI-based > OUI Table.**

![OUI Table](image)

2. Under Telephony OUI(s), specify the VOIP OUI prefix.
   
   The OUI prefix must be in the format AA:BB:CC.
3. Under Description, type a description that identifies the manufacturer or vendor associated with the OUI. The maximum length of description is 32 characters.

4. Click Add.

To delete one or more OUI prefixes from the table:

1. Select the check box next to each OUI prefix to remove.
2. Click Delete.

Spanning Tree Protocol

The Spanning Tree Protocol (STP) provides a tree topology for any arrangement of bridges. STP also provides one path between end stations on a network, eliminating loops. Spanning tree versions supported include Common STP, Multiple STP, and Rapid STP.

Classic STP provides a single path between end stations, avoiding and eliminating loops. For information about configuring Common STP, see CST Port Configuration on page 121.

Multiple Spanning Tree Protocol (MSTP) supports multiple instances of Spanning Tree to efficiently channel VLAN traffic over different interfaces. Each instance of the spanning tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree (RSTP), with slight modifications in the working but not the end effect (chief among the effects, is the rapid transitioning of the port to Forwarding). The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full-duplex connectivity and ports which are connected to end stations, resulting in rapid transitioning of the port to Forwarding state and the suppression of topology change notification. These features are represented by the parameters pointtopoint and edgeport. MSTP is compatible to both RSTP and STP. A MSTP bridge can be configured to behave entirely as a RSTP bridge or a STP bridge.

Note: For two bridges to be in the same region, the force version should be 802.1s and their configuration name, digest key, and revision level should match. For additional information about regions and their effect on network topology, refer to the IEEE 802.1Q standard.

The Spanning Tree menu contains links described in the following sections.

- STP Configuration
- CST Configuration
- CST Port Configuration
- CST Port Status
- Rapid STP
- MST Configuration
- MST Port Configuration
• **STP Statistics**

**STP Configuration**

The STP Configuration screen contains fields for enabling STP on the switch.

➢ To configure STP settings on the switch:

1. Select Switching > STP > Basic > STP Configuration.

2. From the Spanning Tree State field, specify whether to enable or disable Spanning Tree operation on the switch.

3. From the STP Operation Mode field, specify the Force Protocol Version parameter for the switch.

   Options are:
   • **STP** (Spanning Tree Protocol). IEEE 802.1D
   • **RSTP** (Rapid Spanning Tree Protocol). IEEE 802.1w
   • **MSTP** (Multiple Spanning Tree Protocol). IEEE 802.1s

4. Specify the configuration name and revision level.

   • **Configuration Name**. Name used to identify the configuration currently being used. It can be up to 32 alphanumeric characters.
   • **Configuration Revision Level**. Number used to identify the configuration currently being used. The values allowed are between 0 and 65535. The default value is 0.
5. The Forward BPDU while STP Disabled field specifies whether spanning tree BPDUs should be forwarded or not while spanning-tree is disabled on the switch. The value is enabled or disabled.

6. Click **Apply**.

7. View the STP Status information displayed on the screen.

CST Configuration

Use the CST Configuration screen to configure Common Spanning Tree (CST) and Internal Spanning Tree on the switch.

➢ To configure CST settings:

1. Select Switching > STP > Advanced > CST Configuration.

2. Specify values for CST in the appropriate fields:
   - **Bridge Priority.** When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. Specifies the bridge priority value for the Common and Internal Spanning Tree (CST). The valid range is 0–61440. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if the priority is attempted to be set to any value between 0 and 4095, it will be set to 0. The default priority is 32768.
   - **Bridge Max Age (secs).** Specify the bridge maximum age time for the Common and Internal Spanning Tree (CST), which indicates the amount of time in seconds a bridge waits before implementing a topological change. The valid range is 6–40, and the value must be less than or equal to (2 * Bridge Forward Delay) – 1 and greater than or equal to 2 * (Bridge Hello Time +1). The default value is 20.
   - **Bridge Hello Time (secs).** Specify the switch Hello time for the Common and Internal Spanning Tree (CST), which indicates the amount of time in seconds a root bridge waits between configuration messages. The value is fixed at 2 seconds.
   - **Bridge Forward Delay (secs).** Specify the switch forward delay time, which indicates the amount of time in seconds a bridge remains in a listening and learning state before forwarding packets. The value must be greater or equal to (Bridge Max Age / 2) + 1. The time range is from 4 seconds to 30 seconds. The default value is 15.
   - **Spanning Tree Maximum Hops.** Specify the maximum number of bridge hops the information for a particular CST instance can travel before being discarded. The valid range is 6–40.
3. Click **Apply**.
4. View the MSTP status information displayed on the Spanning Tree CST Configuration screen.

5. Click **Refresh** to update the information on the screen with the most current data.

**CST Port Configuration**

Use the CST Port Configuration screen to configure Common Spanning Tree (CST) and Internal Spanning Tree on a specific port on the switch.

➢ **To configure CST port settings:**

1. Select **Switching > STP > Advanced > CST Port Configuration.**

![CST Port Configuration](image)

2. To configure CST settings for a physical port, enter the interface and click **Go** to select that particular interface.

3. Select the interfaces for which you want to configure the CST settings:
   - To configure CST settings for a Link Aggregation Group (LAG), click **LAGS.**
   - To configure CST settings for both physical ports and LAGs, click **ALL.**

4. Select the check box next to the port or LAG to configure.

You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

5. Configure the CST values for the selected port(s) or LAG(s):
• **STP Status.** Enable or disable the Spanning Tree Protocol Administrative Mode associated with the port or port channel.

• **Fast Link.** Specifies if the specified port is an Edge Port with the CST. Possible values are Enable or Disable. The default is Disable.

• **BPDU Forwarding.** Specifies whether spanning tree BPDUs should be forwarded while spanning tree is disabled on the switch. The value is enabled or disabled.

• **Port State.** The Forwarding state of this port. This field is read-only.

• **Path Cost.** Set the Path Cost to a new value for the specified port in the common and internal spanning tree. It takes a value in the range of 0–200000000.

• **Priority.** The priority for a particular port within the CST. The port priority is set in multiples of 16. If you specify a value that is not a multiple of 16, the priority is set to the priority is automatically set to the next lowest priority that is a multiple of 16. For example, if you set a value between 0 and 15, the priority is set to 0. If you specify a number between 16 and 31, the priority is set to 16. Priority range is 0-240. The default value is 128.

• **External Port Path Cost.** Set the External Path Cost to a new value for the specified port in the spanning tree. It takes a value in the range of 0–200000000.

• **Port ID.** The port identifier for the specified port within the CST. It is made up from the port priority and the interface number of the port.

• **Hello Timer.** Specifies the switch Hello time, which indicates the amount of time in seconds a port waits between configuration messages. The value is fixed at 2 seconds.

6. Click **Apply.**
CST Port Status

Use the Spanning Tree CST Port Status screen to display Common Spanning Tree (CST) and Internal Spanning Tree on a specific port on the switch.

To display the Spanning Tree CST Port Status screen, click **Switching > STP > Advanced > CST Port Status**.

<table>
<thead>

GS752TXS and GS728TXS Smart Switches

MST Configuration

Use the Spanning Tree MST Configuration screen to configure Multiple Spanning Tree (MST) on the switch.

To configure an MST instance:

1. Select **Switching > STP > Advanced > MST Configuration**.

2. Configure the MST values:
   - **MST ID**. Specify the ID of the MST to create. Valid values for this are between 1 and 4094.
   - **Priority**. Specifies the bridge priority value for the MST. When switches or bridges are running STP, each is assigned a priority. After exchanging BPDUs, the switch with the lowest priority value becomes the root bridge. The bridge priority is a multiple of 4096. If you specify a priority that is not a multiple of 4096, the priority is automatically set to the next lowest priority that is a multiple of 4096. For example, if the priority is attempted to be set to any value between 0 and 4095, it will be set to 0. The default priority is 32768. The valid range is 0–61440.
   - **VLAN ID**. The menu contains all VLANs configured on the switch. Select a VLAN to associate with the MST instance.

3. Click **Add**.

4. View the MST instance information.
   - For each configured instance, the information described in the following table displays on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>Specifies the spanning tree operation mode. Different modes are STP, RSTP, and MSTP.</td>
</tr>
<tr>

<td>Indicates whether the port is enabled as an edge port.</td>
</tr>
<tr>
<td>Status</td>
<td>The Forwarding State of this port.</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
Bridge Identifier | The bridge identifier for the selected MST instance. It is made up using the bridge priority and the base MAC address of the bridge.
Time Since Topology Change | Displays the total amount of time since the topology of the selected MST instance last changed. The time is displayed in hour/minute/second format, for example, 5 hours, 10 minutes, and 4 seconds.
Topology Change Count | Displays the total number of times topology has changed for the selected MST instance.
Topology Change | Indicates whether a topology change is in progress on any port assigned to the selected MST instance. The possible values are True or False.
Designated Root | Displays the bridge identifier of the root bridge, which is made up from the bridge priority and the base MAC address of the bridge.
Root Path Cost | Displays the path cost to the Designated Root for this MST instance.
Root Port | Indicates the port to access the Designated Root for this MST instance.

➢ To delete an MST instance:
1. Select the check box next to the instance.
2. Click Delete.

MST Port Configuration

Use the MST Port Configuration screen to configure and display Multiple Spanning Tree (MST) settings on a specific port on the switch.

➢ To configure MST port settings:
1. Select Switching > STP > Advanced > MST Port Configuration.

---

**Note:** If no MST instances have been configured on the switch, the screen displays a “No MSTs Available” message.
2. To configure MST settings for a physical port, enter the interface and click Go to select that particular interface.

3. Select the interfaces for which you want to configure the CoS settings:
   - To configure MST settings for a Link Aggregation Group (LAG), click LAGS.
   - To configure MST settings for both physical ports and LAGs, click ALL.

4. Select the check box next to the port or LAG to configure.
   You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

5. Configure the MST values for the selected port(s) or LAG(s):
   - **Port Priority**. The priority for a particular port within the selected MST instance. The port priority is set in multiples of 16. If you specify a value that is not a multiple of 16, the priority is set to the next lowest priority that is a multiple of 16. For example, if you set a value between 0 and 15, the priority is set to 0. If you specify a number between 16 and 31, the priority is set to 16. It takes a value in the range of 0–240.
   - **Port Path Cost**. Set the Path Cost to a new value for the specified port in the selected MST instance. It takes a value in the range of 0–200000000.

6. Click Apply.

7. View the MST port status information.

The following table describes the read-only MST port configuration information displayed on the Spanning Tree CST Configuration screen:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto-calculated Port Path Cost</td>
<td>Displays whether the path cost is automatically calculated (Enabled) or not (Disabled). Path cost is calculated based on the link speed of the port if the configured value for Port Path Cost is zero.</td>
</tr>
<tr>
<td>Port ID</td>
<td>The port identifier for the specified port within the selected MST instance. It is made up from the port priority and the interface number of the port.</td>
</tr>
<tr>
<td>Port Up Time Since Counters Last Cleared</td>
<td>Time since the counters were last cleared, displayed in Days, Hours, Minutes, and Seconds.</td>
</tr>
<tr>
<td>Port Mode</td>
<td>Spanning Tree Protocol Administrative Mode associated with the port or port channel. Possible values are <strong>Enable</strong> or <strong>Disable</strong>.</td>
</tr>
</tbody>
</table>
Click Refresh to update the screen with the latest MST information.

## STP Statistics

Use the Spanning Tree Statistics screen to view information about the number and type of bridge protocol data units (BPDUs) transmitted and received on each port.

To display the spanning tree statistics, select **Switching > STP > Advanced > STP Statistics**.
The following table describes the information available on the STP Statistics screen.

<table>
<thead>
<tr>

</tbody>
</table>

**Multicast**

Multicast IP traffic is traffic that is destined to a host group. Host groups for IPv4 multicast are identified by class D addresses, which range from 224.0.0.0 to 239.255.255.255. Host groups for IPv6 multicast are identified by the prefix ff00::/8.

From the Multicast link, you can access the following screens:

- *Bridge Multicast Forwarding*
- *MFDB Table*
- *MFDB Statistics*
- *Auto-Video*
- *IGMP Snooping*
- *IGMP Snooping Querier*
- *MLD Snooping*
Bridge Multicast Forwarding

When you create a VLAN, a default multicast forwarding option is assigned. You can use the Global Multicast Mode setting to set all VLANs currently configured on the switch to a selected forwarding mode. The global setting does not create a default setting for VLANs created subsequently—it simply ensures that all existing VLANs are configured with the specified mode. You can also configure how the switch forwards multicast packets on an individual or per-VLAN basis.

➢ To configure bridge multicast forwarding:
  1. Select Switching > Multicast > MFDB > Bridge Multicast Forwarding.

    ![](Bridge Multicast Forwarding.png)

  2. Select the VLAN for which the Forwarding Mode is to be changed.
  3. From the Forwarding Mode menu, select the forwarding mode:
     * **Forward Unregistered.** If a packet is received from a VLAN with a multicast destination address and no ports in the VLAN are registered to receive multicast packets for that address, then the packet is flooded to all ports in the VLAN. The responsibility for accepting or dropping the packets belongs to the hosts. If a multicast packet is received and there are ports registered to receive it, the packet is sent only to the registered ports.
     * **Forward All.** All multicast packets received from a VLAN are flooded to all ports in the VLAN, regardless of port registrations to multicast addresses.
     * **Filter Unregistered.** If a packet is received from a VLAN for a multicast destination address and no ports in the VLAN are registered to receive multicast packets for that address, then the packets are dropped.
  4. Click **Apply.**
MFDB Table

The Multicast Forwarding Database (MFDB) holds the port membership information for all active multicast address entries. The key for an entry consists of a VLAN ID and MAC address pair. Entries can contain data for more than one protocol.

➢ To search the MFDB table:

1. Select Switching > Multicast > MFDB > MFDB Table.

2. Next to Search By MAC Address, specify the MAC Address whose MFDB table entry you want to view.

   Enter six two-digit hexadecimal numbers separated by colons, for example 00:01:23:43:45:67.

3. Click Go.

   If the address exists, that entry will be displayed. An exact match is required.

   The MFDB Table screen displays the following:

   • **MAC Address.** The multicast MAC address for which you requested data.
   • **VLAN ID.** The VLAN ID to which the multicast MAC address is related.
   • **Component.** This is the component that is responsible for this entry in the Multicast Forwarding Database. Possible values are IGMP Snooping, GMRP, Static Filtering and MLD Snooping.
   • **Type.** This displays the type of the entry. Static entries are those that are configured by the end user. Dynamic entries are added to the table as a result of a learning process or protocol.
   • **Description.** The text description of this multicast table entry. Possible values are Management Configured, Network Configured and Network Assisted.
   • **Interface.** The list of interfaces that are designated for forwarding (Fwd:) and filtering (Flt:) for the selected address.
   • **Forwarding Interfaces.** The resultant forwarding list is derived from combining all the forwarding interfaces and removing the interfaces that are listed as the static filtering interfaces.

4. Click Refresh to refresh the web screen to show the latest MFDB information.
MFDB Statistics

This screen displays the MFDB statistics for the system.

➢ To view the MFDB statistics:

  1. Select Switching > Multicast > MFDB > MFDB Statistics.

The MFDB Statistics screen displays the following:

- **Max MFDB Table Entries.** The maximum number of entries that the Multicast Forwarding Database table can hold.
- **Most MFDB Entries Since Last Reset.** The largest number of entries that have been present in the Multicast Forwarding Database table since last reset. This value is also known as the MFDB high-water mark.
- **Current Entries.** The current number of entries in the Multicast Forwarding Database table.

  2. Click **Refresh** to update the screen with the latest MST information.

Auto-Video

Use this screen to configure the Auto-Video parameters.

➢ To configure Auto-Video:

  1. Select Switching > Multicast > Auto-Video.

  ![Auto-Video Configuration](image)

  2. Select one of the following radio buttons:

      - Select the **Disable** radio button to globally disable Auto-Video administrative mode for the switch.
      - Select the **Enable** radio button to globally enable Auto-Video administrative mode for the switch.

The Auto-Video VLAN field shows the number of Auto-configured IGMP snooping VLANs.

  3. Click **Apply**.
IGMP Snooping

Internet Group Management Protocol (IGMP) Snooping is a feature that allows a switch to forward multicast traffic intelligently on the switch. Multicast IP traffic is traffic that is destined to a host group. Host groups are identified by class D IP addresses, which range from 224.0.0.0 to 239.255.255.255. Based on the IGMP query and report messages, the switch forwards traffic only to the ports that request the multicast traffic. This prevents the switch from broadcasting the traffic to all ports and possibly affecting network performance.

A traditional Ethernet network can be separated into different network segments to prevent placing too many devices onto the same shared media. Bridges and switches connect these segments. When a packet with a broadcast or multicast destination address is received, the switch will forward a copy into each of the remaining network segments in accordance with the IEEE MAC Bridge standard. Eventually, the packet is made accessible to all nodes connected to the network.

This approach works well for broadcast packets that are intended to be seen or processed by all connected nodes. In the case of multicast packets, however, this approach could lead to less efficient use of network bandwidth, particularly when the packet is intended for only a small number of nodes. Packets will be flooded into network segments where no node has any interest in receiving the packet. While nodes will rarely incur any processing overhead to filter packets addressed to unrequested group addresses, they are unable to transmit new packets onto the shared media for the period of time that the multicast packet is flooded. The problem of wasting bandwidth is even worse when the LAN segment is not shared, for example in full-duplex links.

Allowing switches to snoop IGMP packets is a creative effort to solve this problem. The switch uses the information in the IGMP packets as they are being forwarded throughout the network to determine which segments should receive packets directed to the group address.

IGMP Snooping Configuration

Use the IGMP Snooping Configuration screen to configure the parameters for IGMP snooping. These parameters are used to build forwarding lists for multicast traffic.

➢ To configure IGMP snooping:

1. Select Switching > Multicast > IGMP Snooping > IGMP Snooping Configuration.
2. Enable or disable IGMP Snooping on the switch:
   - **Enable.** The switch snoops all IGMP packets it receives to determine which segments should receive packets directed to the group address.
   - **Disable.** The switch does not snoop IGMP packets.

3. Select whether to validate the IGMP IP header.
   - **Enable.** The switch checks the IP header of all IGMP messages for the Router Alert option. If the option is not present, the packet is dropped.
   - **Disable.** The IGMP IP header is not checked for Router Alert option.

4. Click **Apply**.

The following table displays information about the global IGMP snooping status and statistics on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multicast Control Frame Count</td>
<td>Displays the number of multicast control frames that have been processed by the CPU.</td>
</tr>
<tr>
<td>Interfaces Enabled for IGMP Snooping</td>
<td>Lists the interfaces currently enabled for IGMP Snooping. To enable interfaces for IGMP snooping, see <strong>IGMP Snooping Interface Configuration</strong> on page 135.</td>
</tr>
<tr>
<td>VLAN Ids Enabled For IGMP Snooping</td>
<td>Displays VLAN IDs enabled for IGMP snooping. To enable VLANs for IGMP snooping, see <strong>IGMP Snooping VLAN Configuration</strong> on page 137.</td>
</tr>
<tr>
<td>VLAN Ids Enabled For IGMP Snooping Querier</td>
<td>Displays VLAN IDs enabled for IGMP snooping querier.</td>
</tr>
</tbody>
</table>
IGMP Snooping Interface Configuration

Use the IGMP Snooping Interface Configuration screen to configure IGMP snooping settings on specific interfaces.

➢ To configure IGMP snooping interface settings:

1. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping Interface Configuration**.

2. To configure IGMP Snooping settings for a physical port, enter the interface and click **Go** to select that particular interface.

3. Select the interfaces for which you want to configure the CoS settings:
   • To configure IGMP Snooping settings for a Link Aggregation Group (LAG), click **LAGS**.
   • To configure IGMP Snooping settings for both physical ports and LAGs, click **ALL**.

4. Select the check box next to the port or LAG to configure.

   You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

5. Configure the IGMP Snooping values for the selected port(s) or LAG(s):
   • **Admin Mode.** Select the interface mode for the selected interface for IGMP Snooping for the switch from the menu. The default is **Disable**.
   • **Host Timeout.** Specify the amount of time you want the switch to wait for a report for a particular group on a particular interface before it deletes that interface from the group. Enter a value between 2 and 3600 seconds. The default is 260 seconds.
• **Max Response Time.** Specify the amount of time you want the switch to wait after sending a query on an interface because it did not receive a report for a particular group on that interface. Enter a value greater or equal to 1 and less than the Host Time-out, in seconds. The default is 10 seconds.

• **MRouter Timeout.** Specify the amount of time you want the switch to wait to receive a query on an interface before removing it from the list of interfaces with multicast routers attached. Enter a value between 0 and 3600 seconds. The default is 0 seconds. A value of zero indicates an infinite time-out; no expiration.

• **Fast Leave Admin Mode.** Select the Fast Leave mode for a particular interface from the menu. The default is Disable.

6. Click **Apply**.

**IGMP Snooping Table**

Use the IGMP Snooping Table screen to view all of the entries in the Multicast Forwarding Database that were created for IGMP snooping.

➢ **To view the entries in the IGMP snooping table:**

1. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping Table.**

2. Next to Search By MAC Address, specify the MAC Address whose MFDB table entry you want to view.

   Enter six two-digit hexadecimal numbers separated by colons, for example 00:01:23:43:45:67.

3. View the information associated with the IGMP snooping table entry.

   The following table describes the information in the IGMP snooping table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>A multicast MAC address for which the switch has forwarding and/or filtering information. The format is 6 two-digit hexadecimal numbers that are separated by colons, for example, 01:00:5e:45:67:89.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>A VLAN ID for which the switch has forwarding and filtering information.</td>
</tr>
<tr>
<td>Type</td>
<td>This displays the type of the entry. Static entries are those that are configured by the end user. Dynamic entries are added to the table as a result of a learning process or protocol.</td>
</tr>
</tbody>
</table>
Use the buttons at the bottom of the screen to perform the following actions:

- Click **Clear** to clear one or all of the IGMP Snooping entries.
- Click **Refresh** to reload the screen and display the most current information.

**IGMP Snooping VLAN Configuration**

Use the IGMP Snooping VLAN Configuration screen to configure IGMP snooping settings for VLANs on the system.

To **configure IGMP snooping settings for VLANs:**

1. Select **Switching > Multicast > IGMP Snooping > IGMP Snooping VLAN Configuration.**

2. Enter the VLAN ID in the appropriate field and configure the IGMP Snooping values:
   - **Fast Leave Admin Mode.** Enable or disable the IGMP Snooping Fast Leave Mode for the specified VLAN ID. Enabling fast-leave allows the switch to immediately remove the Layer 2 LAN interface from its forwarding table entry upon receiving an IGMP leave message for that multicast group without first sending out MAC-based general queries to the interface. You should enable fast-leave admin mode only on VLANs where only one host is connected to each layer 2 LAN port. This prevents the inadvertent dropping of the other hosts that were connected to the same layer 2 LAN port but were still interested in receiving multicast traffic directed to that group. Also, fast-leave processing is supported only with IGMP version 2 hosts.
   - **Host Timeout.** Sets the value for group membership interval of IGMP snooping for the specified VLAN ID. The valid range is (Maximum Response Time + 1) to 3600 seconds.
   - **Maximum Response Time.** Sets the value for maximum response time of IGMP Snooping for the specified VLAN ID. Valid range is 1 to 25. The configured value must be less than the Group Membership Interval. The default is 10 seconds.
   - **MRouter Timeout.** Enter the amount of time that a switch will wait to receive a query on the VLAN before removing it from the list of VLANs with multicast routers attached. Enter a value between 0 and 3600 seconds. The default is 0 seconds, which means there is no expiration.
- **Query Mode.** Enable or disable the IGMP Querier Mode for the specified VLAN ID.
- **Query Interval.** Enter the value for IGMP Query Interval for the specified VLAN ID. The valid range is 1–1800 seconds. The default is 60 seconds.

3. Click **Add**.

➤ **To disable IGMP snooping on one or more VLANs:**

1. Select the check box next to each VLAN ID on which IGMP snooping is to be disabled.
2. Click **Delete**.

**Multicast Router Configuration**

If a multicast router is attached to the switch, its existence can be learned dynamically. You can also statically configure an interface as a multicast router interface, which is an interface that faces a multicast router or IGMP querier and receives multicast traffic. Use this screen to manually configure an interface as a static multicast router interface. All IGMP packets snooped by the switch will be forwarded to the multicast router reachable from this interface. The configuration is not needed most of the time since the switch will automatically detect the presence of multicast router and forward IGMP packet accordingly. It is needed only when you want to make sure the multicast router always receives IGMP packets from the switch in a complex network.

➤ **To configure the multicast router mode for one or more interfaces:**

1. Select **Switching > Multicast > IGMP Snooping > Multicast Router Configuration**.

2. Select each interface to configure.
3. Use the Multicast Router menu to enable or disable Multicast Router on the selected interfaces.

4. Click Apply.

**Multicast Router VLAN Configuration**

This screen configures the interface to only forward the snooped IGMP packets that come from VLAN ID to the multicast router attached to this interface. The configuration is not needed most of the time since the switch will automatically detect the presence of a multicast router and forward IGMP packets accordingly. It is only needed when you want to make sure that the multicast router always receives IGMP packets from the switch in a complex network.

➢ **To configure a multicast routing VLAN:**

1. Select Switching > Multicast > IGMP Snooping > Multicast Router VLAN Configuration.

2. Select the Interface for which you want Multicast Router to be enabled or to be disabled.

3. Enter the VLAN ID for which the Multicast Router Mode is to be Enabled or Disabled.

4. Enable the VLAN ID for the multicast router.

5. Click Apply.

**IGMP Snooping Querier**

IGMP snooping requires that one central switch or router periodically query all end-devices on the network to announce their multicast memberships. This central device is the IGMP querier. The IGMP query responses, known as IGMP reports, keep the switch updated with the current multicast group membership on a port-by-port basis. If the switch does not receive updated membership information in a timely fashion, it will stop forwarding multicasts to the port where the end device is located.

These screens enable you to configure and display information on IGMP snooping queriers on the network and, separately, on VLANs.

The IGMP Snooping Querier contains links described in the following sections.

- IGMP Snooping Querier Configuration
- IGMP Snooping Querier VLAN Configuration
- IGMP Snooping Querier VLAN Status
IGMP Snooping Querier Configuration

Use this screen to enable or disable the IGMP Snooping Querier feature, specify the IP address of the router to perform the querying, and configure the related parameters.

To configure IGMP snooping querier settings:

1. Select Switching > Multicast > IGMP Snooping Querier > IGMP Snooping > Querier Configuration.

2. From the Querier Admin Mode field, enable or disable the administrative mode for IGMP Snooping Querier.

3. Specify the IP address to be used as source address in periodic IGMP queries om the Snooping Querier Address field.
   This address is used when no address is configured on the VLAN on which the query is being sent.

4. Specify the IGMP protocol version used in periodic IGMP queries in the IGMP Version field.

5. Specify the time interval in seconds between periodic queries sent by the snooping querier in the Query Interval field.
   The Query Interval must be a value in the range of 1–1800 seconds. The default value is 60.

6. Specify the time interval in seconds after which the last querier information is removed in the Querier Expiry Interval field.
   The Querier Expiry Interval must be a value in the range of 60–300 seconds. The default value is 125.

7. Click Apply.
IGMP Snooping Querier VLAN Configuration

To create a new VLAN ID for IGMP snooping:

1. Select Switching > Multicast > IGMP Snooping Querier > Querier VLAN Configuration.

2. Select New Entry from the VLAN ID field and complete the following fields:
   - **VLAN ID.** Specifies the VLAN ID for which the IGMP Snooping Querier is to be enabled.
   - **Querier Election Participate Mode.** Enable or disable Querier Participate Mode.
     - **Disabled.** Upon seeing another querier of the same version in the VLAN, the snooping querier moves to the non-querier state.
     - **Enabled.** The snooping querier participates in querier election, in which the least IP address operates as the querier in that VLAN. The other querier moves to non-querier state.
   - **Snooping Querier VLAN Address.** Specify the Snooping Querier IP Address to be used as the source address in periodic IGMP queries sent on the specified VLAN.

3. Click **Apply.**
**IGMP Snooping Querier VLAN Status**

Use this screen to view the operational state and other information for IGMP snooping queriers for VLANs on the network.

To view operational information on IGMP snooping queriers, select **Switching > Multicast > IGMP Snooping Querier > Querier VLAN Status**.

The following table describes the information available on the Querier VLAN Status screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Specifies the VLAN ID on which the IGMP Snooping Querier is administratively enabled and for which VLAN exists in the VLAN database.</td>
</tr>
<tr>
<td>Operational State</td>
<td>Specifies the operational state of the IGMP Snooping Querier on a VLAN:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Querier</strong>: The snooping switch is the querier in the VLAN. The snooping switch will send out periodic queries with a time interval equal to the configured querier query interval. If the snooping switch sees a better querier (numerically lower) in the VLAN, it moves to non-querier mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Non-Querier</strong>: The snooping switch is in non-querier mode in the VLAN. If the querier expiry interval timer expires, the snooping switch moves into querier mode.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Disabled</strong>: The snooping querier is not operational on the VLAN. The snooping querier moves to disabled mode when IGMP snooping is not operational on the VLAN, when the querier address is not configured, or the network management address is not configured.</td>
</tr>
<tr>
<td>Operational Version</td>
<td>Displays the IGMP protocol version of the operational querier.</td>
</tr>
<tr>
<td>Last Querier Address</td>
<td>Displays the IP address of the last querier from which a query was snooped on the VLAN.</td>
</tr>
<tr>
<td>Last Querier Version</td>
<td>Displays the IGMP protocol version of the last querier from which a query was snooped on the VLAN.</td>
</tr>
<tr>
<td>Operational Max Response Time</td>
<td>Displays the maximum response time to be used in the queries that are sent by the snooping querier.</td>
</tr>
</tbody>
</table>
MLD Snooping

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on its directly attached links and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD version 1 (MLDv1) is equivalent to IGMPv2 and MLD version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 Multicast MAC Addresses. The switch can be configured to perform MLD Snooping and IGMP Snooping simultaneously.

