Regulatory and Legal
Si ce produit est vendu au Canada, vous pouvez accéder à ce document en français canadien à https://www.netgear.com/support/download/.

(If this product is sold in Canada, you can access this document in Canadian French at https://www.netgear.com/support/download/.)

For regulatory compliance information including the EU Declaration of Conformity, visit https://www.netgear.com/about/regulatory/.

See the regulatory compliance document before connecting the power supply.

For NETGEAR’s Privacy Policy, visit https://www.netgear.com/about/privacy-policy.

By using this device, you are agreeing to NETGEAR’s Terms and Conditions at https://www.netgear.com/about/terms-and-conditions. If you do not agree, return the device to your place of purchase within your return period.

Do not use this device outdoors.

Applicable to 6 GHz devices only: Only use the device indoors. The operation of 6 GHz devices is prohibited on oil platforms, cars, trains, boats, and aircraft, except that operation of this device is permitted in large aircraft while flying above 10,000 feet. Operation of transmitters in the 5.925-7.125 GHz band is prohibited for control of or communications with unmanned aircraft systems.

Contents

Chapter 1 Hardware Setup
Unpack your router.................................10
Top panel LEDs and buttons..........................11
Rear panel.............................................14
Router label...........................................15
Extend the antennas.................................16
Position your router.................................16
Connect your router to a modem.................17
About the speed of your Internet connection 18
Wall-mount your router.............................19

Chapter 2 Connect to the network and access the router
Connect to the router network......................21
  Connect to the router using a wired connection....21
  Connect to the router WiFi network.................21
  Connect to the WiFi network using WPS............21
Types of logins........................................22
Install and manage your router with the Nighthawk app 22
Use a web browser to access the router..........23
  Automatic Internet setup..........................23
  Log in to the router..................................25
  Change the language..................................25

Chapter 3 Specify Your Internet Settings
Use the Internet Setup Wizard.......................28
Manually set up the Internet connection..........28
  Specify an Internet connection without a login....28
  Specify an Internet connection that uses a login..30
Get Multi-Gig Internet with the Multi-Gig port ....32
Specify IPv6 Internet connections..................33
  Requirements for entering IPv6 addresses...........33
Use auto detect for an IPv6 Internet connection..34
Set up an IPv6 6to4 tunnel Internet connection...35
Set up an IPv6 pass-through Internet connection.36
Set up an IPv6 fixed Internet connection...........37
Set up an IPv6 DHCP Internet connection.........38
Chapter 4 Control Access to the Internet

Manage NETGEAR Armor.................................................................49
Activate Armor using the Nighthawk app..................................49
View or change your NETGEAR Armor settings using the
Nighthawk app...............................................................................49

Network access control list..............................................................50
Enable the network access control list and set the access rule.50
Manage the allowed devices on the network ACL...............52
Manage the blocked devices on the network ACL...............53
Use keywords to block Internet sites.................................................54
Delete keywords from the blocked list............................................55
Block services from the Internet....................................................56
Prevent blocking on a trusted computer........................................57
Schedule when to block Internet sites and services..............58
Set up security event email notifications.....................................59

Chapter 5 Manage WiFi Settings

Use the WPS Wizard for WiFi connections....................................62
Use the WPS Wizard with the push button.................................62
Use the WPS Wizard with a PIN number.....................................63
Specify basic WiFi settings................................................................63
Change the WiFi mode..................................................................65
Change the WiFi mode if AX WiFi is enabled...........................66
Change the WiFi mode if AX WiFi is disabled...........................67
Change the WiFi password or the WiFi security.........................69
Set up a guest WiFi network..........................................................71
Configure WPA/WPA2 Enterprise WiFi security.........................74
Control the WiFi radios.................................................................76
Use the WiFi On/Off button..........................................................76
Enable or disable the WiFi radios.................................................76
Enable or disable AX WiFi............................................................77
Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio.78
Enable or disable OFDMA..............................................................79
Change the transmission power control......................................80
Set up a WiFi schedule.................................................................80
Enable or disable Smart Connect.................................................81
Enable or disable implicit beamforming......................................82
Chapter 6 Manage Network Settings

View or change the WAN settings
Set up a default DMZ server
Change the router’s device name
Change the LAN TCP/IP settings
Specify the IP addresses that the router assigns
Disable the DHCP server feature in the router
Manage reserved LAN IP addresses
  Reserve an IP address
  Edit a reserved IP address
  Delete a reserved IP address
Set up a bridge for a port group or VLAN tag group
  Set up a bridge for a port group or an IPTV port
  Set up a bridge for a VLAN tag group
Manage custom static routes
  Set up a static route
  Edit a static route
  Delete a static route
Set up the router as a WiFi access point
Set up the router in bridge mode
Return the router to router mode
Improve network connections with Universal Plug and Play
Enable or disable flow control for Ethernet ports
Manage Ethernet port aggregation to a LAN device
  Set up LAN port aggregation to a LAN device
  View or change the router LAN port aggregation mode

Chapter 7 Optimize Performance

Use Dynamic QoS to optimize Internet traffic management
Enable Dynamic QoS
Enable or disable the automatic QoS database update
Manually update the dynamic QoS database
Wi-Fi Multimedia Quality of Service

Chapter 8 Manage Your Router

Update the router firmware
Check for new firmware and update the router
Manually upload firmware to the router
Manage the firmware update settings
Change the admin password
Enable admin password reset ........................................................120
Reset the admin password ............................................................121
Always use HTTPS to access the router .........................................122
View information about the router and the Internet and WiFi
settings ...............................................................................................123
Display the statistics of the Internet port .......................................123
Check the Internet connection status ............................................125
View devices currently on the network ..........................................126
Monitor Internet traffic .....................................................................127
Manage the router configuration file .............................................128
  Back up the settings ........................................................................129
  Erase the settings ..........................................................................129
  Restore the settings ........................................................................130
Disable LED blinking or turn off LEDs ............................................130
Set your time zone ............................................................................131
Set the NTP server ............................................................................132
Connect to your router with Anywhere Access ............................132
Specify ReadyDLNA media server settings ...................................133
Return the router to its factory default settings ............................134
  Use the Reset button .......................................................................134
  Erase the settings ..........................................................................135

Chapter 9 Share USB Storage Devices Attached to the Router

USB device requirements ........................................................................................................137
Connect a USB storage device to the router .........................................................137
Access a storage device connected to the router from a
  Windows-based computer .........................................................................................138
Map a USB device to a Windows network drive ..............................................138
Access a storage device that is connected to the router from a
  Mac .........................................................................................................139
Enable FTP access within your network .........................................................140
View network folders on a storage device .....................................................140
Add a network folder on a USB storage device ......................................141
Edit a network folder on a USB storage device ........................................142
Safely remove a USB storage device ..........................................................143

Chapter 10 Use Dynamic DNS to Access USB Storage Devices
  Through the Internet

Set up and manage Dynamic DNS .................................................................145
  Set up a new Dynamic DNS account ....................................................145
  Specify a DNS account that you already created ................................146
  Change the Dynamic DNS settings .....................................................147
Your personal FTP server ...............................................................................147
  Set up your personal FTP server ..........................................................148
Set up FTP access through the Internet....................................148
Set up HTTPS access through the Internet....................................149
Access USB storage devices through the Internet.......................150

Chapter 11 Use OpenVPN to Access Your Network

About VPN connections..................................................................153
LAN IP addressing in VPN networks..............................................153
Enable OpenVPN service in the router..........................................154
Install OpenVPN software on a VPN client....................................155
   Install OpenVPN software on a Windows-based computer...156
   Install OpenVPN software on a Mac computer......................157
   Install OpenVPN software on an iOS device.........................158
   Install OpenVPN software on an Android device...............159
Use VPN to access your Internet service at home.......................160
   Allow VPN client Internet access in the router.................160
   Block VPN client Internet access in the router.................161
Use VPN to remotely access a USB storage device attached to the
   router.................................................................................................162

Chapter 12 Manage port forwarding and port triggering

Manage port forwarding to a local server....................................164
   Set up port forwarding to a local server..............................164
   Add a custom port forwarding service...............................165
   Edit a port forwarding service............................................166
   Delete a port forwarding entry..........................................167
   Application example: Make a local web server public...........167
   How the router implements the port forwarding rule.............168
Port triggering............................................................................168
   Add a port triggering service............................................169
   Enable port triggering........................................................170
   Application example: Port triggering for Internet relay chat port
     triggering......................................................................................170

Chapter 13 Troubleshooting

Quick tips...........................................................................................173
   Sequence to restart your network......................................173
   Check the power adapter and Ethernet cable connections...173
   Check the WiFi settings.........................................................173
   Check the network settings................................................173
Troubleshoot with the LEDs............................................................174
   Standard LED behavior when the router is powered on.....174
   Power LED is off or blinking..............................................174
   LEDs never turn off...........................................................174
   Internet or Ethernet LAN port LEDs are off.......................175
WiFi LED is off.................................................................175
You cannot log in to the router.................................175
You cannot access the Internet.................................176
Troubleshoot Internet browsing..............................178
Changes are not saved..............................................178
Troubleshoot WiFi connectivity............................179
Troubleshoot your network using the ping utility.....179
  Test the LAN path to your router.........................179
  Test the path from a Windows-based computer to a remote device.................................180

Appendix A Supplemental Information

  Factory settings.........................................................183
  Technical specifications...........................................184
1

Hardware Setup

This chapter contains the following sections:

• Unpack your router
• Top panel LEDs and buttons
• Rear panel
• Router label
• Extend the antennas
• Position your router
• Connect your router to a modem
• About the speed of your Internet connection
• Wall-mount your router

For more information about the topics covered in this manual, visit the support website at netgear.com/support.
Unpack your router

Your package contains the router, the power adapter, and an Ethernet cable.

Figure 1. Package contents
Top panel LEDs and buttons

The status LEDs and two buttons are located on the top panel of the router.

![Top view of the router](image)

Figure 2. Top view
Table 1. LED descriptions

<table>

</table>
Table 1. LED descriptions (Continued)

<table>
<thead>
<tr>
<th>LED and Button</th>
<th>Description</th>
</tr>
</thead>
</table>
| **LAN port 5 LED for either the Multi-Gig Internet port or the 1G Internet port** 5 | The LED color indicates the speed: white for a 2.5 Gbps connection (Multi-Gig Internet port only) and amber for a 1 Gbps or 100 Mbps Ethernet connection.  
  **Solid white** (Multi-Gig Internet port only): The router detected a 2.5 Gbps link with a powered-on device.  
  **Blinking white** (Multi-Gig Internet port only): The port is sending or receiving traffic at 2.5 Gbps.  
  **Solid amber**: The router detected a 1 Gbps or 100 Mbps link with a powered-on device.  
  **Blinking amber**: The port is sending or receiving traffic at 1 Gbps or 10 Mbps.  
  **Off**: No device is connected to this Ethernet port. |
| **USB 3.0 port LED** ![USB](image) | **Solid white**: A USB device is connected to USB 3.0 port and is ready.  
  **Blinking white**: A USB device is plugged in to USB 3.0 port and is trying to connect.  
  **Off**: No USB device is connected to USB 3.0 port, or someone clicked the **Safely Remove Hardware** button and it is now safe to remove the attached USB device. |
| **WiFi LED and button** ![WiFi](image) | Pressing the **WiFi** button for two seconds turns WiFi LED and WiFi radios on and off.  
  **Solid white**: The WiFi radios are on.  
  **Off**: The WiFi radios are turned off and you cannot use WiFi to connect to the router. |
| **WPS LED and button** ![WPS](image) | Pressing the **WPS** button lets your WPS-enabled device join your router’s WiFi network without typing the WiFi password.  
  **Solid white**: The WiFi radios are on and WPS is enabled.  
  **Blinking white**: The WPS process is active (the WPS button was pressed). When the WPS-enabled device connects to your router’s WiFi network, the LED lights solid white.  
  **Fast-blinking white**: The WPS-enabled device did not connect to your router’s WiFi network. |
Rear panel

The following figure shows the rear panel connectors and buttons.

Figure 3. Rear panel

The rear panel contains the following components:

1. **Reset button**: Pressing the **Reset** button resets the router.
   If the **Reset** button is pressed for at least 10 seconds and the Power LED blinks white, the router returns to its factory settings. For information about the factory settings, see Factory settings on page 183.

2. **1G Internet port/Ethernet LAN port 5**: One Gigabit Ethernet RJ-45 WAN port to connect your router to an Internet modem such as a cable modem or DSL modem. If you do not use the 1G Internet port for your Internet connection (for example, if you set up a Multi-Gig Internet connection using the Multi-Gig 2.5G/1G Ethernet port), you can use the 1G Internet port as an extra LAN port. Therefore, the port is also labeled LAN 5.

3. **LAN ports**: Use the four Gigabit Ethernet RJ-45 LAN ports to connect Ethernet LAN devices to your router.
   The router supports LAN port aggregation: You can use Ethernet ports 3 and 4 to set up a port aggregation link to a LAN device that also supports Ethernet port aggregation. For more information, see Manage Ethernet port aggregation to a LAN device on page 107.
4. **Multi-Gig 2.5G/1G Internet/Ethernet LAN port 5**: Use a Category 5e (Cat5e) Ethernet cable or higher rated Ethernet cable to connect a high-speed modem for a high-speed Internet connection. For more information, see Get Multi-Gig Internet with the Multi-Gig port on page 32.
   If you do not use the 2.5G/1G Internet port for your Internet connection (for example, if you set up a Gigabit Internet connection using the 1G Internet port), you can use the 2.5G/1G Internet port as an extra LAN port. For example, you can connect a high-speed LAN device such as a Multi-Gig Ethernet switch or ReadyNAS storage system to the port. Therefore, the port is also labeled LAN 5.

5. **USB-C 3.0 port**: Use the USB-C 3.0 port to connect a storage device to your router.

6. **Power On/Off button**: Press the Power On/Off button to provide power to the router.

7. **DC power connector**: Connect the power adapter that came in your product package to the DC power connector.

**Router label**

The router label shows the login information, WiFi Network Name (SSID), network key (password), serial number, and MAC address.

The following image is an example of what your router label might look like:

![Figure 4. RAXE300 router label](image-url)
Extend the antennas

Before you install your router, extend the antennas as shown in the following figure.

Figure 5. Position the antennas

Position your router

The router lets you access your network anywhere within the operating range of your WiFi network. However, the operating distance or range of your WiFi connection can vary significantly depending on the physical placement of your router.

In addition, position your router according to the following guidelines:

- Place your router near the center of the area where your computers and other devices operate, and within line of sight to your WiFi devices.
- Make sure that the router is within reach of an AC power outlet and near Ethernet cables for wired computers.
- Place the router in an elevated location, minimizing the number walls and ceilings between the router and your other devices.
- Place the router away from electrical devices such as these:
  - Ceiling fans
  - Home security systems
  - Microwaves
  - Computers
  - Base of a cordless phone
  - 2.4 GHz or 5 GHz cordless phones
• Place the router away from large metal surfaces, large glass surfaces, insulated walls, and items such as these:
  - Solid metal door
  - Aluminum studs
  - Fish tanks
  - Mirrors
  - Brick
  - Concrete

The following factors might limit the range of your WiFi:
• The thickness and number of walls the WiFi signal passes through can limit the range.
• Other WiFi access points in and around your home might affect your router’s signal. WiFi access points are routers, repeaters, WiFi range extenders, and any other devices that emit a WiFi signal for network access.

Connect your router to a modem

Before you can set up your router, you need to connect it to your existing modem.

**Note:** If your Internet connection does not require a modem, you can connect your main Internet Ethernet cable to your router.

After you connected your router to a modem and powered it on, finish your router’s installation process using the Nighthawk app or router web interface. For more information, see Connect to the network and access the router on page 20.
To connect your router to a modem and power it on:

1. If you own a modem, unplug the power from your modem, remove and reinsert the modem’s backup battery if it uses one, and then plug the modem back in.

2. Use the Ethernet cable that came with your router to connect an Ethernet port on the modem to the yellow Internet port on the router.

   **Note:** If your Internet connection does not require a modem, connect your main Ethernet cable to the yellow Internet port on the router.

3. Connect the power adapter to your router and plug the power adapter into a power outlet.

4. If the Power LED does not automatically light, press the **Power On/Off** button on the rear panel of the router.
   The router’s Power LED lights solid white when the router is ready.

About the speed of your Internet connection

If your ISP offers Internet speeds up to 1 Gbps, use the yellow 1G Internet port to connect the router to your modem. This is the most likely setup for your Internet connection.

However, if your ISP offers Internet speeds faster than 1 Gbps, you can use the yellow Multi-Gig 2.5G/1G Internet port on your router for your Internet connection (see Get Multi-Gig Internet with the Multi-Gig port on page 32). The Multi-Gig port supports speeds of up to 2.5 Gbps.

The Internet port that you do not use for your Internet connection can function as an extra LAN port (that is, as a LAN 5 port).
Wall-mount your router

You can wall-mount your router using the wall-mounting holes on the bottom of your router.

**Note:** We recommend using M3 x 20 mm screws.

![Figure 7. Bottom of the RAXE300 router](image)

**To wall-mount your router:**

1. Drill holes in the wall where you want to wall-mount your router.
2. Insert wall anchors in the holes.
3. Insert screws into the wall anchors, leaving 3/16 inch (0.5 cm) of each screw exposed.
4. Align the router’s wall-mounting holes with the screws and mount your router.
Connect to the network and access the router

You can connect to the router’s WiFi networks or use a wired Ethernet connection. This chapter explains the ways you can connect and how to access the router and log in.

The chapter contains the following sections:

- Connect to the router network
- Types of logins
- Install and manage your router with the Nighthawk app
- Use a web browser to access the router
- Change the language
Connect to the router network

You can connect to the router network using a wired, WiFi, or WPS connection.

**Note:** If you set up your computer to use a static IP address, change the settings so that it uses Dynamic Host Configuration Protocol (DHCP).

Connect to the router using a wired connection

You can connect your computer to the router using an Ethernet cable and join the router’s local area network (LAN).

**To connect your computer to the router with an Ethernet cable:**
1. Make sure that the router is receiving power (its Power LED is lit).
2. Connect an Ethernet cable to an Ethernet port on your computer.
3. Connect the other end of the Ethernet cable to an Ethernet port on the router.
   Your computer connects to the local area network (LAN).

Connect to the router WiFi network

You can connect WiFi-enabled devices to the router WiFi network using the router WiFi network name and password.