MLD Snooping Configuration

In IPv4, Layer 2 switches can use IGMP Snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast address. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

To configure MLD snooping:

1. Select Switching > Multicast > MLD Snooping > MLD Snooping Configuration.

2. Next to MLD Snooping Admin Mode, enable the administrative mode for MLD Snooping on the switch.

3. Click Apply.

4. View MLD snooping information on the switch:
   - Multicast Control Frame Count. The number of multicast control frames that are processed by the CPU.
   - Interfaces Enabled for MLD Snooping. A list of all the interfaces currently enabled for MLD Snooping. To enable an interface for MLD snooping, see MLD Interface Configuration on page 144.
• **VLAN IDs Enabled For MLD Snooping.** The VLANs enabled for MLD snooping. To enable a VLAN for MLD snooping, see *MLD VLAN Configuration* on page 145.

5. Click **Refresh** to update the screen with the latest information from the switch.

**MLD Interface Configuration**

For MLD snooping to be active on an interface, it must be enabled both globally and on the interface (physical or LAG).

➢ **To configure an interface for MLD snooping:**

1. Select **Switching > Multicast > MLD Snooping > Interface Configuration.**

2. To configure MLD settings for a physical port, enter the interface and click **Go** to select that particular interface.

3. Select the interfaces for which you want to configure the CoS settings:
   - To configure MLD settings for a Link Aggregation Group (LAG), click **LAGS**.
   - To configure MLD settings for both physical ports and LAGs, click **ALL**.

4. Select all physical, VLAN and LAG interface you want to configure in the Interface field.

5. Select the interface mode for the selected interface for MLD Snooping for the switch from the Admin Mode field.
   - The default is disable.

6. Use the Group Membership Interval(secs) field to specify the amount of time you want the switch to wait for a report for a particular group on a particular interface before it deletes that interface from the group.
The valid range is from (2 to 3600) seconds. The configured value must be greater than Max Response Time. The default is 260 seconds.

7. Use the Max Response Time(secs) field to specify the amount of time you want the switch to wait after sending a query on an interface because it did not receive a report for a particular group on that interface.

Enter a value greater or equal to 1 and less than the Group Membership Interval in seconds. The default is 10 seconds. The configured value must be less than the Group Membership Interval.

8. Use the Present Expiration Time(secs) field to specify the amount of time you want the switch to wait to receive a query on an interface before removing it from the list of interfaces with multicast routers attached.

Enter a value between 0 and 3600 seconds. The default is 0 seconds. A value of zero indicates an infinite time-out, that is, no expiration.

9. Use the Fast Leave Admin Mode field to select the Fast Leave mode for a particular interface from the menu.

The default is Disable.

10. Click Apply

MLD VLAN Configuration

MLD Snooping can be enabled on a per-VLAN basis. It is necessary to keep track of the interfaces that are participating in a VLAN in order to apply or remove configurations.

➢ To configure the MLD VLAN:

1. Select Switching > Multicast > MLD Snooping > MLD VLAN Configuration.

<table>
<thead>
<tr>
<th>MLD VLAN Configuration</th>
<th>VLAN ID</th>
<th>Admin Mode</th>
<th>Fast Leave Admin Mode</th>
<th>Group Membership Interval</th>
<th>Maximum Response Time</th>
<th>Multicast Router Expiry Time</th>
</tr>
</thead>
</table>

2. Under VLAN ID, specify the on which MLD Snooping is enabled.

3. In the Admin Mode list, select Enable.

4. In the Fast Leave Admin Mode list, specify the desired mode:

5. Enable or disable the MLD Snooping Fast Leave Mode for the specified VLAN.

If fast leave is enabled, the VLAN can be immediately removed from the layer 2 forwarding table entry when the switch receives an MLD leave message for a multicast group without first sending out MAC-based general queries.
6. Under Group Membership Interval, specify the number of seconds the VLAN should to wait for a report for a particular group on the VLAN before the MLD snooping feature deletes the VLAN from the group.

7. Under Maximum Response Time, specify the number of seconds the VLAN should wait after sending a query if does not receive a report for a particular group. The specified value should be less than the group membership Interval.

8. Under Multicast Router Expiry Time, specify the number of seconds the VLAN should wait to receive a query before it is removed from the list of VLANs with multicast routers attached.

9. Click Add.

➢ To disable MLD snooping on a VLAN:

1. Select the check box next to each VLAN on which MLD snooping should be disabled.

2. Click Delete.

**Multicast Router Configuration**

In addition to building and maintaining lists of multicast group memberships, the Snooping switch also maintains a list of multicast routers. When forwarding multicast packets, they should be forwarded on ports that have joined using MLD/IGMP and also on ports on which multicast routers are attached. In MLD/IGMP, there is only one active querier. This means that all other routers on the network are suppressed and are not detectable by the switch. If a query is not received on an interface within a specified length of time (multicast router present expiration time), then that interface is removed from the list of interfaces with multicast routers attached. The multicast router present expiration time is configurable via management. The default value for the multicast router expiration time is zero, which indicates an infinite time-out, that is, no expiration.

➢ To configure the Multicast Router:

1. Select Snooping > Multicast Router Configuration.
2. To configure Multicast Router settings for a physical port, enter the interface and click Go to select that particular interface.

3. Select the interfaces for which you want to configure the CoS settings:
   • To configure Multicast Router settings for a Link Aggregation Group (LAG), click LAGS.
   • To configure Multicast Router settings for both physical ports and LAGs, click ALL.

4. Use the Multicast Router field to enable or disable Multicast Router on the selected interface.

5. Click Apply.

**Multicast Router VLAN Configuration**

The statically configured router attached (VLAN, Interface) is added to the learned multicast router attached interface list if the interface is active and is a member of the VLAN. Unlike in the previous release of the system firmware, Snooping dynamic learning mode (snooping interface mode or snooping VLAN mode) does not need not be enabled on the interface. The dynamic learning mode is applicable only for dynamically learned multicast router information (Queries from an attached true Querier).

➢ To configure the multicast router VLAN:

1. Select Switching > Multicast > MLD Snooping > Multicast Router Configuration VLAN Configuration.
2. Select the interface in unit/slot/port format in the Interface field and click on the Go button. The entry corresponding to the specified interface will be selected.

3. Enter the VLAN ID in the VLAN ID field for which the Multicast Router Mode is to be Enabled or Disabled.

4. Use the Multicast Router field to enable or disable Multicast Router on the selected interface.

5. Click Apply.

**Querier Configuration**

Use this screen to enable or disable the MLD Querier Configuration feature, specify the IP address of the router to perform the querying, and configure the related parameters.

➢ To configure the querier settings:

1. Select **Switching > Multicast > MLD Snooping > Querier Configuration**.

2. From the Querier Admin Mode field, enable or disable the administrative mode for MLD Snooping Querier.

3. In the Querier Address field, specify the Snooping Querier Address to be used as source address in periodic MLD queries. This address is used when no address is configured on the VLAN on which query is being sent. The supported IPv6 formats are x:x:x:x:x:x:x:x and x::x.
4. In the MLD Version field, the MLD protocol version used in periodic MLD queries is displayed.
   The supported MLD Version is 1.

5. In the Query Interval field, specify the time interval in seconds between periodic queries sent by the snooping querier.
   The Query Interval must be a value in the range of 1–1800 seconds. The default value is 60.

6. In the Querier Expiry Interval field, specify the time interval in seconds after which the last querier information is removed.
   The Querier Expiry Interval must be a value in the range of 60–300 seconds. The default value is 60.

7. Click Apply.

Querier VLAN Configuration

Use this screen to configure MLD queriers for use with VLANs on the network.

To configure MLD queriers:

1. Select Switching > Multicast > MLD Snooping Querier > Querier VLAN Configuration.

2. Under VLAN ID, specify the VLAN ID for which the MLD Snooping Querier is to be enabled.

3. From the Querier Election Participate Mode list, select the mode:
   • Disable. Upon seeing another querier of the same version in the VLAN, the snooping querier moves to the non-querier state.
   • Enable. The snooping querier participates in querier election, in which the least IP address operates as the querier in that VLAN. The other querier moves to non-querier state.

4. Under Snooping Querier VLAN Address, specify the snooping querier IP address to be used as the source address in periodic MLD queries sent on the specified VLAN.

5. Click Add.

6. View the status information described in the following table.
### Field | Description
--- | ---
Operational State | Specifies the operational state of the IGMP Snooping Querier on a VLAN:
  - **Querier.** The snooping switch is the querier in the VLAN. The snooping switch will send out periodic queries with a time interval equal to the configured querier query interval. If the snooping switch sees a better querier (numerically lower) in the VLAN, it moves to non-querier mode.
  - **Non-Querier.** The snooping switch is in non-querier mode in the VLAN. If the querier expiry interval timer expires, the snooping switch moves into querier mode.
  - **Disabled.** The snooping Querier is not operational on the VLAN. The Snooping Querier moves to disabled mode when MLD Snooping is not operational on the VLAN or when the querier address is not configured or the network management address is also not configured.
Operational Version | Displays the MLD protocol version of the operational querier.
Last Querier Address | Displays the IP address of the last querier from which a query was snooped on the VLAN.
Last Querier Version | Displays the MLD protocol version of the last querier from which a query was snooped on the VLAN.
Operational Max Response Time | Displays the maximum response time to be used in the queries that are sent by the snooping querier.

To remove an MLD snooping querier configuration:
1. Select the check box next to each entry to remove.
2. Click Delete.

### Forwarding Database

The forwarding database maintains a list of MAC addresses after having received a packet from this MAC address. The transparent bridging function uses the forwarding database entries to determine how to forward a received frame.

The Address Table link contains links described in the following sections.

- **MAC Address Table**
- **Dynamic Address Configuration**
- **Static MAC Address**
MAC Address Table

The MAC Address Table contains information about unicast entries for which the switch has forwarding and/or filtering information. This information is used by the transparent bridging function in determining how to propagate a received frame. Use the search function of the MAC Address Table screen to display information about the entries in the table.

The MAC Address Table contains information about unicast entries for which the switch has forwarding and/or filtering information. This information is used by the transparent bridging function in determining how to propagate a received frame. Use the search function of the MAC Address Table screen to display information about the entries in the table.

To search for an entry in the MAC address table:

1. Select Switching > Address Table > Basic > Address Table.

2. Use the Search By field to search for MAC Addresses by MAC Address, VLAN ID, or Interface.
   - **MAC Address.** Select MAC Address from the menu and enter a 6-byte hexadecimal MAC address in 2-digit groups separated by colons, then click Go. If the address exists, that entry will be displayed. An exact match is required.
   - **VLAN ID.** Select VLAN ID from the menu, enter the VLAN ID, for example, 100. Then click Go. If any entries with that VLAN ID exist they are displayed.
   - **Interface.** Select Interface from the menu, enter the interface ID in g1, g2... format, then, click Go. If any entries learned on that interface exist, they are displayed.

3. Click Clear to clear Dynamic MAC Addresses in the table.

4. Click Refresh to redisplay the screen to show the latest MAC Addresses.
The following table describes the information available for each entry in the address table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Specifies the VLAN ID on which the IGMP Snooping Querier is administratively enabled and for which VLAN exists in the VLAN database.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>A unicast MAC address for which the switch has forwarding and/or filtering information. The format is a six-byte MAC address with each byte separated by colons. For example, 00:0F:89:AB:CD:EF.</td>
</tr>
<tr>
<td>Interface</td>
<td>The port where this address was learned: that is, this field displays the port through which the MAC address can be reached.</td>
</tr>
<tr>
<td>Status</td>
<td>The status of this entry. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Static. The entry was added when a static MAC filter was defined.</td>
</tr>
<tr>
<td></td>
<td>• Learned. The entry was learned by observing the source MAC addresses of incoming traffic, and is currently in use.</td>
</tr>
<tr>
<td></td>
<td>• Management. The system MAC address, which is identified with interface c1.</td>
</tr>
</tbody>
</table>

**Dynamic Address Configuration**

Use the Dynamic Address screen to set the amount of time to keep a learned MAC address entry in the forwarding database. The forwarding database contains static entries, which are never aged out, and dynamically learned entries, which are removed if they are not updated within a given time.

➢ To configure the dynamic address setting:

1. Select **Switching > Address Table > Advanced > Dynamic Addresses.**

   ![Dynamic Address](image)

2. In the Address Aging Timeout field, specify the number of seconds the forwarding database should wait before deleting a learned entry that has not been updated.

   IEEE 802.1D-1990 recommends a default of 300 seconds. Enter any number of seconds between 10 and 1000000. The factory default is 300.

   **Note:** IEEE 802.1D recommends a default of 300 seconds, which is the factory default.

3. Click **Apply.**
Static MAC Address

Use the Static MAC Address Configuration screen to configure and view static MAC addresses on an interface.

➢ To add a static MAC address:

1. Select Switching > Address Table > Advanced > Static MAC Address.

2. Select the VLAN ID corresponding to the MAC address to add.
3. Specify the MAC address to add.
4. Specify the interface associated with the MAC address.
5. Click Add.

➢ To delete a static MAC address:

1. Select the check box next to each entry to remove.
2. Click Delete.
The GS752TXS and GS728TXS Smart Switches supports IP routing. Use the menus under the Routing tab to manage routing on the system.

When a packet enters the switch, the destination MAC address is checked to see if it matches any of the configured routing interfaces. If it does, then the switch searches the host table for a matching destination IP address. If an entry is found, then the packet is routed to the host. If there is no matching entry, then the switch performs a longest prefix match on the destination IP address. If an entry is found, then the packet is routed to the next hop. If there is no match, then the packet is routed to the next hop specified in the default route. If there is no default route configured, then the packet is passed to the software to be handled appropriately.

The routing table can have entries added either statically by the administrator or dynamically via a routing protocol. The host table can have entries added either statically by the administrator or dynamically via ARP.

This chapter contains the following sections.

- Configuring IP Settings
- Configure VLAN Routing
- Configuring Router Discovery
- Configure and View Routes
- Configure ARP

### Configuring IP Settings

To configure and display IP routing data, see the following sections:

- IP Configuration
- VLAN Routing Wizard
- IP Statistics
IP Configuration

Use the IP Configuration screen to configure routing parameters for the switch.

To enable routing on the switch:

1. Select Routing > IP > IP Configuration.

2. Next to Routing Mode, select Enable.

You must enable routing for the switch before you can route through any of the interfaces. Routing is also enabled or disabled per VLAN interface. The default value is Disable.

The following table describes the IP configuration information displayed on the screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Time to Live</td>
<td>The default value inserted into the Time-To-Live field of the IP header of datagrams originated by the switch, if a TTL value is not supplied by the transport layer protocol. The default value is 64.</td>
</tr>
<tr>
<td>Maximum Next Hops</td>
<td>The maximum number of hops supported by the switch. This is a compile-time constant. The default value is 1.</td>
</tr>
</tbody>
</table>

3. Click Apply.

IP Statistics

The statistics reported on the IP Statistics screen are as specified in RFC 1213.

To display the IP statistics screen:

Select Routing > IP > Statistics. The IP Statistics screen displays.
The following table describes the IP statistics information displayed on the screen.

**Table 21. IP routing statistics**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IpInReceives</td>
<td>The total number of input datagrams received from interfaces, including those received in error.</td>
</tr>
<tr>
<td>IpInHdrErrors</td>
<td>The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.</td>
</tr>
<tr>
<td>IpInAddrErrors</td>
<td>The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IpForwDatagrams</td>
<td>The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter includes only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.</td>
</tr>
<tr>
<td>IpInUnknownProtos</td>
<td>The number of locally addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.</td>
</tr>
<tr>
<td>IpInDiscards</td>
<td>The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting reassembly.</td>
</tr>
<tr>
<td>IpInDelivers</td>
<td>The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).</td>
</tr>
<tr>
<td>IpOutRequests</td>
<td>The total number of IP datagrams which local IP user protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.</td>
</tr>
<tr>
<td>IpOutDiscards</td>
<td>The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.</td>
</tr>
<tr>
<td>IpOutNoRoutes</td>
<td>The number of IP datagrams discarded because no route could be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this ‘no-route’ criterion. Note that this includes any datagrams which a host cannot route because all of its default gateways are down.</td>
</tr>
<tr>
<td>IpReasmTimeout</td>
<td>The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.</td>
</tr>
<tr>
<td>IpReasmReqds</td>
<td>The number of IP fragments received which needed to be reassembled at this entity.</td>
</tr>
<tr>
<td>IpReasmOKs</td>
<td>The number of IP datagrams successfully reassembled.</td>
</tr>
<tr>
<td>IpReasmFails</td>
<td>The number of failures detected by the IP reassembly algorithm (for whatever reason: timed out, errors, etc.). Note that this is not necessarily a count of discarded IP fragments since some algorithms can lose track of the number of fragments by combining them as they are received.</td>
</tr>
<tr>
<td>IpFragOKs</td>
<td>The number of IP datagrams that have been successfully fragmented at this entity.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IpFragFails</td>
<td>The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.</td>
</tr>
<tr>
<td>IpFragCreates</td>
<td>The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.</td>
</tr>
<tr>
<td>IpRoutingDiscards</td>
<td>The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free up buffer space for other routing entries.</td>
</tr>
<tr>
<td>IcmpInMsgs</td>
<td>The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.</td>
</tr>
<tr>
<td>IcmpInErrors</td>
<td>The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, etc.).</td>
</tr>
<tr>
<td>IcmpInDestUnreachs</td>
<td>The number of ICMP Destination Unreachable messages received.</td>
</tr>
<tr>
<td>IcmpInTimeExcds</td>
<td>The number of ICMP Time Exceeded messages received.</td>

<td>The number of ICMP Parameter Problem messages sent.</td>
</tr>
<tr>
<td>IcmpOutSrcQuenchs</td>
<td>The number of ICMP Source Quench messages sent.</td>
</tr>
</tbody>
</table>
Configure VLAN Routing

You can configure GS752TXS and GS728TXS Smart Switches software with some ports supporting VLANs and some supporting routing. You can also configure the software to allow traffic on a VLAN to be treated as if the VLAN were a router port.

When a port is enabled for bridging (default) rather than routing, all normal bridge processing is performed for an inbound packet, which is then associated with a VLAN. Its MAC Destination Address (MAC DA) and VLAN ID are used to search the MAC address table. If routing is enabled for the VLAN, and the MAC DA of an inbound unicast packet is that of the internal bridge-router interface, the packet is routed. An inbound multicast packet is forwarded to all ports in the VLAN, plus the internal bridge-router interface, if it was received on a routed VLAN.

Since a port can be configured to belong to more than one VLAN, VLAN routing might be enabled for all of the VLANs on the port, or for a subset. VLAN Routing can be used to allow more than one physical port to reside on the same subnet. It could also be used when a VLAN spans multiple physical networks, or when additional segmentation or security is required. This section shows how to configure GS752TXS and GS728TXS Smart Switches software to support VLAN routing. A port can be either a VLAN port or a router port, but not both. However, a VLAN port can be part of a VLAN that is itself a router port.

VLAN Routing Wizard

The VLAN Routing Wizard creates a VLAN, adds selected ports to the VLAN. The VLAN Wizard gives the user the option to add the selected ports as a Link Aggregation (LAG). With this wizard, you can:

- Create a VLAN and generate a unique name for VLAN.
- Add selected ports to the newly created VLAN and remove selected ports from the default VLAN.
• Create a LAG, add selected ports to a LAG, then add LAG to the newly created VLAN.
• Enable tagging on selected ports if the port is in another VLAN. Disable tagging if a
  selected port does not exist in another VLAN.
• Exclude ports not selected from the VLAN.
• Enable routing on the VLAN using the IP address and subnet mask entered.

➢ To configure VLAN routing using the VLAN routing wizard:

1. Click Routing > VLAN > VLAN Routing Wizard.

![VLAN Routing Wizard](image)

2. Enter the VLAN Identifier (VID) associated with this VLAN in the Vlan ID field. The range of
   the VLAN ID is (1 to 4093).
   
   The Ports fields displays selectable physical ports (when a unit is selected) and LAGs (if any). Selected ports will be added to the Routing VLAN. Each port has three modes:
   
   • **T(Tagged)**. Select the ports on which all frames transmitted for this VLAN will be
     tagged. The ports that are selected will be included in the VLAN.
   
   • **U(Untagged)**. Select the ports on which all frames transmitted for this VLAN will be
     untagged. The ports that are selected will be included in the VLAN.
   
   • **BLANK(Autodetect)**. Select the ports that can be dynamically registered in this
     VLAN via GVRP. This selection has the effect of excluding a port from the selected
     VLAN.

3. Define the IP address of the VLAN interface in the IP Address field.
4. Define the subnet mask of the VLAN interface in the Network Mask field.
5. Click Apply.
VLAN Routing Configuration

Use the VLAN Routing Configuration screen to view information about the VLAN routing interfaces configured on the system or to assign an IP address and subnet mask to VLANs on the system.

➢ To configure VLAN routing:

1. Select Routing > VLAN > VLAN Routing.

   ![VLAN Routing Configuration](image)

2. In the VLAN list, select the VLAN you want to configure for VLAN routing.
   This field will display the all IDs of VLANs configured on this switch.

3. Enter an IP address of the VLAN routing interface.

4. Enter a subnet mask for the VLAN routing interface.

5. Under IP MTU, specify the maximum size of IP packets sent on an interface.
   A valid range is from 68 bytes to the link MTU. The default value is 1500. A value of 0 indicates that the IP MTU is unconfigured. When the IP MTU is unconfigured, the router uses the link MTU as the IP MTU. The link MTU is the maximum frame size minus the length of the layer 2 header.

6. Click Add.

7. View the following information about the routing VLAN.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>The port number assigned to the VLAN Routing Interface.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC Address assigned to the VLAN Routing Interface.</td>
</tr>
</tbody>
</table>
Configuring Router Discovery

The Router Discovery protocol is used by hosts to identify operational routers on the subnet. Router Discovery messages are of two types: Router Advertisements and Router Solicitations. The protocol mandates that every router periodically advertise the IP Addresses it is associated with. Hosts listen for these advertisements and discover the IP Addresses of neighboring routers.

Router Discovery Configuration

Use the Router Discovery Configuration screen to enter or change Router Discovery parameters.

➢ To configure the router discovery parameters:

1. Select Routing > Router Discovery.

2. Select the router interface for which data is to be configured.

   To perform the same configuration on all interfaces, select the check box in the heading row. To configure a single interface, select the check box associated with the interface. The interface number displays in the Interface field in the table heading row.

3. Select Enable or Disable from the drop-down menu.

   If you select Enable, Router Advertisements are transmitted from the selected interface.

4. Enter the IP Address to be used to advertise the router.

5. Enter the maximum time (in seconds) allowed between router advertisements sent from the interface.

   The value must be in the range of (4 to 1800). Default value is 600.

6. Enter the minimum time (in seconds) allowed between router advertisements sent from the interface.

   The value must be in the range of (3 to 1800). Default value is 450.

7. Enter the value (in seconds) to be used as the lifetime field in router advertisements sent from the interface.

   This is the maximum length of time that the advertised addresses are to be considered as valid router addresses by hosts. The value must be in the range of (4 to 9000). Default value is 1800.
8. Specify the preference level of the router as a default router relative to other routers on the same subnet.

Higher numbered addresses are preferred. You must enter an integer. The value must be in the range of (-2147483648 to 2147483647). Default value is 0.

9. Click **Apply**.

**Configure and View Routes**

From the Route Configuration screen, you can configure static and default routes and view the routes that the switch has already learned.

➢ **To configure a static route:**

1. Select **Routing > Route Configuration**.

2. Select whether the route is to be a Default route or a Static route.

   If creating a default route, all you need to specify is the next hop IP address; otherwise you need to specify each field.

3. In the Network Address field, specify the IP route prefix for the destination.

   To create a route, a valid routing interface must exist and the next hop IP Address must be on the same network as the routing interface.

4. Enter the subnet mask.

   Also referred to as the subnet/network mask, this indicates the portion of the IP address that identifies the attached network.

5. Enter the next hop IP address.

   This is the outgoing router IP address to use when forwarding traffic to the next router (if any) in the path towards the destination. The next router is always one of the adjacent neighbors or the IP address of the local interface for a directly attached network. When creating a route, the next hop IP must be on the same network as the routing interface. Valid next hop IP Addresses can be seen in the Route Status table.

6. Enter the preference value.
The preference is an integer value from 1 to 255. You can specify the preference value (sometimes called administrative distance) of an individual static route. For more information, see the Preference description in Table 22.

7. Enter a description for this route.
   This is the description of this route that identifies the route. The description must consist of alphanumeric, dash or underscore characters and have a length in the range from (0 to 31).

8. Click Add.

➢ To delete one or more static routes:
   1. Select the check box next to each route to remove.
   2. Click Delete.

The Route Status table provides information about the static routes configured on the switch and the dynamic routes the switch has learned.

Table 22. Routing table information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Route Type</td>
<td>Indicates whether the learned route is a static or default route.</td>
</tr>
<tr>
<td>Network Address</td>
<td>The IP route prefix for the destination.</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>Also referred to as the subnet/network mask, this indicates the portion of the IP interface address that identifies the attached network.</td>
</tr>
</tbody>
</table>
| Protocol         | This field tells which protocol created the specified route. The possibilities are one of the following:  
   • Local  
   • Static |
| Route Type       | This field can be Connected or Static or Dynamic based on the protocol. |
| Next Hop Interface | The outgoing router interface to use when forwarding traffic to the destination. |
| Next Hop IP Address | The outgoing router IP address to use when forwarding traffic to the next router (if any) in the path toward the destination. The next router is always one of the adjacent neighbors or the IP address of the local interface for a directly attached network. |
| Preference       | The preference is an integer value from 1 to 255. The user can specify the preference value of an individual static route. |
| Metric           | Administrative cost of the path to the destination. |
Configure ARP

The address resolution protocol (ARP) associates a layer 2 MAC address with a layer 3 IPv4 address. GS752TXS and GS728TXS Smart Switches software features both dynamic and manual ARP configuration. With manual ARP configuration, you can statically add entries into the ARP table.

ARP is a necessary part of the Internet protocol (IP) and is used to translate an IP address to a media (MAC) address, defined by a local area network (LAN) such as Ethernet. A station needing to send an IP packet must learn the MAC address of the IP destination, or of the next hop router, if the destination is not on the same subnet. This is achieved by broadcasting an ARP request packet, to which the intended recipient responds by unicasting an ARP reply containing its MAC address. Once learned, the MAC address is used in the destination address field of the layer 2 header prepended to the IP packet.

The ARP cache is a table maintained locally in each station on a network. ARP cache entries are learned by examining the source information in the ARP packet payload fields, regardless of whether it is an ARP request or response. Thus, when an ARP request is broadcast to all stations on a LAN segment or virtual LAN (VLAN), every recipient has the opportunity to store the sender’s IP and MAC address in their respective ARP cache. The ARP response, being unicast, is normally seen only by the requestor, who stores the sender information in its ARP cache. Newer information always replaces existing content in the ARP cache.

The GS752TXS/GS728TXS switches support 1024 ARP entries, which includes dynamic and static ARP entries.

Devices can be moved in a network, which means the IP address that was at one time associated with a certain MAC address is now found using a different MAC, or can have disappeared from the network altogether (i.e., it has been reconfigured, disconnected, or powered off). This leads to stale information in the ARP cache unless entries are updated in reaction to new information seen on the network, periodically refreshed to determine if an address still exists, or removed from the cache if the entry has not been identified as a sender of an ARP packet during the course of an ageout interval, usually specified via configuration.

To configure and display ARP details, see the following sections:

- **ARP Cache**
- **Create a Static ARP Entry**
- **Configure Global ARP Settings**
- **Remove an ARP Entry From the ARP Cache**

ARP Cache

Use the ARP Cache screen to view entries in the ARP table, a table of the remote connections most recently seen by this switch.

➢ **To display entries in the ARP table:**

Select **Routing > ARP > Basic > ARP Cache**. The ARP Cache screen displays.
The following table provides information included in the management VLAN ARP section.

Table 23. ARP cache information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Displays the associated IP address of a device on a subnet attached to one of the switch's existing routing interfaces.</td>
</tr>
<tr>
<td>Port</td>
<td>Shows the associated interface of the connection.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the MAC address of the device.</td>
</tr>
</tbody>
</table>

The following table provides information included in the routing VLANs ARP cache section.

Table 24. ARP cache information for routing VLANs

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The routing interface associated with the ARP entry.</td>
</tr>
<tr>
<td>IP Address</td>
<td>Displays the associated IP address of a device on a subnet attached to one of the switch's existing routing interfaces.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the unicast MAC address of the device.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of the ARP entry. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Local.</strong> An ARP entry associated with one of the switch's routing interface's MAC addresses.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Gateway.</strong> A dynamic ARP entry whose IP address is that of a router.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Static.</strong> An ARP entry configured by the user.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Dynamic.</strong> An ARP entry which has been learned by the router.</td>
</tr>
<tr>
<td>Age</td>
<td>Age since the entry was last refreshed in the ARP Table. The format is hh:mm:ss.</td>
</tr>
</tbody>
</table>

Create a Static ARP Entry

Use this screen to add a static entry to the ARP table.
To add an entry to the ARP table:

1. Select Routing > ARP > Advanced > ARP Create.

2. Under IP Address, specify the IP address to add.
   
   It must be the IP address of a device on a subnet attached to one of the switch’s existing routing interfaces.

3. Under MAC Address, specify the unicast MAC address of the device.
   
   The format is six two-digit hexadecimal numbers separated by colons, for example 00:06:29:32:81:40.

4. Click Add.

For information about the information in the Routing VLANs ARP Cache table, see Table 24, ARP cache information for routing VLANs on page 167

Configure Global ARP Settings

Use the Global ARP Configuration screen to display and change the configuration parameters of the ARP table.

To display or change the parameters of the ARP table:

1. Select Routing > ARP > Advanced > Global ARP Configuration.

2. Enter the value you want the switch to use for the ARP entry age out time.
   
   You must enter a valid integer, which represents the number of seconds it will take for an ARP entry to age out. The range for this field is 15 to 21600 seconds. The default value for Age Time is 1200 seconds.

3. Enter the value you want the switch to use for the ARP response time-out.
You must enter a valid integer, which represents the number of seconds the switch will wait for a response to an ARP request. The range for this field is 1 to 10 seconds. The default value for Response Time is 10 second.

4. Enter an integer which specifies the maximum number of times an ARP request will be retried.

   The range for this field is 0 to 10. The default value for Retries is 10.

5. Enter an integer which specifies the maximum number of entries for the ARP cache.

   The range for this field is 79 to 1024. The default value for Cache Size is 1024.

6. Select the dynamic renew radio button.

   This controls whether the ARP component automatically attempts to renew ARP Entries of type Dynamic when they age out. The default setting is Enable.

7. Click Apply.
Remove an ARP Entry From the ARP Cache

Use this screen to remove certain entries from the ARP Table.

➢ To remove entries from the ARP table:

1. Select Routing > ARP > Advanced > ARP Entry Management.

2. Select the type of ARP entry to be removed from the Remove From Table drop down menu.

   The choices listed specify the type of ARP Entry to be deleted:
   
   • All Dynamic Entries
   • All Dynamic and Gateway Entries
   • Specific Dynamic / Gateway Entry. Selecting this allows you to specify the required IP address.
   • Specific Static Entry.
   • None. Select if you do not want to delete any entry from the ARP Table.

   If you select Specific Dynamic/Gateway Entry or Specific Static Entry in the Remove from Table list, you can enter the IP address of an entry to remove from the ARP table.

3. Click Apply
Use the features you access from the QoS tab to configure Quality of Service (QoS) settings on the switch. The QoS tab contains links described in the following sections.

- **Class of Service**
- **Differentiated Services**

In a typical switch, each physical port consists of one or more queues for transmitting packets on the attached network. Multiple queues per port are often provided to give preference to certain packets over others based on user-defined criteria. When a packet is queued for transmission in a port, the rate at which it is serviced depends on how the queue is configured and possibly the amount of traffic present in the other queues of the port. If a delay is necessary, packets get held in the queue until the scheduler authorizes the queue for transmission. As queues become full, packets have no place to be held for transmission and get dropped by the switch.

QoS is a means of providing consistent, predictable data delivery by distinguishing between packets that have strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given special treatment in a QoS-capable network. With this in mind, all elements of the network must be QoS-capable. The presence of at least one node which is not QoS-capable creates a deficiency in the network path and the performance of the entire packet flow is compromised.

### Class of Service

The Class of Service (CoS) queueing feature lets you directly configure certain aspects of switch queueing. This provides the desired QoS behavior for different types of network traffic when the complexities of DiffServ are not required. The priority of a packet arriving at an interface can be used to steer the packet to the appropriate outbound CoS queue through a mapping table. CoS queue characteristics that affect queue mapping, such as minimum guaranteed bandwidth, or transmission rate shaping are user configurable at the queue (or port) level.

Eight queues per port are supported. The eighth queue is used for stacking which is not configurable for the user. Configurable queues are from 0 to 6.
From the Advanced link, the Class of service menu under the QoS tab, you can access the following screens:

- **Basic CoS Configuration**
- **CoS Interface Configuration**
- **Interface Queue Configuration**
- **802.1p to Queue Mapping**
- **DSCP to Queue Mapping**

**Basic CoS Configuration**

Use the Trust Mode Configuration screen to set the class of service trust mode of an interface. Each port in the switch can be configured to trust one of the packet fields (802.1p or IP DSCP), or to not trust any packet’s priority designation (untrusted mode). If the port is set to a trusted mode, it uses a mapping table appropriate for the trusted field being used. This mapping table indicates the CoS queue to which the packet should be forwarded on the appropriate egress port(s). Of course, the trusted field must exist in the packet for the mapping table to be of any use, so there are default actions performed when this is not the case. These actions involve directing the packet to a specific CoS level configured for the ingress port as a whole, based on the existing port default priority as mapped to a traffic class by the current 802.1p mapping table.

Alternatively, when a port is configured as untrusted, it does not trust any incoming packet priority designation and uses the port default priority value instead. All packets arriving at the ingress of an untrusted port are directed to a specific CoS queue on the appropriate egress port(s), in accordance with the configured default priority of the ingress port. This process is also used for cases where a trusted port mapping is unable to be honored, such as when a non-IP packet arrives at a port configured to trust the IP DSCP value.

➢ **To configure global CoS settings:**

1. Select **QoS > Basic > CoS Configuration**.

![CoS Configuration](image)

2. Select the **Global** radio button to specify the CoS configurable interfaces.

   The option Global represents the most recent global configuration settings.

   Alternatively, you can select the **Interface** radio button to apply trust mode settings to individual interfaces. The per-interface setting overrides the global settings.

3. From the Global Trust Mode drop down list, select the trust mode for ingress traffic on the switch.
Global Trust Mode can be one of the following:

- **Untrusted.** Do not trust any CoS packet marking at ingress.
- **802.1p.** The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues.
- **DSCP.** The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.

4. From the Interface Trust Mode drop down list, select the trust mode for ingress traffic on the interface.

Interface Trust Mode can be one of the following:

- **Untrusted.** Do not trust any CoS packet marking at ingress.
- **802.1p.** The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues.
- **DSCP.** The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.

5. Click **Apply.**

### CoS Interface Configuration

Use the CoS Interface Configuration screen to apply an interface shaping rate to all interfaces or to a specific interface.

➢ **To configure CoS settings for an interface:**

1. Select **QoS > CoS > Advanced > CoS Interface Configuration.**

   ![Cos Interface Configuration](image)

2. To configure CoS settings for a specific interface, enter the interface and click **Go** to select that particular interface.

3. Alternatively, select the check box associated with each interface for which you want to configure the CoS settings:
   - To configure CoS settings for a Link Aggregation Group (LAG), click **LAGS.**
   - To configure CoS settings for both physical ports and LAGs, click **ALL.**

   The same settings will be applied to all selected interfaces.
4. From the Interface Trust Mode drop down list, select the trust mode for ingress traffic on the selected interfaces.
   - **Untrusted.** Do not trust any CoS packet marking at ingress.
   - **802.1p.** The eight priority tags that are specified in IEEE 802.1p are p0 to p7. The QoS setting lets you map each of the eight priority levels to one of seven internal hardware priority queues.
   - **DSCP.** The six most significant bits of the DiffServ field are called the Differentiated Services Code Point (DSCP) bits.

5. In the Interface Shaping Rate field, specify the maximum bandwidth allowed.
   This is typically used to shape the outbound transmission rate in increments of 64 kbps in this range of 16–16384. This value is controlled independently of any per-queue maximum bandwidth configuration. It is effectively a second-level shaping mechanism. The default value is 0. The value 0 means the maximum is unlimited.

   The expected shaping at egress interface is calculated as:

   \[
   \text{frameSize} \times \text{shaping} / (\text{frameSize} + \text{IFG}) \],

   where IFG (Inter frame gap) is 20 bytes, frameSize is configured frame size of the traffic and shaping is configured traffic shaping in the Interface Shaping Rate field.

   For example, when the frame size is 64 bytes and the interface shaping rate is 64, the expected shaping will be approximately 48kbps.

   Setting the value to 0 resets the configured traffic-shape rate.

6. Click **Apply**.

**Interface Queue Configuration**

Use the Interface Queue Configuration screen to define what a particular queue does by configuring switch egress queues. User-configurable parameters control the amount of bandwidth used by the queue, the queue depth during times of congestion, and the scheduling of packet transmission from the set of all queues on a port. Each port has its own CoS queue-related configuration.

The configuration process is simplified by allowing each CoS queue parameter to be configured globally or per-port. A global configuration change is automatically applied to all ports in the system.

➢ **To configure CoS queue settings for an interface:**

1. Select **QoS > CoS > Advanced > Interface Queue Configuration.**
To configure CoS queue settings for a physical port, enter the interface and click Go to select that particular interface.

Select the interfaces for which you want to configure the interface queue settings:
- To configure CoS settings for a Link Aggregation Group (LAG), click LAGS.
- To configure CoS settings for both physical ports and LAGs, click ALL.

Select the check box next to the port or LAG to configure. You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply a trust mode or rate to all interfaces.

Configure any of the following settings:
- **Queue ID.** Use the menu to select the queue to be configured.
- **Minimum Bandwidth.** Enter a percentage of the maximum negotiated bandwidth for the selected queue on the interface. Specify a percentage from 0–100, in increments of 1.
- **Scheduler Type.** Selects the type of queue processing from the drop-down menu. Options are Weighted and Strict. Defining on a per-queue basis allows the user to create the desired service characteristics for different types of traffic.
  - **Weighted.** Weighted round robin associates a weight to each queue. This is the default.
  - **Strict.** Services traffic with the highest priority on a queue first.
Queue Management Type. Displays the type of packet management used for all packets, which is Taildrop. All packets on a queue are safe until congestion occurs. At this point, any additional packets queued are dropped.

6. Click Apply.

802.1p to Queue Mapping

Use this screen to view or change which internal traffic classes are mapped to the 802.1p priority class values in Ethernet frames the device receives. The priority-to-traffic class mappings can be applied globally or per-interface. The mapping allows the switch to group various traffic types (for example, data or voice) based on their latency requirements and give preference to time-sensitive traffic.

To map 802.1p priorities to queues:

2. Select one of the following radio buttons:
   - Select the Global radio button to apply the same 802.1p priority mapping to all CoS configurable interfaces.
   - Select the Interface radio button to apply 802.1p priority mapping to on a per-interface basis.

   If you map 802.1p priorities to individual interfaces, select the Interface radio button and then select the interface from the drop-down menu. The interface settings override the global settings for 802.1p priority mapping.

3. Select the queue to map to the predefined 802.1p priority values.

   The 802.1p Priority row contains traffic class selectors for each of the eight 802.1p priorities to be mapped. The priority goes from low (0) to high (7). For example, traffic with a priority of 0 is for most data traffic and is sent using “best effort.” Traffic with a higher priority, such as 7, might be time-sensitive traffic, such as voice or video.

   The values in each drop-down menu represent the traffic class. The traffic class is the hardware queue for a port. Higher traffic class values indicate a higher queue position. Before traffic in a lower queue is sent, it must wait for traffic in higher queues to be sent.

4. Click Apply.
DSCP to Queue Mapping

Use the DSCP to Queue Mapping screen to specify which internal traffic class to map the corresponding DSCP value.

➢ To map DSCP values to queues:

2. For each DSCP value, select a hardware queue to associate with the value.

The traffic class is the hardware queue for a port. Higher traffic class values indicate a higher queue position. Before traffic in a lower queue is sent, it must wait for traffic in higher queues to be sent. Valid range is 0–6.

3. Click Apply.
Differentiated Services

The QoS feature contains Differentiated Services (DiffServ) support that allows traffic to be classified into streams and given certain QoS treatment in accordance with defined per-hop behaviors.

Standard IP-based networks are designed to provide “best effort” data delivery service. “Best effort” service implies that the network delivers the data in a timely fashion, although there is no guarantee that it will. During times of congestion, packets can be delayed, sent sporadically, or dropped. For typical Internet applications, such as e-mail and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. Conversely, any degradation of service has undesirable effects on applications with strict timing requirements, such as voice or multimedia.

Defining DiffServ

To use DiffServ for QoS, the links accessible from the Differentiated Services configuration menu must first be used to define the following categories and their criteria:

1. Class: Create classes and define class criteria.
2. Policy: Create policies, associate classes with policies, and define policy statements.
3. Service: Add a policy to an inbound interface

Packets are classified and processed based on defined criteria. The classification criteria is defined by a class. The processing is defined by a policy's attributes. Policy attributes can be defined on a per-class instance basis, and it is these attributes that are applied when a match occurs. A policy can contain multiples classes. When the policy is active, the actions taken depend on which class matches the packet.

Packet processing begins by testing the class match criteria for a packet. A policy is applied to a packet when a class match within that policy is found.

The Differentiated Services menu contains links to the various DiffServ configuration and display features, described in the following sections:

- Diffserv Configuration
- Class Configuration
- IPv6 Class Configuration
- Policy Configuration
- Service Configuration
- Service Statistics
DiffServ Configuration

Use the DiffServ Configuration screen to display DiffServ General Status Group information, which includes the current administrative mode setting as well as the current and maximum number of rows in each of the main DiffServ private MIB tables.

➢ To configure the global DiffServ mode:
   1. Select QoS > DiffServ > Advanced > DiffServ Configuration.

2. Select the administrative mode for DiffServ:
   • Enable. Differentiated Services are active.
   • Disable. The DiffServ configuration is retained and can be changed, but it is not active.

3. Click Apply.

The following table describes the information displayed in the Status table on the DiffServ Configuration screen:

Table 25. DiffServ MIB table information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class Table</td>
<td>The current and maximum number of rows of the class table.</td>
</tr>
<tr>
<td>Class Rule Table</td>
<td>The current and maximum number of rows of the class rule table.</td>
</tr>
<tr>
<td>Policy Table</td>
<td>The current and maximum number of rows of the policy table.</td>
</tr>
<tr>
<td>Policy Instance Table</td>
<td>The current and maximum number of rows of the policy instance table.</td>
</tr>
<tr>
<td>Policy Attributes Table</td>
<td>The current and maximum number of rows of the policy attributes table.</td>
</tr>
<tr>
<td>Service Table</td>
<td>The current and maximum number of rows of the service table.</td>
</tr>
</tbody>
</table>
Class Configuration

Use the Class Configuration screen to add a new DiffServ class name, or to rename or delete an existing class. The screen also allows you to define the criteria to associate with a DiffServ class. As packets are received, these DiffServ classes are used to prioritize packets. You can have multiple match criteria in a class. The logic is a Boolean logical-and for this criteria. After creating a Class, click the class link to the Class screen.

➢ To create a DiffServ class:

1. Select QoS > DiffServ > Advanced > Class Configuration.
2. In the Class Name field, enter a class name.
3. Select the class type
4. Click Add.

The switch supports only the Class Type value All, which means all the various match criteria defined for the class should be satisfied for a packet match. All signifies the logical AND of all the match criteria.

➢ To rename an existing class:

1. Select the check box next to the configured class.
2. Under Class Name, update the name.
3. Click Apply.

➢ To delete a class:

1. Select the check box next to the class name.
2. Click Delete.

➢ To configure the class match criteria:

1. Click the class name for an existing class.

The class name is a hyperlink. The following figure shows the configuration fields for the class.
2. Define the criteria to associate with a DiffServ class:
   - **Match Every.** This adds to the specified class definition a match condition whereby all packets are considered to belong to the class.
   - **Reference Class.** Selects a class to start referencing for criteria. A specified class can reference at most one other class of the same type.
   - **Class of Service.** Select the field and enter a class of service 802.1p user priority value to be matched for the packets. The valid range is 0–7.
   - **VLAN.** Select the field and enter a VLAN ID to be matched for packets. The VLAN ID range is 1–4093.
   - **Ethernet Type.** This lists the keywords for the Ether Type from which one can be selected.
   - **Source MAC Address.** This is the source MAC address specified as six, two-digit hexadecimal numbers separated by colons.
   - **Source MAC Mask.** This is a bit mask in the same format as MAC Address indicating which part(s) of the source MAC Address to use for matching against packet content.
   - **Destination MAC Address.** This is the destination MAC address specified as six, two-digit hexadecimal numbers separated by colons.
   - **Destination MAC Mask.** This is a bit mask in the same format as MAC Address indicating which part(s) of the destination MAC Address to use for matching against packet content.
• **Protocol Type.** Requires a packet’s layer 4 protocol to match the protocol you select. If you select Other, enter a protocol number in the field that displays. The valid range is 0–255.

• **Source IP Address.** Requires a packet’s source port IP address to match the address listed here. In the IP Address field, enter a valid source IP address in dotted-decimal format.

• **Source Mask.** Enter a valid subnet mask to determine which bits in the IP address are significant. Note that this is not a wildcard mask.

• **Source L4 Port.** Requires a packet’s TCP/UDP source port to match the port you select. Select the desired L4 keyword from the list on which the rule can be based. If you select Other, the screen refreshes and a Port ID field displays. Enter a user-defined Port ID by which packets are matched to the rule.

• **Destination IP Address.** Requires a packet’s destination port IP address to match the address listed here. In the IP Address field, enter a valid destination IP address in dotted-decimal format.

• **Destination Mask.** Enter a valid subnet mask to determine which bits in the IP address are significant. This is not a wildcard mask.

• **Destination L4 Port.** Requires a packet’s TCP/UDP destination port to match the port you select. Select the desired L4 keyword from the list on which the rule can be based. If you select Other, the screen refreshes and a Port ID field displays. Enter a user-defined Port ID by which packets are matched to the rule.

• **IP DSCP.** Matches the packet’s DSCP to the class criteria’s when selected. Select the DSCP type from the menu or enter a DSCP value to match. If you select Other, enter a custom value in the DSCP Value field that displays.

• **IP Precedence.** Matches the packet’s IP Precedence value to the class criteria’s when Enter a value in the range of 0–7.

• **IP ToS.** Matches the packet’s Type of Service bits in the IP header to the class criteria’s when selected and a value is entered. In the ToS Bits field, enter a two-digit hexadecimal number to match the bits in a packet’s ToS field. In the ToS Mask field, specify the bit positions that are used for comparison against the IP ToS field in a packet.

3. **Click Apply.**
IPv6 Class Configuration

The IPv6 Class Configuration feature extends the existing QoS ACL and DiffServ functionality by providing support for IPv6 packet classification. An Ethernet IPv6 packet is distinguished from an IPv4 packet by its unique Ethertype value, so all IPv6 classifiers include the Ethertype field. An IPv6 access list serves the same purpose as its IPv4 counterpart.

Prior to the IPv6 class feature, any DiffServ class definition was assumed to apply to an IPv4 packet. That is, any match item in a class rule was interpreted in the context of an IPv4 header. An example is a class rule that specifies an L4 Port match value. With the introduction of the IPv6 match capability, it must be specified if this class rule is for IPv4 or for IPv6 packets. To facilitate this distinction, a class configuration parameter is added to specify whether a class applies to IPv4 or IPv6 packet streams.

The Destination and Source IPv6 addresses use a prefix length value instead of an individual mask to qualify it as a subnet address or a host address. The flow label is a 20-bit number that is unique to an IPv6 packet, used by end stations to signify some form of quality-of-service (QoS) handling in routers.

Packets that match an IPv6 classifier are only allowed to be marked using the 802.1p (COS) field or the IP DSCP field in the Traffic Class octet. IP Precedence is not defined for IPv6: this is not an appropriate type of packet marking.

IPv6 ACL/DiffServ assignment is appropriate for LAG interfaces. The procedures described by an ACL or DiffServ policy are equally applicable on a LAG interface.

To create a new IPv6 class:
1. Select QoS > DiffServ > Advanced > IPv6 Class Configuration.
2. Enter a class name in the Class Name field.
3. Select the class type to associate with the policy.
4. Click Add.

The switch supports only the Class Type value All, which means all the various match criteria defined for the class should be satisfied for a packet match. All signifies the logical AND of all the match criteria.

To rename an existing class:
1. Select the check box next to the configured class.
2. Under Class Name, update the name.
3. Click Apply.
To delete a class:

1. Select the check box next to the class name.
2. Click Delete.

The same set of fields described for IPv6 ACL classification are also supported as match criteria for DiffServ classes. Prior to the introduction of IPv6 class rule fields, any layer 3 or layer 4 item was interpreted as a field in an IPv4 packet. To properly interpret the match criteria fields and create classifier entries, it is necessary for the configuration to specify what type of packet a class defines.

Policy Configuration

Use the Policy Configuration screen to associate a collection of classes with one or more policy statements. After creating a Policy, click the policy link to the Policy screen.

To create a new DiffServ policy:

1. Select QoS > DiffServ > Advanced > Policy Configuration.
2. Enter a policy name in the Policy Name field.
3. Select the existing DiffServ class to associate with the policy.
4. Click Add.

The available policy type is In, which indicates the type is specific to inbound traffic. This field is not configurable.

To rename an existing policy or add a new member class to the policy:

1. Select the check box next to the configured class.
2. Update the desired fields.
3. Click Apply.

To delete a policy:

1. Click the check box associated with the policy to remove.
2. Click Delete.
To configure the policy attributes:

1. Click the name of the policy.

The policy name is a hyperlink. The following figure shows the configuration fields for the policy.

2. Configure the policy attributes:
   - **Assign Queue.** Select this value from the drop-down list. This is an integer value in the range 0 to 7.
   - **Drop.** Select this option to drop packets for this policy-class.
   - **Mark VLAN CoS.** Select this value from the drop-down list. This is an integer value in the range from 0 to 7 for setting the VLAN priority.
   - **Mark IP Precedence.** Select this value from the drop-down list. This is an IP Precedence value in the range from 0 to 7.
• **Mark IP DSCP.** This lists the keywords for the known DSCP values from which one can be selected.

• **Simple Policy.** This lists the keywords for the known DSCP values from which one can be selected.

3. **Color Conform Class.** This field is visible only if you select Color Aware Color Mode on the Policing Attributes screen, this lists the DiffServ classes that are valid for use as a conform color-aware specifier.

   One of the classes must be selected from this list.

4. If you select the Simple Policy attribute, configure the following fields:
   • **Color Mode.** Color Aware mode requires the existence of one or more color classes that are valid for use with this policy instance; otherwise, the color mode is color blind, which is the default.
   • **Color Conform Mode.** The match-criteria of the color Conform class.
   • **Committed Rate.** The committed rate is specified in kilobits per second (Kbps) and is an integer from 1–4294967295.
   • **Committed Burst Size.** The committed burst size is specified in kilobytes (KB) and is an integer from 1–128.
   • **Conform Action.** Determines what happens to packets that are considered conforming (below the police rate). Select one of the following actions:
     - **Send.** (default) These packets are presented unmodified by DiffServ to the system forwarding element.
     - **Drop.** These packets are immediately dropped.
     - **Mark CoS.** These packets are marked by DiffServ with the specified CoS value before being presented to the system forwarding element. This selection requires that the Mark CoS value field be set.
     - **Mark IP Precedence.** These packets are marked by DiffServ with the specified IP Precedence value before being presented to the system forwarding element. This selection requires that the Mark IP Precedence value field be set.
     - **Mark IP DSCP.** These packets are marked by DiffServ with the specified DSCP value before being presented to the system forwarding element. This selection requires that the DSCP value field be set. If you select Other, enter a custom value in the DSCP Value field that displays.
   • **Violate Action.** Determines what happens to packets that are considered non-conforming (above the police rate). Select one of the following actions:
     - **Send.** (default) These packets are presented unmodified by DiffServ to the system forwarding element.
     - **Drop.** (default) These packets are immediately dropped.
     - **Mark CoS.** These packets are marked by DiffServ with the specified CoS value before being presented to the system forwarding element. This selection requires that the Mark CoS value field be set.
- **Mark IP Precedence.** These packets are marked by DiffServ with the specified IP Precedence value before being presented to the system forwarding element. This selection requires that the Mark IP Precedence value field be set.

- **Mark IP DSCP.** These packets are marked by DiffServ with the specified DSCP value before being presented to the system forwarding element. This selection requires that the DSCP value field be set.

5. Click **Apply**.

### Service Configuration

Use the Service Configuration screen to activate a policy on an interface.

**To attach a DiffServ policy to an interface:**

1. Select **QoS > DiffServ > Advanced > Service Configuration**.

2. To configure DiffServ policy settings for a physical port, enter the interface and click **Go** to select that particular interface.

3. Select the interfaces for which you want to configure the service interface settings:
   - To configure service interface settings for a Link Aggregation Group (LAG), click **LAGS**.
   - To configure service interface settings for both physical ports and LAGs, click **ALL**.

4. Select the check box next to the port or LAG to configure.
   You can select multiple ports and LAGs to apply the same setting to the selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.

5. From the Policy In Name list, select the policy to attach to the interface.

6. Click **Apply**.
To remove a policy from an interface:
1. Select the interface(s) on which the policy is to be removed.
2. From the Policy In Name list, select None.
3. Click Apply.

Service Statistics

Use the Service Statistics screen to display service-level statistical information about all interfaces that have DiffServ policies attached.

To display the service statistics screen:
Select QoS > DiffServ > Advanced > Service Statistics. The Service Statistics screen displays.

<table>
<thead>
<tr>
<th>Service Statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
</tr>
</tbody>
</table>

The following table describes the information available on the Service Statistics screen.

Table 26. Service statistics

<table>
<thead>
<tr>

</tbody>
</table>
Managing Device Security

Use the features available from the Security tab to configure management security settings for port, user, and server security. The Security tab contains links described in the following sections.

- Management Security Settings
- Configuring Management Access
- Port Authentication
- Traffic Control
- Configuring Access Control Lists

Management Security Settings

From the Management Security menu, you can configure the login password, Remote Authorization Dial-In User Service (RADIUS) settings, Terminal Access Controller Access Control System (TACACS+) settings, and authentication lists.

The Management Security folder contains links described in the following sections.

- Change Password
- RADIUS Configuration
- Configuring TACACS+
- Authentication List Configuration

Change Password

Use the screen to change the login password.

➢ To change the login password for the management interface:

2. Specify the current password in the Old Password field.
   The entered password will be displayed in asterisks (*). Passwords are 1–20 alphanumeric characters in length and are case sensitive.

3. Enter the new password.
   It will not display as it is typed, and only asterisks (*) will show on the screen. Passwords are 1–20 alphanumeric characters in length and are case sensitive.

4. To confirm the password, enter it again to make sure you entered it correctly.
   This field will not display, but will show asterisks (*)

5. Click **Apply**.

   ➤ **To reset the password to the default value:**

6. Select the Reset Password check box.
7. Click **Apply**.

---

**Note:** In you have forgotten the password and are unable to log in to the switch management interface, press the Factory Defaults button on the front panel of the switch for more than one second. The device reboots, and all switch settings, including the password, are reset to the factory default values. If you press the reset button for less than one second, the switch reboots, but the switch loads the saved configuration.
RADIUS Configuration

RADIUS servers provide additional security for networks. The RADIUS server maintains a user database, which contains per-user authentication information. The switch passes information to the configured RADIUS server, which can authenticate a user name and password before authorizing use of the network. RADIUS servers provide a centralized authentication method for:

- Web Access
- Access Control Port (802.1X)

The RADIUS folder contains links described in the following sections.

- Global Configuration
- RADIUS Server Configuration
- Accounting Server Configuration

Global Configuration

Use the RADIUS Configuration screen to add information about one or more RADIUS servers on the network.

➢ To configure global RADIUS server settings:

![Global Configuration](image)

The Current Server IP Address field is blank if no servers are configured (see RADIUS Server Configuration on page 192). The switch supports up to three configured RADIUS servers. If more than one RADIUS servers are configured, the current server is the server configured as the primary server. If no servers are configured as the primary server, the current server is the most recently added RADIUS server.

2. In the Max Number of Retransmits field, specify the value of the maximum number of times a request packet is retransmitted to the RADIUS server.

Consideration to maximum delay time should be given when configuring RADIUS maximum retransmit and RADIUS time-out. If multiple RADIUS servers are configured, the maximum retransmit value on each will run out before the next server is attempted. A retransmit will not occur until the configured time-out value on that server has passed without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the product of (retransmit times time-out) for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces will be blocked until the RADIUS application returns a response.
3. In the Timeout Duration field, specify the time-out value, in seconds, for request retransmissions.

Consideration to maximum delay time should be given when configuring RADIUS maximum retransmit and RADIUS timeout. If multiple RADIUS servers are configured, the maximum retransmit value on each will run out before the next server is attempted. A retransmit will not occur until the configured timeout value on that server has passed without a response from the RADIUS server. Therefore, the maximum delay in receiving a response from the RADIUS application equals the product of (retransmit times timeout) for all configured servers. If the RADIUS request was generated by a user login attempt, all user interfaces will be blocked until the RADIUS application returns a response.

4. From the Accounting Mode menu, select whether the RADIUS accounting mode is enabled or disabled on the current server.

5. Click Apply.

**RADIUS Server Configuration**

Use the RADIUS Server Configuration screen to view and configure various settings for the current RADIUS server configured on the system.