**To connect to the WiFi network:**
1. Make sure that the router is receiving power (its Power LED is lit).
2. On your WiFi-enabled device, open your device’s WiFi network management settings.
3. Find and select the router WiFi network name (SSID).
   The router WiFi network name (SSID) is on the router label.
4. Enter the router network key (password).
   The router network key (password) is on the router label.
   Your device connects to the WiFi network.

Connect to the WiFi network using WPS

You can connect WPS-enabled devices to the router’s WiFi network with Wi-Fi Protected Setup (WPS). Your router has a **WPS** button that you can use to connect WPS-enabled devices.
To use WPS to connect to the WiFi network:
1. Make sure that the router is receiving power (its Power LED is lit).
2. Check the WPS instructions for your WPS-enabled device.
3. Press the WPS button on the router.
4. Within two minutes, on your WPS-enabled device, press its WPS button or follow its instructions for how to connect using WPS.
   Your WPS-enabled device connects to the WiFi network.

Types of logins

Separate types of logins serve different purposes. It is important that you understand the differences so that you know which login to use when.

Several types of logins are associated with the router:

- **ISP login.** The login that your Internet service provider (ISP) gave you logs you in to your Internet service. Your ISP gave you this login information in a letter or some other way. If you cannot find this login information, contact your ISP.
- **WiFi network key, WiFi passphrase, or WiFi password.** Your router is preset with a unique WiFi network name (SSID) and password for WiFi access. This information is on the router label.
- **NETGEAR account login.** The free NETGEAR account that you need to register your router and manage your subscriptions. If you do not own a NETGEAR account, you can create one.
- **Router login.** The router login password that you need to log in to the router with the admin user name when you use a web browser to access the router.

Install and manage your router with the Nighthawk app

With the Nighthawk app, you can easily install and manage your router. The app automatically updates the router to the latest firmware, allows you to personalize your WiFi network, and even helps register your router with NETGEAR.

The Nighthawk app is available for iOS and Android mobile devices.
Note: Your router is not connected to the Internet until you finish setting it up with the app. If you are connected to your router’s WiFi network before the setup, you do not have Internet access and cannot download the app.

Use your cellular data or connect to your previous router’s WiFi network to download the app. During the installation, the app instructs you when you need to connect to your router’s WiFi.

To install your router using the Nighthawk app:
1. Visit Nighthawk-app.com to download the Nighthawk app.

   Note: To download the app, you need to use your cellular data or connect your mobile device to your previous router’s WiFi network.

2. Wait for the Nighthawk app to download on your mobile device.
3. Launch the Nighthawk app.
4. Follow the instructions that display in the app to install your router and connect to the Internet.

Use a web browser to access the router

When you connect to the network (either with WiFi or with an Ethernet cable), you can use a web browser to access the router to view or change its settings. When you access the router, the software automatically checks to see if your router can connect to your Internet service.

Automatic Internet setup

You can set up your router automatically, or you can use a web browser to access the router and set up your router manually. Before you start the setup process, get your ISP information and make sure that the computers and devices in the network are using the settings described here.

When your Internet service starts, your Internet service provider (ISP) typically gives you all the information needed to connect to the Internet. For DSL service, you might need the following information to set up your router:

- The ISP configuration information for your DSL account
- ISP login name and password
- Fixed or static IP address setting (special deployment by ISP; this setting is rare)
If you cannot locate this information, ask your ISP to provide it. When your Internet connection is working, you no longer need to launch the ISP login program on your computer to access the Internet. When you start an Internet application, your router automatically logs you in.

The NETGEAR installation assistant runs on any device with a web browser. Installation and basic setup takes about 15 minutes to complete.

**To automatically set up your router:**

1. Make sure that the router is powered on.
2. Make sure that your computer or mobile device is connected to the router with an Ethernet cable (wired) or over WiFi with the preset security settings listed on the label.

   **Note:** If you want to change the router’s WiFi settings, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

3. Launch a web browser.
   The page that displays depends on whether you accessed the router before:
   - The first time you set up the Internet connection for your router, the browser goes to [http://www.routerlogin.net](http://www.routerlogin.net) and the Configuring the Internet Connection page displays.
   - If you already set up the Internet connection, enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field for your browser to start the installation process.

4. Follow the onscreen instructions.
   The router connects to the Internet.

5. If the browser does not display the NETGEAR installation assistant, do the following:
   - Make sure that the computer is connected to one of the LAN Ethernet ports or over WiFi to the router.
   - Make sure that the router is receiving power and that its Power LED is lit.
   - Close and reopen the browser or clear the browser cache.
   - If the computer is set to a static or fixed IP address (this setting is uncommon), change it to obtain an IP address automatically from the router.

6. If the router does not connect to the Internet, do the following:
   a. Review your settings. Make sure that you selected the correct options and typed everything correctly.
   b. Contact your ISP to verify that you are using the correct configuration information.
Log in to the router

When you first connect to your router and launch a web browser, the browser automatically displays the router web interface. If you want to view or change settings for the router later, you can use a browser to log in to the router web interface.

**To log in to the router:**
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   
   **Note:** You can also enter `http://www.routerlogin.com` or `http://192.168.1.1`. The procedures in this manual use `http://www.routerlogin.net`.

   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   
   The BASIC Home page displays.

Change the language

By default, the language that displays when you log in to the router web interface is set to **Auto**.

**To change the language:**
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   
   The BASIC Home page displays.
4. In the upper right corner, select a language from the menu.
5. When prompted, click the **OK** button to confirm this change.
   The page refreshes with the language that you selected.
3

Specify Your Internet Settings

Usually, the quickest way to set up the router to use your Internet connection is to allow your router to detect the Internet connection automatically when you first access the router web interface. You can also customize and manually specify your Internet settings.

This chapter contains the following sections:

• **Use the Internet Setup Wizard**
• **Manually set up the Internet connection**
• **Specify IPv6 Internet connections**
• **Manage the MTU size**
Use the Internet Setup Wizard

You can use the Setup Wizard to detect your Internet settings and automatically set up your router. The Setup Wizard is not the same as the pages that display the first time you connect to your router to set it up.

To use the Setup Wizard:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Setup Wizard.
   The Setup Wizard page displays.
5. Select the Yes radio button.
   If you select the No radio button, you are taken to the Internet Setup page (see Manually set up the Internet connection on page 28).
6. Click the Next button.
   The Setup Wizard searches your Internet connection for servers and protocols to determine your Internet configuration.

Manually set up the Internet connection

You can view or change the router’s Internet connection settings.

Specify an Internet connection without a login

To specify the Internet connection settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.

4. Select **Internet**. The Internet Setup page displays.

5. In the Does your Internet connection require a login? section, leave the **No** radio button selected.

6. In the WAN Preference section, select one of the following options:
   - **Internet Port (1 Gbps)**. Select this option if you connected a modem to the Internet port on your router.
   - **Multi-Gig Port (2.5/1 Gbps)**. Select this option if you want to use the Multi-Gig port for your Internet connection. For more information, see Get Multi-Gig Internet with the Multi-Gig port on page 32.

7. If your Internet connection requires an account name or host name, do the following:
   a. In the Account Name (If Required) section, click the **Edit** button. The Device Name page displays. By default, the router model is the device name.
   b. Type the name in the **Device Name** field.
   c. Click the **Apply** button. Your settings are saved.
   d. Select **Internet**. The Internet Setup page displays again.

8. If your Internet connection requires a domain name, type it in the **Domain Name (If Required)** field. For the other sections on this page, the default settings usually work, but you can change them.

9. Select an Internet IP Address radio button:
   - **Get Dynamically from ISP**. Your ISP uses DHCP to assign your IP address. Your ISP automatically assigns these addresses.
   - **Use Static IP Address**. Enter the IP address, IP subnet mask, and the gateway IP address that your ISP assigned. The gateway is the ISP router to which your router connects.

10. Select a Domain Name Server (DNS) Address radio button:
Get Automatically from ISP. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.

Use These DNS Servers. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

11. Select a Router MAC Address radio button:
   - Use Default Address. Use the default MAC address.
   - Use Computer MAC Address. The router captures and uses the MAC address of the computer that you are now using. You must use the one computer that the ISP allows.
   - Use This MAC Address. Enter the MAC address that you want to use.

12. Click the Apply button.
   Your settings are saved.

13. Click the Test button to test your Internet connection.
   If the NETGEAR website does not display within one minute, see You cannot access the Internet on page 176.

Specify an Internet connection that uses a login

To view or change the basic Internet setup:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select Internet.
   The Internet Setup page displays.
5. In the Does your Internet connection require a login? section, select the Yes radio button.
6. In the **WAN Preference** section, select one of the following options:

   - **Internet Port (1 Gbps).** Select this option if you connected a modem to the Internet port on your router.
   - **Multi-Gig Port (2.5/1 Gbps).** Select this option if you want to use the Multi-Gig port for your Internet connection. For more information, see Get Multi-Gig Internet with the Multi-Gig port on page 32.

7. From the **Internet Service Provider** menu, select the encapsulation method: **PPPoE, L2TP, or PPTP.**

8. In the **Login** field, enter the login name that your ISP gave you. This login name is often an email address.

9. In the **Password** field, type the password that you use to log in to your Internet service.

10. If your ISP requires a service name, type it in the **Service Name (if Required)** field.

11. From the **Connection Mode** menu, select **Always On, Dial on Demand, or Manually Connect.**

12. To change the number of minutes until the Internet login times out, in the **Idle Timeout (In minutes)** field, type the number of minutes. This is how long the router keeps the Internet connection active when no one on the network is using the Internet connection. A value of 0 (zero) means never log out.

13. Select an Internet IP Address radio button:

   - **Get Dynamically from ISP.** Your ISP uses DHCP to assign your IP address. Your ISP automatically assigns these addresses.
   - **Use Static IP Address.** Enter the IP address, IP subnet mask, and the gateway IP address that your ISP assigned. The gateway is the ISP router to which your router connects.

14. Select a Domain Name Server (DNS) Address radio button:

   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

15. Select a Router MAC Address radio button:

   - **Use Default Address.** Use the default MAC address.
• **Use Computer MAC Address.** The router captures and uses the MAC address of the computer that you are now using. You must use the one computer that the ISP allows.

• **Use This MAC Address.** Enter the MAC address that you want to use.

16. Click the **Apply** button.
   Your settings are saved.

17. Click the **Test** button to test your Internet connection.
   If the NETGEAR website does not display within one minute, see **You cannot access the Internet** on page 176.

### Get Multi-Gig Internet with the Multi-Gig port

The Multi-Gig port on your router is an Ethernet port capable of speeds of up to 2.5 Gbps. You can connect a Multi-Gig capable device to the Multi-Gig port on your router and enjoy Multi-Gig speeds.

To set up the Multi-Gig port on your router for your Internet connection, you need the following:

- A service provider that offers an Internet speed that’s over 1 Gbps.
- A modem that supports a high-speed Ethernet port for an Internet speed that’s over 1 Gbps.

**To set up the Multi-Gig port on your router for your Internet connection:**

1. Connect the Multi-Gig port on the router to the high-speed Ethernet port on the modem.

2. Launch a web browser from a computer or mobile device that is connected to the router network.

   A login window opens.

4. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

5. Select **Internet**.
   The Internet Setup page displays.

6. In the WAN Preference section, select the **Multi-Gig Port (2.5/1 Gbps)** radio button.
7. Click the **Apply** button.
   Your settings are saved.

Specify IPv6 Internet connections

You can set up an IPv6 Internet connection if the router does not detect it automatically.

**To set up an IPv6 Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 page displays.
5. From the **Internet Connection Type** menu, select the IPv6 connection type:
   - If you are not sure, select **Auto Detect** so that the router detects the IPv6 type that is in use.
   - If your Internet connection does not use PPPoE or DHCP, or is not fixed, but is IPv6, select **Auto Config**.

   If you are not sure about your type of IPv6 connection, you can also ask your Internet service provider (ISP).
6. Click the **Apply** button.
   Your settings are saved.

Requirements for entering IPv6 addresses

IPv6 addresses are denoted by eight groups of hexadecimal quartets that are separated by colons. You can reduce any four-digit group of zeros within an IPv6 address to a single zero or omit it. The following errors invalidate an IPv6 address:

- More than eight groups of hexadecimal quartets
- More than four hexadecimal characters in a quartet
- More than two colons in a row
Use auto detect for an IPv6 Internet connection

To set up an IPv6 Internet connection through autodetection:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
   The IPv6 page displays.
5. From the Internet Connection Type menu, select Auto Detect.
   The page adjusts.
   The router automatically detects the information in the following fields:
   - **Connection Type.** This field indicates the connection type that is detected.
   - **Router’s IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
   - **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
6. Select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.
   This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).
7. (Optional) Select the Use This Interface ID check box and specify the interface ID to be used for the IPv6 address of the router’s LAN interface.
   If you do not specify an ID here, the router generates one automatically from its MAC address.
8. Select an IPv6 Filtering radio button:
   • **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   • **Open.** In open mode, the router inspects UDP packets only.

9. Click the **Apply** button.
   Your settings are saved.

---

**Set up an IPv6 6to4 tunnel Internet connection**

The remote relay router is the router to which your router creates a 6to4 tunnel. Make sure that the IPv4 Internet connection is working before you apply the 6to4 tunnel settings for the IPv6 connection.

**To set up an IPv6 Internet connection by using a 6to4 tunnel:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **6to4 Tunnel**.
   The page adjusts.
   The router automatically detects the information in the Router’s IPv6 Address on LAN field. This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select a Remote 6to4 Relay Router radio button:
   • **Auto.** Your router uses any remote relay router that is available on the Internet.
     This is the default setting.
• **Static IP Address.** Enter the static IPv4 address of the remote relay router. Your IPv6 ISP usually provides this address.

7. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

8. Select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

9. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router’s LAN interface.
   If you do not specify an ID here, the router generates one automatically from its MAC address.

10. Select an IPv6 Filtering radio button:
    - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
    - **Open.** In open mode, the router inspects UDP packets only.

11. Click the **Apply** button.
    Your settings are saved.

---

### Set up an IPv6 pass-through Internet connection

In pass-through mode, the router works as a Layer 2 Ethernet switch with two ports (LAN and WAN Ethernet ports) for IPv6 packets. The router does not process any IPv6 header packets.

**To set up a pass-through IPv6 Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net.**
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

   The IPv6 page displays.

5. From the Internet Connection Type menu, select Pass Through.
   The page adjusts, but no additional fields display.

6. Click the Apply button.
   Your settings are saved.

Set up an IPv6 fixed Internet connection

To set up a fixed IPv6 Internet connection:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
   The IPv6 page displays.
5. From the Internet Connection Type menu, select Fixed.
   The page adjusts.
6. Configure the fixed IPv6 addresses for the WAN connection:
   - IPv6 Address/Prefix Length. The IPv6 address and prefix length of the router WAN interface.
   - Default IPv6 Gateway. The IPv6 address of the default IPv6 gateway for the router’s WAN interface.
   - Primary DNS Server. The primary DNS server that resolves IPv6 domain name records for the router.
• **Secondary DNS Server.** The secondary DNS server that resolves IPv6 domain name records for the router.

**Note:** If you do not specify the DNS servers, the router uses the DNS servers that are configured for the IPv4 Internet connection on the Internet Setup page. (See Manually set up the Internet connection on page 28.)

7. Select an IP Address Assignment radio button:

• **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.

• **Auto Config.** This is the default setting.

This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

8. In the **IPv6 Address/Prefix Length** fields, specify the static IPv6 address and prefix length of the router’s LAN interface.

If you do not specify an ID here, the router generates one automatically from its MAC address.

9. Select an IPv6 Filtering radio button:

• **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.

• **Open.** In open mode, the router inspects UDP packets only.

10. Click the **Apply** button.

Your settings are saved.

Set up an IPv6 DHCP Internet connection

**To set up an IPv6 Internet connection with a DHCP server:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net.**

   A login window opens.

3. Enter the router admin user name and password.

   The user name is **admin.** The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**. The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **DHCP**. The page adjusts. The router automatically detects the information in the following fields:

- **Router’s IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

- **Router’s IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. (Optional) In the **User Class (If Required)** field, enter a host name. Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.

7. (Optional) In the **Domain Name (If Required)** field, enter a domain name. You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP’s mail server is mail.xxx.yyy.zzz, type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.

8. Select an IPv6 Domain Name Server (DNS) Address radio button:

- **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.

- **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

9. Select an IP Address Assignment radio button:

- **Use DHCP Server**. This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.

- **Auto Config**. This is the default setting. This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).
10. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router’s LAN interface.
   If you do not specify an ID here, the router generates one automatically from its MAC address.

11. Select an IPv6 Filtering radio button:
   - **Secured**. In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open**. In open mode, the router inspects UDP packets only.

12. Click the **Apply** button.
   Your settings are saved.

Set up an IPv6 PPPoE Internet connection

**To set up a PPPoE IPv6 Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 page displays.
5. From the **Internet Connection Type** menu, select **PPPoE**.
   The page adjusts.
   The router automatically detects the information in the following fields:
   - **Router’s IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
   - **Router’s IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the
prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. In the Login field, enter the login information for the ISP connection. This is usually the name that you use in your email address. For example, if your main mail account is JerAB@ISP.com, you would type JerAB in this field. Some ISPs (like Mindspring, Earthlink, and T-DSL) require that you use your full email address when you log in. If your ISP requires your full email address, type it in this field.

7. In the Password field, enter the password for the ISP connection.

8. In the Service Name field, enter a service name. If your ISP did not provide a service name, leave this field blank.

**Note:** The default setting of the Connection Mode menu is Always On to provide a steady IPv6 connection. The router never terminates the connection. If the connection is terminated, for example, when the modem is turned off, the router attempts to reestablish the connection immediately after the PPPoE connection becomes available again.

9. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

10. Select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

11. (Optional) Select the Use This Interface ID check box and specify the interface ID to be used for the IPv6 address of the router’s LAN interface. If you do not specify an ID here, the router generates one automatically from its MAC address.

12. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
• **Open.** In open mode, the router inspects UDP packets only.

13. Click the **Apply** button.
   Your settings are saved.

Use auto config for an IPv6 Internet connection

**To set up an IPv6 Internet connection through auto configuration:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **Auto Config**.
   The page adjusts.
   The router automatically detects the information in the following fields:

   • **Router’s IPv6 Address on WAN.** This field shows the IPv6 address that is acquired for the router’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

   • **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. **(Optional)** In the **DHCP User Class (If Required)** field, enter a host name.
   Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.