➢ To configure a RADIUS server:

2. To add a RADIUS server, specify the following settings:
   - In the Server Address field, specify the IP address of the RADIUS server to add.
   - In the Authentication Port field, specify the UDP port number the server uses to verify the RADIUS server authentication. The valid range is 1–65535. The default value is 1812.
   - From the Secret Configured menu, select Yes to add a RADIUS secret in the next field. You must select Yes before you can configure the RADIUS secret. After you add the RADIUS server, this field indicates whether the shared secret for this server has been configured.
   - In the Secret field, type the shared secret text string used for authenticating and encrypting all RADIUS communications between the switch and the RADIUS server. This secret must match the RADIUS encryption.
   - From the Active menu, specify whether the server is a Primary or Secondary server.
   - From the Message Authenticator menu, enable or disable the message authenticator attribute for the selected server.

3. Click Add.
To modify settings for a RADIUS server that is already configured on the switch:
1. Select the check box next to the server IP address.
2. Update the desired fields for the selected server.
3. Click Apply.

To delete a configured RADIUS server:
1. Select the check box next to the IP address of the server to remove.
2. Click Delete.

The following table describes the RADIUS server statistics available on the screen.

Table 27. RADIUS server statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server Address</td>
<td>This displays all configured RADIUS servers.</td>
</tr>
<tr>
<td>Round Trip Time</td>
<td>The time interval, in hundredths of a second, between the most recent Access-Reply/Access-Challenge and the Access-Request that matched it from this RADIUS authentication server.</td>
</tr>
<tr>
<td>Access Requests</td>
<td>The number of RADIUS Access-Request packets sent to this server. This number does not include retransmissions.</td>
</tr>
<tr>
<td>Access Retransmissions</td>
<td>The number of RADIUS Access-Request packets retransmitted to this server.</td>
</tr>
<tr>
<td>Access Accepts</td>
<td>The number of RADIUS Access-Accept packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>
<td>Access Rejects</td>
<td>The number of RADIUS Access-Reject packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>
<td>Access Challenges</td>
<td>The number of RADIUS Access-Challenge packets, including both valid and invalid packets, that were received from this server.</td>
</tr>
<tr>
<td>Malformed Access Responses</td>
<td>The number of malformed RADIUS Access-Response packets received from this server. Malformed packets include packets with an invalid length. Bad authenticators or signature attributes or unknown types are not included as malformed access-responses.</td>
</tr>
<tr>
<td>Bad Authenticators</td>
<td>The number of RADIUS Access-Response packets containing invalid authenticators or signature attributes received from this server.</td>
</tr>
<tr>
<td>Pending Requests</td>
<td>The number of RADIUS Access-Request packets destined for this server that have not yet timed out or received a response.</td>
</tr>
<tr>
<td>Timeouts</td>
<td>The number of authentication timeouts to this server.</td>
</tr>
<tr>
<td>Unknown Types</td>
<td>The number of RADIUS packets of unknown type which were received from this server on the authentication port.</td>
</tr>
<tr>
<td>Packets Dropped</td>
<td>The number of RADIUS packets received from this server on the authentication port and dropped for some other reason.</td>
</tr>
</tbody>
</table>
Use the buttons at the bottom of the screen to perform the following actions:

- Click **Clear Counters** to clear the authentication server and RADIUS statistics to their default values.
- Click **Refresh** to refresh the screen with the most current data from the switch.

**Accounting Server Configuration**

Use the RADIUS Accounting Server Configuration screen to view and configure various settings for one or more RADIUS accounting servers on the network.

➢ **To configure the RADIUS accounting server:**

1. Select **Security > Management Security > RADIUS > Accounting Server Configuration.**

   ![Accounting Server Configuration](image)

2. In the Accounting Server Address field, specify the IP address of the RADIUS accounting server to add.

3. In the Port field, specify the UDP port number the server uses to verify the RADIUS accounting server authentication.
   
   The valid range is 0–65535. Default is 1813.

4. From the Secret Configured menu, select **Yes** to add a RADIUS secret in the next field.
   
   You must select Yes before you can configure the RADIUS secret. After you add the RADIUS accounting server, this field indicates whether the shared secret for this server has been configured.

5. In the Secret field, type the shared secret to use with the specified accounting server.

6. From the Accounting Mode menu, enable or disable the RADIUS accounting mode.
7. Click **Apply**.

The following table describes RADIUS accounting server statistics available on the screen.

### Table 28. RADIUS accounting server statistics

<table>
<thead>
<tr>

</tbody>
</table>

Use the buttons at the bottom of the screen to perform the following actions:

- Click **Clear Counters** to reset all statistics to their default value.
- Click **Refresh** to update the screen with the most current information.
Configuring TACACS+

TACACS+ provides a centralized user management system, while still retaining consistency with RADIUS and other authentication processes. TACACS+ provides the following services:

- **Authentication.** Provides authentication during login and via user names and user-defined passwords.
- **Authorization.** Performed at login. When the authentication session is completed, an authorization session starts using the authenticated user name. The TACACS+ server checks the user privileges.

The TACACS+ protocol ensures network security through encrypted protocol exchanges between the device and TACACS+ server.

The TACACS+ folder contains links described in the following sections.

- Configuring TACACS+
- TACACS+ Server Configuration

**TACACS+ Configuration**

The TACACS+ Configuration screen contains the TACACS+ settings for communication between the switch and the TACACS+ server you configure via the inband management port.

To configure global TACACS+ settings:

1. Select **Security > Management Security > TACACS+ > TACACS+ Configuration**.

2. In the Key String field, specify the authentication and encryption key for TACACS+ communications between the GS752TXS/GS728TXS and the TACACS+ server.

   The valid range is 0–128 characters. The key must match the key configured on the TACACS+ server.

3. In the Connection Timeout field, specify the maximum number of seconds allowed to establish a TCP connection between the GS752TXS/GS728TXS and the TACACS+ server.

   The valid range is 1–30 seconds. Default is 5 seconds.

4. Click **Apply**.
**TACACS+ Server Configuration**

Use the TACACS+ Server Configuration screen to configure up to five TACACS+ servers with which the switch can communicate.

➢ To configure TACACS+ server:

1. Select **Security > Management Security > TACACS+ > Server Configuration**.

2. In the TACACS Server field, specify the IP address of the TACACS server.

   **Note:** The Add option is available if fewer than five TACACS+ servers are configured on the system, and the Server Address field is only available when Add is selected in the TACACS+ Server IP Address field.

   After you add one or more TACACS+ servers, additional fields appear on the TACACS+ Server Configuration screen.

3. In the Priority field, specify the order in which the TACACS+ servers are used.
   A value of 0 is the highest priority. The valid range is 0–65535.

4. In the Port field, specify the authentication port number through which the TACACS+ session occurs.
   The default is port 49, and the range is 0–65535.

5. In the Key String field, specify the authentication and encryption key for TACACS+ communications between the GS752TXS/GS728TXS and the TACACS+ server.
   This key must match the encryption used on the TACACS+ server. The valid range is 0–128 characters.

6. In the Connection Timeout field, specify the amount of time that passes before the connection between the device and the TACACS+ server times out.
   The field range is from 1 to 30 seconds.

7. Click **Apply**.
Authentication List Configuration

Use the Authentication List screen to configure the default login list. A login list specifies one or more authentication methods to validate switch or port access for the admin user.

**Note:** Admin is the only user on the system and is assigned to a preconfigured list named defaultList, which you cannot delete.

**HTTP Authentication List**

The HTTP authentication list defines the HTTP authentication method used for the default list.

To change the HTTP authentication method for the defaultList:

2. Select the check box next to the httpList name.

3. Use the drop-down menu in the 1 column to select the authentication method that should appear first in the selected authentication login list.

   If you select a method that does not time out as the first method, such as local, no other method will be tried, even if you have specified more than one method. This parameter will not appear when you first create a new login list. User authentication occurs in the order the methods are selected. Possible methods are as follows:

   - **Local.** The user's locally stored ID and password will be used for authentication. Since the local method does not time out, if you select this option as the first method, no other method will be tried, even if you have specified more than one method.
   - **RADIUS.** The user's ID and password will be authenticated using the RADIUS server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch uses Method 2 to authenticate the user.
   - **TACACS+.** The user's ID and password will be authenticated using the TACACS+ server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch attempts user authentication Method 2.
   - **None.** The authentication method is unspecified. This option is only available for Method 2 and Method 3.
4. Use the menu in the 2 column to select the authentication method, if any, that should appear second in the selected authentication login list.

   This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. This parameter will not appear when you first create a new login list.

5. Use the menu in the 3 column to select the authentication method, if any, that should appear third in the selected authentication login list.

   This parameter will not appear when you first create a new login list.

6. Use the menu in the 4 column to select the method, if any, that should appear fourth in the selected authentication login list.

   This is the method that will be used if all previous methods time out. Note that this parameter will not appear when you first create a new login list.

7. Click Apply.

**HTTPS Authentication List**

The HTTPS authentication list defines the HTTPS authentication method used for the default list.

➢ To change the HTTPS authentication method for the defaultList:

2. Select the check box next to the httpsList name.

3. Use the drop-down menu in the 1 column to select the authentication method that should appear first in the selected authentication login list.

   If you select a method that does not time out as the first method, such as ‘local’, no other method will be tried, even if you have specified more than one method. This parameter will not appear when you first create a new login list. User authentication occurs in the order the methods are selected. Possible methods are as follows:

   - **Local.** The user’s locally stored ID and password will be used for authentication. Since the local method does not time out, if you select this option as the first method, no other method will be tried, even if you have specified more than one method.

   - **RADIUS.** The user's ID and password will be authenticated using the RADIUS server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch uses Method 2 to authenticate the user.
• **TACACS+**. The user's ID and password will be authenticated using the TACACS+ server. If you select RADIUS or TACACS+ as the first method and an error occurs during the authentication, the switch attempts user authentication Method 2.

• **None**. The authentication method is unspecified. This option is only available for Method 2 and Method 3.

4. Use the menu in the 2 column to select the authentication method, if any, that should appear second in the selected authentication login list.

   This is the method that will be used if the first method times out. If you select a method that does not time out as the second method, the third method will not be tried. This parameter will not appear when you first create a new login list.

5. Use the menu in the 3 column to select the authentication method, if any, that should appear third in the selected authentication login list.

   This parameter will not appear when you first create a new login list.

6. Use the menu in the 4 column to select the method, if any, that should appear fourth in the selected authentication login list.

   This is the method that will be used if all previous methods time out. Note that this parameter will not appear when you first create a new login list.

7. Click **Apply**.

**Dot1x Authentication List**

The Dot1x authentication list defines the dot1x authentication method used for the default list.

➢ To change the Dot1x authentication method for the defaultList:

1. Select **Security > Management Security > Authentication List > Dot1x Authentication List**.

   ![Dot1x Authentication List](image)

2. Select the check box next to the dot1xList name.

3. Use the drop-down menu in the 1 column to select the method that should appear first in the selected authentication login list.

   The options are:
   - **Local**. The user's locally stored ID and password will be used for authentication.
   - **Radius**. The user's ID and password will be authenticated using the RADIUS server instead of locally.
   - **None**. The user will not be authenticated.
4. Click Apply.

Configuring Management Access

From the Access menu, you can configure HTTP and Secure HTTP access to the GS752TXS/GS728TXS management interface. You can also configure Access Control Profiles and Access Rules.

The Access tab contains links described in the following sections.

- HTTP Configuration
- Secure HTTP Configuration
- Certificate Management
- Certificate Download
- Access Control

HTTP Configuration

Use the HTTP Configuration screen to configure the HTTP server settings on the system.

➢ To configure the HTTP server settings:

2. Enable or disable the Web Java Mode.
   
   This applies to both secure and unsecure HTTP connections.

3. In the HTTP Session Soft Timeout field, specify the number of minutes an HTTP session can be idle before a timeout occurs.

   After the session is inactive for the configured amount of time, the administrator is automatically logged out and must reenter the password to access the management interface. A value of zero corresponds to an infinite time-out. The valid range is 0 to 60 minutes. The default value is 5 minutes.

4. In the HTTP Session Hard Timeout field, specify the hard time-out for HTTP sessions.

   This time-out is unaffected by the activity level of the session. The value must be in the range of (0–168) hours. A value of zero corresponds to an infinite time-out. The default value is 24 hours.
5. In the Maximum Number of HTTP Sessions field, specify the maximum number of HTTP sessions that can exist at the same time.
   The value must be in the range of (0–4). The default value is 4.

6. Click Apply.

Secure HTTP Configuration

Secure HTTP enables the transmission of HTTP over an encrypted Secure Sockets Layer (SSL) or Transport Layer Security (TLS) connection. When you manage the switch by using a Web interface, secure HTTP can help ensure that communication between the management system and the switch is protected from eavesdroppers and man-in-the-middle attacks.

Use the Secure HTTP Configuration screen to configure the settings for HTTPS communication between the management station and the switch.

➢ To configure HTTPS settings:

2. Use the radio buttons in the HTTPS Admin Mode field to enable or disable the Administrative Mode of Secure HTTP.
   The default value is Disable. You can only download SSL certificates when the HTTPS Admin mode is disabled.

3. Use the radio buttons in the SSL Version 3 field to enable or disable Secure Sockets Layer Version 3.0.
   The default value is Enable.

4. Use the radio buttons in the TLS Version 1 field to enable or disable Transport Layer Security Version 1.0.
   The default value is Enable.

5. In the HTTPS Port field, specify the TCP port to use for HTTPS data.
   The value must be in the range of 1025–65535. Port 443 is the default value.

6. In the HTTPS Session Soft Timeout (Minutes) field, specify the number of minutes an HTTPS session can be idle before a timeout occurs.
After the session is inactive for the configured amount of time, the administrator is automatically logged out and must re-enter the password to access the management interface. A value of zero corresponds to an infinite timeout. The valid range is 1—60 minutes. The default value is 5 minutes.

7. In the HTTPS Session Hard Timeout (Hours) field, specify the number of hours an HTTPS session can remain active, regardless of session activity.

   The value must be in the range of (1–168) hours. The default value is 24 hours.

8. In the Maximum Number of HTTPS Sessions field, specify the maximum number of HTTPS sessions that can be open at the same time.

   The value must be in the range of (0–4). The default value is 4.

9. Click Apply.

Certificate Management

Use this screen to generate or delete certificates.

To manage certificates:

From the Certificate Present field, a Yes or No status displays.

2. Under Certificate Present, select one of the following:
   - Select None to not display the certificates. This is the default selection.
   - Select Generate Certificates to generate the Certificate files.
   - Select Delete Certificates to delete the corresponding Certificate files, if it is present.

   The Certificate Generation Status field displays whether SSL certificate generation is in progress.

   Certificate Present displays whether there is a certificate present on the device.

3. Click Apply to start the certification configuration.
Certificate Download

For the Web server on the switch to accept HTTPS connections from a management station, the Web server needs a public key certificate. You can generate a certificate externally (for example, off-line) and download it to the switch.

Before you download a file to the switch, the following conditions must be true:

• The file to download from the TFTP server is on the server in the appropriate directory.
• The file is in the correct format.
• The switch has a path to the TFTP server.

➢ To configure the certificate download settings for HTTPS sessions:

2. From the File Type menu, select the type of SSL certificate to download, which can be one of the following:

3. From the Server Address Type menu, specify either IPv4 or DNS to indicate the format of the TFTP Server Address field.
   The default is IPv4.

4. In the TFTP Server IP field, specify the address of the TFTP server.
   The address can be an IP address in standard x.x.x.x format or a hostname. The hostname must start with a letter of the alphabet. Make sure that the software image or other file to be downloaded is available on the TFTP server.

5. Enter the path of the file which you want to download in the Remote File Path field.
   You can enter up to 96 characters. The factory default is blank.

6. In the Remote File Name field, specify the name of the file to download, including the path.
You can enter up to 32 characters.

7. Select the Start File Transfer check box.

8. Click **Apply** to start the transfer.

9. A status message displays during the transfer and upon successful completion of the transfer.
Access Control

Access control allows you to define a profile configuration and set access rules.

Access Profile Configuration

Use the Access Profile Configuration screen to set up a security access profile.

➢ To configure an access profile:

2. Enter the name of the access profile to be added in the Access Profile Name field. Maximum length is 32 characters.

3. Select one of the following options:
   • Activate Profile. Activate an access profile.
   • Deactivate Profile. Deactivate an access profile.
   • Remove Profile. Remove an access profile. The access profile should be deactivated before removing the access profile.

The Packets Filtered field displays the number of packets filtered.

The Profile Summary section displays the following:

- **Rule Type.** This is the action to be performed when the rules selected are matched.
- **Service Type.** The policy is restricted by the management chosen from Drop-down menu. Possible methods include “HTTP”, “Secure HTTP (SSL)”, and “SNMP”.
- **Source IP Address.** This is the Source IP Address of the client originating the management traffic. Fill in the “Source IP address” in the text box provided.
- **Mask.** This is the Source IP Address Mask of the client originating the management traffic.
- **Priority.** Assign a priority to the rule. The rules are validated against the incoming management request in the ascending order of their priorities. If a rule matches, action is performed and subsequent rules below are ignored. For example, if a Source
IP 10.10.10.10 is configured with priority 1 to permit, and Source IP 10.10.10.10 is configured with priority 2 to Deny, then access is permitted if the profile is active, and the second rule is ignored.

4. Click Apply.

Access Rule Configuration

Use the Access Rule Configuration screen to add security access rules.

To configure access rules:

2. Specify the following settings:
   - **Rule Type.** Select the action to be performed when the rules selected are matched. Use the drop-down box and select “Permit” or “Deny” access.
   - **Service Type.** Select from the drop-down box. The policy is restricted by the management chosen from the drop-down menu. Possible methods include HTTP, Secure HTTP (SSL), and SNMP.
   - **Source IP Address.** Enter Source IP Address of the client originating the management traffic. Fill in the “Source IP address” in the text box.
   - **Mask.** Enter Source IP Address Mask of the client originating the management traffic. Fill in the “Mask” details in the text box provided.
   - **Priority.** Assign a priority to the rule. The rules are validated against the incoming management request in the ascending order of their priorities. If a rule matches, action is performed and subsequent rules below are ignored. For example, if a Source IP 10.10.10.10 is configured with priority 1 to permit, and Source IP 10.10.10.10 is configured with priority 2 to Deny, then access is permitted if the profile is active, and the second rule is ignored.

3. Click Apply.
Port Authentication

In port-based authentication mode, when 802.1X is enabled globally and on the port, successful authentication of any one supplicant attached to the port results in all users being able to use the port without restrictions. At any given time, only one supplicant is allowed to attempt authentication on a port in this mode. Ports in this mode are under bidirectional control. This is the default authentication mode.

The 802.1X network has three components:

- **Authenticators.** Specifies the port that is authenticated before permitting system access.
- **Supplicants.** Specifies the host connected to the authenticated port requesting access to the system services.
- **Authentication Server.** Specifies the external server, for example, the RADIUS server that performs the authentication on behalf of the authenticator, and indicates whether the user is authorized to access system services.

The Port Authentication links described in the following sections.

- **802.1X Configuration**
- **Port Authentication**
- **Port Summary**

802.1X Configuration

Use the 802.1X Configuration screen to enable or disable port access control on the system.

➢ **To configure global 802.1X settings:**

1. Select **Security > Port Authentication > Basic > 802.1X Configuration.**
2. Specify the Port Based Authentication State mode on the switch.
   The default setting is Disable.
   - **Enable.** Port-based authentication is permitted on the switch.

   **Note:** If 802.1X is enabled, authentication is performed by a RADIUS server. This means the primary authentication method must be RADIUS. To set the method, select Security > Management Security > Authentication List and select RADIUS as method 1 for defaultList. For more information, see Authentication List Configuration on page 198.

   - **Disable.** The switch does not check for 802.1X authentication before allowing traffic on any ports, even if the ports are configured to allow only authenticated users.

3. Select the radio button in the VLAN Assignment Mode field.
   Select Enable and Disable. The default value is Disable.

4. Select the radio button in the Dynamic VLAN Creation Mode field.
   This lists two options for Dynamic VLAN Creation Mode: Enable and Disable. The default value is Disable.

5. Select the radio button in the EAPOL Flood Mode.
   This lists two options for EAPOL Flood Mode: Enable and Disable. The default value is Disable.

6. Click Apply.

**Port Authentication**

Use the Port Authentication screen to enable and configure port access control on one or more ports.

➢ To configure 802.1X settings for the port:

   **Note:** Use the horizontal scroll bar at the bottom of the browser to view all the fields on the Port Authentication screen. The figures on the following screen are both images of the Port Authentication screen.
2. Select the check box next to the port to configure.
   You can also select multiple check boxes to apply the same settings to the select ports, or select the check box in the heading row to apply the same settings to all ports.

3. For one or more of the selected port, specify the following settings:
   - **Port Control.** Defines the port authorization state. The control mode is only set if the link status of the port is link up. The possible field values are:
     - **Auto.** The system automatically detects the mode of the interface.
     - **Authorized.** The system places the interface into an authorized state without being authenticated. The interface sends and receives normal traffic without client port-based authentication.
     - **Unauthorized.** The system denies the selected interface system access by moving the interface into unauthorized state. The switch cannot provide authentication services to the client through the interface.
     - **MAC based.** The authenticator PAE sets the controlled port mode to reflect the outcome of authentication exchanges between a supplicant, an authenticator, and an authentication server on a per supplicant basis.
   - **Guest VLAN ID.** This field allows the user to configure the Guest VLAN ID on the interface. The valid range is 0–4093. The default value is 0. Enter 0 to reset the Guest VLAN ID on the interface.
   - **Guest VLAN Period.** This input field allows the user to enter the Guest VLAN period for the selected port. The Guest VLAN period is the value, in seconds, of the timer
used by the Guest VLAN Authentication. The Guest VLAN timeout must be a value in the range of 1–300. The default value is 90.

- **Unauthenticated VLAN ID.** This input field allows the user to enter the Unauthenticated VLAN Id for the selected port. The valid range is 0–3965. The default value is 0. Changing the value will not change the configuration until the **Apply** button is pressed. Enter 0 to clear the Unauthenticated VLAN Id on the interface.

- **Periodic Reauthentication.** Use this field to enable or disable reauthentication of the supplicant for the specified port. Select **Enable** or **Disable**. If the value is **Enable**, reauthentication will occur. Otherwise, reauthentication will not be allowed. The default value is **Disable**. Changing the selection will not change the configuration until the **Apply** button is pressed.

- **Reauthentication Period.** Indicates the time span in which the selected port is reauthenticated. The field value is in seconds. The range is 1–65535, and the field default is 3600 seconds.

- **Quiet Period.** This input field allows the user to configure the quiet period for the selected port. This command sets the value, in seconds, of the timer used by the authenticator state machine on this port to define periods of time in which it will not attempt to acquire a supplicant. The quiet period is the period for which the authenticator does not attempt to acquire a supplicant after a failed authentication exchange with the supplicant. The quiet period must be a number in the range of 0 and 65535. A quiet period value of 0 means that the authenticator state machine will never acquire a supplicant. The default value is 60. Changing the value will not change the configuration until the Submit button is pressed.

- **Resending EAP.** This input field allows you to configure the transmit period for the selected port. The transmit period is the value, in seconds, of the timer used by the authenticator state machine on the specified port to determine when to send an EAPOL EAP Request/Identify frame to the supplicant. The transmit period must be a number in the range of 1–65535. The default value is 30.

- **Max EAP Requests.** This input field allows you to enter the maximum requests for the selected port. The maximum requests value is the maximum number of times the authenticator state machine on this port will retransmit an EAPOL EAP Request/Identity before timing out the supplicant. The maximum requests value must be in the range of 1–10. The default value is 2.

- **Supplicant Timeout.** This input field allows the user to enter the supplicant time-out for the selected port. The supplicant time-out is the value, in seconds, of the timer used by the authenticator state machine on this port to time-out the supplicant. The supplicant time-out must be a value in the range of 1 and 65535. The default value is 30.

- **Server Timeout.** Defines the amount of time that lapses before the switch resends a request to the authentication server. The field value is in seconds. The range is 1–65535, and the field default is 30 seconds.

4. Click **Apply**.

5. Click **Initialize** to begin the initialization sequence on the selected port(s).
This button is only selectable if the control mode is *auto*. If the button is not selectable, it will be grayed out. When this button is clicked, the action is immediate. It is not required to click **Apply** for the action to occur.

6. Click **Reauthenticate** to begin the reauthentication sequence on the selected port.

This button is only selectable if the control mode is *auto*. If the button is not selectable, it will be grayed out. When this button is pressed, the action is immediate. It is not required to click **Apply** for the action to occur.

The fields in the following table are not configurable.

### Table 29. Port authentication status information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control Direction</td>
<td>The control direction displays the control direction for the specified port, which is always Both. The control direction dictates the degree to which protocol exchanges take place between Supplicant and Authenticator. The unauthorized controlled port exerts control over communication in both directions (disabling both incoming and outgoing frames). This field is not configurable.</td>
</tr>
<tr>
<td>Protocol Version</td>
<td>This protocol version displays the protocol version associated with the selected port. The only possible value is 1, corresponding to the first version of the 802.1X specification. This field is not configurable.</td>
</tr>
<tr>
<td>PAE Capabilities</td>
<td>This PAE capabilities display the port access entity (PAE) functionality of the selected port. Possible values are Authenticator or Supplicant. This field is not configurable.</td>
</tr>
<tr>
<td>Authenticator PAE State</td>
<td>The authenticator PAE state displays the current state of the authenticator PAE state machine. Possible values are as follows: Initialize, Disconnected, Connecting, Authenticating, Authenticated, Aborting, Held, ForceAuthorized, ForceUnauthorized</td>
</tr>
<tr>
<td>Backend State</td>
<td>The backend state displays the current state of the backend authentication state machine. Possible values are as follows: Request, Response, Success, Fail, Timeout, Initialize, Idle</td>
</tr>
</tbody>
</table>
Port Summary

To access the port Summary screen:

Select **Security > Port Authentication > Advanced > Port Summary**. The Port Summary screen for the 802.1X feature displays.

</tbody>
</table>
Traffic Control

From the Traffic Control menu, you can configure MAC Filters, Storm Control, Port Security, and Protected Port settings.

The Traffic Control folder contains links described in the following sections.

- MAC Filter:
  - MAC Filter Configuration
  - MAC Filter Summary
- Storm Control
- Port Security:
  - Port Security Configuration
  - Port Security Interface Configuration
  - Security MAC Address
- Protected Ports Membership

MAC Filter Configuration

Use the MAC Filter Configuration screen to create MAC filters that limit the traffic allowed into and out of specified ports on the system.

➢ To configure MAC filter settings:

2. Select Create Filter from the MAC Filter menu.
   
   If no filters have been configured, this is the only option available.
3. From the VLAN ID menu, select the VLAN to use with the MAC address to fully identify packets you want filtered.
   You can change this field only when the Create Filter option is selected from the MAC Filter menu.

4. In the MAC Address field, specify the MAC address of the filter in the format 00:01:1A:B2:53:4D.
   You can change this field when you have selected the Create Filter option.
   You cannot define filters for the following MAC addresses:
   • 00:00:00:00:00
   • 01:80:C2:00:00:00 to 01:80:C2:00:00:0F
   • 01:80:C2:00:00:20 to 01:80:C2:00:00:21
   • FF:FF:FF:FF:FF:FF

5. Click the orange bar under the Source Port Members heading to display the available ports. Select the port(s) to include in the inbound filter.
   If a packet with the MAC address and VLAN ID you specify is received on a port that is not in the list, it will be dropped.

6. Click the orange bar under the Destination Port Members heading to display the available ports.
   Select the port(s) to include in the outbound filter. Packets with the MAC address and VLAN ID you selected will be transmitted only out of ports that are in the list. Destination ports can be included only in the Multicast filter.

7. Click Apply.

To delete a configured MAC filter:
1. In the MAC Filter list, select the filter to remove.
2. Click Delete.
MAC Filter Summary

Use the MAC Filter Summary screen to view the MAC filters that are configured on the system.

To display the MAC filter summary screen:

Select Security > Traffic Control > MAC Filter > MAC Filter Summary. The MAC Filter Summary screen displays

![MAC Filter Summary Screen](image)

Figure 8. MAC filter summary screen

The following table describes the information displayed on the screen:

Table 31. MAC filter summary information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>Identifies the MAC address that is filtered.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>The VLAN ID used with the MAC address to fully identify packets you want filtered. You can only change this field when you have selected the Create Filter option.</td>
</tr>
<tr>
<td>Source Port Members</td>
<td>Displays the ports included in the inbound filter.</td>
</tr>
<tr>
<td>Destination Port Members</td>
<td>Displays the ports included in the outbound filter.</td>
</tr>
</tbody>
</table>
Storm Control

A broadcast storm is the result of an excessive number of broadcast messages simultaneously transmitted across a network by a single port. Forwarded message responses can overload network resources and/or cause the network to time out.

The switch measures the incoming broadcast/multicast/unknown unicast packet rate per port and discards packets when the rate exceeds the defined value. Storm control is enabled per interface, by defining the packet type and the rate at which the packets are transmitted.

To configure storm control settings:

1. Select **Security > Traffic Control > Storm Control**.

2. Select the check box next to the port to configure.

   Select multiple check boxes to apply the same setting to all selected ports. Select the check box in the heading row to apply the same settings to all ports.

3. From the Ingress Control Mode menu, select the mode of broadcast affected by storm control.
   - **Disable**. Do not use storm control.
   - **Unknown Unicast**. If the rate of unknown L2 unicast (destination lookup failure) traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped.
   - **Multicast**. If the rate of L2 multicast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped.
   - **Broadcast**. If the rate of L2 broadcast traffic ingressing on an interface increases beyond the configured threshold, the traffic will be dropped.

4. When the selected Ingress Control Mode is an option other than Disable, select **Enable** or **Disable** from the Status menu to specify the administrative status of the mode.
5. Select Control Action mode to either Shutdown or RateLimit.
   The default mode is RateLimit. The Control Action field provides the ability to shutdown the port when threshold of configured broadcast storm recovery feature gets breached.

6. In the Threshold field, specify the maximum rate at which unknown packets are forwarded.
   The range is a percent of the total threshold between 0–100%. The default is 5%.

7. In the Flow Control menu, select **Enable** or **Disable** flow control. The default is **Disable**.

8. Click **Apply**.

### Port Security Configuration

Use the Port Security feature to lock one or more ports on the system. When a port is locked, only packets with an allowable source MAC addresses can be forwarded. All other packets are discarded.

➢ **To configure the global port security mode:**

1. Select **Security > Traffic Control > Port Security > Port Security Configuration**.

2. In the Port Security Mode field, select the appropriate radio button to enable or disable port security on the switch.

3. Click **Apply**.

The Port Security Violation table shows information about violations that occurred on ports that are enabled for port security. The following table describes the fields in the Port Security Violation table.

#### Table 32. Port security violation information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>Identifies the port where a violation occurred.</td>
</tr>
<tr>
<td>Last Violation MAC</td>
<td>Displays the source MAC address of the last packet that was discarded at a locked port.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN ID corresponding to the Last Violation MAC address.</td>
</tr>
</tbody>
</table>
Port Security Interface Configuration

A MAC address can be defined as allowable by one of two methods: dynamically or statically. Both methods are used concurrently when a port is locked.

Dynamic locking implements a first arrival mechanism for port security. You specify how many addresses can be learned on the locked port. If the limit has not been reached, then a packet with an unknown source MAC address is learned and forwarded normally. When the limit is reached, no more addresses are learned on the port. Any packets with source MAC addresses that were not already learned are discarded. You can effectively disable dynamic locking by setting the number of allowable dynamic entries to zero.

Static locking allows you to specify a list of MAC addresses that are allowed on a port. The behavior of packets is the same as for dynamic locking: only packets with an allowable source MAC address can be forwarded.

To configure port security settings:

2. To configure port security settings for a Link Aggregation Group (LAG), click LAGS.
3. To configure port security settings for both physical ports and LAGs, click ALL.
4. To configure settings for a physical port, enter the port in unit/slot/port format and click on the Go button.

   The entry corresponding to the specified port will be selected.

5. Select the check box next to the port or LAG to configure.

   Select multiple check boxes to apply the same setting to all selected interfaces. Select the check box in the heading row to apply the same settings to all interfaces.
6. Specify the following settings:
   - **Port Security.** Enable or Disable the port security feature for the selected port.
   - **Max Allowed Dynamically Learned MAC.** Sets the maximum number of dynamically learned MAC addresses on the selected interface.
   - **Max Allowed Statically Locked MAC.** Sets the maximum number of statically locked MAC addresses on the selected interface.
   - **Enable Violation Traps.** Enables or disables the sending of new violation traps designating when a packet with a disallowed MAC address is received on a locked port.

7. Click **Apply.**

**Security MAC Address**

Use the Security MAC Address screen to convert a dynamically learned MAC address to a statically locked address.

➢ To convert learned MAC addresses:

1. Select **Security > Traffic Control > Port Security > Security MAC Address.**

   ![Security MAC Address](image)

2. Select the Convert Dynamic Address to Static check box.

3. The **Number Of Dynamic MAC Addresses Learned** field displays the number of dynamically learned MAC addresses on a specific port.

4. Use the **Port List** menu to select the interface for which you want to display data.

5. Click **Apply.**

   The Dynamic MAC Address entries are converted to Static MAC address entries in a numerically ascending order until the Static limit is reached.
The Dynamic MAC Address Table shows the MAC addresses and their associated VLANs learned on the selected port. Use the Port List menu to select the interface for which you want to display data.

**Table 33. Dynamic MAC address table information**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Displays the VLAN ID corresponding to the Last Violation MAC address.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>Displays the MAC addresses learned on a specific port.</td>
</tr>
</tbody>
</table>

**Protected Ports Membership**

If a port is configured as protected, it does not forward traffic to any other protected port on the switch, but it will forward traffic to unprotected ports. Use the Protected Ports Membership screen to configure the ports as protected or unprotected.

➢ **To configure protected ports:**

1. Select **Security > Traffic Control > Protected Ports**.

2. Click the orange bar to display the available ports.

3. Click the box below each port to configure as a protected port.

   Protected ports are marked with a check mark. No traffic forwarding is possible between two protected ports.

4. Click **Apply**.
Configuring Access Control Lists

Access Control Lists (ACLs) ensure that only authorized users have access to specific resources while blocking off any unwarranted attempts to reach network resources. ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and above all provide security for the network. GS752TXS and GS728TXS Smart Switches software supports IPv4 and MAC ACLs.

To configure an ACL, first create an IPv4-based or MAC-based ACL ID. Then, create a rule and assign it to a unique ACL ID. Next, define the rules, which can identify protocols, source, and destination IP and MAC addresses, and other packet-matching criteria. Finally, use the ID number to assign the ACL to a port or to a LAG.

The Security > ACL configuration menu contains links described in the following sections.

• ACL Wizard
• Basic
  • MAC ACL
  • MAC Rules
  • MAC Binding Configuration
  • MAC Binding Table
• Advanced
  • IP ACL
  • IP Rules
  • IP Extended Rules
  • IPv6 ACL
  • IPv6 Rules
  • IP Binding Configuration
  • IP Binding Table
  • VLAN Binding Table
ACL Wizard

ACL Wizard helps you to create a simple ACL and apply it to the selected ports easily and quickly. First, you can select an ACL type. Then, you can add an ACL rule to this ACL and a rule can be applied this ACL on the selected ports. The ACL Wizard allows you only to create the ACL, but does not allow you to modify it. For information about how to modify it, see the instructions on the to the ACL configuration screen.

To display the ACL wizard screen:

2. In the ACL Type field, specify the ACL type used to create the ACL.

You can select one type from 10 optional types:

- **ACL Based on Destination MAC**: Use this to create an ACL based on the destination MAC address, destination MAC mask and VLAN.
- **ACL Based on Source MAC**: Use this to create an ACL based on the source MAC address, source MAC mask and VLAN.
- **ACL Based on Destination IPv4**: Use this to create an ACL based on the destination IPv4 address and IPv4 address mask.
- **ACL Based on Source IPv4**: Use this to create an ACL based on the source IPv4 address and IPv4 address mask.
- **ACL Based on Destination IPv6**: Use this to create an ACL based on the destination IPv6 prefix and IPv6 prefix length.
- **ACL Based on Source IPv6**: Use this to create an ACL based on the source IPv6 prefix and IPv6 prefix length.
- **ACL Based on Destination IPv4 L4 Port**: Use this to create an ACL based on the destination IPv4 layer4 port number.
- **ACL Based on Source IPv4 L4 Port**: Use this to create an ACL based on the source IPv4 layer4 port number.
• **ACL Based on Destination IPv6 L4 Port.** Use this to create an ACL based on the destination IPv6 layer4 port number.

• **ACL Based on Source IPv6 L4 Port.** Use this to create an ACL based on the source IPv6 layer4 port number.

3. In the Rule ID field, enter a whole number in the range of (1 to 10) that will be used to identify the rule.

4. In the Action field, specify what action should be taken if a packet matches the rule’s criteria. The choices are permit or deny.

5. In the Match Every field, specify True or False.

6. In the Destination MAC field, specify the destination MAC address to compare against an Ethernet frame. Valid format is (xx:xx:xx:xx:xx:xx).
   
   The BPDU keyword can be specified using a Destination MAC address of 01:80:C2:xx:xx:xx.

7. In the Destination MAC Mask field, specify the destination MAC address mask specifying which bits in the destination MAC to compare against an Ethernet frame.
   
   Valid format is (xx:xx:xx:xx:xx:xx). The BPDU keyword can be specified using a Destination MAC mask of 00:00:00:ff:ff:ff.

8. The VLAN specifies the VLAN ID to compare against an Ethernet frame.
   
   Valid range of values is (1 to 4095). Either VLAN Range or VLAN can be configured.

9. In the Binding Configuration area, specify the packet filtering direction for an ACL in the Direction field.
   
   Valid direction is Inbound only.

10. In the Port Selection Table area, specify the list of all available valid interfaces for ACL mapping.

   All non routing physical interfaces and interfaces participating in LAG are listed.

11. To add a new rule to the ACL based on destination MAC, select the check box next to the Name field, then click **Add**.

12. Click **Apply**.

➢ **To remove a rule:**

   1. Select the rule to remove.

   2. Click **Delete**.
**MAC ACL**

A MAC ACL consists of a set of rules which are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit/Deny) is taken and the additional rules are not checked for a match.

There are multiple steps involved in defining a MAC ACL and applying it to the switch:

1. Create the ACL ID. See MAC ACL.
2. Create a MAC rule. See MAC Rules.
3. Create a MAC binding configuration. See MAC Binding Configuration.
4. Optionally, create a MAC binding table. See MAC Binding Table.

➢ To add a MAC ACL:

1. Select **Security > Basic > MAC ACL**.

   ![](image)

   The MAC ACL table displays the number of ACLs currently configured in the switch and the maximum number of ACLs that can be configured. The current size is equal to the number of configured IPv4 ACLs plus the number of configured MAC ACLs.

2. Specify a name for the MAC ACL in the Name field.
   
   The name string can include alphabetic, numeric, dash, underscore, or space characters only. The name must start with an alphabetic character.

3. Click **Add**.

   Each configured ACL displays the following information:

   - **Rules**. Displays the number of rules currently configured for the MAC ACL.
   - **Direction**. Displays the direction of packet traffic affected by the MAC ACL, which can be Inbound or blank.

➢ To change the name of a MAC ACL:

1. Select the check box next to the Name field for the ACL to modify.
2. Under Name, specify the new name.
3. Click **Apply**.
To delete a MAC ACL:
1. Select the check box next to the Name field.
2. Click Delete.

MAC Rules
Use the MAC Rules screen to define rules for MAC-based ACLs. The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. A default 'deny all' rule is the last rule of every list.

Note: To set up a new MAC ACL, use the MAC ACL screen.

To add rules to a MAC ACL:
2. From the ACL Name list, select the MAC ACL for which to create or update a rule.
3. Under Rule ID, specify ID for the rule.
4. Configure the ACL rule criteria by selecting options or specifying values as follows:
   • Action. Specify what action should be taken if a packet matches the rule's criteria:
     • Permit. Forwards packets that meet the ACL criteria.
     • Deny. Drops packets that meet the ACL criteria.
   • Assign Queue. Specifies the hardware egress queue identifier used to handle all packets matching this ACL rule. Enter an identifying number from 0–7 in this field.
   • Redirect Interface. Specifies the specific egress interface where the matching traffic stream is forced, bypassing any forwarding decision normally performed by the device.
   • Match Every. Requires a packet to match the criteria of this ACL. Select True or False from the drop-down menu. Match Every is exclusive to the other filtering rules, so if Match Every is True, the other rules on the screen are not available.
   • CoS. Requires a packet’s class of service (CoS) to match the CoS value listed here. Enter a CoS value between 0–7 to apply this criteria.
   • Destination MAC. Requires an Ethernet frame’s destination port MAC address to match the address listed here. Enter a MAC address in this field. The valid format is xx:xx:xx:xx:xx:xx.
• **Destination MAC Mask.** If desired, enter the MAC Mask associated with the Destination MAC to match. The MAC address mask specifies which bits in the destination MAC to compare against an Ethernet frame. Use Fs and zeros in the MAC mask, which is in a wildcard format. An F means that the bit is not checked, and a zero in a bit position means that the data must equal the value given for that bit. For example, if the MAC address is aa:bb:cc:dd:ee:ff, and the mask is 00:00:ff:ff:ff:ff, all MAC addresses with aa:bb:xx:xx:xx:xx result in a match (where x is any hexadecimal number). A MAC mask of 00:00:00:00:00:00 matches a single MAC address.

• **EtherType Key.** Requires a packet’s EtherType to match the EtherType you select. Select the EtherType value from the drop-down menu. If you select User Value, you can enter a custom EtherType value.

• **EtherType User Value.** This field is configurable if you select User Value from the EtherType drop-down menu. The value you enter specifies a customized Ethertype to compare against an Ethernet frame. The valid range of values is 0x0600–0xFFFF.

• **Source MAC.** Requires a packet’s source port MAC address to match the address listed here. Enter a MAC address in this field. The valid format is xx:xx:xx:xx:xx:xx.

• **Source MAC Mask.** If desired, enter the MAC mask for the source MAC address to match. Use Fs and zeros in the MAC mask, which is in a wildcard format. An F means that the bit is not checked, and a zero in a bit position means that the data must equal the value given for that bit. The valid format is xx:xx:xx:xx:xx:xx. A MAC mask of 00:00:00:00:00:00 matches a single MAC address.

• **VLAN.** Requires a packet’s VLAN ID to match the ID listed here. Enter the VLAN ID to apply this criteria. The valid range is 1–4093.

• **Logging.** When set to 'Enable', logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, this will cause periodic traps to be generated indicating the number of times this rule was 'hit' during the current report interval. A fixed 5-minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is only supported for a 'Deny' Action.

5. Click Add.

➢ To change the match criteria for a rule:

1. Select the check box associated with the rule.
2. Modify the fields as desired.
3. Click Apply.

➢ To delete a rule:

1. Select the check box associated with the rule to remove.
2. Click Delete.
MAC Binding Configuration

When an ACL is bound to an interface, all the rules that have been defined are applied to the selected interface. Use the MAC Binding Configuration screen to assign MAC ACL lists to ACL Priorities and Interfaces.

To configure MAC ACL interface bindings:

1. Select **Security > ACL > Basic > MAC Binding Configuration**.

2. Select an existing MAC ACL which requires binding configuration from the ACL ID menu. The packet filtering direction for ACL is Inbound, which means the MAC ACL rules are applied to traffic entering the port.

3. Specify an optional sequence number to indicate the order of this access list relative to other access lists already assigned to this interface and direction.

   A low number indicates high precedence order. If a sequence number is already in use for this interface and direction, the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user, a sequence number that is one greater than the highest sequence number currently in use for this interface and direction will be used. The valid range is 1–4294967295.

4. Click the appropriate orange bar to expose the available ports or LAGs.

   - To add the selected ACL to a port or LAG, click the box directly below the port or LAG number so that a check mark displays in the box.
   - To remove the selected ACL from a port or LAG, click the box directly below the port or LAG number to clear the selection. A check mark in the box indicates that the ACL is applied to the interface.

5. Click **Apply**.
The Interface Binding Status section on the MAC Binding Configuration screen displays the following information:

- **Interface**: Displays selected interface.
- **Direction**: Displays selected packet filtering direction for ACL.
- **ACL Type**: Displays the type of ACL assigned to selected interface and direction.
- **ACL ID**: Displays the ACL Number or Name identifying the ACL assigned to selected interface and direction.
- **Sequence Number**: Displays the Sequence Number signifying the order of specified ACL relative to other ACLs assigned to selected interface and direction.

**MAC Binding Table**

Use the MAC Binding Table screen to view or delete the MAC ACL bindings.

➢ **To delete a MAC ACL-to-interface binding**:

1. Select **Security > ACL > Basic > Binding Table**.

2. Select the check box next to the interface associated with the MAC ACL.

3. Click **Delete**.

The following table describes the information displayed in the MAC Binding Table.

**Table 34. MAC binding table information**

<table>
<thead>
<tr>

</tbody>
</table>
IP ACL

IP ACLs allow network managers to define classification actions and rules for specific ingress ports. Packets can be filtered on ingress (inbound) ports only. If the filter rules match, then some actions can be taken, including dropping the packet or disabling the port. For example, a network administrator defines an ACL rule that says port number 20 can receive TCP packets. However, if a UDP packet is received the packet is dropped.

ACLs are composed of access control entries (ACE), or rules, that consist of the filters that determine traffic classifications.

Use the IP ACL Configuration screen to add or remove IP-based ACLs.

➢ To configure an IP ACL:

1. Select **Security > ACL > Advanced > IP ACL**.

![IP ACL Configuration](image)

The IP ACL area shows the current size of the ACL table versus the maximum size of the ACL table. The current size is equal to the number of configured IPv4 ACLs plus the number of configured MAC ACLs. The maximum size is 100.

2. In the IP ACL ID field, specify the ACL ID. The ID is an integer in the following range:
   - **1–99**. Creates an IP Standard ACL, which allows you to permit or deny traffic from a source IP address.
   - **100–199**. Creates an IP Extended ACL, which allows you to permit or deny specific types of layer 3 or layer 4 traffic from a source IP address to a destination IP address. This type of ACL provides more granularity and filtering capabilities than the standard IP ACL.

3. Click **Add**.

Each configured ACL displays the following information:

- **Rules**. Displays the number of rules currently configured for the IP ACL.
- **Type**. Identifies the ACL as either a standard or extended IP ACL.

➢ To delete an IP ACL

1. Select the check box next to the IP ACL ID field.
2. Click **Delete**.
IP Rules

Use the IP Rules screen to define rules for IP-based standard ACLs. The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded.

**Note:** There is an implicit deny all rule at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit “deny all” rule applies and the packet is dropped.

➢ **To add IP rules:**

1. Select **Security > ACL > Advanced > IP Rules**.

   In the following figure, an IP rule exists, and one rule has been configured.

2. From the ACL ID/Name list, select the IP ACL for which to create a rule.

3. Click **Add**.

4. Next to Rule ID, specify a number from 1–10 to identify the IP ACL rule.

5. Select or specify values for one or more of the following match criteria:
   - **Rule ID**. Specify a number from 1–10 to identify the IP ACL rule. You can create up to 10 rules for each ACL.
   - **Action**. Select the ACL forwarding action, which is one of the following:
- **Permit.** Forwards packets which meet the ACL criteria.
- **Deny.** Drops packets which meet the ACL criteria.

- **Egress Queue.** Specifies the hardware egress queue identifier used to handle all packets matching this ACL rule.
- **Logging.** When set to Enable, logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, then this causes periodic traps to be generated indicating the number of times this rule was hit during the current report interval. A fixed 5-minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is visible for a Deny action.
- **Match Every.** Requires a packet to match the criteria of this ACL. Select True or False from the drop-down menu. Match Every is exclusive to the other filtering rules, so if Match Every is True, the other rules on the screen are not available.
- **Src IP Address.** Requires a packet's source IP address to match the address listed here. Enter an IP Address in the appropriate field using dotted-decimal notation. The address you enter is compared to a packet's source IP Address.
- **Src IP Mask.** Specifies the source IP address wildcard mask. Wild card masks determine which bits are used and which bits are ignored. A wild card mask of 255.255.255.255 indicates that no bit is important. A wildcard of 0.0.0.0 indicates that all of the bits are important. Wildcard masking for ACLs operates differently from a subnet mask. A wildcard mask is in essence the inverse of a subnet mask. For example, to apply the rule to all hosts in the 192.168.1.0/24 subnet, enter 0.0.0.255 in the Source IP Mask field. This field is required when you configure a source IP address.

6. Click **Apply.**

➢ **To modify the match criteria for an ACL rule:**

1. From the ACL Name list on the IP Rules screen, select the ACL that includes the rule to update.
2. In the Basic ACL Rule Table, click the rule ID.

   The rule ID is a hyperlink to the Standard ACL Rule Configuration screen.
3. Modify the ACL rule information.
4. Click **Apply.**

➢ **To delete and IP ACL rule:**

1. In the Basic ACL Rule Table on the IP Rules screen, select the check box associated with the rule to remove.
2. Click **Delete.**

**IP Extended Rules**

Use the IP Extended Rules screen to define rules for IP-based extended ACLs. The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded.

---

233
Note: There is an implicit “deny all” rule at the end of an ACL list. This means that if an ACL is applied to a packet and if none of the explicit rules match, then the final implicit “deny all” rule applies and the packet is dropped.

To add rules to an IP ACL:

In the following figure, an extended IP ACL exists, and one rule has been configured.

2. In the ACL ID/Name list, select the ACL to add the rule to.
3. Click Add.

The screen displays the extended ACL Rule Configuration fields.

4. Next to Rule ID, specify a number from 1–10 to identify the IP ACL rule.
   You can create up to 10 rules for each ACL.
5. Select or specify values for one or more of the following match criteria:

- **Action.** Select the ACL forwarding action, which is one of the following:
  - **Permit.** Forwards packets which meet the ACL criteria.
  - **Deny.** Drops packets which meet the ACL criteria.

- **Egress Queue.** Specifies the hardware egress queue identifier used to handle all packets matching this ACL rule.

- **Match Every.** Requires a packet to match the criteria of this ACL. Select True or False from the drop-down menu. Match Every is exclusive to the other filtering rules, so if Match Every is True, the other rules on the screen are not available.

- **Protocol Type.** Requires a packet's protocol to match the protocol listed here. Select a type from the drop-down menu or enter the protocol number in the available field.

- **Src IP Address.** Requires a packet's source IP address to match the address listed here. Type an IP Address in the appropriate field using dotted-decimal notation. The address you enter is compared to a packet's source IP Address.

- **Src IP Mask.** Specifies the source IP address wildcard mask. Wild card masks determine which bits are used and which bits are ignored. A wild card mask of 255.255.255.255 indicates that no bit is important. A wildcard of 0.0.0.0 indicates that all of the bits are important. Wildcard masking for ACLs operates differently from a subnet mask. A wildcard mask is in essence the inverse of a subnet mask. For example, to apply the rule to all hosts in the 192.168.1.0/24 subnet, you type 0.0.0.255 in the Source IP Mask field. This field is required when you configure a source IP address.

- **Src L4 Port.** Requires a packet's TCP/UDP source port to match the port listed here. Click Complete one of the following fields:
  - **Source L4 Keyword.** Select the desired L4 keyword from a list of source ports on which the rule can be based.
  - **Source L4 Port Number.** If the source L4 keyword is Other, enter a user-defined Port ID by which packets are matched to the rule.

- **Dst IP Address.** Requires a packet's destination port IP address to match the address listed here. Enter an IP Address in the appropriate field using dotted-decimal notation. The address you enter is compared to a packet's destination IP Address.

- **Dst IP Mask.** Specifies the destination IP address wildcard mask. Wild card masks determine which bits are used and which bits are ignored. A wild card mask of 255.255.255.255 indicates that no bit is important. A wildcard of 0.0.0.0 indicates that all of the bits are important. Wildcard masking for ACLs operates differently from a subnet mask. A wildcard mask is in essence the inverse of a subnet mask. For example, to apply the rule to all hosts in the 192.168.1.0/24 subnet, you type 0.0.0.255 in the Source IP Mask field. This field is required when you configure a source IP address.

- **Dst L4 Port.** Requires a packet's TCP/UDP destination port to match the port listed here. Complete one of the following fields:
  - **Destination L4 Keyword.** Select the desired L4 keyword from a list of destination ports on which the rule can be based.
- **Destination L4 Port Number.** If the destination L4 keyword is Other, enter a user-defined Port ID by which packets are matched to the rule.

- **Service Type.** Select one of the Service Type match conditions for the extended IP ACL rule. The possible values are IP DSCP, IP precedence, and IP TOS, which are alternative ways of specifying a match criterion for the same Service Type field in the IP header, however each uses a different user notation. After you select the service type, specify the value associated with the type.
  - **IP DSCP.** Specify the IP DiffServ Code Point (DSCP) value. The DSCP is defined as the high-order six bits of the Service Type octet in the IP header. Select an IP DSCP value from the menu. To specify a numeric value in the available field, select Other from the menu and type an integer from 0 to 63 in the field.
  - **IP Precedence.** The IP Precedence field in a packet is defined as the high-order three bits of the Service Type octet in the IP header. This is an optional configuration. Enter an integer from 0 to 7.
  - **IP TOS Bits.** Matches on the Type of Service bits in the IP header when checked. In the first TOS field, specify the two-digit hexadecimal TOS number. The second field is for the TOS Mask, which specifies the bit positions that are used for comparison against the IP TOS field in a packet. The TOS Mask value is a two-digit hexadecimal number from 00 to ff, representing an inverted (wildcard) mask. The zero-valued bits in the TOS Mask denote the bit positions in the TOS Bits value that are used for comparison against the IP TOS field of a packet. For example, to check for an IP TOS value having bits 7 and 5 set and bit 1 clear, where bit 7 is most significant, use a TOS Bits value of a0 and a TOS Mask of 00.

 6. Click **Apply**.

-➢ ![To modify the match criteria for an ACL rule:](image)

  1. From the ACL Name list on the Extended ACL Rules screen, select the ACL that includes the rule to update.
  2. In the Extended ACL Rule Table, click the rule ID.

    The rule ID is a hyperlink to the Extended ACL Rule Configuration screen.
  3. Modify the ACL rule information.
  4. Click **Apply**.

-➢ ![To delete an IP ACL rule:](image)

  1. In the Extended ACL Rule Table on the IP Rules screen, select the check box associated with the rule to remove.
  2. Click **Delete**.

**IPv6 ACL**

An IPv6 ACL consists of a set of rules which are matched sequentially against a packet. When a packet meets the match criteria of a rule, the specified rule action (Permit/Deny) is taken and the additional rules are not checked for a match. On this menu, the interfaces to
which an IP ACL applies must be specified, as well as whether it applies to inbound or outbound traffic. Rules for the IPv6 ACL are specified/created using the IPv6 Rules screen.

➢ To add an IPv6 ACL:

1. Select Security > ACL > Advanced > IPv6 ACL.

The current number of the IP ACLs configured on the switch is displayed in the Current Number of ACL area. The maximum number of IP ACLs that can be configured on the switch is displayed in the Maximum ACL field, depending on the hardware. The name of IPv6 ACL can be configured in IPv6 ACL field. The number of the rules associated with the IP ACL is displayed in the Rules field. The ACL type is IPv6 ACL and displayed in the Type field.

2. Under IPv6 ACL, specify a name to identify the IPv6 ACL.
3. Click Add.

➢ To delete an IPv6 ACL:

1. Select the check box associated with the ACL.
2. Click Delete.

IPv6 Rules

Use the IPv6 Rules screen to configure the rules for the IPv6 Access Control Lists. The IPv6 Access Control Lists are created using the IPv6 Access Control List Configuration screen. By default, no specific value is in effect for any of the IPv6 ACL rules.

➢ To add a rule to an IPv6 ACL:

2. In the ACL Name list, select the name of the ACL to add a rule to.

3. Click **Add**.

   The screen displays the IPv6 ACL Rule Configuration fields.

4. Next to Rule ID, specify a number from 1–10 to identify the IPv6 ACL rule.

   You can create up to 10 rules for each ACL.

5. Select or specify values for one or more of the following match criteria:

   - **Rule ID.** Enter a whole number in the range of 1 to 10 that will be used to identify the rule. An IPv6 ACL can have up to 10 rules.
   - **Action.** Specify what action should be taken if a packet matches the rule’s criteria. The choices are Permit or Deny.
   - **Logging.** When set to Enable, logging is enabled for this ACL rule (subject to resource availability in the device). If the Access List Trap Flag is also enabled, then this causes periodic traps to be generated indicating the number of times this rule was hit during the current report interval. A fixed 5-minute report interval is used for the entire system. A trap is not issued if the ACL rule hit count is zero for the current interval. This field is visible for a Deny action.
   - **Assign Queue ID.** Specifies the hardware egress queue identifier used to handle all packets matching this IPv6 ACL rule. The valid range of Queue IDs is from 0 to 6. This field is visible for a Permit Action.
   - **Mirror Interface.** Specifies the specific egress interface where the matching traffic stream is copied in addition to being forwarded normally by the device. This field cannot be set if a Redirect Interface is already configured for the ACL rule. This field is visible for a 'Permit' Action.
   - **Redirect Interface.** Specifies the specific egress interface where the matching traffic stream is forced, bypassing any forwarding decision normally performed by the device. This field cannot be set if a Mirror Interface is already configured for the ACL rule. This field is visible for a Permit Action.
• **Match Every.** Select true or false from the pull down menu. True signifies that all packets will match the selected IPv6 ACL and Rule and will be either permitted or denied. In this case, since all packets match the rule, the option of configuring other match criteria will not be offered. To configure specific match criteria for the rule, remove the rule and recreate it, or reconfigure Match Every to False for the other match criteria to be visible.

• **Protocol.** There are two ways to configure IPv6 protocol:
  - Specify an integer ranging from 0 to 255 after selecting protocol keyword “other”. This number represents the IPv6 protocol.
  - Select name of a protocol from the existing list of IPv6, ICMPv6, TCP, and UDP.

• **Source Prefix/Prefix Length.** Specify IPv6 Prefix combined with IPv6 Prefix length of the network or host from which the packet is being sent. Prefix length can be in the range (0 to 128).