7. **(Optional)** In the **DHCP Domain Name (If Required)** field, enter a domain name.
   You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP’s mail server is mail.xxx.yyy.zzz, type
xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.

8. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

9. Select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

10. (Optional) Select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the router’s LAN interface.
    If you do not specify an ID here, the router generates one automatically from its MAC address.

11. Select an IPv6 Filtering radio button:
    - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
    - **Open.** In open mode, the router inspects UDP packets only.

12. Click the **Apply** button.
    Your settings are saved.

**Set up an IPv6 6rd Internet connection**

The 6rd protocol makes it possible to deploy IPv6 to sites using a service provider’s IPv4 network. 6rd uses the service provider’s own IPv6 address prefix. This limits the operational domain of 6rd to the service provider’s network and is under direct control of the service provider. The IPv6 service provided is equivalent to native IPv6. The 6rd mechanism relies on an algorithmic mapping between the IPv6 and IPv4 addresses that are assigned for use within the service provider’s network. This mapping allows for automatic determination of IPv4 tunnel endpoints from IPv6 prefixes, allowing stateless operation of 6rd.
With a 6rd tunnel configuration, the router follows the RFC5969 standard, supporting two ways to establish a 6rd tunnel IPv6 WAN connection:

- **Auto Detect mode.** In IPv6 Auto Detect mode, when the router receives option 212 from the DHCPv4 option, autodetect selects the IPv6 as 6rd tunnel setting. The router uses the 6rd option information to establish the 6rd connection.

- **Manual mode.** Select 6rd Tunnel. If the router receives option 212, the fields are automatically completed. Otherwise, you must enter the 6rd settings.

**To set up an IPv6 6rd Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**. A login window opens.

3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**. The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **6rd**. The page adjusts.

   The router automatically detects the information in the following sections:

   - **6rd (IPv6 Rapid Development) Configuration.** The router detects the service provider’s IPv4 network and attempts to establish an IPv6 6rd tunnel connection. If the IPv4 network returns 6rd parameters to the router, the page adjusts to display the correct settings in this section.

   - **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the router’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select an IPv6 Domain Name Server (DNS) Address radio button:

   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns this address.

   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.
7. Select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the router assigns IPv6 addresses to the devices on your home network (the LAN).

8. (Optional) Select the **Use This Interface ID** check box and specify the interface ID that you want to be used for the IPv6 address of the router’s LAN interface.

   If you do not specify an ID here, the router generates one automatically from its MAC address.

9. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

10. Click the **Apply** button.
    Your settings are saved.

Manage the MTU size

The maximum transmission unit (MTU) is the largest data packet a network device transmits.

MTU concepts

When one network device communicates across the Internet with another, the data packets travel through many devices along the way. If a device in the data path uses a lower maximum transmission unit (MTU) setting than the other devices, the data packets must be split or “fragmented” to accommodate the device with the smallest MTU.

The best MTU setting for NETGEAR equipment is often the default value. In some situations, changing the value fixes one problem but causes another. Leave the MTU unchanged unless one of these situations occurs:

- You experience problems connecting to your Internet service, and the technical support of either the Internet service provider (ISP) or NETGEAR recommends changing the MTU setting.
For example, if a secure website does not open, or displays only part of a web page, you might need to change the MTU.

- You use VPN and experience severe performance problems.
- You used a program to optimize MTU for performance reasons and now you are experiencing connectivity or performance problems.

**CAUTION:** An incorrect MTU setting can cause Internet communication problems. For example, you might not be able to access certain websites, frames within websites, secure login pages, or FTP or POP servers.

If you suspect an MTU problem, a common solution is to change the MTU to 1400. If you are willing to experiment, you can gradually reduce the MTU from the maximum value of 1500 until the problem goes away. The following table describes common MTU sizes and applications.

**Table 2. Common MTU sizes**

<table>
<thead>
<tr>
<th>MTU</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500</td>
<td>The largest Ethernet packet size. This setting is typical for connections that do not use PPPoE or VPN and is the default value for NETGEAR routers, adapters, and switches.</td>
</tr>
<tr>
<td>1492</td>
<td>Used in PPPoE environments.</td>
</tr>
<tr>
<td>1472</td>
<td>Maximum size to use for pinging. (Larger packets are fragmented.)</td>
</tr>
<tr>
<td>1468</td>
<td>Used in some DHCP environments.</td>
</tr>
<tr>
<td>1458</td>
<td>Used in PPPoA environments.</td>
</tr>
<tr>
<td>1436</td>
<td>Used in PPTP environments or with VPN.</td>
</tr>
</tbody>
</table>

**Change the MTU size**

**To change the MTU size:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password.
   - The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   - The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
   The WAN Setup page displays.

5. In the **MTU Size** field, enter a value from 616 to 1500.
6. Click the **Apply** button.
   Your settings are saved.
Control Access to the Internet

The router comes with a built-in firewall that helps protect your home network from unwanted intrusions from the Internet.

This chapter contains the following sections:

• Manage NETGEAR Armor
• Network access control list
• Use keywords to block Internet sites
• Delete keywords from the blocked list
• Block services from the Internet
• Prevent blocking on a trusted computer
• Schedule when to block Internet sites and services
• Set up security event email notifications
Manage NETGEAR Armor

Your router supports NETGEAR Armor. After you start your subscription, NETGEAR Armor protects your home network from potential cyber threats and provides complete data protection, advanced threat defense, webcam protection, multilayer ransomware protection, anti-phishing, safe files, secure browsing, rescue mode, anti-fraud, and anti-theft. In addition, NETGEAR Armor provides multiple performance and privacy tools.

NETGEAR Armor can support features for your Windows-based computers and your Mac OS, iOS, and Android devices.

For more information about NETGEAR Armor, visit netgear.com/landings/armor/default.aspx.

You can manage NETGEAR Armor from the Nighthawk app.

Activate Armor using the Nighthawk app

To activate Armor using the Nighthawk app:
1. Launch the Nighthawk app.
   The dashboard displays.
2. Tap **Security**.
   The Armor page displays.
3. Tap the **ACTIVATE** button.
   Armor is activated.

View or change your NETGEAR Armor settings using the Nighthawk app

To view or change your NETGEAR Armor settings using the Nighthawk app:
1. Launch the Nighthawk app.
   The dashboard displays.
2. Tap **Security**.
   The Armor page displays.
   You can now view or change the settings.
Network access control list

You can use the network access control list (ACL) to block or allow access to your network and the Internet through your router. An ACL functions with the MAC addresses of WiFi and wired devices that the router detects on the network and that you can either allow access to your network or deny access to your network. That is, the router can detect the MAC addresses of devices that are or were connected to the its network and list the MAC addresses of these devices.

If you set up a network ACL with an access rule that allows access to the network, devices on the network ACL are an exception to the access rule:

- A device for which you place the MAC address on the network ACL is denied access to the network.
- All other devices are allowed access to the network.

If you set up a network ACL with an access rule that denies access to the network, devices on the network ACL are an exception to the access rule:

- A device for which you place the MAC address on the network ACL is allowed access to the network.
- All other devices are denied access to the network.

**Note:** Each network device has a MAC address, which is a unique 12-character physical address, containing the hexadecimal characters 0–9, a–f, or A–F (uppercase or lowercase) only, and separated by colons (for example, 00:09:AB:CD:EF:01). Typically, the MAC address is on the label of a device. If you cannot see the label, you can display the MAC address using the network configuration utilities of a computer.

Enable the network access control list and set the access rule

When you enable network access control, you must select whether new devices are allowed to access the network or are blocked from accessing the network. By default, connected devices are allowed access to the network, but you can also block these devices from accessing the network.

**To enable and manage the network access control list for the entire network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. 
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. 
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Access Control**. 
   The Access Control page displays.

5. Select the **Turn on Access Control** check box. 
   You must select this check box before you can specify an access rule and use the **Allow** and **Block** buttons. When the **Turn on Access Control** check box is cleared, all devices are allowed to connect, even if a device is in the list of blocked devices.

6. Click the **Apply** button. 
   Your settings are saved.

7. Select an access rule for new devices:
   - **Allow all new devices to connect**: With this setting, if you add a new device, it can access the network. You do not need to enter its MAC address on this page. We recommend that you leave this radio button selected.
   - **Block all new devices from connecting**: With this setting, if you add a new device, before it can access the network, you must enter its MAC address for an Ethernet connection and its MAC address for a WiFi connection in the allowed list. For more information, see **Manage the allowed devices on the network ACL** on page 52.

   The access rule does not affect previously blocked or allowed devices. It applies only to devices joining the network in the future after you apply these settings.

8. To manage access for devices that are connected or were connected to the network, do the following:
   - If you blocked all new devices from connecting, to allow the device that you are currently using to continue to access the network, select the check box next to your computer or device in the table, and click the **Allow** button.
   - To either continue to allow or to block other computers and devices that are connected or were connected, select the check box next to the device in the table, and click either the **Allow** button or the **Block** button.

9. Click the **Apply** button. 
   Your settings are saved.
Manage the allowed devices on the network ACL

If you set up an access control list (ACL) that blocks all new devices from accessing the network, you must specify which devices are allowed to access the network.

You can add a device, remove a device, or edit the information for a device.

**To manage devices that are allowed to access to network:**
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is *admin*. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > Access Control**.
   The Access Control page displays.
5. Click the **View list of allowed devices not currently connected to the network** link.
   A table displays the detected device name, MAC address, and connection type of the devices that are not connected but allowed to access the network.
6. To add a device to the allowed list, do the following:
   a. Click the **Add** button.
      The Add Allowed Device page displays.
   b. Enter the MAC address and device name for the device that you want to allow.
   c. On the Add Allowed Device page, click the **Apply** button.
      The device is added to the allowed list on the Access Control page.
7. To remove a device from the allowed list, do the following:
   a. Select the check box for the device.
   b. Click the **Remove from the list** button.
      The device is removed from the allowed list.
8. To change the information for a device on the allowed list, do the following:
   a. Select the check box for the device.
   b. Click the **Edit** button.
      The Edit Device Name page displays.
   c. Change the access rule or device name.
   d. On the Edit Device Name page, click the **Apply** button.
      The device is changed on the allowed list on the Access Control page.

9. Click the **Apply** button.
   Your settings are saved.

Manage the blocked devices on the network ACL

If you set up an access control list (ACL) that allows all new devices to access the network but you want to block some devices from accessing the network, you must specify the devices that you want to block.

You can add a device, remove a device, or change the information for a device.

**To manage devices that are blocked from accessing the network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > Access Control**.
   The Access Control page displays.
5. Click the **View list of blocked devices not currently connected to the network** link.
   The Access Control page displays.
   A table displays the detected device name, MAC address, and connection type of the devices that are not connected and are blocked from accessing the network.
6. To add a device to the blocked list, do the following:
   a. Click the **Add** button.
      The Add Blocked Device page displays.
   b. Enter the MAC address and device name for the device that you want to block.
   c. On the Add Blocked Device page, click the **Apply** button.
      The device is added to the blocked list on the Access Control page.

7. To remove a device from the blocked list, do the following:
   a. Select the check box for the device.
   b. Click the **Remove from the list** button.
      The device is removed from the blocked list.

8. To change the information for a device on the blocked list, do the following:
   a. Select the check box for the device.
   b. Click the **Edit** button.
      The Edit Device Name page displays.
   c. Change the access rule or device name.
   d. On the Edit Device Name page, click the **Apply** button.
      The device is changed on the blocked list on the Access Control page.

9. Click the **Apply** button.
   Your settings are saved.

Use keywords to block Internet sites

You can use keywords to block certain Internet sites from your network. You can use blocking all the time or based on a schedule.

**Note:** Keyword blocking only works for website URLs that begin with http:// only. It does not work for URLs that begin with https://.

**To block Internet sites:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
A login window opens.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

   The Block Sites page displays.

5. Select a keyword blocking option:
   - **Per Schedule.** Turn on keyword blocking according to a schedule that you set. For more information, see Schedule when to block Internet sites and services on page 58.
   - **Always.** Turn on keyword blocking all the time, independent of the Schedule page.

6. In the Type keyword or domain name here field, enter a keyword or domain that you want to block.
   For example:
   - Specify the domain suffix (for example, .com) if you want to block only sites with a domain suffix such as .com. In such a situation, sites with domain suffixes such as .edu and .gov are still allowed.
   - Enter a period (.) to block all Internet browsing access.

7. Click the Add Keyword button.
   The keyword is added to the keyword list. The keyword list supports up to 32 entries.

8. Click the Apply button.
   Keyword blocking takes effect.

Delete keywords from the blocked list

To delete keywords from the list:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Sites**.
The Block Sites page displays.

5. Do one of the following:
   - To delete a single word, select it and click the **Delete Keyword** button. The keyword is removed from the list.
   - To delete all keywords on the list, click the **Clear List** button. All keywords are removed from the list.

6. Click the **Apply** button. Your settings are saved.

**Block services from the Internet**

You can block Internet services on your network based on the type of service. You can block the services all the time or based on a schedule.

**Note:** Service blocking only works for website URLs that begin with http:// only. It does not work for URLs that begin with https://.

**To block services:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Services**.
The Block Services page displays.

5. Specify when to block the services:
• To block the services all the time, select the **Always** radio button.
• To block the services based on a schedule, select the **Per Schedule** radio button.

For information about how to specify the schedule, see Schedule when to block Internet sites and services on page 58.

6. Click the **Add** button.
   The Block Services Setup page displays.

7. To add a service that is in the **Service Type** menu, select the application or service. The settings for this service automatically display in the fields.

8. To add a service or application that is not in the menu, select **User Defined**, and do the following:
   a. If you know that the application uses either TCP or UDP, select the appropriate protocol. Otherwise, select **TCP/UDP** (both).
   b. Enter the starting port and ending port numbers. If the service uses a single port number, enter that number in both fields. To find out which port numbers the service or application uses, you can contact the publisher of the application, ask user groups or newsgroups, or search on the Internet.

9. Select a filtering option:
   • **Only This IP Address**. Block services for a single computer.
   • **IP Address Range**. Block services for a range of computers with consecutive IP addresses on your network.
   • **All IP Addresses**. Block services for all computers on your network.

10. Click the **Add** button.
   Your settings are saved.

### Prevent blocking on a trusted computer

You can exempt one trusted computer from blocking. The computer that you exempt must be assigned a fixed IP address. You can use the reserved IP address feature to specify the IP address. See Manage reserved LAN IP addresses on page 93.

**To specify a trusted computer:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Sites**.
   The Block Sites page displays.

5. Scroll down and select the **Allow trusted IP address to visit blocked sites** check box.

6. In the **Trusted IP Address** field, enter the IP address of the trusted computer.

7. Click the **Apply** button.
   Your settings are saved.

## Schedule when to block Internet sites and services

When you schedule blocking, the same schedule is used to block sites and to block services.

**To schedule blocking:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Schedule**.
   The Schedule page displays.
5. Specify when to block keywords and services:
   - **Days to Block.** Select the check box for each day that you want to block the keywords, or select the **Every Day** check box, which automatically selects the check boxes for all days.
   - **Time of Day to Block.** Select a start and end time in 24-hour format, or select the **All Day** check box for 24-hour blocking.

6. Click the **Apply** button.
   Your settings are saved.

### Set up security event email notifications

The router can email you its logs of router activity. The log records router activity and security events such as attempts to access blocked sites or services.

**To set up email notifications:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > E-mail**.
   The E-mail page displays.
5. Select the **Turn E-mail Notification On** check box.
6. In the **Primary E-mail Address** field, type the email address to which logs and alerts are to be sent.
   This email address is also used for the From address. If this field is blank, log and alert messages are not sent.
7. In the **Your Outgoing Mail Server** field, enter the name of your ISP outgoing (SMTP) mail server (such as mail.myISP.com).
   You might be able to find this information in the configuration window of your email program. If you leave this field blank, log and alert messages are not sent.
8. In the **Outgoing Mail Server Port Number** field, enter a port number in the field. If you do not know the port number, leave the default port number.

9. If your outgoing email server requires authentication, select the **My Mail Server requires authentication** check box, and do the following:
   a. In the **User Name** field, type the user name for the outgoing email server.
   b. In the **Password** field, type the password for the outgoing email server.

10. To send alerts when someone attempts to visit a blocked site, select the **Send Alerts Immediately** check box.
    Email alerts are sent immediately when someone attempts to visit a blocked site.

11. To send logs based on a schedule, specify these settings:
    a. From **Send logs according to this schedule** menu, select the schedule type.
    b. For a weekly schedule, from the **Day** menu, select the day.
    c. For a weekly or daily schedule, from the **Time** menu, select the time, and select the **am** or **pm** radio button.

12. Click the **Apply** button.
    Your settings are saved.
    Logs are sent automatically according to the schedule that you set. If the log fills before the specified time, it is sent. After the log is sent, it is cleared from the router memory. If the router cannot email the log and the log buffer fills, the router overwrites the log.
Manage WiFi Settings

You can customize the router’s WiFi settings.

This chapter contains the following sections:

- Use the WPS Wizard for WiFi connections
- Specify basic WiFi settings
- Change the WiFi mode
- Change the WiFi password or the WiFi security
- Set up a guest WiFi network
- Configure WPA/WPA2 Enterprise WiFi security
- Control the WiFi radios
- Enable or disable AX WiFi
- Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio
- Enable or disable OFDMA
- Change the transmission power control
- Set up a WiFi schedule
- Enable or disable Smart Connect
- Enable or disable implicit beamforming
- Enable or disable MU-MIMO
- Enable or disable PMF
- Enable or disable WPA3 H2E
Use the WPS Wizard for WiFi connections

WPS (Wi-Fi Protected Setup) lets you connect a WPS-enabled device to your WiFi network without typing the WiFi password. Instead, you push a button or enter a PIN to connect.

If you use the push button method, the device that you are trying to connect must provide either a physical button or a software button. If you use the PIN method, you must know the PIN of the device that you are trying to connect.

**Note:** You cannot use the WPS Wizard to connect a device to a guest network.

Use the WPS Wizard with the push button

To use the push button method to connect a WiFi device to the your WiFi network, the device must have either a physical button or a software button.

**To use the WPS Wizard with the push button:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > WPS Wizard**. A note explaining WPS displays.
5. Click the **Next** button.
   The Add WPS Client page displays.
   By default, the **Push Button (recommended)** radio button is selected.
6. Click the **WPS** button that is displayed on the page.
7. Within two minutes, go to the WPS-enabled device and use its WPS software to connect to the WiFi network.
   The WPS process automatically sets up the WPS-enabled device with the network password when it connects. The router web interface displays a confirmation message.
Use the WPS Wizard with a PIN number

To use a PIN number to connect a WiFi device to the your WiFi network, you must know the PIN number of the device.

To use the WPS Wizard with a PIN number:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select **ADVANCED > WPS Wizard**. A note explaining WPS displays.
5. Click the **Next** button. The Add WPS Client page displays.
   - By default, the **Push Button (recommended)** radio button is selected.
6. Select the **PIN Number** radio button.
7. In the **Enter Clients' PIN** field, enter the PIN number of the device.
8. Click the **Next** button.
   - For four minutes, the router attempts to find the WiFi device.
9. Within four minutes, go to the WiFi device and use its WPS software to join the network without entering a password. The WPS process automatically sets up the WPS-enabled device with the network password when it connects. The router web interface displays a confirmation message.

Specify basic WiFi settings

The router comes with preset security. This means that the WiFi network name (SSID), network key (password), and security option (encryption protocol) are preset in the factory. You can find the preset SSID and password on the router label.
**Note:** The preset SSID and password are uniquely generated for every device to protect and maximize your WiFi security.

If you change your preset security settings, make a note of the new settings and store it in a safe place where you can easily find it.

**Note:** If your computer is connected with WiFi when you change the SSID or other WiFi security settings, you are disconnected when you click the **Apply** button. To avoid this problem, use a computer with a wired connection to access the router.

**To specify basic WiFi settings:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**. A login window opens.

3. Enter the router admin user name and password.
   - The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   - The BASIC Home page displays.

4. Select **Wireless**.
   - The Wireless Settings page displays.
   - You can specify the settings for the 2.4 GHz band, 5 GHz band, and 6 GHz band.

5. From the **Region** menu, select your region.
   - In some locations, you cannot change this setting.

6. To control the SSID broadcast, select or clear the **Enable SSID Broadcast** check box.
   - When this check box is selected, the router broadcasts its network name (SSID) so that it displays when you scan for local WiFi networks on your computer or mobile device.

7. To change the network name (SSID), type a new name in the **Name (SSID)** field.
   - The name can be up to 32 characters long and it is case-sensitive. The default SSID is randomly generated and is on the router label. If you change the name, make sure to write down the new name and keep it in a safe place.

8. To change the WiFi channel, select a number from the **Channel** menu.
In some regions, not all channels are available. Do not change the channel unless you experience interference (shown by lost connections or slow data transfers). If this happens, experiment with different channels to see which is the best.

When you use multiple access points, it is better if adjacent access points use different channels to reduce interference. The recommended channel spacing between adjacent access points is four channels (for example, in the 2.4 GHz band, use Channels 1 and 5, or 6 and 10).

**Note:** If you are using a WiFi 6E device, use a Preferred Scanning Channel (PSC) to prevent a situation in which your device cannot find the SSID. PSCs are a group of 20 MHz channels that are prioritized within the 6 GHz WiFi band. Instead of scanning the entire 6 GHz spectrum for an optimal channel, WiFi 6E devices scan PSCs for efficient connectivity. The PSCs on the router are channels 5, 21, 37 (default), 53, 69, 85, 101, 117, 133, 149, 165, 181, 197, and 213. The availability of the channels depends on the region in which the router operates.

9. Click the **Apply** button.
   Your settings are saved.
   If you connected wirelessly to the network and you changed the SSID, you are disconnected from the network.

10. Make sure that you can connect wirelessly to the network with its new settings.
    If you cannot connect wirelessly, check the following:
    - Is your computer or mobile device connected to another WiFi network in your area? Some WiFi devices automatically connect to the first open network without WiFi security that they discover.
    - Is your computer or mobile device trying to connect to your network with its old settings (before you changed the settings)? If so, update the WiFi network selection in your computer or mobile device to match the current settings for your network.

**Change the WiFi mode**

The WiFi mode options for the 2.4 GHz, 5 GHz, and 6 GHz WiFi networks depend on whether AX WiFi is enabled. For more information about AX WiFi, see [Enable or disable AX WiFi](#) on page 77.
Change the WiFi mode if AX WiFi is enabled

To change the WiFi mode if AX WiFi is enabled:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter http://www.routerlogin.net.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

   The Wireless Settings page displays.

5. In the Wireless Network (2.4 GHz b/g/n/ax) section, select a WiFi mode from the Mode menu.
   - **Up to 54 Mbps.** This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, but limits 802.11ax and 802.11n devices to functioning at up to 54 Mbps.
   - **Up to 286 Mbps.** This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, but limits 802.11ax and 802.11n devices to functioning at up to 286 Mbps.
   - **Up to 600 Mbps.** This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, and allows 802.11ax and 802.11n devices to function at up to 600 Mbps. This mode is the default mode.

6. In the Wireless Network (5 GHz a/n/ac/ax) section, select a WiFi mode from the Mode menu.
   - **Up to 573 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, but limits 802.11ax, 802.11ac, and 802.11n devices to functioning at up to 573 Mbps.
   - **Up to 1147 Mbps.** This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, but limits 802.11ax and 802.11ac devices to functioning at up to 1147 Mbps.
7. In the Wireless Network (6 GHz a/n/ac/ax) section, select a WiFi mode from the **Mode** menu.

- **Up to 286 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, but limits 802.11ax, 802.11ac and 802.11n devices to functioning at up to 286 Mbps.

- **Up to 600 Mbps.** This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, but limits 802.11ax and 802.11ac devices to functioning at up to 600 Mbps.

- **Up to 1200 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, and allows 802.11ax and 802.11ac devices to function at up to 1200 Mbps. This mode is the default mode.

- **Up to 2400 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network and allows 802.11ax and 802.11ac devices to function at up to 2400 Mbps.

8. Click the **Apply** button.

Your settings are saved.

---

### Change the WiFi mode if AX WiFi is disabled

**To change the WiFi mode settings if AX WiFi is disabled:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter `http://www.routerlogin.net`.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **Wireless**.
   The Wireless Settings page displays.

5. In the Wireless Network (2.4 GHz b/g/n/ax) section, select a WiFi mode from the **Mode** menu.

   - **Up to 54 Mbps**. This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, but limits 802.11ax and 802.11n devices to functioning at up to 54 Mbps.

   - **Up to 145 Mbps**. This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, but limits 802.11ax and 802.11n devices to functioning at up to 145 Mbps.

   - **Up to 300 Mbps**. This mode allows 802.11ax, 802.11n, 802.11g, and 802.11b devices to join the selected WiFi network in the 2.4 GHz band of the network, and allows 802.11ax and 802.11n devices to function at up to 300 Mbps. This mode is the default mode.

6. In the Wireless Network (5 GHz a/n/ac/ax) section, select a WiFi mode from the **Mode** menu.

   - **Up to 346 Mbps**. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, but limits 802.11ax, 802.11ac, and 802.11n devices to functioning at up to 346 Mbps.

   - **Up to 800 Mbps**. This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, but limits 802.11ax and 802.11ac devices to functioning at up to 800 Mbps.

   - **Up to 1733 Mbps**. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, and allows 802.11ax and 802.11ac devices to function at up to 1733 Mbps. This mode is the default mode.

   - **Up to 3466 Mbps**. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 5 GHz band of the network, and allows 802.11ax and 802.11ac devices to function at up to 3466 Mbps.
7. In the Wireless Network (6 GHz a/n/ac/ax) section, select a WiFi mode from the Mode menu.

- **Up to 286 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, but limits 802.11ax, 802.11ac and 802.11n devices to functioning at up to 286 Mbps.

- **Up to 600 Mbps.** This mode allows for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, but limits 802.11ax and 802.11ac devices to functioning at up to 600 Mbps.

- **Up to 1200 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network, and allows 802.11ax and 802.11ac devices to function at up to 1200 Mbps. This mode is the default mode.

- **Up to 2400 Mbps.** This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the selected WiFi network in the 6 GHz band of the network and allows 802.11ax and 802.11ac devices to function at up to 2400 Mbps.

8. Click the **Apply** button.
   
   Your settings are saved.

### Change the WiFi password or the WiFi security

The WiFi password is different from the admin password that you use to log in to the router.

Your router comes with preset security settings. We recommend that you use the preset security settings, but you can change the settings. Do not disable the preset security.

For information about configuring WAP/WPA2 Enterprise security, see Configure WPA/WPA2 Enterprise WiFi security on page 74.

**To change the WiFi password or the WiFi security:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

   
   A login window opens.

3. Enter the router admin user name and password.
The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

The Wireless Settings page displays.

5. To change the 2.4 GHz, 5 GHz, or 6 GHz WiFi password, enter a new password in the Password (Network Key) field.

For the 2.4 GHz and 5 GHz WiFi networks, the Password (Network Key) field displays for the following WiFi security options:

- **WPA2-PSK [AES]**: To change the password for this security option, you must enter a password that contains 8 to 63 characters.
- **WPA-PSK [TKIP] + WPA2-PSK [AES]**: To change the password for this security option, you must enter a password that contains 8 to 63 characters.
- **WPA3-PSK**: To change the password for this security option, you must enter a password that contains 8 to 127 characters.
- **WPA2-PSK [TKIP] + WPA3-PSK**: To change the password for this security option, you must enter a password that contains 8 to 63 characters.

For the 6 GHz WiFi network, the Password (Network Key) field displays for the WPA3-PSK WiFi security option. To change the password for this security option, you must enter a password that contains 8 to 127 characters.

**Note:** By default, your password is hidden. To display your password, click the icon next to the Password field.

6. To change the type of WiFi security for the 2.4 GHz or 5 GHz WiFi network, select a Security Options radio button:

- **None.** An open WiFi network that does not provide any security. Any WiFi device can join the WiFi network. We recommend that you do not use an open WiFi network.
- **WPA2-PSK [AES].** This security option is the default setting. This security option enables WiFi devices that support WPA2 to join the router’s WiFi network. If you did not change the WiFi password, the default password displays. The default password is printed on the router label. WPA2 provides a secure connection but some older WiFi devices do not detect WPA2 and support only WPA. If your network includes such older devices, select WPA-PSK [TKIP] + WPA2-PSK [AES] security.
- **WPA-PSK [TKIP] + WPA2-PSK [AES].** This security option enables WiFi devices that support either WPA or WPA2 to join the router’s WiFi network. However,
WPA-PSK [TKIP] is less secure than WPA2-PSK [AES] and limits the speed of WiFi devices to 54 Mbps.

- **WPA3-PSK.** This security option enables WiFi devices that support WPA3 to join the WiFi network. WPA3 is the latest security standard, uses SAE encryption, and is more secure than WPA2. If all devices on your network support WPA3, we recommend that you use this type of security. If your network includes devices that do not support WPA3, select WPA2-PSK [TKIP] + WPA3-PSK security.

- **WPA2-PSK [TKIP] + WPA3-PSK.** This security option enables WiFi devices that support either WPA2 or WPA3 to join the router’s WiFi network. However, WPA3PSK [TKIP] is less secure than WPA3-PSK.

7. To change the type of WiFi security for the 6 GHz WiFi network, select a Security Options radio button:
   - **Enhanced Open.** This security option allows you to set up an open WiFi network for public use, and provides data protection and encryption to your open WiFi network. If you select this security option, devices will not be required to enter a password to join the network.
   - **WPA3-PSK.** This security option enables WiFi devices that support WPA3 to join the WiFi network. WPA3 is the latest security standard, uses SAE encryption, and is more secure than WPA2. If all devices on your network support WPA3, we recommend that you use this type of security.

8. Click the Apply button.
   Your settings are saved.

## Set up a guest WiFi network

A guest WiFi network allows visitors to use the Internet without using your WiFi security password or with a different WiFi password. By default, the guest WiFi network is disabled. You can enable and configure the guest WiFi network for each WiFi band.

For the 2.4 GHz band, the router supports a guest network for 802.11ax, 802.11n, 802.11g, and 802.11b devices. For the 5 GHz band, the router supports a guest network for 802.11ax, 802.11ac, 802.11n, and 802.11a devices. For the 6 GHz band, the router supports a guest network for 802.11ax devices.

The WiFi mode of the guest WiFi network depends on the WiFi mode of the main WiFi network. For example, if you configure the WiFi mode for the main WiFi network as Up to 54 Mbps in the 2.4 GHz band, the guest WiFi network also functions in the Up to 54 Mbps mode in the 2.4 GHz band. The channel also depends on the channel selection of the main WiFi network.
The router provides three default guest WiFi networks with the following names (SSIDs):

- **2.4 GHz guest WiFi network SSID**. NETGEAR-Guest
- **5 GHz guest WiFi network SSID**. NETGEAR-5G-Guest
- **6 GHz guest WiFi network SSID**. NETGEAR-6G-Guest

By default, these networks are configured as open networks without security but are disabled. You can enable one, two, or all networks. You can also change the SSIDs for these networks.

**To set up a guest WiFi network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **Guest Network**.
   The Guest Network Settings page displays.
5. Configure the following settings to set up a 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network:
   - **Enable Guest Network**. By default, the guest WiFi network is disabled. To enable the guest WiFi network for the 2.4 GHz, 5 GHz, or 6 GHz WiFi band, select the **Enable Guest Network** check box.
   - **Enable SSID Broadcast**. By default, the router broadcasts the SSID of the WiFi band so that WiFi stations can detect the WiFi name (SSID) in their scanned network lists. To turn off the SSID broadcast for the 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network, clear the **Enable SSID Broadcast** check box.
   - **Allow guests to see each other and access my local network**. By default, WiFi clients that are connected to the 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network cannot access WiFi devices or Ethernet devices that are connected to the main WiFi network. To allow access to the main WiFi network, select the **Allow guests to see each other and access my local network** check box.
   - **Guest Wireless Network Name (SSID)**. The SSID is the 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network name. The default 2.4 GHz SSID is NETGEAR-Guest. The default 5 GHz SSID is NETGEAR-5G-Guest. The default 6 GHz SSID is NETGEAR-6G-Guest.
To change the SSID, enter a 32-character (maximum), case-sensitive name in this field.

6. Select a WiFi security option for the 2.4 GHz or 5 GHz guest WiFi network:

- **None.** An open WiFi network that does not provide any security. Any WiFi device can join the 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network. This is the default setting for the guest WiFi network.

- **WPA2-PSK [AES].** WPA2 provides a secure and fast connection but some older WiFi devices do not detect WPA2 and support only WPA. Select WPA2-PSK [AES] security to allow 802.11n devices to connect to the 2.4 GHz, 5 GHz, or 6 GHz guest WiFi network at the fastest speed. If your guest WiFi network includes older devices that do not support WPA2, select WPA-PSK [TKIP] + WPA2-PSK [AES] security. To use WPA2 security, in the **Password (Network Key)** field, enter a phrase of 8 to 63 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.

- **WPA-PSK [TKIP] + WPA2-PSK [AES].** This type of security enables WiFi devices that support either WPA or WPA2 to join the 2.4 GHz band of the guest WiFi network. However, WPA-PSK [TKIP] is less secure than WPA2-PSK [AES] and limits the speed of WiFi devices to 54 Mbps. To use WPA + WPA2 security, in the **Password (Network Key)** field, enter a phrase of 8 to 63 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.

- **WPA3-PSK.** This type of security enables WiFi devices that support WPA3 to join the guest WiFi network. WPA3 is the latest security standard, uses SAE encryption, and is more secure than WPA2. If all devices on your guest WiFi network support WPA3, we recommend that you use this type of security. To use WPA3 security, in the **Password (Network Key)** field, enter a phrase of 8 to 127 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.

- **WPA2 + WPA3.** This type of security, which is the same as WPA3/WPA2-PSK, enables WiFi devices that support either WPA3 or WPA2 to join the guest WiFi network. This type of security uses SAE and AES encryption. WPA2-PSK (which uses AES) is less secure than WPA3 (which uses SAE). In the Passphrase field, enter a phrase of 8 to 63 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this passphrase. To use WPA2 + WPA3 security, in the **Password (Network Key)** field, enter a phrase of 8 to 127 characters. To join the 2.4 GHz or 5 GHz guest WiFi network, a user must enter this password.

7. Select a WiFi security option for the 6 GHz guest WiFi network:

- **Enhanced Open.**

- **WPA3-Personal.** This type of security enables WiFi devices that support WPA3 to join the guest WiFi network. WPA3 is the latest security standard, uses SAE encryption, and is more secure than WPA2. If all devices on your guest WiFi
network support WPA3, we recommend that you use this type of security. To use WPA3 security, in the Password (Network Key) field, enter a phrase of 8 to 127 characters. To join the 6 GHz guest WiFi network, a user must enter this password.

8. Click the **Apply** button.
Your settings are saved.

**Configure WPA/WPA2 Enterprise WiFi security**

Remote Authentication Dial In User Service (RADIUS) is an enterprise-level method for centralized Authentication, Authorization, and Accounting (AAA) management. To enable the router to provide WPA and WPA2 enterprise WiFi security, the WiFi network that the router provides must be able to access a RADIUS server.

WPA/WPA2 Enterprise security is an option for the 2.4 GHz band and 5 GHz band.

**Note:** When you configure WPA/WPA2 Enterprise security on the router, WPS is disabled.

**To configure WPA and WPA2 enterprise security:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **Wireless**.
   The Wireless Settings page displays.

5. Scroll down to the Wireless Network (2.4 GHz b/g/n/ax) section or the Wireless Network (5 GHz a/n/ac/ax) section, and select the **WPA/WPA2 Enterprise** radio button.
6. Enter the following WPA/WPA2 Enterprise settings:

- **Encryption mode.** From the Encryption Mode menu, select the enterprise mode:
  - **WPA2 [AES].** This is the default mode. WPA2 provides a secure connection but some older WiFi devices do not detect WPA2 and support only WPA. If your network includes such older devices, select WPA [TKIP] + WPA2 [AES] security.
  - **WPA [TKIP] + WPA2 [AES].** This type of security enables WiFi devices that support either WPA or WPA2 to join the router’s WiFi network.

- **RADIUS server IP Address.** Enter the IPv4 address of the RADIUS server to which the WiFi network can connect.

- **RADIUS server Port.** Enter the number of the port on the router that is used to access the RADIUS server for authentication. The default port number is 1812.

- **RADIUS server Shared Secret.** Enter the shared secret (RADIUS password) that is used between the router and the RADIUS server during authentication of a WiFi user.