• **Source L4 Port.** Specify a packet's source layer 4 port as a match condition for the selected IPv6 ACL rule. Source port information is optional. Source port information can be specified in two ways:
  - Select keyword “other” from the drop-down menu and specify the number of the port in the range from 0 to 65535.
  - Select one of the keyword from the list: DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

• **Destination Prefix/Prefix Length.** Enter up to 128-bit prefix combined with prefix length to be compared to a packet's destination IP Address as a match criteria for the selected IPv6 ACL rule. Prefix length can be in the range (0 to 128).

• **Destination L4 Port.** Specify a packet's destination layer 4 port as a match condition for the selected IPv6 ACL rule. Destination port information is optional. Destination port information can be specified in two ways:
  - Select keyword “other” from the drop-down menu and specify the number of the port in the range from 0 to 65535.
  - Select one of the keyword from the list: DOMAIN, ECHO, FTP, FTPDATA, HTTP, SMTP, SNMP, TELNET, TFTP, and WWW. Each of these values translates into its equivalent port number, which is used as both the start and end of the port range.

• **Flow Label.** Flow label is 20-bit number that is unique to an IPv6 packet, used by end stations to signify quality-of-service handling in routers. Flow label can be specified within the range (0 to 1048575).

• **IPv6 DSCP Service.** Specify the IP DiffServ Code Point (DSCP) field. The DSCP is defined as the high-order six bits of the Service Type octet in the IPv6 header. This is an optional configuration. Enter an integer from 0 to 63. The IPv6 DSCP is selected by possibly selection one of the DSCP keyword from a drop-down menu. If a value is to be selected by specifying its numeric value, then select the **Other** option in the drop-down menu and a text box will appear where the numeric value of the DSCP can be entered.

6. **Click Apply.**
To delete an IPv6 rule:

1. On the IPv6 Rules screen in the ACL Name list, select the name of the ACL that includes the rule to remove.
2. In the IPv6 Rule Table, select the check box of the rule to delete.
3. Click Delete.
IP Binding Configuration

When an ACL is bound to an interface, all the rules that have been defined are applied to the selected interface. Use the IP Binding Configuration screen to assign ACL lists to ACL Priorities and Interfaces.

➢ To add IP ACL interface bindings:

2. Select an existing IP ACL in which you want to add an IP ACL interface binding from the ACL ID menu.

   The packet filtering direction for ACL is Inbound, which means the IP ACL rules are applied to traffic entering the port.

3. Specify an optional sequence number to indicate the order of this access list relative to other access lists already assigned to this interface and direction.

   A low number indicates high precedence order. If a sequence number is already in use for this interface and direction, then the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user, then a sequence number that is one greater than the highest sequence number currently in use for this interface and direction will be used. The valid range is 1–4294967295.

4. Click the appropriate orange bar to expose the available ports or LAGs.
   • To add the selected ACL to a port or LAG, click the box directly below the port or LAG number so that a check mark displays in the box.
   • To remove the selected ACL from a port or LAG, click the box directly below the port or LAG number to clear the selection. A check mark in the box indicates that the ACL is applied to the interface.

5. Click Apply.
IP Binding Table

Use the IP Binding Table screen to view or delete the IP ACL bindings.

> To delete an IP ACL binding:

1. Select Security > ACL > Advanced > Binding Table.

2. Select the check box associated with the ACL-to-interface binding to remove.

3. Click Delete.

The following table describes the information displayed in the IP binding table.

Table 35. IP binding table information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the interface to which the IP ACL is bound.</td>
</tr>
<tr>
<td>Direction</td>
<td>Specifies the packet filtering direction for ACL. The only valid direction is Inbound, which means the IP ACL rules are applied to traffic entering the port.</td>
</tr>
<tr>
<td>ACL Type</td>
<td>Displays the type of ACL assigned to selected interface and direction.</td>
</tr>
<tr>
<td>ACL ID</td>
<td>Displays the ACL Number identifying the ACL assigned to selected interface and direction.</td>
</tr>
<tr>
<td>Seq No.</td>
<td>Displays the Sequence Number signifying the order of specified ACL relative to other ACLs assigned to selected interface and direction.</td>
</tr>
</tbody>
</table>
VLAN Binding Table

Use the VLAN binding table screen to associate an ACL with a VLAN.

To configure an ACL-to-VLAN binding:

1. Select Security > ACL > Advanced > Vlan Binding Table.

2. In the VLAN ID field, specify a VLAN ID for ACL mapping.

3. In the Direction field, specify the direction of packet traffic affected by the ACL, which can be Inbound or blank.

4. (Optional) In the Sequence Number field, specify the sequence number of the access lists. This sequence number indicates the order of this access list relative to other access lists already assigned to this VLAN and direction. A lower number indicates higher precedence order. If a sequence number is already in use for this VLAN and direction, the specified access list replaces the currently attached access list using that sequence number. If the sequence number is not specified by the user (i.e., the value is 0), a sequence number that is one greater than the highest sequence number currently in use for this VLAN and direction will be used. Valid range is (1 to 4294967295).

5. From the ACL Type list, select the type of ACL:
   - IP ACL
   - MAC ACL
   - IPv6 ACL

6. From the ACL ID list, select the ID of the ACL to bind to the specified VLAN.
   The ACL ID field displays all the ACLs configured, depending on the ACL Type selected.

7. Click Add.

To delete a VLAN binding:

1. Select the check box next to the VLAN with the ACL binding to remove.

2. Click Delete.
Use the features available from the Monitoring tab to view a variety of information about the switch and its ports and to configure how the switch monitors events. The Monitoring tab contains configuration menus described in the following sections.

- **Ports**
- **Logs**
- **Mirroring**

**Ports**

The screens available from the Ports menu contain a variety of information about the number and type of traffic transmitted from and received on the switch. From the Ports menu, you can access the following links:

- **Switch Statistics**
- **Port Statistics**
- **Port Detailed Statistics**
- **EAP Statistics**
- **Cable Test**

**Switch Statistics**

The Switch Statistics screen displays detailed statistical information about the traffic the switch handles.

➢ **To view the switch statistics:**

Click Monitoring > Ports > Switch Statistics.
The following table describes the switch statistics displayed on the screen.

**Table 36. Switch statistics**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>This object indicates the ifIndex of the interface table entry associated with the processor of this switch.</td>
</tr>
<tr>
<td>Octets Received</td>
<td>The total number of octets of data received by the processor (excluding framing bits, but including FCS octets).</td>
</tr>
<tr>
<td>Packets Received Without Errors</td>
<td>The total number of packets (including broadcast packets and multicast packets) received by the processor.</td>
</tr>
<tr>
<td>Unicast Packets Received</td>
<td>The number of subnetwork-unicast packets delivered to a higher-layer protocol.</td>
</tr>
<tr>
<td>Multicast Packets Received</td>
<td>The total number of packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of packets received that were directed to the broadcast address. This does not include multicast packets.</td>
</tr>
</tbody>
</table>

Table 36. Switch statistics (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receive Packets Discarded</td>
<td>The number of inbound packets which were chosen to be discarded, even though no errors had been detected, in order to prevent their being delivered to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.</td>
</tr>
<tr>
<td>Octets Transmitted</td>
<td>The total number of octets transmitted out of the interface, including framing characters.</td>
</tr>
<tr>
<td>Packets Transmitted Without Errors</td>
<td>The total number of packets transmitted out of the interface.</td>
</tr>
<tr>
<td>Unicast Packets Transmitted</td>
<td>The total number of packets that higher level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Multicast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to a Multicast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Broadcast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to the Broadcast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Transmit Packets Discarded</td>
<td>The number of outbound packets which were chosen to be discarded, even though no errors had been detected, in order to prevent their being delivered to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.</td>
</tr>
<tr>
<td>Most Address Entries Ever Used</td>
<td>The highest number of Forwarding Database Address Table entries that have been learned by this switch since the most recent reboot.</td>
</tr>
<tr>
<td>Address Entries in Use</td>
<td>The number of learned and static entries in the Forwarding Database Address Table for this switch.</td>
</tr>
<tr>
<td>Maximum VLAN Entries</td>
<td>The maximum number of Virtual LANs (VLANs) allowed on this switch.</td>
</tr>
<tr>
<td>Most VLAN Entries Ever Used</td>
<td>The largest number of VLANs that have been active on this switch since the last reboot.</td>
</tr>
<tr>
<td>Static VLAN Entries</td>
<td>The number of presently active VLAN entries on this switch that have been created statically.</td>
</tr>
<tr>
<td>Dynamic VLAN Entries</td>
<td>The number of presently active VLAN entries on this switch.</td>
</tr>
<tr>
<td>VLAN Deletes</td>
<td>The number of VLANs on this switch that have been created and then deleted since the last reboot.</td>
</tr>
<tr>
<td>Time Since Counters Last Cleared</td>
<td>The elapsed time, in days, hours, minutes, and seconds, since the statistics for this switch were last cleared.</td>
</tr>
</tbody>
</table>

Use the buttons at the bottom of the screen to perform the following actions:

- Click **Clear** to clear all the statistics counters, resetting all switch summary and detailed statistics to default values. The discarded packets count cannot be cleared.
- Click **Refresh** to refresh the screen with the most current data from the switch.
Port Statistics

The Port Statistics screen displays a summary of per-port traffic statistics on the switch.

To access the port summary screen:

2. Select whether to display physical interfaces, link aggregation groups (LAGs), or both by clicking one of the following links above the table heading:
   - 1 (or the unit ID of the switch). Only physical interfaces are displayed. This is the default setting.
   - LAGS. Only link aggregation groups are displayed.
   - All. Both physical interfaces and link aggregation groups are displayed.

To locate an interface quickly, type the interface number (for example, 1/g5) in the Go To Interface field at the top or bottom of the table and click Go.

The following table describes the per-port statistics displayed on the screen.

Table 37. Port statistics

<table>
<thead>
<tr>

<tr>
<td>Packets Transmitted Without</td>
<td>The number of frames that have been transmitted by this port to its segment.</td>
</tr>
<tr>
<td>Errors</td>
<td></td>
</tr>
</tbody>
</table>
To reset the counters for all interfaces on the switch:
1. Select the check box in the heading of the table.
2. Click Clear.

To reset the counters for a specific interface:
1. Select the check box next to the interface for which you want to clear the counters.
   You can also type the interface number (for example, 1/g7) in the Go To Interface field at the top or bottom of the table and click Go.
2. Click Clear.

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>
Port Detailed Statistics

The Port Detailed Statistics screen displays a variety of per-port traffic statistics.

➢ To access the port detailed screen:

   The Port Detailed Statistics figure shows some, but not all, of the fields on the screen.

2. From the Interface list, select the interface with the statistics to view.

3. From the MST list, select the MST ID associated with the interface (if available).
The following table describes the detailed port information displayed on the screen.

### Table 38. Detailed interface statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ifIndex</td>
<td>This field indicates the ifIndex of the interface table entry associated with this port on an adapter.</td>
</tr>
</tbody>
</table>
| Port Type            | For most ports this field is blank. Otherwise the possible values are:  
|                      | • **Mirrored**. Indicates that the port has been configured as a monitoring port and is the source port in a port mirroring session. For additional information about port monitoring and probe ports, see *Mirroring* on page 268.  
|                      | • **Probe**. Indicates that the port has been configured as a monitoring port and is the destination port in a port mirroring session. For additional information about port monitoring and probe ports, see *Mirroring* on page 268.  
|                      | • **Port Channel**. Indicates that the port has been configured as a member of a port-channel, which is also known as a Link Aggregation Group (LAG). |
| Port Channel ID      | If the port is a member of a port channel, the port channel's interface ID and name are shown. Otherwise, Disable is shown.               |
| Port Role            | Each MST Bridge Port that is enabled is assigned a Port Role for each spanning tree. The port role will be one of the following values: Root Port, Designated Port, Alternate Port, Backup Port, Master Port, or Disabled Port. |
| STP Mode             | Displays the Spanning Tree Protocol (STP) Administrative Mode for the port or LAG. The possible values for this field are:  
|                      | • **Enable**. Enables the Spanning Tree Protocol for this port.  
|                      | • **Disable**. Disables the Spanning Tree Protocol for this port.                                                                             |
| STP State            | Displays the port's current state Spanning Tree state. This state controls what action a port takes on receipt of a frame. If the bridge detects a malfunctioning port it will place that port into the broken state. The other five states are defined in IEEE 802.1D:  
|                      | • Disabled  
|                      | • Blocking  
|                      | • Listening  
|                      | • Learning  
|                      | • Forwarding  
|                      | • Broken                                                                                                                                      |
| Admin Mode           | Displays the port control administration state:  
|                      | • **Enable**. The port can participate in the network (default).  
|                      | • **Disable**. The port is administratively down and does not participate in the network.                                                                 |
| Flow Control Mode    | Indicates whether flow control is enabled or disabled for the port. This field is not valid for LAG interfaces.

<td>Packets Received 1024-1518 Octets</td>
<td>The total number of packets (including bad packets) received that were between 1024 and 1518 octets in length inclusive (excluding framing bits but including FCS octets).</td>
</tr>
<tr>
<td>Packets Received &gt; 1518 Octets</td>
<td>The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets) and were otherwise well formed.</td>
</tr>
<tr>
<td>Total Packets Received Without Errors</td>
<td>The total number of packets received that were without errors.</td>
</tr>
<tr>
<td>Unicast Packets Received</td>
<td>The number of subnetwork-unicast packets delivered to a higher-layer protocol.</td>
</tr>
<tr>
<td>Multicast Packets Received</td>
<td>The total number of good packets received that were directed to a multicast address. This number does not include packets directed to the broadcast address.</td>
</tr>
<tr>
<td>Broadcast Packets Received</td>
<td>The total number of good packets received that were directed to the broadcast address. This does not include multicast packets.</td>
</tr>
<tr>
<td>Total Packets Received with MAC Errors</td>
<td>The total number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.</td>
</tr>
</tbody>
</table>
Table 38. Detailed interface statistics (Continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jabbers Received</td>
<td>The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non integral number of octets (Alignment Error). This definition of jabber is different than the definition in IEEE 802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition where any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</td>
</tr>
<tr>
<td>Fragments Received</td>
<td>The total number of packets received that were less than 64 octets in length with ERROR CRC (excluding framing bits but including FCS octets).</td>
</tr>
<tr>
<td>Undersize Received</td>
<td>The total number of packets received that were less than 64 octets in length with GOOD CRC (excluding framing bits but including FCS octets).</td>
</tr>
<tr>
<td>Alignment Errors</td>
<td>The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with a non integral number of octets.</td>
</tr>
<tr>
<td>Rx FCS Errors</td>
<td>The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had a bad Frame Check Sequence (FCS) with an integral number of octets.</td>
</tr>
<tr>
<td>Overruns</td>
<td>The total number of frames discarded as this port was overloaded with incoming packets, and could not keep up with the inflow.</td>
</tr>
<tr>
<td>Total Received Packets Not Forwarded</td>
<td>A count of valid frames received which were discarded (i.e., filtered) by the forwarding process.</td>
</tr>
<tr>
<td>Local Traffic Frames</td>
<td>The total number of frames dropped in the forwarding process because the destination address was located off of this port.</td>
</tr>
<tr>
<td>802.3x Pause Frames Received</td>
<td>A count of MAC Control frames received on this interface with an opcode indicating the PAUSE operation. This counter does not increment when the interface is operating in half-duplex mode.</td>

<tr>
<td>Multicast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to a Multicast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Broadcast Packets Transmitted</td>
<td>The total number of packets that higher-level protocols requested be transmitted to the Broadcast address, including those that were discarded or not sent.</td>
</tr>
<tr>
<td>Transmit Packets Discarded</td>
<td>The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. A possible reason for discarding a packet could be to free up buffer space.</td>
</tr>
<tr>
<td>Total Transmit Errors</td>
<td>The sum of Single, Multiple, and Excessive Collisions.</td>
</tr>
<tr>
<td>Total Transmit Packets Discarded</td>
<td>The sum of single collision frames discarded, multiple collision frames discarded, and excessive frames discarded.</td>
</tr>
<tr>
<td>Single Collision Frames</td>
<td>A count of the number of successfully transmitted frames on a particular interface for which transmission is inhibited by exactly one collision.</td>
</tr>
<tr>
<td>Multiple Collision Frames</td>
<td>A count of the number of successfully transmitted frames on a particular interface for which transmission is inhibited by more than one collision.</td>
</tr>
<tr>
<td>Excessive Collision Frames</td>
<td>A count of frames for which transmission on a particular interface fails due to excessive collisions.</td>
</tr>
</tbody>
</table>
Use the buttons at the bottom of the screen to perform the following actions:

- Click **Clear** to clear all the counters. This resets all statistics for this port to the default values.
- Click **Refresh** to refresh the data on the screen and display the most current statistics.

</table>
EAP Statistics

Use the EAP Statistics screen to display information about EAP packets received on a specific port.

➢ To display the EAP statistics screen:

2. Select whether to display physical interfaces, link aggregation groups (LAGs), or both by clicking one of the following links above the table heading:
   - 1 (or the unit ID of the switch). Only physical interfaces are displayed. This is the default setting.
   - All. Both physical interfaces and link aggregation groups are displayed.

To locate an interface quickly, type the interface number (for example, 1/g5) in the Go To Interface field at the top or bottom of the table and click Go.

The following table describes the EAP statistics displayed on the screen.

Table 39. EAP statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ports</td>
<td>The interface which is polled for statistics.</td>
</tr>
<tr>
<td>Frames Received</td>
<td>The number of valid EAPOL frames received on the port.</td>
</tr>
<tr>
<td>Frames Transmitted</td>
<td>The number of EAPOL frames transmitted through the port.</td>
</tr>
<tr>
<td>Start Frames Received</td>
<td>The number of EAPOL Start frames received on the port.</td>
</tr>
<tr>
<td>Logoff Frames Received</td>
<td>The number of EAPOL Log off frames that have been received on the port.</td>
</tr>
<tr>
<td>Last Frame Version</td>
<td>The protocol version number attached to the most recently received EAPOL frame.</td>
</tr>
<tr>
<td>Last Frame Source</td>
<td>The source MAC Address attached to the most recently received EAPOL frame.</td>
</tr>
<tr>
<td>Invalid Frames Received</td>
<td>The number of unrecognized EAPOL frames received on this port.</td>
</tr>
<tr>
<td>Length Error Frames Received</td>
<td>The number of EAPOL frames with an invalid Packet Body Length received on this port.</td>
</tr>
</tbody>
</table>
Use the buttons at the bottom of the screen to perform the following actions:

- To clear all the EAP counters for all ports on the switch, select the check box in the row heading and click **Clear**. The button resets all statistics for all ports to default values.
- To clear the counters for a specific port, select the check box associated with the port and click **Clear**.
- Click **Refresh** to refresh the data on the screen and display the most current statistics.

### Cable Test

Use the Cable Test screen to display information about the cables connected to switch ports.

**To display the cable test screen:**

1. Select **Monitoring > Ports > Cable Test**.

![Cable Test Screen](image)

2. Select whether to display physical interfaces, link aggregation groups (LAGs), or both by clicking one of the following links above the table heading:
   - **1** (or the unit ID of the switch). Only physical interfaces are displayed. This is the default setting.
• **All.** Both physical interfaces and link aggregation groups are displayed.

To locate an interface quickly, type the interface number (for example, 1/g5) in the Go To Interface field at the top or bottom of the table and click **Go**.

3. **Click Apply** to perform a cable test on the selected interface.

The cable test can take up to 2 seconds to complete. If the port has an active link then the link is not taken down and the cable status is always 'Normal'. The command returns a cable length estimate if this feature is supported by the PHY for the current link speed. Note that if the link is down and a cable is attached to a 10/100 Ethernet adapter then the cable status can be Open or Short because some Ethernet adapters leave unused wire pairs unterminated or grounded.

The following table describes the cable information displayed on the screen.

**Table 40. Cable information**

<td>The estimated distance in meters from the end of the cable to the failure</td>
</tr>
<tr>
<td></td>
<td>location. The failure location is displayed only if the cable status</td>
</tr>
<tr>
<td></td>
<td>is Open or Short.</td>
</tr>
</tbody>
</table>
**Logs**

The switch can generate messages in response to events, faults, or errors occurring on the platform as well as changes in configuration or other occurrences. These messages are stored locally and can be forwarded to one or more centralized points of collection for monitoring purposes or long-term archival storage. Local and remote configuration of the logging capability includes filtering of messages logged or forwarded based on severity and generating component.

The Logs menu contains links described in the following sections.

- **Memory Logs**
- **FLASH Log**
- **Server Log**
- **Trap Logs**
- **Event Logs**

**Memory Logs**

The Memory Log stores messages in memory based upon the settings for message component and severity. Use the Memory Log screen to set the administrative status and behavior of logs in the system buffer. These log messages are cleared when the switch reboots.

➢ **To configure the memory log settings:**

1. Select **Monitoring > Logs > Memory Log**.

![Memory Log Configuration](image)

2. Select the radio buttons in the Admin Status field to determine whether to log messages.
   - **Enable**. Enables system logging.
   - **Disable**. Prevents the system from logging messages.
3. From the Behavior menu, specify the behavior of the log when it is full.
   • **Wrap.** When the buffer is full, the oldest log messages are deleted as the system logs new messages.
   • **Stop on Full.** When the buffer is full, the system stops logging new messages and preserves all existing log messages.

4. If you change the buffered log settings, click **Apply** to apply the changes to the system and the changes will be saved.

   The Memory Log table displays on the Memory Log screen.

   The Total Number of messages displays the number of messages the system has logged in memory. Only the 64 most recent entries are displayed on the screen.

   The rest of the screen displays the Memory Log messages. The format of the log message is the same for messages that are displayed for the message log, persistent log, or console log. Messages logged to a collector or relay via syslog have the same format as well.

   The following example shows the standard format for a log message:

   ```
   <14> Mar 24 05:34:05 10.131.12.183-1 UNKN[2176789276]:
       main_login.c(179) 3855 %% HTTP Session 19 initiated for user admin
       connected from 10.27.64.122
   
   The number contained in the angle brackets represents the message priority, which is derived from the following values:
   
   Priority = (facility value × 8) + severity level.
   
   The facility value is usually one, which means it is a user-level message. Therefore, to determine the severity level of the message, subtract eight from the number in the angle brackets. The example log message has a severity level of 6 (informational). For more information about the severity of a log message, see Server Log on page 263.
   
   The message was generated on March 24 at 5:34:05 a.m by the switch with an IP address of 10.131.12.183. The component that generated the message is unknown, but it came from line 179 of the main_login.c file. This is the 3,855th message logged since the switch was last booted. The message indicates that the administrator logged onto the HTTP management interface from a host with an IP address of 10.27.64.122.
   
   Use the buttons at the bottom of the screen to perform the following actions:
   
   • Click **Clear** to clear the messages out of the buffered log in the memory.
   • Click **Refresh** to update the screen with the latest messages in the log.
FLASH Log

The FLASH log is a log that is stored in persistent storage, which means that the log messages are retained across a switch reboot.

Either the system startup log or the system operation log stores a message received by the log subsystem that meets the storage criteria, but not both. On system startup, if the startup log is configured, it stores messages up to its limit. The operation log, if configured, then begins to store the messages.

Use the FLASH Log screen to enable or disable persistent logging and to set the severity filter.

➢ To configure the FLASH log settings:

1. Select Monitoring > Logs > FLASH Log.

2. Select the radio buttons in the Admin Status field to determine whether to log messages to persistent storage.
   - Enable. Enables persistent logging.
   - Disable. Prevents the system from logging messages in persistent storage.

3. From the Severity Filter field, specify the type of log messages to record.

   A log records messages equal to or above a configured severity threshold. For example, if you select Error, the logged messages include Error, Critical, Alert, and Emergency. The default severity level is Alert (1). The severity can be one of the following levels:
   - Emergency (0). The highest warning level. If the device is down or not functioning properly, an emergency log is saved to the device.
   - Alert (1). The second-highest warning level. An alert log is saved if there is a serious device malfunction, such as all device features being down. Action must be taken immediately.
   - Critical (2). The third-highest warning level. A critical log is saved if a critical device malfunction occurs, for example, two device ports are not functioning, while the rest of the device ports remain functional.
   - Error (3). A device error has occurred, such as if a port is offline.
   - Warning (4). The lowest level of a device warning.
• **Notice** (5). Normal but significant conditions. Provides the network administrators with device information.

• **Informational** (6). Provides device information.

• **Debug** (7). Provides detailed information about the log. Debugging should only be entered by qualified support personnel.

4. If you make any changes to the screen, click **Apply** to apply the change to the system.

The rest of the screen displays the number of persistent messages the system has logged and the persistent log messages.

Use the buttons at the bottom of the screen to perform the following actions:

• Click **Clear** to clear the messages out of the buffered log.

• Click **Refresh** to refresh the screen with the most current data from the switch.

## Server Log

Use the Server Log screen to allow the switch to send log messages to the remote logging hosts configured on the system.

➢ **To configure local log server settings:**

1. Select **Monitoring > Logs > Server Log** link.

2. Select the radio buttons in the Admin Status field to determine whether to send log messages to the remote syslog hosts configured on the switch.

   • **Enable**. Messages will be sent to all configured hosts (syslog collectors or relays) using the values configured for each host.

   • **Disable**. Stops logging to all syslog hosts. Disable means no messages will be sent to any collector/relay.

3. In the Local UDP Port field, specify the port on the switch from which syslog messages are sent.

4. Click **Apply** to save the settings.
The Server Log Configuration area displays the following information:

- The Messages Received field shows the number of messages received by the log process. This includes messages that are dropped or ignored.
- The Messages Relayed field shows the number of messages forwarded by the syslog function to a syslog host. Messages forwarded to multiple hosts are counted once for each host.
- The Messages Ignored field shows the number of messages that were ignored.

To add a remote syslog host (log server):

1. Specify the following settings in the following list.
   - **IP Address Type**. Specify the IP Address Type of Host. It can be one of the following:
     - IPv4
     - IPv6
     - DNS
   - **Host Address**. Specify the hostname of the host configured for syslog.
   - **Port**. Specify the port on the host to which syslog messages are sent. The default port is 514.
   - **Severity Filter**. Use the menu to select the severity of the logs to send to the logging host. Logs with the selected severity level and all logs of greater severity are sent to the host. For example, if you select Error, the logged messages include Error, Critical, Alert, and Emergency. The default severity level is Alert (1). The severity can be one of the following levels:
     - **Emergency** (0). The highest warning level. If the device is down or not functioning properly, an emergency log is saved to the device.
     - **Alert** (1). The second highest warning level. An alert log is saved if there is a serious device malfunction, such as all device features being down.
     - **Critical** (2). The third highest warning level. A critical log is saved if a critical device malfunction occurs, for example, two device ports are not functioning, while the rest of the device ports remain functional.
     - **Error** (3). A device error has occurred, such as if a port is offline.
     - **Warning** (4). The lowest level of a device warning.
     - **Notice** (5). Provides the network administrators with device information.
     - **Informational** (6). Provides device information.
     - **Debug** (7). Provides detailed information about the log. Debugging should only be entered by qualified support personnel.

2. Click **Add**.

The Status field in the Server Configuration table shows whether the remote logging host is currently active.
To delete an existing host:
1. Select the check box next to the host to remove.
2. Click Delete.

To modify the settings for an existing host:
1. Select the check box next to the host to modify.
2. Change the desired information.
   Click Apply.

Trap Logs

Use the Trap Logs screen to view information about the SNMP traps generated on the switch.

To view trap log information:
Select Monitoring > Logs > Trap Logs. The Trap Logs screen displays.

![Trap Logs Screen]

Figure 10. Trap log screen
The following table describes the Trap Log information displayed on the screen.

Table 41. Trap log statistics

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Traps Since Last Reset</td>
<td>The number of traps that have occurred since the switch last reboot.</td>
</tr>
<tr>
<td>Trap Log Capacity</td>
<td>The maximum number of traps stored in the log. If the number of traps exceeds the capacity, the entries will overwrite the oldest entries.</td>
</tr>
<tr>
<td>Number of Traps Since Log Last Viewed</td>
<td>The number of traps that have occurred since the traps were last displayed. Displaying the traps by any method (such as terminal interface display, web display, or upload file from switch) will cause this counter to be cleared to 0.</td>
</tr>
</tbody>
</table>

The screen also displays information about the traps that were sent.

Table 42. Trap log information

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log</td>
<td>The sequence number of this trap.</td>
</tr>
<tr>
<td>System Up Time</td>
<td>The time at which this trap occurred, expressed in days, hours, minutes, and seconds since the last reboot of the switch.</td>
</tr>
<tr>
<td>Trap</td>
<td>Information identifying the trap.</td>
</tr>
</tbody>
</table>
Event Logs

Use the Event Log screen to display the event log, which is used to hold error messages for catastrophic events. After the event is logged and the updated log is saved in flash memory, the switch will be reset. The log can hold at least 2,000 entries and is erased when an attempt is made to add an entry after it is full. The event log is preserved across system resets.

To view the event logs:

Select Monitoring > Logs > Event Logs. The Event Logs screen displays

![Event Logs screen](image)

The following table describes the Event Log information displayed on the screen.

### Table 43. Event Log information

<table>
<thead>
<tr>
<th>Field</th>

<td>The time the event occurred, measured from the previous reset.</td>
</tr>
</tbody>
</table>
Mirroring

The Port Mirroring screen allows you to view and configure port mirroring on the system. Port mirroring selects the network traffic for analysis by a network analyzer. This is done for specific ports of the switch. As such, many switch ports are configured as source ports and one switch port is configured as a destination port. You have the ability to configure how traffic is mirrored on a source port. Packets that are received on the source port, that are transmitted on a port, or are both received and transmitted, can be mirrored to the destination port.

The packet that is copied to the destination port is in the same format as the original packet on the wire. This means that if the mirror is copying a received packet, the copied packet is VLAN tagged or untagged as it was received on the source port. If the mirror is copying a transmitted packet, the copied packet is VLAN tagged or untagged as it is being transmitted on the source port.

Use the Port Mirroring screen to define port mirroring sessions.

1. Select Monitoring > Mirroring > Port Mirroring.

2. In the Destination Interface list, select the port to which port traffic is be copied.
3. Select the mode for port mirroring on the selected port from the Session Mode:
   • **Enable**. Multiple Port Mirroring is active on the selected port.
   • **Disable**. Port mirroring is not active on the selected port, but the mirroring information is retained.

4. Select the source port(s).
   You can configure multiple ports and LAGs as source ports.
   a. Display the port(s) or LAG(s) to configure as source ports.
      To display physical interfaces, LAGs, or both, click one of the following links above the table heading:
      • **1** (or the unit ID of the switch). Only physical interfaces are displayed. This is the default setting.
      • **LAGS**. Only link aggregation groups are displayed.
      • **All**. Both physical interfaces and link aggregation groups are displayed.
      To locate an interface quickly, type the interface number (for example, 1/g5) in the Go To Interface field at the top or bottom of the table and click Go.
   b. Select the check box next to each physical port or LAG to configure as the mirrored source.

5. From the Direction list, specify the direction of the Traffic to be mirrored from the configured mirrored port(s).
   The default value is Tx and Rx.
   • **Tx and Rx**. Enable both transmitting and receiving on the selected ports.
   • **Tx only**. Enable only transmitting on the selected ports.
   • **Rx only**. Enable only receiving on the selected ports.

6. Click **Apply** to apply the settings to the system.
   If the port is configured as a source port, the Status value is Mirrored.

➢ **To delete a mirrored port:**
   1. Select the check box next to the mirrored port.
   2. Click **Delete**.
Use the features available from the Maintenance tab to help you manage the switch. The Maintenance tab contains links described in the following sections.

- Reset
- Upload
- Download
- File Management

## Reset

The Reset menu contains links described in the following sections.

- Device Reboot
- Factory Default

## Device Reboot

Use the Device Reboot screen to reboot the switch.

> **To reboot the switch:**

1. Select Maintenance > Reset > Device Reboot.

2. Select the Unit ID of the stack member to reboot an individual switch or select All to reboot all units in the stack.

3. Select the check box.

4. Click Apply. The switch resets immediately.
The management interface is not available until the switch completes the boot cycle. After the switch resets, the login screen displays.

**Factory Default**

Use the Factory Default screen to reset the system configuration to the factory default values.

---

**Note:** If you reset the switch to the default configuration, the IP address is reset to 192.168.0.239, and the DHCP client is enabled. If you lose network connectivity after you reset the switch to the factory defaults, see *Connect the Switch to the Network* on page 10.

---

To reset the switch to the factory default settings:

1. Select **Maintenance > Reset > Factory Default**.

2. Select the check box on the screen.

3. Click **Apply**. The switch resets immediately.

**Upload**

The switch supports system file uploads from the switch to a remote system by using either TFTP or HTTP.

The Upload menu contains links described in the following sections.

- **TFTP File Upload**
- **HTTP File Upload**
TFTP File Upload

Use the TFTP File Upload screen to upload configuration (ASCII), log (ASCII), and image (binary) files from the switch to a TFTP server on the network.

To upload a file from the switch to the TFTP server:

2. Use the File Type menu to specify the type of file you want to upload:
   - **Archive**: Retrieve the image from the operational flash.
   - **Text Configuration**: Retrieve the stored text configuration.
   - **Error Log**: Retrieve the system error (persistent) log, sometimes referred to as the event log.
   - **Trap Log**: Retrieve the system trap records.
   - **Buffered Log**: Retrieve the system buffered (in-memory) log. The factory default is Archive.

3. Select the image from the **Image Name** field.

4. From the Server Address Type field, specify the format to use for the address you type in the TFTP Server Address field:
   - **IPv4**: Indicates the TFTP server address is an IP address in dotted-decimal format.
   - **DNS**: Indicates the TFTP server address is a host name.

5. In the Server Address field, specify the IP address or host name of the TFTP server.
   The address you type must be in the format indicated by the TFTP Server Address Type.

6. In the Transfer File Path field, specify the path on the TFTP server where you want to put the file.
   You can enter up to 32 characters. Include the backslash at the end of the path. A path name with a space is not accepted. Leave this field blank to save the file to the root TFTP directory.

7. In the Transfer File Name field, specify a destination file name for the file to upload.
   You can enter up to 32 characters. The transfer fails if you do not specify a file name. For an Archive transfer, use an .stk file extension.
8. Select the Start File Transfer check box to initiate the file upload.
9. Click Apply to begin the file transfer.

---

**Note:** The file transfer will not begin until you click Apply.

The last row of the table displays information about the progress of the file transfer. The screen refreshes automatically until the file transfer completes or fails.

**HTTP File Upload**

Use the HTTP File Upload screen to upload files of various types from the switch to the management system by using an HTTP session (for example, via your Web browser).

**To upload a file from the switch to another system by using HTTP:**

1. Select **Maintenance > Upload > HTTP File Upload.**

2. From the File Type menu, specify what type of file you want to upload from the switch:
   - **Archive.** The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy; while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the non-active image. This is a safety feature for faults occurring during the boot upgrade process.
   - **Text Configuration.** A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed without having to translate the contents for the switch to understand. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name, serial number, IP address), and download it to that device.

3. If you are uploading an GS752TXS/GS728TXS image (Archive), select the image on the switch to upload to the management system.
   
   This field is visible only when Archive is selected as the File Type.

4. Click **Apply.**

A window displays to allow you to open the text file on the management system or to save the image or text file to the management system.
Download

The switch supports system file downloads from a remote system to the switch by using either TFTP or HTTP.

The Download menu contains links described in the following sections.

• TFTP File Download
• HTTP File Download

TFTP File Download

Use the Download File to switch screen to download device software, the image file, the configuration files and SSL files from a TFTP server to the switch.

Before you download a file to the switch, the following conditions must be true:

• The file to download from the TFTP server is on the server in the appropriate directory.
• The file is in the correct format.
• The switch has a path to the TFTP server.

You can also download files via HTTP. See HTTP File Download on page 277 for additional information.

➢ To download a file to the switch from a TFTP server:

1. Select Maintenance > Download > TFTP File Download.

2. From the File Type menu, specify what type of file you want to download to the switch:

• Archive. The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy; while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the non-active image. This is a safety feature for faults occurring during the boot upgrade process.
• **Text Configuration.** A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed without having to translate the contents for the switch to understand. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name, serial number, IP address), and download it to that device.

• **SSL Trusted Root Certificate PEM File.** SSL Trusted Root Certificate File (PEM Encoded).

• **SSL Server Certificate PEM File.** SSL Server Certificate File (PEM Encoded).

• **SSL DH Weak Encryption Parameter PEM File.** SSL Diffie-Hellman Weak Encryption Parameter File (PEM Encoded).

• **SSL DH Strong Encryption Parameter PEM File.** SSL Diffie-Hellman Strong Encryption Parameter File (PEM Encoded).

3. If you are downloading an GS752TXS/GS728TXS image (Archive), select the image on the switch to overwrite from the Image Name field. This field is visible only when Archive is selected as the File Type.

   **Note:** It is recommended that you do not overwrite the active image. The system will display a warning that you are trying to overwrite the active image.

4. From the Server Address Type field, specify the format for the address you type in the TFTP Server Address field
   • **IPv4.** Indicates the TFTP server address is an IP address in dotted-decimal format.
   • **DNS.** Indicates the TFTP server address is a hostname.

5. In the TFTP Server IP field, specify the IP address or hostname of the TFTP server. The address you type must be in the format indicated by the TFTP Server Address Type.

6. In the Transfer File Path field, specify the path on the TFTP server where the file is located. Enter up to 160 characters. Include the backslash at the end of the path. A path name with a space is not accepted. Leave this field blank to save the file to the root TFTP directory.

7. In the Remote File Name field, specify the name of the file to download from the TFTP server. You can enter up to 32 characters. A file name with a space is not accepted.

8. Select the **Start File Transfer** check box to initiate the file upload.

   **Note:** The file transfer will not begin until you click **Apply.**

9. Click **Apply** to begin the file transfer.
The last row of the table displays information about the progress of the file transfer. The screen refreshes automatically until the file transfer completes or fails.

To activate a software image that you download to the switch, see *File Management* on page 278.

**HTTP File Download**

Use the HTTP File Download screen to download files of various types to the switch using an HTTP session (for example, via your Web browser).

➢ **To download a file to the switch by using HTTP:**

1. Select **Maintenance > Download > HTTP File Download.**

2. From the File Type menu, specify what type of file you want to download to the switch:
   - **Archive.** The archive is the system software image, which is saved in one of two flash sectors called images (image1 and image2). The active image stores the active copy; while the other image stores a second copy. The device boots and runs from the active image. If the active image is corrupted, the system automatically boots from the non-active image. This is a safety feature for faults occurring during the boot upgrade process.
   - **Text Configuration.** A text-based configuration file enables you to edit a configured text file (startup-config) offline as needed without having to translate the contents for the switch to understand. The most common usage of text-based configuration is to upload a working configuration from a device, edit it offline to personalize it for another similar device (for example, change the device name, serial number, IP address), and download it to that device.

3. If you are downloading an GS752TXS/GS728TXS image (Archive), select the image on the switch to overwrite from the Image Name field.

   This field is only visible when Archive is selected as the File Type.
Note: It is recommended that you do not overwrite the active image. The system will display a warning that you are trying to overwrite the active image.

4. Next to the Select File field, click Browse to locate the file you want to download.
5. Click the Apply button to initiate the file download.

Note: After a file transfer is started, wait until the screen refreshes. When the screen refreshes, the Select File option will be blanked out. This indicates that the file transfer is done.

File Management

The system maintains two versions of the GS752TXS/GS728TXS software in permanent storage. One image is the active image, and the second image is the backup image. The active image is loaded during subsequent switch restarts. This feature reduces switch down time when upgrading or downgrading the GS752TXS/GS728TXS software.

The File Management menu contains links described in the following sections.

- Copy
- Dual Image Configuration
- Dual Image Status

Copy

Use the Copy screen to copy an image from one location (primary or backup) to another.

➢ To copy an image:

1. Select Maintenance > File Management > Copy.

2. Select image1 or image2 as the source image.

From the Stack Member list, select ID of the destination stack member unit to which you are going to copy from stack manager.
3. Select image1 or image2 as the destination image.
4. Click **Apply**.

**Dual Image Configuration**

The system running a legacy software version will ignore (not load) a configuration file created by the newer software version. When a configuration file created by the newer software version is discovered by the system running an older version of the software, the system will display an appropriate warning to the user.

Use the Dual Image Configuration screen to set the boot image, configure an image description, or delete an image.

> **To configure dual image settings:**

1. Select **Maintenance > File Management > Dual Image > Dual Image Configuration**.

   ![Dual Image Configuration Screen](image)

2. Select the unit number of the stack member to configure and individual switch or select **All** to configure all units in the stack with the same dual image settings.
3. In the **Image Name** field, select one of the images.
   
   The **Current-active** field displays the name of the active image.
4. In the **Image Description** field, type a description.
5. To set the selected image as the active image, select the **Activate Image** check box.

---

**Note:** After activating an image, you must perform a system reset of the switch to run the new code.

6. To remove the selected image from permanent storage on the switch, select the **Delete Image** check box.
   
   You cannot delete the active image.
7. Click **Apply**.
Dual Image Status

The Dual Image Status screen shows the following:

- **Image1 Ver.** The version of the image1 code file.
- **Image2 Ver.** The version of the image2 code file.
- **Current-active.** The currently active image on this unit.
- **Next-active.** The image to be used on the next restart of this unit.
- **Image1 Description.** The description associated with the image1 code file.
- **Image2 Description.** The description associated with the image2 code file.

![Dual Image Status](image)

Figure 12. Dual image status
The NETGEAR Smart Control Center (SCC) is a Windows based application. Its main function is to discover NETGEAR Smart switches in your network and connect them to your network. For information about device discovery and network connectivity, see Chapter 1, Getting Started.

In addition to device discovery, the Smart Control Center includes network configuration utilities and several maintenance features. This chapter describes the following Smart Control Center utilities:

- **Network Utilities**
- **Upload and Download the Configuration**
- **Upgrade the Firmware**
- **View and Manage Tasks**

### Network Utilities

The Network tab includes the following network utility buttons:

- **DHCP Refresh.** Forces the switch to release the current bindings and request new address information from the DHCP server.
- **Reboot Device.** Reboots the selected device.
- **Web Browser Access.** Launches a web browser and connects to the management interface for the selected device.
- **Configure Device.** Allows you to modify network information for the switch, including the IP address, DHCP client mode, system name, and location. For more information about this feature, see *Configure the Device* on page 283.
• **Change Password.** Allows you to set a new password for the device. For more information about this feature, see *Change the Switch Password* on page 284.
Configure the Device

Use the Configure Device button to define basic switch configuration information.

➢ To modify switch information:
  1. Select the switch.

3. To assign or update a static IP address, default gateway, or subnet mask, disable the DHCP client and enter the new information.
   You can also specify a system name and location for the switch.

4. Type the password in the Current Password field.
   You cannot apply the changes without a valid switch password. The default password for the switch is **password**.

5. Click Apply.
   The switch is updated with the changes to the network information.
Change the Switch Password

Use the Change Password button to change the administrative password you use to log in to the switch management interface.

➢ To change the switch password:

1. Select the switch.
2. Click Change Password.
   Additional fields appear on the screen.

3. Type the switch password in the Current Password field.
   The default password for the switch is password.

4. Type the new password in the New Password and Confirm Password fields.
   The password can contain up to 20 ASCII characters.

5. Click Apply.
   The switch is updated with the new password.
Manage the Switch Configuration and Firmware

The Maintenance tab includes links to perform the following tasks:

- **Upload and download the configuration.** Upload the configuration file from the switch to an administrative system or other network location or download the configuration file from a remote device to the switch.
- **Firmware upgrade.** Load a new firmware image on the switch.

Upload and Download the Configuration

When you make changes to the switch, the configuration information is stored in a file on the switch. You can back up the configuration by uploading the configuration file from the switch to an administrative system. You can download a saved configuration file from the administrative system to the switch. The configuration file you download to the switch overwrites the running configuration on the switch.

Configuration upload and download is useful if you want to save a copy of the current switch configuration (Upload Configuration) before you make changes. If you do not like the changes, you can use the Download Configuration option to restore the switch to the settings in the saved configuration file.

➢ **To save a copy of the current switch configuration on your administrative system:**

1. Click the Maintenance tab and select the device with the configuration to save.
2. Click **Upload Configuration.**
   The Browse for Folder window displays
3. Navigate to and select the folder where you want to store the configuration file.
4. Click OK.
5. Enter the switch password and click Apply.

The file is uploaded to the administrative computer as a *.cfg file. You can open it and view the contents with a text editor.

➢ To restore the configuration to a previously saved version:
1. Click the Maintenance tab and select the device with the configuration to restore.
2. Click Download Configuration.

The Select a Configuration window displays.
3. Navigate to and select the configuration file to download to the switch.
4. Click Open.
5. Download the file to the switch immediately, or schedule a different date and time to download the configuration file.
   - Immediately. Select the Run Now check box.
   - Later. Clear the Run Now check box and enter a date and time to complete the download.
6. Enter the switch password in the Current Password field.
7. Click Apply.

Note: Click the Tasks tab to view status information about the configuration download. The Task Management information shows whether the download was completed successfully or when a delayed download is scheduled.
Upgrade the Firmware

The application software for the GS752TXS and GS728TXS Smart Switches is upgradeable, enabling your switch to take advantage of improvements and additional features as they become available. Before you begin, download the firmware file from the NETGEAR Support web site for your switch to a TFTP server on your network.

This procedure uses the TFTP protocol to implement the transfer from computer to switch.

---

**Note:** You can also upgrade the firmware using the TFTP Download and HTTP Download features mentioned in this book. See *HTTP File Upload* on page 274.

---

➢ To upgrade your firmware:

1. Click the Maintenance tab.
2. Click the **Firmware** link directly below the Maintenance tab.
3. Select the switch to upgrade and click **Download Firmware**.
   
   A window opens and allows you to browse to and select the firmware image to download.
4. Navigate to and select the firmware image on the TFTP server.
5. Click **Open**.

   Additional fields display on the screen and allow you to choose whether to download the image to the primary or secondary storage and when to download the image.
6. Download the firmware to primary or secondary storage.
   • Download the firmware as to primary storage. By default, the firmware is downloaded to primary storage and will become the active image after the download completes and the switch reboots.
   • Download the firmware to secondary storage. Select the Secondary Storage option to save the firmware as a backup image on the switch. To prevent the switch from using the downloaded firmware as the active image, make sure the Run this FW after download check box is clear.

   **Note:** NETGEAR recommends that you download the same image as the primary and secondary image for redundancy.

7. Download the firmware to the switch immediately, or schedule a different date and time to download the firmware.
   • Immediately. Select the Run Now check box.
   • Later. Clear the Run Now check box and enter a date and time to complete the download.

8. Enter the switch password in the Current Password field.
9. Click **Apply**.

**WARNING:**

It is important that you do not power off the administrative system or the switch while the firmware upgrade is in progress.

If the download and upgrade is immediate, the upgrade process continues. When the process is complete, the switch automatically reboots.

**Note:** Click the Tasks tab to view status information about the firmware upgrade. The Task Management information shows information about the file transfer process. After the firmware upgrade is complete and the switch reboots, an entry in the Task table indicates that the upgrade was successful. If the download is scheduled for a later time or date, an entry shows the scheduled task.
View and Manage Tasks

From the Tasks tab, you can view information about configuration downloads and firmware upgrades that have already occurred, are in progress, or are scheduled to take place at a later time. You can also delete or reschedule selected tasks. Figure 13 shows the Tasks screen.

![Tasks Screen](image-url)

Figure 13. Tasks screen

The following list describes the command buttons that are specific to the Tasks screen:

- **Delete Task**: Remove a completed or schedule task from the list.
- **Reschedule**: Change the scheduled date and time for a pending firmware upgrade.
- **Select Range**: Select all tasks that occurred or are scheduled to occur within a certain period of time.
This appendix covers the following topics:

- Troubleshooting Configuration Menu
- Troubleshooting Chart

## Troubleshooting Configuration Menu

The Maintenance main navigation tab gives access to the Troubleshooting configuration menu. This menu lets you perform basic troubleshooting functions such as pinging an IPv4 or IPv6 address to check if the switch can communicate with a particular network host and tracing an IPv4 route to determine the packet’s path to a remote destination.

The Troubleshooting configuration menu has the links that are described in the following sections:

- Ping
- Ping IPv6
- TraceRoute

### Ping

Use the Ping screen to tell the switch to send a Ping request to a specified IP address. You can use this feature to check whether the switch can communicate with a particular network host.

➢ To send a ping to an IPv4 address:

1. Select Maintenance > Troubleshooting > Ping.
2. In the IP Address/Host Name field, specify the IP address or the host name of the station you want the switch to ping. The initial value is blank. This information is not retained across a power cycle.

3. Configure the following settings:
   - In the Count field, specify the number of pings to send. The valid range is 1–15.
   - In the Interval (secs) field, specify the number of seconds between pings sent. The valid range is 1–60.
   - In the Size field, specify the size of the ping (ICMP) packet to send. The valid range is 0–65507.
   - The Ping field displays the result after the switch sends a Ping request to the specified address.

4. Click **Apply** to initiate the ping.
   
The switch sends the number of pings specified in the Count field, and the results are displayed below the configurable data in the Ping area:
   - If successful, you will see “Reply From IP/Host: icmp_seq = 0. time = xx usec. Tx = x, Rx = x Min/Max/Avg RTT = x/x/x msec.”
   - If a reply to the ping is not received, you will see “Reply From IP/Host: Destination Unreachable. Tx = x, Rx = 0 Min/Max/Avg RTT = 0/0/0 msec.”
Ping IPv6

Use the Ping IPv6 screen to send a Ping request to a specified host name or IPv6 address. You can use this to check whether the switch can communicate with a particular IPv6 station. When you click the Apply button, the switch will send three pings and the results will be displayed below the configurable data.

➢ To send a ping to an IPv6 address:

2. In the Ping field, select either Global or Link Global to select either the global IPv6 Address/Host Name or Link Local Address to ping.

3. Configure the following settings:
   - In the IPv6 Address/Host Name field, enter the IPv6 address or Host name of the station you want the switch to ping. The initial value is blank. The IPv6 Address or Hostname you enter is not retained across a power cycle.
   - In the Datagram Size. Enter the datagram size. The valid range is 48–2048.
   - The Result field displays the result after the switch sends a Ping IPv6 request to the specified IPv6 address.

4. Click Apply to send the ping.

The switch sends the number of pings specified in the Count field, and the results are displayed below the configurable data in the Result area:
   - If successful, the output will be “Send count=3, Receive count = n from (IPv6 Address).Average round trip time = n ms”.
   - If a reply to the ping is not received, the following displays: “Reply From IP/Host: Destination Unreachable. Tx = x, Rx = 0 Min/Max/Avg RTT = 0/0/0 msec”.

---

293
TraceRoute

Use the traceroute utility to discover the paths that a packet takes to a remote destination.

➢ To trace a route to an IPv4 address or host:

1. Select **Maintenance > Troubleshooting > TraceRoute**.

2. In the Hostname/IP Address field, specify the IP address or the hostname of the station you want the switch to ping.
   The initial value is blank. This information is not retained across a power cycle.

3. Configure the following settings:
   • **Probes Per Hop**. Specify the number of times each hop should be probed. The valid range is 1–10.
   • **MaxTTL**. Specify the maximum time-to-live for a packet in number of hops. The valid range is 1–255.
   • **InitTTL**. Specify the initial time-to-live for a packet in number of hops. The valid range is 1–255.
   • **MaxFail**. Specify the maximum number of failures allowed in the session. The valid range is 0–255.
   • **Interval**. Specify the time between probes in seconds. The valid range is 1–60.
   • **Port**. Specify the UDP destination port in probe packets. The valid range is 1–65535.
   • **Size**. Specify the size of probe packets. The valid range is 0–65507.

4. Click **Apply** to initiate the traceroute.
   The results are displayed in the TraceRoute area.
# Troubleshooting Chart

The following table lists symptoms, causes, and solutions of possible problems.

**Table 44. Troubleshooting chart**

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power LED is off. No power is received.</td>
<td>No power is received.</td>
<td>Check the power cord connections for the switch at the switch and the connected AC power source.</td>
</tr>
<tr>
<td>Link/ACT LED is off when a cable connects the port to a valid device.</td>
<td>Port connection is not working.</td>
<td>• Check the crimp on the connectors, and make sure that the plug is correctly inserted and locked into the port at both the switch and the connecting device. • Ensure that all cables are used correctly and comply with the Ethernet specifications. • Check for a defective adapter card, cable, or port by testing them in an alternate environment where all products are functioning.</td>
</tr>
<tr>
<td>File transfer is slow, or performance degradation is a problem.</td>
<td>Half- or full-duplex setting on the switch and the connected device are not the same.</td>
<td>Make sure that the attached device is configured to autonegotiate.</td>
</tr>
<tr>
<td>A segment or device is not recognized as part of the network.</td>
<td>One or more devices are not connected correctly, or cabling does not meet Ethernet guidelines.</td>
<td>Verify that the cabling is correct. Ensure that all connectors are securely positioned in the required ports. Equipment could have been accidentally disconnected.</td>
</tr>
<tr>
<td>Link/ACT LED is flashing continuously on all connected ports, and the network is disabled.</td>
<td>A network loop (redundant path) has been created.</td>
<td>Break the loop by ensuring that there is only one path from any networked device to any other networked device.</td>
</tr>
</tbody>
</table>
Virtual Local Area Networks (VLANs)

A local area network (LAN) can generally be defined as a broadcast domain. Hubs, bridges, or switches in the same physical segment or segments connect all end node devices. End nodes can communicate with each other without the need for a router. Routers connect LANs together, routing the traffic to the appropriate port.

A virtual LAN (VLAN) is a local area network with a definition that maps workstations on some basis other than geographic location (for example, by department, type of user, or primary application). To enable traffic to flow between VLANs, traffic must go through a router, just as if the VLANs were on two separate LANs.