7. Click the **Apply** button.
   Your settings are saved.

8. Make sure that you can reconnect over WiFi to the network with its new security settings.
   If you cannot connect over WiFi, check the following:

   - If your computer or mobile device is already connected to another WiFi network in your area, disconnect it from that WiFi network and connect it to the WiFi network that the router provides. Some WiFi devices automatically connect to the first open network without WiFi security that they discover.

   - If your computer or mobile device is trying to connect to your network with its old settings (before you changed the settings), update the WiFi network selection in your computer or mobile device to match the current settings for your network.

   - Does your computer or mobile device display as an attached device? If it does, it is connected to the network.

   - Are you using the correct network name (SSID) and password?
Control the WiFi radios

The router’s internal WiFi radios broadcast signals in the 2.4 GHz and 5 GHz ranges. By default, they are on so that you can connect over WiFi to the router. When the WiFi radios are off, you can still use an Ethernet cable for a LAN connection to the router. You can turn the WiFi radios on and off with the WiFi On/Off button on the router, or you can log in to the router and enable or disable the WiFi radios. If you are close to the router, it might be easier to press its WiFi On/Off button. If you are away from the router or already logged in, it might be easier to enable or disable them.

Use the WiFi On/Off button

To turn the WiFi radios off and on with the WiFi On/Off button:

Press the WiFi On/Off button on the top of the router for two seconds.
If you turned off the WiFi radios, the WiFi On/Off LED and the WPS LED turn off. If you turned on the WiFi radios, the WiFi On/Off LED and the WPS LED light.

Enable or disable the WiFi radios

If you used the WiFi On/Off button to turn off the WiFi radios, you can’t log in to the router to turn them back on. You must press the WiFi On/Off button again for two seconds to turn the WiFi radios back on.

To enable or disable the WiFi radios:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
5. Do one of the following for your router’s WiFi networks:
   • Turn off the WiFi radio. Clear the Enable Wireless Router Radio check box.
- **Turn on the WiFi radio.** Select the **Enable Wireless Router Radio** check box.

6. Click the **Apply** button.
   Your settings are saved.

### Enable or disable AX WiFi

AX WiFi improves your network’s capacity, Internet upload and download speeds, and WiFi range by allowing WiFi traffic from different devices to be concurrently managed. To do this, AX WiFi uses Orthogonal Frequency-Division Multiple-Access (OFDMA), 4x4 multi-user MIMO, and intelligent scheduling.

AX WiFi is enabled by default.

**To enable or disable AX WiFi:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **Wireless**.
   The Wireless Setup page displays.
5. Select or clear the **Enable AX** check box.
   Selecting this check box turns on AX WiFi and clearing this check box turns off AX WiFi.
6. Click the **Apply** button.
   Your settings are saved.
Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio

20/40 coexistence allows a 20 MHz and 40 MHz channel width to be supported simultaneously. By default, 20/40 MHz coexistence is enabled on the 2.4 GHz radio to prevent interference between WiFi networks in your environment at the expense of the WiFi speed. If no other WiFi networks are present in your environment, you can disable 20/40 MHz coexistence to increase the WiFi speed on the 2.4 GHz radio to the maximum supported speed for the WiFi mode.

20/40 MHz coexistence applies to the 2.4 GHz radio.

**To enable or disable 20/40 MHz coexistence for the 2.4 GHz radio:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **Wireless**.
   The Wireless Setup page displays.
5. In the Wireless Network (2.4Ghz b/g/n/ax section, select or clear the **Enable 20/40 MHz** check box.
   Selecting this check box enables 20/40 MHz coexistence and clearing this check box disables 20/40 MHz coexistence.
   By default, 20/40 MHz coexistence is enabled and the check box is selected.
6. Click the **Apply** button.
   Your settings are saved. The 2.4 GHz radio restarts and WiFi clients might need to reconnect.
Enable or disable OFDMA

If AX WiFi is enabled (which it is by default), you can enable Orthogonal Frequency-Division Multiple-Access (OFDMA) for each radio band independently. By default, OFDMA is disabled in both radio bands, even when AX WiFi is enabled.

OFDMA allows data transmission signals to be split into smaller signals. Your router sends these small signals directly to individual devices in your network. Because multiple devices can be served in the same transmission window, your router doesn’t have to wait for medium access for every packet. This method of communication increases network speed and efficiency.

Note the following about OFDMA:

- Enable OFDMA if your network includes many Internet of things (IoT) devices.
- After you enable OFDMA, if you notice that some of your devices do not function as expected, disable OFDMA to see if the devices function fine.
- If your network includes many older devices, you might want to keep OFDMA disabled.

To enable or disable OFDMA:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
   The Wireless Setup page displays.
5. Select or clear the Enable OFDMA in 6GHz check box.
   Selecting this check box turns on OFDMA in the 6 GHz radio band and clearing this check box turns off OFDMA in the 6 GHz radio band.
   OFDMA in 6 GHz is enabled by default.
6. Click the Apply button.
   Your settings are saved.
Change the transmission power control

By default, you router’s transmission power is set to 100%. This allows your router to give you whole home WiFi coverage. If you don’t need whole home WiFi coverage, and you also want to save power consumption while using your router, you can lower the transmission power of your router.

To change the transmission power control:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
   The Wireless Settings page displays.
5. Scroll down to the Wireless Advanced Settings section for the radio for which you want to change the transmission power control.
   You can change the transmission power control for one, two, or all radios.
6. Select a percentage from the Transmit Power Control menu.
7. Click the Apply button.
   Your settings are saved.

Set up a WiFi schedule

You can turn off the WiFi signal from your router at times when you do not need a WiFi connection. For example, you might turn it off for the weekend if you leave town.

To set up the WiFi schedule:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

The BASIC Home page displays.

5. Scroll down to the Wireless Advanced Settings section for the radio for which you want to set up a WiFi schedule. You can set up a WiFi schedule for one, two, or all radios.

6. Click the **Add a new period** button. The page adjusts.

7. Use the menus, radio buttons, and check boxes to set up a period during which you want to turn off the WiFi signal.

8. Click the **Apply** button. The Wireless Settings page displays.

9. Select the **Turn off wireless signal by schedule** check box to activate the schedule.

10. Click the **Apply** button. Your settings are saved.

**Enable or disable Smart Connect**

Smart Connect selects the fastest WiFi band for your device. For Smart Connect to work, the 2.4 GHz and 5 GHz bands must use the same WiFi network name (SSID) and network key (password). That means that when you connect to the router with WiFi, you see only one SSID that connects to both bands.

**Note:** If you enable Smart Connect and the SSID and passwords for the 2.4 GHz and 5 GHz bands do not match, the WiFi settings for 2.4 GHz band overwrites the WiFi settings for 5 GHz band.

**To enable or disable Smart Connect:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.

   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time
   that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

   The Wireless Setup page displays.

5. Select or clear the Enable Smart Connect check box.
   Selecting this check box turns on Smart Connect and clearing this check box turns
   off Smart Connect.

6. Click the Apply button.
   Your settings are saved.

Enable or disable implicit beamforming

Beamforming shapes a directional WiFi signal aimed at a WiFi client based on the client's
location, as opposed to radiating the signal out in all directions. This feature improves
WiFi range and performance. Clients do not need to support beamforming to benefit
from implicit beamforming.

To enable or disable implicit beamforming:

1. Launch a web browser from a computer or mobile device that is connected to the
   router network.

2. Enter http://www.routerlogin.net.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time
   that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

   The Wireless Settings page displays.

5. Select or clear the Enable Implicit BEAMFORMING check box.
   Selecting this check box enables implicit beamforming. Clearing this check box
   disables implicit beamforming.

6. Click the Apply button.
Enable or disable MU-MIMO

Multiuser multiple input, multiple output (MU-MIMO) improves performance when many WiFi clients that are MU-MIMO-capable transfer data at the same time. For MU-MIMO to function, WiFi clients must support MU-MIMO, and they must be connected to a 5 GHz WiFi band. This feature is enabled by default, but you can disable it.

**To enable or disable MU-MIMO:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
   The Wireless Settings page displays.
5. Select or clear the **Enable MU-MIMO** check box.
   Selecting this check box enables MU-MIMO. Clearing this check box disables MU-MIMO.
6. Click the **Apply** button.
   Your settings are saved.
   If you connected over WiFi to the network, you are disconnected from the network and must reconnect.

Enable or disable PMF

Protected Management Frames (PMF) is a security feature that protects unicast and multicast management frames from being intercepted and changed for malicious purposes.
To enable or disable PMF:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
   The Wireless Settings page displays.
5. Enable or disable the PMF feature:
   - Enable PMF. To enable PMF, clear the Disable PMF check box. If you enable PMF, devices that do not support PMF cannot connect to the WiFi network.
   - Disable PMF. To disable PMF, select the Disable PMF check box. PMF is disabled for the WiFi network.
6. Click the Apply button.
   Your settings are saved.

Enable or disable WPA3 H2E

WPA3 Hash-to-Element (H2E) provides increased WiFi security but is not supported on clients that run a Windows version earlier than Windows 10 21H2 or Windows 11.

If all your Windows WiFi clients can support 6 GHz and WPA3 and run Windows 10 21H2 or Windows 11, we recommend that you enable WPA3 H2E. Do not enable WPA3 H2E if your Windows WiFi clients can support 6 GHz and WPA3 but run an earlier Windows version, otherwise your Windows clients cannot connect to the 6 GHz radio using WPA3 security. This feature is disabled by default.

To enable or disable WPA3 H2E:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.  
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.  
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.  
The Wireless Settings page displays.

5. Select or clear the **Enable WPA3 H2E only in 6 GHz band** check box.  
Selecting this check box enables WPA3 H2E. Clearing this check box disables WPA3 H2E.

6. Click the **Apply** button.  
Your settings are saved.  
If you connected over WiFi to the network, you are disconnected from the network and must reconnect.
Manage Network Settings

You can customize the router’s network settings. We recommend that you install the router and connect it to the Internet before you change its network settings.

This chapter contains the following sections:

- View or change the WAN settings
- Set up a default DMZ server
- Change the router’s device name
- Change the LAN TCP/IP settings
- Specify the IP addresses that the router assigns
- Disable the DHCP server feature in the router
- Manage reserved LAN IP addresses
- Set up a bridge for a port group or VLAN tag group
- Manage custom static routes
- Set up the router as a WiFi access point
- Set up the router in bridge mode
- Return the router to router mode
- Improve network connections with Universal Plug and Play
- Enable or disable flow control for Ethernet ports
- Manage Ethernet port aggregation to a LAN device
View or change the WAN settings

You can view or configure wide area network (WAN) settings for the Internet port. You can set up a DMZ (demilitarized zone) server, change the maximum transmit unit (MTU) size, and enable the router to respond to a ping to its WAN (Internet) port.

To view or change the WAN settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
   The WAN Setup page displays.

View or change the following settings:

- **Disable Port Scan and DoS Protection.** DoS protection protects your LAN against denial of service attacks such as Syn flood, Smurf Attack, Ping of Death, and many others. Select this check box only in special circumstances.

- **Default DMZ Server.** This feature is sometimes helpful when you are playing online games or videoconferencing, but it makes the firewall security less effective.

- **Respond to Ping on Internet Port.** This feature allows your router to be discovered. Use this feature only as a diagnostic tool or for a specific reason.

- **Disable IGMP Proxying.** IGMP proxying allows a computer on the local area network (LAN) to receive the multicast traffic it is interested in from the Internet. If you do not need this feature, you can select this check box to disable it.

- **MTU Size (in bytes).** The normal MTU (maximum transmit unit) value for most Ethernet networks is 1500 bytes, or 1492 bytes for PPPoE connections. Change the MTU only if you are sure that it is necessary for your ISP connection.

- **NAT Filtering.** Network Address Translation (NAT) determines how the router processes inbound traffic. Secured NAT protects computers on the LAN from attacks from the Internet but might prevent some Internet games, point-to-point applications, or multimedia applications from working. Open NAT provides a much less secured firewall but allows almost all Internet applications to work.
• **Disable SIP ALG.** Some voice and video communication applications do not work well with the SIP ALG. Disabling the SIP ALG might help your voice and video applications to create and accept a call through the router.

5. Click the **Apply** button.  
   Your settings are saved.

### Set up a default DMZ server

The default DMZ server feature is helpful when you are using some online games and videoconferencing applications that are incompatible with Network Address Translation (NAT). The router is programmed to recognize some of these applications and to work correctly with them, but other applications might not function well. In some cases, one local computer can run the application correctly if the IP address for that computer is entered as the default DMZ server.

**WARNING:** DMZ servers pose a security risk. A computer designated as the default DMZ server loses much of the protection of the firewall and is exposed to exploits from the Internet. If compromised, the DMZ server computer can be used to attack other computers on your network.

The router usually detects and discards incoming traffic from the Internet that is not a response to one of your local computers or a service that you configured on the Port Forwarding/Port Triggering page. Instead of discarding this traffic, you can specify that the router forwards the traffic to one computer on your network. This computer is called the default DMZ server.

**To set up a default DMZ server:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.  
   A login window opens.
3. Enter the router admin user name and password.  
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.  
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.  
   The WAN Setup page displays.
5. Select the Default DMZ Server check box.
6. Type the IP address.
7. Click the Apply button.
   Your settings are saved.

Change the router’s device name

The router’s default device name is based on its model number. This device name displays in the file manager when you browse your network.

**To change the router’s device name:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.
5. In the **Device Name** field, type a new name.
6. Click the Apply button.
   Your settings are saved.

Change the LAN TCP/IP settings

The router is preconfigured to use private IP addresses on the LAN side and to act as a DHCP server. The router’s default LAN IP configuration is as follows:

- **LAN IP address**: 192.168.1.1
- **Subnet mask**: 255.255.255.0
These addresses are part of the designated private address range for use in private networks and are suitable for most applications. If your network requires a different IP addressing scheme, you can change these settings.

You might want to change these settings if you need a specific IP subnet that one or more devices on the network use, or if you use competing subnets with the same IP scheme.

To change the LAN TCP/IP settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select `ADVANCED > Setup > LAN Setup`.
   The LAN Setup page displays.
5. In the `IP Address` field, type the IP address.
6. In the `IP Subnet Mask` field, type the subnet mask of the router.
   The IP address and subnet mask identify which addresses are local to a specific device and which must be reached through a gateway or router.
7. Change the RIP settings.
   Router Information Protocol (RIP) allows a router to exchange routing information with other routers.
   a. Select the RIP direction:
      - **Both**: The router broadcasts its routing table periodically and incorporates information that it receives.
      - **Out Only**: The router broadcasts its routing table periodically.
      - **In Only**: The router incorporates the RIP information that it receives.
   b. Select the RIP version:
      - **Disabled**: This is the default setting.
      - **RIP-1**: This format is universally supported. It is adequate for most networks, unless you are using an unusual network setup.
• **RIP-2.** This format carries more information. Both RIP-2B and RIP-2M send the routing data in RIP-2 format. RIP-2B uses subnet broadcasting. RIP-2M uses multicasting.

8. Click the **Apply** button.
   Your settings are saved.
   If you changed the LAN IP address of the router, you are disconnected when this change takes effect.

9. To reconnect, close your browser, relaunch it, and log in to the router.

**Specify the IP addresses that the router assigns**

By default, the router acts as a Dynamic Host Configuration Protocol (DHCP) server. The router assigns IP, DNS server, and default gateway addresses to all computers connected to the LAN. The assigned default gateway address is the LAN address of the router.

These addresses must be part of the same IP address subnet as the router’s LAN IP address. Using the default addressing scheme, define a range between 192.168.1.2 and 192.168.1.254, although you can save part of the range for devices with fixed addresses.

**To specify the pool of IP addresses that the router assigns:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.
5. Make sure that the **Use Router as DHCP Server** check box is selected.
6. Specify the range of IP addresses that the router assigns:
   a. In the **Starting IP Address** field, type the lowest number in the range. This IP address must be in the same subnet as the router.
   
   b. In the **Ending IP Address** field, type the number at the end of the range of IP addresses. This IP address must be in the same subnet as the router.

7. Click the **Apply** button. Your settings are saved.

The router delivers the following address information to any LAN device that requests a DHCP address:

- An IP address from the range that you define
- Subnet mask
- Gateway IP address (the router’s LAN IP address)
- DNS server IP address (the router’s LAN IP address)

## Disable the DHCP server feature in the router

By default, the router acts as a DHCP server. The router assigns IP, DNS server, and default gateway addresses to all computers connected to the LAN. The assigned default gateway address is the LAN address of the router.

You can use another device on your network as the DHCP server or specify the network settings of all your computers.

**To disable the DHCP server feature in the router:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**. A login window opens.

3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.

4. Select **ADVANCED > Setup > LAN Setup**.
The LAN Setup page displays.

5. Clear the **Use Router as DHCP Server** check box.
6. Click the **Apply** button.
   Your settings are saved.

7. (Optional) If this service is disabled and no other DHCP server is on your network, set your computer IP addresses manually so that the computers can access the router.

**Manage reserved LAN IP addresses**

When you specify a reserved IP address for a computer on the LAN, that computer always receives the same IP address each time it accesses the router’s DHCP server. Assign reserved IP addresses to computers or servers that require permanent IP settings.

**Reserve an IP address**

**To reserve an IP address:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.
5. In the Address Reservation section, click the **Add** button.
   The Address Reservation page displays.
6. To reserve the IP address for a device that the router detects automatically, in the Address Reservation Table on the page, select the radio button for the device.
7. To manually reserve the IP address for a device, do the following:
   a. In the **IP Address** field, type the IP address to assign to the device.
      Choose an IP address from the router's LAN subnet, such as 192.168.1.x.
   b. In the **MAC Address** field, type the MAC address of the device.
   c. In the **Device Name** field, type a name for the device.

8. Click the **Add** button.
   Your settings are saved. The reserved address is entered into the Address Reservation table on the LAN Setup page.

The reserved address is not assigned until the next time the computer contacts the router's DHCP server. Reboot the device, or access its IP configuration and force a DHCP release and renew.

**Edit a reserved IP address**

**To edit a reserved address entry:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.
5. Select the radio button next to the reserved address that you want to edit.
6. Click the **Edit** button.
   The Address Reservation page displays.
7. Change the settings.
8. Click the **Apply** button.
   Your settings are saved.
Delete a reserved IP address entry

To delete a reserved address entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Setup > LAN Setup.
   The LAN Setup page displays.
5. Select the radio button next to the reserved address that you want to delete.
6. Click the Delete button.
   The address is removed.

Set up a bridge for a port group or VLAN tag group

Some devices, such as an IPTV, cannot function behind the router’s network address translation (NAT) service or firewall. Based on what your Internet service provider (ISP) requires, for the device to connect to the ISP’s network directly, you can enable the bridge between the device and the router’s Internet port or add new VLAN tag groups to the bridge.

Note: If your ISP provides instructions for how to set up a bridge for IPTV and Internet service, follow those instruction.

Set up a bridge for a port group or an IPTV port

To let packets bypass the router’s network address translation (NAT) service, you can set up a bridge for a port group, that is, a group of ports and WiFi networks. Packets that are sent on your network between the router’s Internet port and a device that is part of the port group are not processed by the router’s NAT service.
If you have an IPTV connected to the router, your IPTV service provider might require you to set up a bridge for an IPTV port that can lease an IP address from your IPTV service provider. That is, the IPTV port uses an IP address within the IPTV service provider’s network (an intranet address).

If the IPTV is connected to a LAN port, you can set up a bridge connection from the Internet port to the LAN port. If the IPTV is connected through WiFi, the router must support the bridging of the Internet port to the WiFi network. The designated LAN port or WiFi network becomes the IPTV port with direct access to the router’s Internet port so that the IPTV traffic is not processed by the router’s NAT service. You can add more than one LAN port and WiFi network to the bridge.

To configure a port group or set up an IPTV port and enable the bridge:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select `ADVANCED > Advanced Setup > VLAN/Bridge Settings`. The VLAN/Bridge Settings page displays.
5. Select the `Enable VLAN/Bridge group` check box. The page expands.
6. Select the `By bridge group` radio button. The page expands.
7. Select a Wired Ports check box or a Wireless check box:
   - **Wired Ports.** If your device is connected to an Ethernet port on the router, select the Wired Ports check box that corresponds to the Ethernet port on the router to which the device is connected.
   - **Wireless.** If your device is connected to your router’s WiFi network, select the Wireless check box that corresponds to the router’s WiFi network to which the device is connected.

   **Note:** You must select at least one Wired Ports or Wireless check box. You can select more than one check box.
8. Click the **Apply** button.
   Your settings are saved.

Set up a bridge for a VLAN tag group

If the devices that are connected to the router’s Ethernet LAN ports or WiFi network include an IPTV device, your ISP might require you to set up a bridge for a VLAN tag group for the router’s Internet interface.

If you are subscribed to IPTV service, the router might require VLAN tags to distinguish between the Internet traffic and the IPTV traffic. A bridge with a VLAN tag group prevents packets that are sent between the IPTV device and the router’s Internet port from being processed through the router’s network address translation (NAT) service.

The router has one preset VLAN with ID 10 and the VLAN name *Internet*. All wired ports and WiFi radios are members of VLAN 10.

You can add VLAN tag groups to a bridge and assign VLAN IDs and priority values to each VLAN tag group.

**To add a VLAN tag group and enable the bridge:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > VLAN/Bridge Settings**.
   The VLAN/Bridge Settings page displays.

5. Select the **Enable VLAN/Bridge group** check box.
   The page expands.

6. Select the **By VLAN tag group** radio button.
   The page expands.

7. Click the **Add** button.
   The Add VLAN Rule page displays.
8. Specify the following settings for the VLAN tag group:

- **Name.** Enter a name for the VLAN tag group. The name can be up to 10 characters.
- **VLAN ID.** Enter a value from 1 to 4094.
- **Priority.** Enter a value from 0 to 7.

9. Select the check box for a wired Ethernet port or wireless network.
   If your device is connected to an Ethernet port on the router, select the wired Ethernet port check box that corresponds to the Ethernet port on the router to which the device is connected. If your device is connected to your router’s WiFi network, select the WiFi check box that corresponds to the router’s WiFi network to which the device is connected.

   You must select at least one Ethernet port or wireless network. You can select more than one port.

10. Click the **Apply** button.
    Your settings are saved. The VLAN tag group is added and enabled.

**Manage custom static routes**

For almost all Internet traffic, routes are automatically and dynamically selected. You can also set up a fixed, static route. Typically, you only need to add static routes when you have more than one router or multiple IP subnets on your network.

As an example of when a static route is needed, consider the following case:

- Your main Internet access is through a cable modem to your ISP. The cable modem is connected to your router.
- Your network also includes an ADSL router that you use to access a remote office site. This ADSL router is connected to a DSL modem, which is used on-demand only.
- Your LAN subnet is 192.168.1.0, and the ADSL router’s address on your LAN is 192.168.1.100.
- The public IP address range at the remote office site is 134.177.0.0.

When you set up your router, two implicit static routes were created:

1. A default route was created between your router and the cable modem that connects to your ISP.
2. A second static route was created between your router and your LAN for all 192.168.1.0 addresses.
With this configuration, if you try to access a device on the 134.177.0.0 network at the remote office site, your router forwards your request to your ISP. In turn, the ISP forwards your request to the remote office site, where the firewall will deny the request.

In this situation, you must define a static route, telling your router to access 134.177.0.0 addresses through your ADSL router at its LAN address of 192.168.1.100.

Here is an example static route setting for this configuration:

- **Destination IP address and subnet mask settings**: The route applies to all addresses at the remote site, so set the destination IP address to 134.177.0.0 and the subnet mask to 255.255.255.0.

- **Gateway IP address**: Traffic for addresses in the 134.177.0.0 network must be forwarded to the ADSL router, so set the gateway IP address to 192.168.1.100 (the ADSL router’s address on your LAN).

- **Private route**: Make the static route private as a security precaution in case Routing Information Protocol (RIP) is activated. A private route is not reported in RIP messages.

**Set up a static route**

**To set up a static route:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter `http://www.routerlogin.net`.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Static Routes**.
   The Static Routes page displays.

5. Click the **Add** button.
   The page adjusts.

6. In the **Route Name** field, type a name for this static route (for identification purposes only).

7. To limit access to the LAN only, select the **Private** check box.
   If the **Private** check box is selected, the static route is not reported in RIP.

8. To prevent the route from becoming active, clear the **Active** check box.
In some situations, you might want to set up a static route but keep it disabled until a later time. By default, the **Active** check box is selected and a route becomes active after you click the **Apply** button.

9. Enter the following settings:
   - **Destination IP Address.** Enter the IP address for the final destination of the route.
   - **IP Subnet Mask.** Enter the IP subnet mask for the final destination of the route. If the destination is a single host, enter 255.255.255.255.
   - **Gateway IP Address.** Enter the IP address of the gateway. The IP address of the gateway must be on the same LAN segment as the router.
   - **Metric.** Enter a number from 2 through 15. This value represents the number of routers between your network and the destination. Usually, a setting of 2 or 3 works.

10. Click the **Apply** button.
    Your settings are saved. The static route is added to the table on the Static Routes page.

**Edit a static route**

**To edit a static route:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Static Routes.** The Static Routes page displays.
5. In the table, select the radio button for the route.
6. Click the **Edit** button.
   The Static Routes page adjusts.
7. Edit the route information.
8. Click the **Apply** button.
Your settings are saved.

**Delete a static route**

**To delete a static route:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Static Routes**.
The Static Routes page displays.

5. In the table, select the radio button for the route.

6. Click the **Delete** button.
The route is removed from the table.

**Set up the router as a WiFi access point**

You can set up the router to run as an access point (AP) on the same local network as another router.

**To set up the router as an AP:**

1. Use an Ethernet cable to connect the Internet port of this router to an Ethernet port on the other router.

2. Launch a web browser from a computer or mobile device that is connected to the router network.

3. Enter **http://www.routerlogin.net**.
   A login window opens.

4. Enter the router admin user name and password.
The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

5. Select **ADVANCED > Advanced Setup > Router/ AP / Bridge Mode**.
The Router / AP / Bridge Mode page displays.

6. Select **AP Mode**.
The page adjusts.

7. Select an IP address setting:
   - **Get dynamically from existing router**. The other router on the network assigns an IP address to this router while it is in AP mode.
   - **Use fixed IP settings on this device (not recommended)**. Use this setting if you want to manually assign a specific IP address to this router while it is in AP mode. Using this option effectively requires advanced network experience.

   **Note**: To avoid interference with other routers or gateways in your network, we recommend that you use different WiFi settings on each router. You can also turn off the WiFi radio on the other router or gateway and use this router only for WiFi client access.

8. Click the **Apply** button.
The IP address of the router changes, and you are disconnected.

**Set up the router in bridge mode**

You can use your router in bridge mode to connect multiple devices wirelessly at the faster 802.11ax speed. You need two routers: one set up as a router and the other set up as a bridge.

Installing your router as a bridge offers the following benefits:

- Take advantage of gigabit WiFi speeds on current devices
- Use Gigabit WiFi for applications like video and gaming.
- Connect multiple devices like NAS, Smart TV, Blu-ray player, and game consoles at gigabit WiFi speeds using a WiFi link.
- Avoid the need for separate WiFi adapters for each device.

For example, you can install the first router in a room like a home office where your Internet connection is located, then set up the second router in bridge mode. Place the router in bridge mode in a different room with your home entertainment center. Cable
the router in bridge mode to your Smart TV, DVR, game console or Blu-ray player, and use its 802.11ax WiFi connection to the first router.

**To set up the router in bridge mode:**

1. Make a note of the WiFi settings of the other router to which this router will connect. You must know the SSID, WiFi security mode, wireless password, and operating frequency (either 2.4 GHz or 5 GHz).

2. Launch a web browser from a computer or mobile device that is connected to the network.

   A login window opens.

4. Enter the router user name and password.
   The user name is `admin`. The default password is `password`. The user name and password are case-sensitive.
   The BASIC Home page displays.

5. Select `ADVANCED > Advanced Setup > Wireless AP`.
   The Router / AP / Bridge Mode page displays.

6. Select `Bridge Mode`.
   The page adjusts.

7. Click the `Setup bridge mode wireless settings` button.
   The Wireless Settings window opens.

8. Specify the settings of the other router to which this router will connect:
   a. Select the wireless network from the menu:
      - Wireless Networks (2.4Ghz b/g/n/ax)
      - Wireless Networks (5Ghz a/n/ac/ax)
      - Wireless Networks (6Ghz a/n/ac/ax)
   b. In the Name (SSID) file, enter the wireless network name (SSID).
   c. In the Security Options section, select a radio button.
   d. If the Password (Network Key) field displays, type the WiFi password (network key) that you use to connect wirelessly to the other router.

9. Click the `Apply` button.
   The window closes and you are returned to the main Wireless Settings page.
10. Click the **Apply** button on the main Wireless Settings page.
   Your settings are saved.

Return the router to router mode

By default, your router is set to router mode. If you changed the mode to access point mode or bridge mode, you can change the mode back to router mode.

**To set up router mode:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless AP**.
   The Router / AP / Bridge Mode page displays.
5. Select **Router Mode**.
   The page adjusts.
6. Click the **Apply** button.
   Your settings are saved.

Improve network connections with Universal Plug and Play

Universal Plug and Play (UPnP) helps devices such as Internet appliances and computers access the network and connect to other devices as needed. UPnP devices can automatically discover the services from other registered UPnP devices on the network.

If you use applications such as multiplayer gaming, peer-to-peer connections, or real-time communications such as instant messaging or remote assistance (a feature in Windows XP), enable UPnP.
To enable Universal Plug and Play:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > UPnP**. The UPnP page displays.

5. Select the **Turn UPnP On** check box. By default, this check box is selected. UPnP for automatic device configuration can be enabled or disabled. If the **Turn UPnP On** check box is cleared, the router does not allow any device to automatically control router resources, such as port forwarding.

6. Type the advertisement period in minutes. The advertisement period specifies how often the router broadcasts its UPnP information. This value can range from 1 to 1440 minutes. The default period is 30 minutes. Shorter durations ensure that control points receive current device status at the expense of more network traffic. Longer durations can compromise the freshness of the device status but can significantly reduce network traffic.

7. Type the advertisement time to live in hops. The time to live for the advertisement is measured in hops (steps) for each UPnP packet sent. Hops are the steps a packet takes between routers. The number of hops can range from 1 to 255. The default value for the advertisement time to live is 4 hops, which should be fine for most home networks. If you notice that some devices are not being updated or reached correctly, it might be necessary to increase this value.

8. Click the **Apply** button. The UPnP Portmap Table displays the IP address of each UPnP device that is accessing the router and which ports (internal and external) that device opened. The UPnP Portmap Table also displays what type of port is open and whether that port is still active for each IP address.

9. To refresh the information in the UPnP Portmap Table, click the **Refresh** button.
Enable or disable flow control for Ethernet ports

EEE 802.3x flow control works by pausing a port if the port becomes oversubscribed (that is, the port receives more traffic than it can process) and dropping all traffic for small bursts of time until the port is no longer congested.

By default, flow control is enabled for all ports. A situation might occur in which you want to disable flow control for a port. For example, for some types of voice over IP (VoIP) phones, if you connect the VoIP phone to an Ethernet port, you might want to disable flow control on the Ethernet port.

To enable or disable flow control for one or more Ethernet ports:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Ethernet Settings.
   The Ethernet Port Advanced Settings page displays.
5. In the Enable flow control section, for each Ethernet port, select or clear the check box.
   Selecting the check box for a port enables flow control for the port. Clearing the check box for a port disables flow control for the port. By default, flow control is enabled for all ports.
6. Click the Apply button.
   Your settings are saved.
Manage Ethernet port aggregation to a LAN device

Ethernet aggregation lets you aggregate two Ethernet ports on your router to improve the aggregated file transfer speed. Ethernet port aggregation is also referred to as link aggregation, teaming port, and port trunking.

To set up Ethernet port aggregation to a LAN device that is configured for 802.3ad Link Aggregation Control Protocol (LACP), first configure Ethernet port aggregation for LAN ports 3 and 4 on your router, and then connect these ports to the two aggregated ports on the LAN device. If you do not configure port aggregation in this order, a network loop occurs, and your network might be shut down.

We refer to Ethernet port aggregation for LAN devices as LAN port aggregation.

**WARNING:** Do not connect an unmanaged switch to LAN ports 3 and 4 on your router if these ports are aggregated. Otherwise, a network loop occurs, and your network might be shut down.

Set up LAN port aggregation to a LAN device

If you are connecting a LAN device such as a switch or NAS, make sure that your LAN device supports either 802.3ad LACP or static LAGs.
To set up LAN port aggregation to a LAN device:

1. Set up LAN port aggregation on your LAN device before connecting it to your router.

   **Note:** If your LAN device supports a static link aggregation group (LAG) only, you must enable static mode on your router before you connect your device to LAN ports 3 and 4 on the router. See the following step for more information about how to enable static mode on your router.

   For information about how to set up LAN port aggregation on your router or computer, see the documentation that came with your router or computer.

2. Log in to your router and enable LAN port aggregation:
   a. Launch a web browser from a computer or mobile device that is connected to the router network.
   c. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   d. Select `ADVANCED > Advanced Setup > Ethernet Settings`. The Ethernet Port Advanced Settings page displays.
   e. In the LAN Port Aggregation section, select an LAN port aggregation mode (by default, LAN port aggregation is disabled):
      - **Enable (LACP-IEEE 802.3ad).** After you connect the Ethernet cables (see the following step), the router communicates with the LAN device that is connected to LAN ports 3 and 4 on your router, and checks to see if LAN port aggregation is supported on the LAN device. If LAN port aggregation is supported, the router automatically trunks LAN ports 3 and 4. If not, LAN ports 3 and 4 work as independent LAN ports. We recommend that you select this mode unless your LAN device can support a static LAG only.
      - **Enable static LAG.** If your device supports a static LAG only, select this mode. Otherwise, we recommend that you to select the **Enable (LACP-IEEE 802.3ad)** radio button instead.
   f. Click the **Apply** button. Your settings are saved.

3. Connect your LAN device to LAN ports 3 and 4 on the router.
View or change the router LAN port aggregation mode

To view or change your router’s LAN port aggregation mode:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select `ADVANCED > Advanced Setup > Ethernet Settings`. The Ethernet Port Advanced Settings page displays. In the LAN Port Aggregation section, the LAN Port Aggregation Status field shows whether port aggregation is active:
   - **Inactive.** No link aggregation LAN device is connected to Ethernet ports 3 and 4 on your router.
   - **Active.** A link aggregation LAN device is connected to Ethernet ports 3 and 4 on your router.
5. To change the LAN port aggregation mode, select one of the following radio buttons:
   - **Disable.** This mode is selected by default. This mode disables LAN port aggregation on your router. LAN ports 3 and 4 can be used as independent Ethernet ports.
   - **Enable (LACP-IEEE 803.3ad).** After you connect the Ethernet cables, the router communicates with the LAN device that is connected to LAN ports 3 and 4 on your router, and checks to see if LAN port aggregation is supported on the LAN device. If LAN port aggregation is supported, the router automatically trunks LAN ports 3 and 4. If not, LAN ports 3 and 4 work as independent Ethernet ports. We recommend that you select this mode unless your LAN device can support a static link aggregation group (LAG) only.
   - **Enable static LAG.** If your device supports a static LAG only, select this mode. Otherwise, we recommend that you to select the **Enable (LACP-IEEE 802.3ad)** radio button instead.

**Note:** If your LAN device supports a static LAG only, you must enable static mode on your router before you connect your device to LAN ports 3 and 4 on the router.
6. If you made changes, click the **Apply** button.
Your settings are saved.
You can set up the router to optimize performance for applications such as Internet gaming, high-definition video streaming, and VoIP communication. By default, the router uses Wi-Fi Multimedia Quality of Service (WMM QoS).

This chapter contains the following sections:

- Use Dynamic QoS to optimize Internet traffic management
- Wi-Fi Multimedia Quality of Service
Use Dynamic QoS to optimize Internet traffic management

Dynamic Quality of Service (QoS) helps improve your router’s Internet traffic management capabilities through better application and device identification, bandwidth allocation, and traffic prioritization techniques. Dynamic QoS resolves traffic congestion when the Internet bandwidth is limited and different demands compete for bandwidth.

Enable Dynamic QoS

Because not everyone uses Dynamic QoS, it is disabled by default.