A VLAN is a group of PCs, servers, and other network resources that behave as if they were connected to a single network segment—even though they might not be. For example, all marketing personnel might be spread throughout a building. Yet if they are all assigned to a single VLAN, they can share resources and bandwidth as if they were connected to the same segment. The resources of other departments can be invisible to the marketing VLAN members, accessible to all, or accessible only to specified individuals, depending on how the IT manager has set up the VLANs.

VLANs have a number of advantages:

- It is easy to do network segmentation. Users that communicate most frequently with each other can be grouped into common VLANs, regardless of physical location. Each group’s traffic is contained largely within the VLAN, reducing extraneous traffic and improving the efficiency of the whole network.
• They are easy to manage. The addition of nodes, as well as moves and other changes, can be dealt with quickly and conveniently from a management interface rather than from the wiring closet.

• They provide increased performance. VLANs free up bandwidth by limiting node-to-node and broadcast traffic throughout the network.

• They ensure enhanced network security. VLANs create virtual boundaries that can be crossed only through a router. So standard, router-based security measures can be used to restrict access to each VLAN.

Packets received by the switch are treated in the following way:

• When an untagged packet enters a port, it is automatically tagged with the port’s default VLAN ID tag number. Each port has a default VLAN ID setting that is user configurable (the default setting is 1). The default VLAN ID setting for each port can be changed in the Port PVID Configuration screen. See Port VLAN ID Configuration on page 106.

• When a tagged packet enters a port, the tag for that packet is unaffected by the default VLAN ID setting. The packet proceeds to the VLAN specified by its VLAN ID tag number.

• If the port through which the packet entered does not have membership with the VLAN specified by the VLAN ID tag, the packet is dropped.

• If the port is a member of the VLAN specified by the packet’s VLAN ID, the packet can be sent to other ports with the same VLAN ID.

• Packets leaving the switch are either tagged or untagged, depending on the setting for that port’s VLAN membership properties. A U for a given port means that packets leaving the switch from that port are untagged. Inversely, a T for a given port means that packets leaving the switch from that port are tagged with the VLAN ID that is associated with the port.

The example given in this section comprises numerous steps to illustrate a wide range of configurations to help provide an understanding of tagged VLANs.

Sample VLAN Configuration

This example demonstrates several scenarios of VLAN use and describes how the switch handles tagged and untagged traffic.

In this example, you create two new VLANs, change the port membership for default VLAN 1, and assign port members to the two new VLANs:

1. In the Basic VLAN Configuration screen (see Basic VLAN Configuration on page 103), create the following VLANs:
   • A VLAN with VLAN ID 10.
   • A VLAN with VLAN ID 20.

2. In the VLAN Membership screen (see VLAN Membership Configuration on page 104) specify the VLAN membership as follows:
   • For the default VLAN with VLAN ID 1, specify the following members: port 7 (U) and port 8 (U).
For the VLAN with VLAN ID 10, specify the following members: port 1 (U), port 2 (U), and port 3 (T).

For the VLAN with VLAN ID 20, specify the following members: port 4 (U), port 5 (T), and port 6 (U).

3. In the Port PVID Configuration screen (see Port VLAN ID Configuration on page 106), specify the PVID for ports g1 and g4 so that packets entering these ports are tagged with the port VLAN ID:
   • Port g1: PVID 10
   • Port g4: PVID 20

4. With the VLAN configuration that you set up, the following situations produce results as described:
   • If an untagged packet enters port 1, the switch tags it with VLAN ID 10. The packet has access to port 2 and port 3. The outgoing packet is stripped of its tag to leave port 2 as an untagged packet. For port 3, the outgoing packet leaves as a tagged packet with VLAN ID 10.
   • If a tagged packet with VLAN ID 10 enters port 3, the packet has access to port 1 and port 2. If the packet leaves port 1 or port 2, it is stripped of its tag to leave the switch as an untagged packet.
   • If an untagged packet enters port 4, the switch tags it with VLAN ID 20. The packet has access to port 5 and port 6. The outgoing packet is stripped of its tag to become an untagged packet as it leaves port 6. For port 5, the outgoing packet leaves as a tagged packet with VLAN ID 20.

Access Control Lists (ACLs)

ACLs ensure that only authorized users have access to specific resources while blocking off any unwarranted attempts to reach network resources.

ACLs are used to provide traffic flow control, restrict contents of routing updates, decide which types of traffic are forwarded or blocked, and provide security for the network. ACLs are normally used in firewall routers that are positioned between the internal network and an external network, such as the Internet. They can also be used on a router positioned between two parts of the network to control the traffic entering or exiting a specific part of the internal network. The added packet processing required by the ACL feature does not affect switch performance. That is, ACL processing occurs at wire speed.

Access lists are a sequential collection of permit and deny conditions. This collection of conditions, known as the filtering criteria, is applied to each packet that is processed by the switch or the router. The forwarding or dropping of a packet is based on whether or not the packet matches the specified criteria.

Traffic filtering requires the following two basic steps:

1. Create an access list definition.

   The access list definition includes rules that specify whether traffic matching the criteria is forwarded normally or discarded. Additionally, you can assign traffic that matches the
criteria to a particular queue or redirect the traffic to a particular port. A default *deny all* rule is the last rule of every list.

2. Apply the access list to an interface in the inbound direction.

The GS752TXS and GS728TXS Smart Switches allows ACLs to be bound to physical ports and LAGs. The switch software supports MAC ACLs and IP ACLs.

**MAC ACL Example Configuration**

The following example shows how to create a MAC-based ACL that permits Ethernet traffic from the Sales department on specified ports and denies all other traffic on those ports.

1. From the MAC ACL screen, create an ACL with the name Sales_ACL for the Sales department of your network (See *MAC ACL* on page 226).
   
   By default, this ACL will be bound on the inbound direction, which means the switch will examine traffic as it enters the port.

2. From the MAC Rules screen, create a rule for the Sales_ACL with the following settings:
   - **ID**: 1
   - **Action**: Permit
   - **Assign Queue**: 0
   - **Match Every**: False
   - **CoS**: 0
   - **Destination MAC**: 01:02:1A:BC:DE:EF
   - **Destination MAC Mask**: 00:00:00:00:FF:FF
   - **Source MAC**: 02:02:1A:BC:DE:EF
   - **Source MAC Mask**: 00:00:00:00:FF:FF
   - **VLAN ID**: 2

   For detailed information about MAC ACL rules, see *MAC Rules* on page 227.

3. From the MAC Binding Configuration screen, assign the Sales_ACL to Ethernet ports 6, 7, and 8, and then click **Apply** (See *MAC Binding Configuration* on page 229).
You can assign an optional sequence number to indicate the order of this access list relative to other access lists if any are already assigned to this interface and direction.

4. The MAC Binding Table displays the interface and MAC ACL binding information (See MAC Binding Table on page 230).

The ACL named Sales_ACL looks for Ethernet frames with destination and source MAC addresses and MAC masks defined in the rule. Also, the frame must be tagged with VLAN ID 2, which is the Sales department VLAN. The CoS value of the frame must be 0, which is the default value for Ethernet frames. Frames that match this criteria are permitted on interfaces 6, 7, and 8 and are assigned to the hardware egress queue 0, which is the default queue. All other traffic is explicitly denied on these interfaces. To allow additional traffic to enter these ports, you must add a new permit rule with the desired match criteria and bind the rule to interfaces 6, 7, and 8.

**Sample Standard IP ACL Configuration**

The following example shows how to create an IP-based ACL that prevents any IP traffic from the Finance department from being allowed on the ports that are associated with other departments. Traffic from the Finance department is identified by each packet's network IP address.

1. From the IP ACL screen, create a new IP ACL with an IP ACL ID of 1 (See IP ACL on page 231).

2. From the IP Rules screen, create a rule for IP ACL 1 with the following settings:
   - **Rule ID**: 1
   - **Action**: Deny
   - **Assign Queue ID**: 0 (optional: 0 is the default value)
   - **Match Every**: False
   - **Source IP Address**: 192.168.187.0
• **Source IP Mask.** 255.255.255.0

For additional information about IP ACL rules, see *IP Rules* on page 232.

3. Click **Add**.

4. From the IP Rules screen, create a second rule for IP ACL 1 with the following settings:
   - **Rule ID.** 2
   - **Action.** Permit
   - **Match Every.** True

5. Click **Add**.

6. From the IP Binding Configuration screen, assign ACL ID 1 to the Ethernet ports 2, 3, and 4, and assign a sequence number of 1 (See *IP Binding Configuration* on page 241).

   By default, this IP ACL is bound on the inbound direction, so it examines traffic as it enters the switch.

7. Click **Apply**.

8. Use the IP Binding Table screen to view the interfaces and IP ACL binding information (See *IP Binding Table* on page 242).

The IP ACL in this example matches all packets with the source IP address and subnet mask of the Finance department's network and deny it on the Ethernet interfaces 2, 3, and 4 of the switch. The second rule permits all non-Finance traffic on the ports. The second rule is required because there is an explicit *deny all* rule as the lowest priority rule.

**Differentiated Services (DiffServ)**

Standard IP-based networks are designed to provide *best effort* data delivery service. *Best effort* service implies that the network deliver the data in a timely fashion, although there is no guarantee that it will. During times of congestion, packets can be delayed, sent sporadically, or dropped. For typical Internet applications, such as e-mail and file transfer, a slight degradation in service is acceptable and in many cases unnoticeable. However, any degradation of service has undesirable effects on applications with strict timing requirements, such as voice or multimedia.

Quality of Service (QoS) can provide consistent, predictable data delivery by distinguishing between packets that have strict timing requirements from those that are more tolerant of delay. Packets with strict timing requirements are given special treatment in a QoS-capable network. With this in mind, all elements of the network must be QoS-capable. If one node is unable to meet the necessary timing requirements, this creates a deficiency in the network path and the performance of the entire packet flow is compromised.
There are two basic types of QoS:

- **Integrated Services.** Network resources are apportioned based on request and are reserved (resource reservation) according to network management policy (RSVP, for example).
- **Differentiated Services.** Network resources are apportioned based on traffic classification and priority, giving preferential treatment to data with strict timing requirements.

The GS752TXS and GS728TXS Smart Switches supports DiffServ.

The DiffServ feature contains a number of conceptual QoS building blocks you can use to construct a differentiated service network. Use these same blocks in different ways to build other types of QoS architectures.

There are 3 key QoS building blocks needed to configure DiffServ:

- Class
- Policy
- Service (i.e., the assignment of a policy to a directional interface)

**Class**

You can classify incoming packets at layers 2, 3, and 4 by inspecting the following information for a packet:

- Source/destination MAC address
- EtherType
- Class of Service (802.1p priority) value (first/only VLAN tag)
- VLAN ID range (first/only VLAN tag)
- IP Service Type octet (also known as: ToS bits, Precedence value, DSCP value)
- Layer 4 protocol (such as TCP or UDP)
- Layer 4 source/destination ports
- Source/destination IP address

From a DiffServ point of view, there are two types of classes:

- DiffServ traffic classes
- DiffServ service levels/forwarding classes
DiffServ Traffic Classes

With DiffServ, you define which traffic classes to track on an ingress interface. You can define simple BA classifiers (DSCP) and a wide variety of multifield (MF) classifiers:

- Layer 2; Layers 3, 4 (IP only)
- Protocol-based
- Address-based

You can combine these classifiers with logical AND or OR operations to build complex MF classifiers (by specifying a class type of all or any, respectively). That is, within a single class, multiple match criteria are grouped together as an AND expression or a sequential OR expression, depending on the defined class type. Only classes of the same type can be nested; class nesting does not allow for the negation (i.e., exclude option) of the referenced class.

To configure DiffServ, you must define service levels, namely the forwarding classes/PHBs identified by a given DSCP value, on the egress interface. These service levels are defined by configuring BA classes for each.

Creating Policies

Use DiffServ policies to associate a collection of classes that you configure with one or more QoS policy statements. The result of this association is referred to as a policy.

From a DiffServ perspective, there are two types of policies:

- **Traffic Conditioning Policy.** A policy applied to a DiffServ traffic class
- **Service Provisioning Policy.** A policy applied to a DiffServ service level

You must manually configure the various statements and rules used in the traffic conditioning and service provisioning policies to achieve the desired Traffic Conditioning Specification (TCS) and the Service Level Specification (SLS) operation, respectively.

Traffic Conditioning Policy

- **Dropping.** Drop a packet upon arrival. This is useful for emulating access control list operation using DiffServ, especially when DiffServ and ACL cannot co-exist on the same interface.
- **Mark IP DSCP or IP Precedence.** Marking/re-marking the DiffServ code point in a packet with the DSCP value representing the service level associated with a particular DiffServ traffic class. Alternatively, the IP Precedence value of the packet can be marked/re-marked.
- **Mark CoS (802.1p).** Sets the three-bit priority field in the first/only 802.1p header to a specified value when packets are transmitted for the traffic class. An 802.1p header is inserted if it does not already exist. This is useful for assigning a layer 2 priority level based on a DiffServ forwarding class (i.e., DSCP or IP Precedence value) definition to
convey some QoS characteristics to downstream switches which do not routinely look at the DSCP value in the IP header.

- **Policy.** A method of constraining incoming traffic associated with a particular class so that it conforms to the terms of the TCS. Special treatment can be applied to out-of-profile packets that are either in excess of the conformance specification or are non-conformant. The DiffServ feature supports the following types of traffic policing treatments (actions):
  - **Drop.** The packet is dropped
  - **Mark cos.** The 802.1p user priority bits are (re)marked and forwarded
  - **Mark dscp.** The packet DSCP is (re)marked and forwarded
  - **Mark prec.** The packet IP Precedence is (re)marked and forwarded
  - **Send.** The packet is forwarded without DiffServ modification

- **Color Mode Awareness.** Policing in the DiffServ feature uses either color blind or color aware mode. Color blind mode ignores the coloration (marking) of the incoming packet. Color aware mode takes into consideration the current packet marking when determining the policing outcome. An auxiliary traffic class is used in conjunction with the policing definition to specify a value for one of the 802.1p, IP DSCP, or IP Precedence fields designating the incoming color value to be used as the conforming color. The color of exceeding traffic can be optionally specified as well.

- **Counting.** Updating octet and packet statistics to keep track of data handling along traffic paths within DiffServ. In this DiffServ feature, counters are not explicitly configured by the user, but are designed into the system based on the DiffServ policy being created. For more information, see *Statistics* on page 79.

- **Assigning QoS Queue.** Directs traffic stream to the specified QoS queue. This allows a traffic classifier to specify which one of the supported hardware queues are used for handling packets belonging to the class.

- **Redirecting.** Forces classified traffic stream to a specified egress port (physical or LAG). This can occur in addition to any marking or policing action. It can also be specified along with a QoS queue assignment.

### Sample DiffServ Configuration

To create a DiffServ Class/Policy and attach it to a switch interface, follow these steps:

1. From the QoS Class Configuration screen, create a new class with the following settings:
   - **Class Name.** Class1
   - **Class Type.** All

   For more information about this screen, see *Class Configuration* on page 180.

2. Click the Class1 hyperlink to view the DiffServ Class Configuration screen for this class.

3. Configure the following settings for Class1:
   - **Protocol Type.** UDP
   - **Source IP Address.** 192.12.1.0
• **Source Mask.** 255.255.255.0
• **Source L4 Port.** Other, and enter 4567 as the source port value
• **Destination IP Address.** 192.12.2.0
• **Destination Mask.** 255.255.255.0
• **Destination L4 Port.** Other, and enter 4568 as the destination port value

For more information about this screen, see *Class Configuration* on page 180.

4. Click **Apply**.

5. From the Policy Configuration screen, create a new policy with the following settings:
   • **Policy Selector.** Policy1
   • **Member Class.** Class1

   For more information about this screen, see *Policy Configuration* on page 184.

6. Click **Add** to add the new policy.

7. Click the Policy1 hyperlink to view the Policy Class Configuration screen for this policy.

8. Configure the Policy attributes as follows:
   • **Assign Queue.** 3
   • **Policy Attribute.** Simple Policy
   • **Color Mode.** Color Blind
   • **Committed Rate.** 1000000 Kbps
   • **Committed Burst Size.** 128 KB
   • **Confirm Action.** Send
   • **Violate Action.** Drop

   For additional information about this screen, see *Policy Configuration* on page 184.

9. From the Service Configuration screen, select the check box next to interfaces g7 and g8 to attach the policy to these interfaces, and then click **Apply** (See *Service Configuration* on page 187).

All UDP packet flows destined to the 192.12.2.0 network with an IP source address from the 192.12.1.0 network that have a Layer 4 Source port of 4567 and Destination port of 4568 from this switch on ports 7 and 8 are assigned to hardware queue 3.

On this network, traffic from streaming applications uses UDP port 4567 as the source and 4568 as the destination. This real-time traffic is time sensitive, so it is assigned to a high-priority hardware queue. By default, data traffic uses hardware queue 0, which is designated as a best-effort queue.

Also the *confirmed action* on this flow is to send the packets with a committed rate of 1,000,000 Kbps and burst size of 128 KB. Packets that violate the committed rate and burst size are dropped.
802.1X

Local Area Networks (LANs) are often deployed in environments that permit unauthorized devices to be physically attached to the LAN infrastructure, or permit unauthorized users to attempt to access the LAN through equipment already attached. In such environments, it can be desirable to restrict access to the services offered by the LAN to those users and devices that are permitted to use those services.

Port-based network access control makes use of the physical characteristics of LAN infrastructures in order to provide a means of authenticating and authorizing devices attached to a LAN port that has point-to-point connection characteristics and of preventing access to that port in cases in which the authentication and authorization process fails. In this context, a port is a single point of attachment to the LAN, such as ports of MAC bridges and associations between stations or access points in IEEE 802.11 Wireless LANs.

The IEEE 802.11 standard describes an architectural framework within which authentication and consequent actions take place. It also establishes the requirements for a protocol between the authenticator (the system that passes an authentication request to the authentication server) and the supplicant (the system that requests authentication), as well as between the authenticator and the authentication server.

The GS752TXS and GS728TXS Smart Switches supports a guest VLAN, which allows unauthenticated users to have limited access to the network resources.

---

**Note:** You can use QoS features to provide rate limiting on the guest VLAN to limit the network resources the guest VLAN provides.

---

Another 802.1X feature is the ability to configure a port to Enable/Disable EAPoL packet forwarding support. You can disable or enable the forwarding of EAPoL when 802.1X is disabled on the device.

The ports of an 802.1X authenticator switch provide the means in which it can offer services to other systems reachable via the LAN. Port-based network access control allows the operation of a switch’s ports to be controlled in order to ensure that access to its services is only permitted by systems that are authorized to do so.

Port access control provides a means of preventing unauthorized access by supplicants to the services offered by a system. Control over the access to a switch and the LAN to which it is connected can be desirable in order to restrict access to publicly accessible bridge ports or to restrict access to departmental LANs.

Access control is achieved by enforcing authentication of supplicants that are attached to an authenticator’s controlled ports. The result of the authentication process determines whether the supplicant is authorized to access services on that controlled port.
A Port Access Entity (PAE) is able to adopt one of two distinct roles within an access control interaction:

- **Authenticator.** A Port that enforces authentication before allowing access to services available via that Port.
- **Supplicant.** A Port that attempts to access services offered by the Authenticator.

Additionally, there exists a third role:

- **Authentication server.** Performs the authentication function necessary to check the credentials of the Supplicant on behalf of the Authenticator.

All three roles are required in order to complete an authentication exchange.

The GS752TXS and GS728TXS Smart Switches supports the Authenticator role only, in which the PAE is responsible for communicating with the Supplicant. The Authenticator PAE is also responsible for submitting the information received from the Supplicant to the Authentication Server in order for the credentials to be checked, which will determine the authorization state of the Port. The Authenticator PAE controls the authorized/unauthorized state of the controlled Port depending on the outcome of the RADIUS-based authentication process.

---

**Sample 802.1X Configuration**

This example shows how to configure the switch so that 802.1X-based authentication is required on the ports in a corporate conference room (g1–g8). These ports are available to visitors and need to be authenticated before granting access to the network. The authentication is handled by an external RADIUS server. When the visitor is successfully authenticated, traffic is automatically assigned to the guest VLAN. This example assumes that a VLAN has been configured with a VLAN ID of 150 and VLAN Name of Guest.

1. From the Port Authentication screen, select ports g1 through g8.
2. From the Port Control menu, select Unauthorized.

The Port Control setting for all other ports where authentication is not needed should be Authorized. When the Port Control setting is Authorized, the port is unconditionally put in a force-Authorized state and does not require any authentication. When the Port Control setting is Auto, the authenticator PAE sets the controlled port mode.
3. In the Guest VLAN field for ports g1–g8, enter 150 to assign these ports to the guest VLAN. You can configure additional settings to control access to the network through the ports. See Port Security Interface Configuration on page 220 for information about the settings.

4. Click Apply.

5. From the 802.1X Configuration screen, set the Port Based Authentication State and Guest VLAN Mode to Enable, and then click Apply (See Port Security Configuration on page 219).

   This example uses the default values for the port authentication settings, but there are several additional settings that you can configure. For example, the EAPOL Flood Mode field allows you to enable the forwarding of EAPoL frames when 802.1X is disabled on the device.

6. From the RADIUS Server Configuration screen, configure a RADIUS server with the following settings:
   - Server Address. 192.168.10.23
   - Secret Configured. Yes
   - Secret. secret123
   - Active. Primary

   For more information, see RADIUS Configuration on page 191.

7. Click Add.

8. From the Authentication List screen, configure the default List to use RADIUS as the first authentication method (See Authentication List Configuration on page 198).

   This example enables 802.1X-based port security on the GS752TXS/GS728TXS switch and prompts the hosts connected on ports g1–g8 for an 802.1X-based authentication. The switch passes the authentication information to the configured RADIUS server.

**MSTP**

Spanning Tree Protocol (STP) runs on bridged networks to help eliminate loops. If a bridge loop occurs, the network can become flooded with traffic. IEEE 802.1s Multiple Spanning Tree Protocol (MSTP) supports multiple instances of Spanning Tree to efficiently channel VLAN traffic over different interfaces. Each instance of the Spanning Tree behaves in the manner specified in IEEE 802.1w, Rapid Spanning Tree, with slight modifications in the working but not the end effect (chief among the effects is the rapid transitioning of the port to the Forwarding state).

The difference between the RSTP and the traditional STP (IEEE 802.1D) is the ability to configure and recognize full duplex connectivity and ports that are connected to end stations, resulting in rapid transitioning of the port to the Forwarding state and the suppression of Topology Change Notification. These features are represented by the parameters pointtopoint and edgeport. MSTP is compatible to both RSTP and STP. It behaves appropriately to STP and RSTP bridges.

A MSTP bridge can be configured to behave entirely as a RSTP bridge or a STP bridge. So, an IEEE 802.1s bridge inherently also supports IEEE 802.1w and IEEE 802.1D.
The MSTP algorithm and protocol provides simple and full connectivity for frames assigned to any given VLAN throughout a Bridged LAN comprising arbitrarily interconnected networking devices, each operating MSTP, STP or RSTP. MSTP allows frames assigned to different VLANs to follow separate paths, each based on an independent Multiple Spanning Tree Instance (MSTI), within Multiple Spanning Tree (MST) Regions composed of LANs and or MSTP Bridges. These Regions and the other Bridges and LANs are connected into a single Common Spanning Tree (CST). [IEEE DRAFT P802.1s/D13]

MSTP connects all Bridges and LANs with a single Common and Internal Spanning Tree (CIST). The CIST supports the automatic determination of each MST region, choosing its maximum possible extent. The connectivity calculated for the CIST provides the CST for interconnecting these Regions, and an Internal Spanning Tree (IST) within each Region. MSTP ensures that frames with a given VLAN ID are assigned to one and only one of the MSTIs or the IST within the Region, that the assignment is consistent among all the networking devices in the Region and that the stable connectivity of each MSTI and IST at the boundary of the Region matches that of the CST. The stable active topology of the Bridged LAN with respect to frames consistently classified as belonging to any given VLAN thus simply and fully connects all LANs and networking devices throughout the network, though frames belonging to different VLANs can take different paths within any Region, per IEEE DRAFT P802.1s/D13.

All bridges, whether they use STP, RSTP or MSTP, send information in configuration messages via Bridge Protocol Data Units (BPDUs) to assign port roles that determine each port's participation in a fully and simply connected active topology based on one or more spanning trees. The information communicated is known as the spanning tree priority vector. The BPDU structure for each of these different protocols is different. A MSTP bridge will transmit the appropriate BPDU depending on the received type of BPDU from a particular port.

An MST Region comprises of one or more MSTP Bridges with the same MST Configuration Identifier, using the same MSTIs, and which have no Bridges attached that cannot receive and transmit MSTP BPDUs. The MST Configuration Identifier has the following components:

- Configuration Identifier Format Selector
- Configuration Name
- Configuration Revision Level
- Configuration Digest: 16-byte signature of type HMAC-MD5 created from the MST Configuration Table (a VLAN ID to MSTID mapping)

As there are Multiple Instances of Spanning Tree, there is a MSTP state maintained on a per-port, per-instance basis (or on a per-port per-VLAN basis: as any VLAN can be in one and only one MSTI or CIST). For example, port A can be forwarding for instance 1 while discarding for instance 2. The port states have changed since IEEE 802.1D specification.

To support multiple spanning trees, a MSTP bridge has to be configured with an unambiguous assignment of VLAN IDs (VIDs) to spanning trees. This is achieved by:

1. Ensuring that the allocation of VIDs to FIDs is unambiguous.
2. Ensuring that each FID supported by the Bridge is allocated to exactly one Spanning Tree Instance.
The combination of VID to FID and then FID to MSTI allocation defines a mapping of VIDs to spanning tree instances, represented by the MST Configuration Table.

With this allocation we ensure that every VLAN is assigned to one and only one MSTI. The CIST is also an instance of spanning tree with a MSTID of 0.

An instance can occur that has no VIDs allocated to it, but every VLAN must be allocated to one of the other instances of spanning tree.

The portion of the active topology of the network that connects any two bridges in the same MST Region traverses only MST bridges and LANs in that region, and never Bridges of any kind outside the Region, in other words connectivity within the region is independent of external connectivity.

**Sample MSTP Configuration**

This example shows how to create an MSTP instance from the GS752TXS/GS728TXS switch. The example network has three different GS752TXS/GS728TXS switches that serve different locations in the network. In this example, ports g1–g5 are connected to host stations, so those links are not subject to network loops. Ports g6–g8 are connected across switches 1, 2, and 3.

Perform the following procedures on each switch to configure MSTP:

1. Use the VLAN Configuration screen to create VLANs 300 and 500 (see Basic VLAN Configuration on page 103).
2. Use the VLAN Membership screen to include ports g1–g8 as tagged (T) or untagged (U) members of VLAN 300 and VLAN 500 (see VLAN Membership Configuration on page 104).
3. From the STP Configuration screen, enable the Spanning Tree State option (see STP Configuration on page 118).
Use the default values for the rest of the STP configuration settings. By default, the STP Operation Mode is MSTP and the Configuration Name is the switch MAC address.

4. From the CST Configuration screen, set the Bridge Priority value for each of the three switches to force Switch 1 to be the root bridge:
   - Switch 1. 4096
   - Switch 2. 12288
   - Switch 3. 20480

   **Note:** Bridge priority values are multiples of 4096.

If you do not specify a root bridge and all switches have the same Bridge Priority value, the switch with the lowest MAC address is elected as the root bridge (see CST Configuration on page 120).

5. From the CST Port Configuration screen, select ports g1–g8 and select Enable from the STP Status menu (see CST Port Configuration on page 121).

6. Click Apply.

7. Select ports g1–g5 (edge ports), and select Enable from the Fast Link menu.
   Since the edge ports are not at risk for network loops, ports with Fast Link enabled transition directly to the Forwarding state.

8. Click Apply.
   You can use the CST Port Status screen to view spanning tree information about each port.

9. From the MST Configuration screen, create a MST instances with the following settings:
   - MST ID. 1
   - Priority. Use the default (32768)
   - VLAN ID. 300
   For more information, see MST Configuration on page 125.

10. Click Add.

11. Create a second MST instance with the following settings
   - MST ID. 2
   - Priority. 49152
   - VLAN ID. 500

12. Click Add.

In this example, assume that Switch 1 has become the Root bridge for the MST instance 1, and Switch 2 has become the Root bridge for MST instance 2. Switch 3 has hosts in the Sales department (ports g1, g2, and g3) and in the HR department (ports g4 and g5). Switches 1 and 2 also have hosts in the Sales and Human Resources departments. The
hosts connected from Switch 2 use VLAN 500, MST instance 2 to communicate with the hosts on Switch 3 directly. Likewise, hosts of Switch 1 use VLAN 300, MST instance 1 to communicate with the hosts on Switch 3 directly.

The hosts use different instances of MSTP to effectively use the links across the switch. The same concept can be extended to other switches and more instances of MSTP.

**VLAN Routing with a Static Route**

Refer to the following sections to configure VLAN routing with a static route.

**VLAN Routing Overview**

VLANs divide broadcast domains in a LAN environment. Whenever hosts in one VLAN need to communicate with hosts in another VLAN, the traffic must be routed between them. This is known as inter-VLAN routing. On the switch, it is accomplished by creating Layer 3 interfaces (Switch virtual interfaces (SVI)).

When a port is enabled for bridging (default) rather than routing, all normal bridge processing is performed for an inbound packet, which is then associated with a VLAN. Its MAC Destination Address (MAC DA) and VLAN ID are used to search the MAC address table. If routing is enabled for the VLAN, and the MAC DA of an inbound unicast packet is that of the internal bridge-router interface, the packet is routed. An inbound multicast packet is forwarded to all ports in the VLAN, plus the internal bridge-router interface, if it was received on a routed VLAN.

Since a port can be configured to belong to more than one VLAN, VLAN routing might be enabled for all of the VLANs on the port, or for a subset. VLAN Routing can be used to allow more than one physical port to reside on the same subnet. It could also be used when a VLAN spans multiple physical networks, or when additional segmentation or security is required. A port can be either a VLAN port or a router port, but not both. However, a VLAN port can be part of a VLAN that is itself a router port.
Sample VLAN Routing Configuration

Complete these steps to configure a switch to perform interVLAN routing.

1. Use the VLAN Configuration screen to enable routing on the switch (see Basic VLAN Configuration on page 103).

2. Determine the IP addresses you want to assign to the VLAN interface on the switch. For the switch to be able to route between the VLANs, the VLAN interfaces must be configured with an IP address. When the switch receives a packet destined for another subnet/VLAN, the switch looks at the routing table to determine where to forward the packet. The packet is then passed to the VLAN interface of the destination. It is then sent to the port where the end device is attached.

3. Configure the VLAN interfaces (by selecting the VLAN; VLANs have to be created statically and ports have to added by using VLAN configuration screens. Refer to the example of configuring VLAN) with the IP address identified using the VLAN Routing Configuration. e.g. IP address 10.1.2.1 and mask 255.255.255.0

4. Repeat this process for all VLANs identified to be configured as the routing interfaces.

Note: You can only use the VLAN Routing Wizard for creating VLANs, adding ports, and enabling it for routing by assigning the IP address and mask.
### GS752TXS and GS728TXS Smart Switches Specifications

The GS752TXS and GS728TXS Smart Switches conform to the TCP/IP, UDP, HTTP, ICMP, TFTP, DHCP, IEEE 802.1D, IEEE 802.1p, and IEEE 802.1Q standards.

Table 45. Switch specifications and performance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Value</th>

Notification of Compliance

NETGEAR Wired Products

Certificate of the Manufacturer/Importer

It is hereby certified that the ProSafe™ GS752TXS Smart Switch has been suppressed in accordance with the conditions set out in the BMPT-AmtsblVfg 243/1991 and Vfg 46/1992. The operation of some equipment (for example, test transmitters) in accordance with the regulations may, however, be subject to certain restrictions. Please refer to the notes in the operating instructions.

The Federal Office for Telecommunications Approvals has been notified of the placing of this equipment on the market and has been granted the right to test the series for compliance with the regulations.

Bestätigung des Herstellers/Importeurs

Das Bundesamt für Zulassungen in der Telekommunikation wurde davon unterrichtet, daß dieses Gerät auf den Markt gebracht wurde und es ist berechtigt, die Serie auf die Erfüllung der Vorschriften hin zu überprüfen.

FCC Caution

• Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate this equipment.

• This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Regulatory Compliance Information

This section includes user requirements for operating this product in accordance with National laws for usage of radio spectrum and operation of radio devices. Failure of the end-user to comply with the applicable requirements may result in unlawful operation and adverse action against the end-user by the applicable National regulatory authority.

Note: This product’s firmware limits operation to only the channels allowed in a particular Region or Country. Therefore, all options described in this user’s guide may not be available in your version of the product.
Europe – EU Declaration of Conformity

Marking by the above symbol indicates compliance with the Essential Requirements of the R&TTE Directive of the European Union (1999/5/EC). This equipment meets the following conformance standards:

EN300 328, EN301 489-17, EN60950

For the current EU Declaration of Conformity, visit http://kb.netgear.com/app/answers/detail/a_id/11621/.

### FCC Requirements for Operation in the United States

**FCC Information to User**

This product does not contain any user serviceable components and is to be used with approved antennas only. Any product changes or modifications will invalidate all applicable regulatory certifications and approvals.

**FCC Guidelines for Human Exposure**

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance of 20 cm between the radiator and your body. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

**FCC Declaration Of Conformity**

We, NETGEAR, Inc., 350 East Plumeria Drive, Santa Clara, CA 95134, declare under our sole responsibility that the ProSafe™ GS752TXS Smart Switch complies with Part 15 of FCC Rules. Operation is subject to the following two conditions:

- This device may not cause harmful interference, and
• This device must accept any interference received, including interference that may cause undesired operation.

**FCC Radio Frequency Interference Warnings & Instructions**

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following methods:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment into an electrical outlet on a circuit different from that which the radio receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

![ProSafe™ GS752TXS Smart Switch](image)

Modifications made to the product, unless expressly approved by NETGEAR, Inc., could void the user's right to operate the equipment.

**Canadian Department of Communications Radio Interference Regulations**

This digital apparatus, (ProSafe™ GS752TXS Smart Switch), does not exceed the Class B limits for radio-noise emissions from digital apparatus as set out in the Radio Interference Regulations of the Canadian Department of Communications.

Canada ID: 4054A-FVX538