To enable Dynamic QoS:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select QoS.
   The QoS page displays.
5. Select the Enable QoS check box.
6. Specify your Internet bandwidth:
   - Let Speedtest detect my Internet bandwidth. We recommend that you use Speedtest to detect your Internet bandwidth.
     To use Speedtest, do the following:
     a. For more accurate Speedtest results, make sure that no other devices are accessing the Internet.
     b. Select the Let Speedtest detect my Internet bandwidth radio button.
     c. Click the Take a Speedtest button. Speedtest determines your Internet bandwidth.
• I want to define my Internet Bandwidth. If you know what your download and upload speed are, select this radio button and enter your download and upload speeds in the fields.

7. To display information about bandwidth utilization, click the Click here to see bandwidth utilization by device and application link.
The Attached Devices page displays. For more information, see View devices currently on the network on page 126.

8. Click the Apply button.
Your settings are saved.

Enable or disable the automatic QoS database update

The router uses a QoS database of the most popular applications and services to implement Dynamic QoS. By default, the router automatically updates this database. You can turn off this feature and manually update the database.

To enable or disable the automatic Dynamic QoS database update:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.

3. Enter the router admin user name and password.
The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select QoS.
The QoS page displays. If you already enabled Dynamic QoS, the Enable QoS check box is selected.

5. Select or clear the Automatically update performance optimization database check box.

6. Click the Apply button.
Your settings are saved.
Manually update the dynamic QoS database

The router uses a QoS database of the most popular applications and services to implement Dynamic QoS. By default, the router automatically updates this database when you enable Dynamic QoS, but if you turned off the automatic update feature, you can manually update the database.

**To manually update the Dynamic QoS database:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select `QoS`.
   The QoS page displays. If you already enabled Dynamic QoS, the `Enable QoS` check box is selected.
5. Click the `Update Now` button.
   The router checks for the newest version of the database and downloads it.
6. Click the `Apply` button.
   Your settings are saved.

Wi-Fi Multimedia Quality of Service

Wi-Fi Multimedia Quality of Service (WMM QoS) prioritizes WiFi voice and video traffic over the WiFi link. WMM QoS is automatically enabled for the router.

WMM QoS prioritizes WiFi data packets from different applications based on four access categories: voice, video, best effort, and background. For an application to receive the benefits of WMM QoS, WMM must be enabled for both the application and the client running it. Legacy applications that do not support WMM and applications that do not require QoS are assigned to the best effort category, which receives a lower priority than voice and video.
Note: We recommend that you do not disable the WMM settings for all radios. If you disable the WMM settings for the 2.4 GHz, 5 GHz, and 6 GHz radios, the maximum link rate your router can reach is 54 Mbps.

**To disable the WMM settings:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > QoS Setup**.
   The QoS page displays.
5. Click the **WMM** tab.
6. To disable WMM for a radio, do the following:
   - To disable WMM for the 2.4 GHz radio, clear the *Enable WMM (Wi-Fi multimedia) settings (2.4 GHz b/g/n/ax)* check box.
   - To disable WMM for the 5 GHz radio, clear the *Enable WMM (Wi-Fi multimedia) settings (5 GHz a/n/ac/ax)* check box.
   - To disable WMM for the 6 GHz radio, clear the *Enable WMM (Wi-Fi multimedia) settings (6 GHz a/n/ac/ax)* check box.
7. Click the **Apply** button.
   Your settings are saved.
Manage Your Router

This chapter describes the router settings for administering and maintaining your router and home network.

The chapter contains the following sections:

- Update the router firmware
- Change the admin password
- Enable admin password reset
- Reset the admin password
- Always use HTTPS to access the router
- View information about the router and the Internet and WiFi settings
- Display the statistics of the Internet port
- Check the Internet connection status
- View devices currently on the network
- Monitor Internet traffic
- Manage the router configuration file
- Disable LED blinking or turn off LEDs
- Set your time zone
- Set the NTP server
- Connect to your router with Anywhere Access
- Specify ReadyDLNA media server settings
- Return the router to its factory default settings
Update the router firmware

You can log in to the router and check if new firmware is available, or you can manually load a specific firmware version to your router.

Check for new firmware and update the router

The router firmware (routing software) is stored in flash memory. You might see a message at the top of the router pages when new firmware is available. You can respond to that message to update the firmware or you can check to see if new firmware is available and update your product.

Note: We recommend that you connect a computer to the router using an Ethernet connection to update the firmware.

To check for new firmware and update your router:

1. Launch a web browser from a computer that is connected to the router network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select ADVANCED > Administration > Router Update. The Router Update page displays.
5. Click the Check button. The router finds new firmware information if any is available and displays a message asking if you want to download and install it.
6. Click the Yes button. The router locates and downloads the firmware and begins the update.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the update. For example, do not close the browser, click a link, or load a new page. Do not turn off the router.
When the upload is complete, your router restarts. The update process typically takes about one minute. Read the new firmware release notes to find out if you must reconfigure the router after updating.

Manually upload firmware to the router

If you want to upload a specific firmware version, or your router fails to update its firmware automatically, follow these instructions.

Note: We recommend that you connect a computer to the router using an Ethernet connection to upload the firmware.

To manually upload a firmware file to your router:

1. Download the firmware for your router from the NETGEAR Download Center, save it to your desktop, and unzip the file if needed.

   Note: The correct firmware file uses an .img or .chk extension.

2. Launch a web browser from a computer that is connected to the router network.

   A login window opens.

4. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

5. Select ADVANCED > Administration > Router Update.
   The Router Update page displays.

6. Click the Browse button.

7. Find and select the firmware file on your computer.

8. Click the Upload button.
   The router begins the upload.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the update. For example, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting. If your router does not reboot, check the Router Status page to confirm whether the new firmware version uploaded.
Manage the firmware update settings

You can set the router to automatically update to future firmware versions as they become available.

**To manage automatic updates for future firmware versions:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select **ADVANCED > Administration > Router Update**. The Router Update page displays.
5. In the Router Auto Firmware Update section, select one of the following radio buttons.
   - **Enable**. The router automatically updates to future firmware versions as they become available. This is the default setting. We recommend that you keep this setting.
   - **Disable**. The router does not automatically update to future firmware versions. You must manually update to future firmware versions.
6. Click the **Apply** button. Your settings are saved.

Change the admin password

The admin password is the one you specified the first time you logged in. You can change this password.

**Note:** The ideal password contains no dictionary words from any language and contains uppercase and lowercase letters, numbers, and symbols. It can be up to 30 characters.
To change the password for the admin user name:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Administration > Set Password**.
   The Set Password page displays.
5. Type the old password in the **Old Password** field.
6. Type the new password in the **Set Password** and **Repeat New Password** fields.
7. Click the **Apply** button.
   Your settings are saved.

Enable admin password reset

The router admin password is used to log in to your router web interface. We recommend that you enable password reset so that you can reset the password if you forget it. This reset process is supported in Chrome, Safari, Firefox, Edge, and Internet Explorer.

To enable password reset:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Administration > Set Password**.
   The Set Password page displays.
5. Select the **Enable Password Reset** check box.
6. Select two security questions and provide answers to them.
7. Click the **Apply** button.
   Your settings are saved.

**Reset the admin password**

If you set up the password reset feature, you can reset your router admin password if you forgot it. This reset process is supported in Chrome, Safari, Firefox, Edge, and Internet Explorer.

**To reset your router admin password:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Click the **Cancel** button.
   If password reset is enabled, you are prompted to enter the serial number of the router.
   The serial number is on the router label.

4. Enter the serial number of the router.

5. Click the **Continue** button.
   The Router Password Reset page displays.

6. Enter the answers to your security questions.

7. Click the **Continue** button.
   The page adjusts.

8. Type a new admin password, confirm your new password, and set new security questions and answers.

9. Click the **Next** button.
   The page displays a confirmation.

10. Click the **Login** button.
    A login window opens.

11. With your new password, log in to the router.
Always use HTTPS to access the router

You can configure the router to require HTTPS connections between your web browser and the router web interface, for example, “https://www.routerlogin.net”. When you enable the HTTPS requirement, connection requests to the router web interface that specify HTTP are automatically converted to HTTPS.

**Note:** After you enable the HTTPS requirement, when you enter http://www.routerlogin.net, your browser might display a security warning because of the self-signed certificate on the router. This is expected behavior. You can proceed, or add an exception for the security warning. For more information, visit https://kb.netgear.com/000062980/what-to-do-incase-of-security-message.

To require HTTPS connections:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
5. Select the Always Use HTTPS to Access Router check box.
6. Click the Apply button. Your settings are saved.
View information about the router and the Internet and WiFi settings

You can view router information, the Internet port status, and WiFi settings.

To view information about the router and the Internet, modem, and WiFi settings:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Click the ADVANCED tab.
   The ADVANCED Home page displays.
   The information on this page uses the following color coding:
   - A green icon indicates that the Internet connection is fine and no problems exist. For a WiFi network, the network is enabled and secured.
   - A red icon indicates that configuration problems exist for the Internet connection or the connection is down. For a WiFi network, the network is disabled or down.
   - An amber icon indicates that the Internet port is configured but cannot get an Internet connection (for example, because the cable is disconnected), that a WiFi network is enabled but unprotected, or that another situation that requires your attention occurred.

Display the statistics of the Internet port

To display the statistics of the Internet port:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.  
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.  
   The BASIC Home page displays.

4. Click the **ADVANCED** tab.  
   The ADVANCED Home page displays.

5. In the Internet Port pane, click the **Show Statistics** button.  
   The Show Statistics window opens and displays following information:
   - **System Up Time.** The time elapsed since the router was last restarted.
   - **Port.** The statistics for the WAN (Internet) port, LAN (Ethernet) ports, and WLANs.  
     For each port, the window displays the following information:
     - **Status.** The link status of the port.
     - **TxPkts.** The number of packets transmitted on this port since the router was last started.
     - **RxPkts.** The number of packets received on this port since the router was last started.
     - **Collisions.** The number of collisions on this port since the router was last started.
     - **Tx B/s.** The current transmission (outbound) bandwidth used on the WAN and LAN ports.
     - **Rx B/s.** The current reception (inbound) bandwidth used on the WAN and LAN ports.
     - **Up Time.** The time elapsed since this port acquired the link.
     - **Poll Interval.** The interval at which the statistics are updated on this page.

6. To change the polling frequency, enter a time in seconds in the **Poll Interval** field and click the **Set Interval** button.  
   To stop the polling entirely, click the **Stop** button.
Check the Internet connection status

To check the Internet connection status:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Click the ADVANCED tab. The ADVANCED Home page displays.
5. In the Internet Port pane, click the Connection Status button. The Connection Status window opens. The information that displays depends on the type of Internet connection.
   For example, if your Internet connection does not require a login and the router receives an IP address automatically, the window displays the following information:
   - **IP Address**. The IP address that is assigned to the router.
   - **Subnet Mask**. The subnet mask that is assigned to the router.
   - **Default Gateway**. The IP address for the default gateway that the router communicates with.
   - **DHCP Server**. The IP address for the Dynamic Host Configuration Protocol server that provides the TCP/IP configuration for all the computers that are connected to the router.
   - **DNS Server**. The IP address of the Domain Name Service server that provides translation of network names to IP addresses.
   - **Lease Obtained**. The date and time when the lease was obtained.
   - **Lease Expires**. The date and time that the lease expires.
6. To release (stop) the Internet connection, click the Release button.
7. To renew (restart) the Internet connection, click the Renew button.
8. To exit the screen, click the Close Window button.
View devices currently on the network

You can view all computers and devices that are currently connected to your network.

**To view devices on the network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **Attached Devices**.
   The following information is displayed in the table:
   - **Status**: Displays only if network access control (see Network access control list on page 50) is enabled. The field displays if a device is allowed or blocked.
   - **Connection Type**: Wired or the WiFi band for the connection.
   - **Device Name**: If the device name is known, it is shown here.

   The following information is displayed when Dynamic QoS is disabled (which it is by default):
   - **IP Address**: The IP address that the router assigned to this device when it joined the network. This address can change if a device is disconnected and rejoins the network.
   - **MAC Address**: The unique MAC address for each device does not change. The MAC address is typically shown on the product label of the device.

   The following information is displayed if you enable Dynamic QoS (see Enable Dynamic QoS on page 112):
   - **Internet Download Speed by Device**: The last measured Internet download speed of the device in Mbps.
   - **Internet Upload Speed by Device**: The last measured Internet upload speed of the device in Mbps.
5. If you enable Dynamic QoS (see Enable Dynamic QoS on page 112), to display the Internet download and upload speed by application for a device, do the following:
   a. In the Device Name column of the table, click the device icon.
      The page adjusts and displays the following information, which applies to the selected device only:
      • **Application**: The application for which bandwidth information is displayed.
      • **Internet Download Speed by App**: The last measured Internet download speed of the application in Mbps.
      • **Internet Download Speed by App**: The last measured Internet download speed of the application in Mbps.
   b. To return to the previous page, click the **Back** button.

6. To update this page, click the **Refresh** button.

### Monitor Internet traffic

Traffic metering allows you to monitor the volume of Internet traffic that passes through the router Internet port. You can set limits for traffic volume.

**To monitor Internet traffic:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**. A login window opens.
3. Enter the router admin user name and password.
   - The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   - The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**. The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
6. To control the volume of Internet traffic, use either the traffic volume control feature or the connection time control feature:
Select the Traffic volume control by radio button and then select one of the following options:

- **No Limit.** No restriction is applied when the traffic limit is reached.
- **Download only.** The restriction is applied to incoming traffic only.
- **Both Directions.** The restriction is applied to both incoming and outgoing traffic.

Select the Connection time control radio button and enter the allowed hours in the Monthly limit field.

7. If your ISP charges for extra data volume when you make a new connection, enter the extra data volume in MB in the Round up data volume for each connection by field.

8. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
   To start the traffic counter immediately, click the Restart Counter Now button.

9. In the Traffic Control section, specify whether the router should issue a warning message before the monthly limit of Mbytes or hours is reached.
   By default, the value is 0 and no warning message is issued. You can select one of the following to occur when the limit is attained:
   - The Internet LED blinks.
   - The Internet connection is disconnected and disabled.

10. Click the Apply button.
    The Internet Traffic Statistics section helps you to monitor the data traffic.

11. To update the Traffic Statistics section, click the Refresh button.
12. To display more information about the data traffic on your router and to change the poll interval, click the Traffic Status button.

**Manage the router configuration file**

The configuration settings of the router are stored within the router in a configuration file. You can back up (save) this file to your computer, restore it, or reset it to the factory default settings.
Back up the settings

**To back up the router’s configuration settings:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net.`
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select `ADVANCED > Administration > Backup Settings.`
   The Backup Settings page displays.
5. Click the **Back Up** button.
6. Follow the direction of your browser to save the file.
   A copy of the current settings is saved in the location that you specified.

Erase the settings

**CAUTION:** This process erases all settings that you configured in the router.

**To erase the settings:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net.`
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select `ADVANCED > Administration > Backup Settings.`
   The Backup Settings page displays.
5. Click the **Erase** button.
The configuration is reset to factory default settings. When the reset is complete, the router restarts. This process takes about two minutes.

**WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting.

**Restore the settings**

**To restore configuration settings that you backed up:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select **ADVANCED > Administration > Backup Settings**. The Backup Settings page displays.
5. Click the **Browse** button to find and select the `.cfg` file.
6. Click the **Restore** button. The file is uploaded to the router and the router restarts.

**WARNING:** Do not interrupt the restoration process.

**Disable LED blinking or turn off LEDs**

The LEDs on the top panel of the router indicate activities and behavior. You can disable LED blinking for network communications, or turn off all LEDs except the Power LED.

**To disable LED blinking or turn off the LEDs:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`. 

A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > LED Control Settings**.
   The LED Control Settings page displays.

5. To disable blinking, clear the **Enable blinking on Internet LED, LAN LED, and Wireless LED when data traffic is detected** radio button.

6. To turn off all LEDs except the Power LED, select the **Turn off all LEDs except Power LED** radio button.

7. Click the **Apply** button.
   Your settings are saved.

Set your time zone

**To set your time zone:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > NTP Settings**.
   The NTP Settings page displays.

5. Select your time zone from the menu.

6. If you live in a region that observes daylight saving time, select the **Automatically adjust for daylight savings time** check box.

7. Click the **Apply** button.
   Your settings are saved.
Set the NTP server

By default, the router uses the NETGEAR NTP server to sync the network time. You can change the NTP server to your preferred NTP server.

**To set the NTP server:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select `ADVANCED > Administration > NTP Settings`.
   The NTP Settings page displays.
5. Select an NTP server radio button:
   - **Use the default NETGEAR NTP server**: Use the preset NETGEAR NTP server.
   - **Set your preferred NTP server**: Use your preferred server.
6. If you selected the **Set your preferred NTP server** radio button, enter the NTP server domain name or IP address in the **Server Address** field.
7. Click the **Apply** button.
   Your settings are saved.

Connect to your router with Anywhere Access

The Anywhere Access feature on the Nighthawk app allows you to connect to your router when you’re away from home and change its settings. Before you can use the Anywhere Access feature on the Nighthawk app, you must update your router’s firmware and download the latest Nighthawk app for your mobile device.
For more information about how to update your router’s firmware, see Check for new firmware and update the router on page 117.

To download the latest Nighthawk app for your mobile device, visit https://www.netgear.com/home/apps-services/nighthawk-app/.

Specify ReadyDLNA media server settings

By default, the router acts as a ReadyDLNA media server, which lets you view movies and photos on DLNA/UPnP AV-compliant media players, such as an Xbox360 and PlayStation.

**To specify media server settings:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > ReadySHARE > Media Server.
   The Media Server (Settings) page displays.
5. Select the Enable DLNA Media Server check box to enable the router to act as a media server.
6. To change the router’s media server name, do the following:
   a. Click the Edit button.
      The Device Name page displays.
      By default, the router model is the device name.
   b. Type the name in the Device Name field.
   c. Click the Apply button.
      Your settings are saved.
   d. Select ADVANCED > ReadySHARE > Media Server.
      The Media Server (Settings) page displays again.
7. To scan for new media files immediately, click the Rescan Media Files files.
The router automatically scans for media files whenever new files are added to your ReadySHARE USB storage device. Only a shared folder with All - no password in Read Access can be scanned for media files.

8. Click the Apply button.
Your settings are saved.

Return the router to its factory default settings

Under some circumstances (for example, if you lost track of the changes that you made to the router settings or you move the router to a different network), you might want to erase the configuration and reset the router to factory default settings.

To reset the router to factory default settings, you can use either the Reset button on the back of the router or the Erase function.

After you reset the router to factory default settings, the user name is admin, the password is password, the LAN IP address is 192.168.1.1 (which is the same as www.routerlogin.net), and the DHCP server is enabled.

**Note:** If the router is in access point mode or bridge mode and you do not know the IP address that is assigned to it, first try to use an IP scanner application to detect the IP address. (IP scanner applications are available online free of charge.) If you can detect the IP address, you don't need to reset the router to factory default settings.

Use the Reset button

**CAUTION:** This process erases all settings that you configured in the router.

**To reset the router to factory default settings:**

1. On the back of the router, locate the Reset button.
2. Using a straightened paper clip, press and hold the Reset button for at least five seconds.
3. Release the Reset button.
   The Power LED starts blinking. When the reset is complete, the router restarts. This process takes about two minutes.
WARNING: To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, if you are connected to the router web interface, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting.

Erase the settings

CAUTION: This process erases all settings that you configured in the router.

To erase the settings:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Administration > Backup Settings.
   The Backup Settings page displays.
5. Click the Erase button.
   The configuration is reset to factory default settings. When the reset is complete, the router restarts. This process takes about two minutes.

WARNING: To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, do not close the browser, click a link, or load a new page. Do not turn off the router. Wait until the router finishes restarting.
Share USB Storage Devices Attached to the Router

This chapter describes how to access and manage storage devices attached to your router. ReadySHARE lets you access and share USB storage devices connected to the router. (If your storage device uses special drivers, it is not compatible.)

**Note:** You can use a USB port on the router to connect a USB storage device like a flash drive or hard drive. Do not connect a computer, USB modem, CD drive, or DVD drive to a USB port on the router.

The chapter contains the following sections:

- **USB device requirements**
- **Connect a USB storage device to the router**
- **Access a storage device connected to the router from a Windows-based computer**
- **Map a USB device to a Windows network drive**
- **Access a storage device that is connected to the router from a Mac**
- **Enable FTP access within your network**
- **View network folders on a storage device**
- **Add a network folder on a USB storage device**
- **Edit a network folder on a USB storage device**
- **Safely remove a USB storage device**

For more information about ReadySHARE features, visit [netgear.com/readyshare](http://netgear.com/readyshare).
USB device requirements

The router works with most USB-compliant external flash and hard drives. For the most up-to-date list of USB devices that the router supports, visit kb.netgear.com/app/answers/detail/a_id/18985/~/readyshare-usb-drives-compatibility-list.

Some USB external hard drives and flash drives require you to load the drivers onto the computer before the computer can access the USB storage device. Such USB storage devices do not work with the router.

The router supports the following file system types for full read/write access:

- FAT16
- FAT32
- NTFS
- NTFS with compression format enabled
- Ext2
- Ext3
- Ext4
- HFS
- HFS+

Connect a USB storage device to the router

ReadySHARE lets you access and share USB storage devices that are connected to a USB port on the router. (If your USB storage device uses special drivers, it is not compatible.)

**To connect a USB device:**

1. Insert your USB storage device into a USB port on the router.
2. If your USB storage device uses a power supply, connect it.

   You must use the power supply when you connect the USB storage device to the router.

   When you connect the USB storage device to the router USB port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).
Access a storage device connected to the router from a Windows-based computer

To access the USB storage device from a Windows-based computer:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
   
   You must use the power supply when you connect the USB storage device to the router.
   
   When you connect the USB storage device to the router’s port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

4. Enter `\readyshare` in the dialog box.
5. Click the OK button.
   
   A window automatically opens and displays the files and folders on the USB storage device.

Map a USB device to a Windows network drive

To map the USB storage device to a Windows network drive:

1. Connect a USB storage device to a USB port on your router.
2. If your USB storage device uses a power supply, connect it.
   
   You must use the power supply when you connect the USB storage device to the router.
   
   When you connect the USB storage device to the router’s port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

4. Enter `\readyshare` in the dialog box.
5. Click the OK button.
   
   A window automatically opens and displays the USB storage device.
6. Right-click the USB device and select **Map network drive**.  
   The Map Network Drive window opens.

7. Select the drive letter to map to the new network folder.

8. Click the **Finish** button.  
   The USB storage device is mapped to the drive letter that you specified.

9. To connect to the USB storage device as a different user, select the **Connect using different credentials** check box, click the **Finish** button, and do the following:
   a. Type the user name and password.
   b. Click the **OK** button.

**Access a storage device that is connected to the router from a Mac**

From a computer or device on the network, you can access a storage device that is connected to the router.

**To access the device from a Mac:**

1. Connect a USB storage device to a USB port on your router.

2. If your USB storage device uses a power supply, connect it.  
   You must use the power supply when you connect the USB storage device to the router.  
   When you connect the USB storage device to the router’s port, it might take up to two minutes before it is ready for sharing. By default, the USB storage device is available to all computers on your local area network (LAN).

3. On a Mac that is connected to the network, select **Go > Connect to Server**.  
   The Connect to Server window opens.

4. In the **Server Address** field, enter **smb://readyshare**.

5. When prompted, select the **Guest** radio button.  
   If you set up access control on the router and you allowed your Mac to access the network, select the **Registered User** radio button and enter **admin** for the name and router admin password for the password. For more information about access control, see **Network access control list** on page 50.

6. Click the **Connect** button.
A window automatically opens and displays the files and folders on the USB storage device.

Enable FTP access within your network

File Transfer Protocol (FTP) lets you download (receive) and upload (send) large files faster.

**To enable FTP access within your network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
5. Select the `FTP` check box.
6. Click the **Apply** button. Your settings are saved.

View network folders on a storage device

You can view network folders on a storage device that is connected to the router.

**To view network folders:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router admin user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > ReadySHARE > Advanced Settings**.
The USB Storage (Advanced Settings) page displays.

5. Scroll down to the Available Networks Folder section to view the following settings:
   - **Share Name**. If only one USB device is connected, the default share name is USB_Storage.
     You can click the name or you can type it in the address field of your web browser. If Not Shared is shown, the default share was deleted and no other share for the root folder exists.
   - **Read Access and Write Access**. The permissions and access controls on the network folder. All-no password (the default) allows all users to access the network folder. The password for admin is the same one that you use to log in to the router.
   - **Folder Name**. The full path of the network folder.
   - **Volume Name**. The volume name from the storage device.
   - **Total Space and Free Space**. The current utilization of the storage device.

### Add a network folder on a USB storage device

You can add network folders on a USB storage device connected to a router USB port.

**To add a network folder:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter `http://www.routerlogin.net`.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > ReadySHARE > Advanced Settings**.
The USB Storage (Advanced Settings) page displays.
5. In the Available Network Folders section, select the USB storage device. If a single device is attached to the USB port, the radio button is selected automatically.

6. Click the **Create Network Folder** button. The Add Folder window opens. If this window does not open, your web browser might be blocking pop-ups. If it is, change the browser settings to allow pop-ups.

7. From the **USB Device** menu, select the USB drive. **Note:** We recommend that you do not attach more than one drive to one USB port (for example, through a USB hub).

8. Click the **Browse** button and in the Folder field, select the folder.

9. In the **Share Name** field, type the name of the share.

10. From the **Read Access** menu and the **Write Access** menu, select the settings that you want. All-no password (the default) allows all users to access the network folder. The other option is that only the admin user is allowed access to the network folder. The password for admin is the same one that you use to log in to the router.

11. Click the **Apply** button. The folder is added on the USB storage device.

12. Click the **Close Window** button. The window closes.

**Edit a network folder on a USB storage device**

You can edit network folders on a USB storage devices connected to a router USB port. **To edit a network folder:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**. A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > ReadySHARE > Advanced Settings**.
   The USB Storage (Advanced Settings) page displays.

5. In the Available Network Folders section, select the USB storage device.

6. Click the **Edit** button.
   The Edit Network Folder window opens.

7. Change the settings in the fields as needed.

8. Click the **Apply** button.
   Your settings are saved.

---

**Safely remove a USB storage device**

Before you physically disconnect a USB storage device from the router USB port, log in to the router and take the USB storage device offline.

**To remove a USB storage device safely:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter **http://www.routerlogin.net**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > ReadySHARE > Advanced Settings**.
   The USB Storage (Advanced Settings) page displays.

5. In the Available Network Folders sections, select the USB storage device.

6. Click the **Safely Remove USB Device** button.
   This takes the device offline.

7. Physically disconnect the USB storage device.
Use Dynamic DNS to Access USB Storage Devices Through the Internet

With Dynamic DNS, you can use the Internet to access a USB device that's connected to a USB port on the router when you're not home.

This chapter contains the following sections:

- Set up and manage Dynamic DNS
- Your personal FTP server
- Set up HTTPS access through the Internet
- Access USB storage devices through the Internet
Set up and manage Dynamic DNS

Internet service providers (ISPs) assign numbers called IP addresses to identify each Internet account. Most ISPs use dynamically assigned IP addresses. This means that the IP address can change at any time. You can use the IP address to access your network remotely, but most people don't know what their IP addresses are or when this number changes.

To make it easier to connect, you can get a free account with a Dynamic DNS service that lets you use a domain name to access your home network. To use this account, you must set up the router to use Dynamic DNS. Then the router notifies the Dynamic DNS service provider whenever its IP address changes. When you access your Dynamic DNS account, the service finds the current IP address of your home network and automatically connects you.

If your ISP assigns a private WAN IP address (such as 192.168.x.x or 10.x.x.x), the Dynamic DNS service does not work because private addresses are not routed on the Internet.

Set up a new Dynamic DNS account

To set up Dynamic DNS and register for a free NETGEAR account:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Advanced Setup > Dynamic DNS. The Dynamic DNS page displays.

5. Select the Use a Dynamic DNS Service check box.

6. From the Service Provider menu, select NETGEAR. You can select another service provider.

7. Select the No radio button.

8. In the Host Name field, type the name that you want to use for your URL.
The host name is sometimes called the domain name. Your free URL includes the host name that you specify and ends with mynetgear.com. For example, specify MyName.mynetgear.com.

9. In the Email field, type the email address for your account.
10. In the Password (6-32 characters) field, type the password for your account.
11. Click the Register button.
12. Follow the onscreen instructions to register for your NETGEAR Dynamic DNS service.

Specify a DNS account that you already created

If you already created a Dynamic DNS account with NETGEAR, No-IP, or DynDNS, you can set up the router to use your account.

To set up Dynamic DNS if you already created an account:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Dynamic DNS.
   The Dynamic DNS page displays.
5. Select the Use a Dynamic DNS Service check box.
6. From the Service Provider menu, select your provider.
7. Select the Yes radio button.
   The page adjusts and displays the Show Status, Cancel, and Apply buttons.
8. In the Host Name field, type the host name (sometimes called the domain name) for your account.
9. Depending on the type of service, specify either the user name of the email address:
   • No-IP account or DynDNS account. In the User Name field, type the user name for your account.
   • NETGEAR account. In the Email field, type the email address for your account.
10. In the Password (6-32 characters) field, type the password for your DDNS account.
11. Click the Apply button.
   Your settings are saved.
12. To verify that your Dynamic DNS service is enabled in the router, click the Show Status button.
   A message displays the Dynamic DNS status.

Change the Dynamic DNS settings

You can change the settings for your Dynamic DNS account.

To change your settings:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Dynamic DNS.
   The Dynamic DNS page displays.
5. Change your DDNS account settings as necessary.
6. Click the Apply button.
   Your settings are saved.

Your personal FTP server

With your customized free URL, you can use FTP to access your network when you aren’t home through Dynamic DNS. To set up your FTP server, you must register for a NETGEAR Dynamic DNS (DDNS) service account and specify the account settings. See Set up a new Dynamic DNS account on page 145.

Note: The router supports only basic DDNS, and the login and password might not be secure. You can use DDNS with a VPN tunnel for a secure connection.
Set up your personal FTP server

To set up your personal account and use FTP:

1. Get your NETGEAR Dynamic DNS domain name.
   For more information, see Set up a new Dynamic DNS account on page 145.

2. Make sure that your Internet connection is working.
   Your router must use a direct Internet connection. It cannot connect to a different
   router to access the Internet.

3. Connect a storage device to the router.

4. If your USB storage device uses a power supply, connect it.
   You must use the power supply when you connect the USB storage device to the
   router.
   When you connect the USB storage device to the router USB port, it might take up
   to two minutes before it is ready for sharing. By default, the USB storage device is
   available to all computers on your local area network (LAN).

5. Set up FTP access in the router.
   See Set up FTP access through the Internet on page 148.

6. On a remote computer with Internet access, you can use FTP to access your router

Set up FTP access through the Internet

To set up FTP access through the Internet:

1. Launch a web browser from a computer or mobile device that is connected to the
   router network.

2. Enter http://www.routerlogin.net.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time
   that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > ReadySHARE > Advanced Settings.
   The USB Storage (Advanced Settings) page displays.

5. Select the FTP (via Internet) check box.
The default port is number 21. Password protection is enabled by default. We recommend that you keep password protection enabled.

6. Click the Apply button.
Your settings are saved.
The link that lets you access the device over the Internet is ftp://public-ip-address/shares. In this link, public-ip-address represents one of the following:

- The IP address that is assigned to the router’s Internet port. You can view this IP address on the ADVANCED Home page.
- If you set up a DDNS account, the router’s DNS name, for example, yourname.mynetgear.com.

7. To limit read and write access of a device to the admin user, select a device in the Available Network Folder’s section.
If only one device is connected, it is automatically selected.

8. Click the Edit button.
The Edit page displays.

9. From the Read Access menu, select admin.
10. From the Write Access menu, select admin.
11. Click the Apply button.
Your settings are saved.

Set up HTTPS access through the Internet

To set up HTTPS access through the Internet:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > ReadySHARE > Advanced Settings.
The USB Storage (Advanced Settings) page displays.

5. Select the HTTPS (via Internet) check box.
   The default port is number 443. Password protection is enabled by default. We recommend that you keep password protection enabled.

6. Click the Apply button.
   Your settings are saved.
   The link that lets you access the device over the Internet is https://public-ip-address/shares. In this link, public-ip-address represents one of the following:
   - The IP address that is assigned to the router’s Internet port. You can view this IP address on the ADVANCED Home page.
   - If you set up a DDNS account, the router’s DNS name, for example, yourname.mynetgear.com.

7. To limit read and write access of a device to the admin user, select a device in the Available Network Folder’s section.
   If only one device is connected, it is automatically selected.

8. Click the Edit button.
   The Edit page displays.

9. From the Read Access menu, select admin.
10. From the Write Access menu, select admin.
11. Click the Apply button.
    Your settings are saved.

Access USB storage devices through the Internet

You can access USB storage devices through the Internet when you’re not home.

To access devices from a remote computer:
1. Launch a web browser on a computer that is not on your home network.
2. Connect to your home router:
The link that lets you access the device over the Internet is https://public-ip-address/shares. In this link, public-ip-address represents one of the following:

- The IP address that is assigned to the router’s Internet port. You can view this IP address on the ADVANCED Home page. For information about setting up HTTPS access through the Internet, see Access USB storage devices through the Internet on page 150.

- If you set up a DDNS account, the router’s DNS name, for example, youname.mynetgear.com. For information about using Dynamic DNS, see Set up and manage Dynamic DNS on page 145.

3. If password protection is enabled (which it is by default), type your admin password. You can now access your storage devices.
11

Use OpenVPN to Access Your Network

You can use OpenVPN software to remotely access your router with virtual private networking (VPN). This chapter explains how to install and use OpenVPN software to set up a VPN tunnel.

The chapter contains the following sections:

- About VPN connections
- LAN IP addressing in VPN networks
- Enable OpenVPN service in the router
- Install OpenVPN software on a VPN client
- Use VPN to access your Internet service at home
- Use VPN to remotely access a USB storage device attached to the router
About VPN connections

A virtual private network (VPN) lets you use the Internet to securely access your network when you aren't home.

This type of VPN access is called a client-to-gateway tunnel. The computer is the client, and the router is the gateway. To use the VPN feature, you must do the following:

- Log in to the router to enable and configure OpenVPN (see Enable OpenVPN service in the router on page 154).
- Install OpenVPN client software and configuration files on your device from which you want to use VPN (see Install OpenVPN software on a VPN client on page 155).
- Run the OpenVPN client software on your device when you want to use a VPN connection.

Enabling OpenVPN on your router allows VPN connections between the router and a client, for example your laptop when you are away from home. The router provides the VPN service and the laptop is the VPN client. Traffic between the router and the laptop is encrypted.

**Note:** The router itself does not function as a VPN client to an external VPN service provider, so it does not encrypt traffic passing between your home network and the Internet.

VPN can use either Dynamic DNS (DDNS) or a static IP address to connect with your router:

- To use a DDNS service, register for a DDNS account with a host name. You use the host name to access your network. The router supports these DDNS accounts: NETGEAR, No-IP, and Dyn. For more information, see Set up and manage Dynamic DNS on page 145.
- If your Internet service provider (ISP) assigned a static WAN IP address that never changes, the VPN can use that IP address to connect to your home network.

LAN IP addressing in VPN networks

For the VPN connection to work, your computer or device (the VPN client) must be connected to a network that uses a different LAN IP address scheme than your router.

The default LAN IP address scheme for the router is 192.168.1.x. (The most common IP schemes are 192.168.x.x, 172.x.x.x, and 10.x.x.x.) If you experience a conflict, change the IP scheme either for your home network or for the network where your VPN client device is connected.
If both networks use the same LAN IP scheme, when the VPN tunnel is established, you cannot access your home router or your home network with the OpenVPN software. For information about changing the LAN settings on the router, see Change the LAN TCP/IP settings on page 89.

Enable OpenVPN service in the router

You must enable the OpenVPN service settings in the router before you can use a VPN connection.

**To enable OpenVPN service:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter the router user name and password. The user name is `admin`. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.

   **Note:** The OpenVPN configuration software packages that you can download on the page are for the VPN client devices (see Install OpenVPN software on a VPN client on page 155).

5. Select the **Enable VPN Service** check box. We recommend that you use the default TUN mode and TAP mode settings. (These settings determine how VPN information is transferred.) If you know that you need other settings, you can change the TUN mode and TAP mode settings, but you must do so before you download and install the OpenVPN configuration software packages on client devices (see Install OpenVPN software on a VPN client on page 155).

6. To change the TUN mode settings, do the following:
   - To change the TUN mode service type, select the **UDP** or **TCP** radio button. The default protocol for TUN mode is UDP.
   - To change the TUN mode service port, type the port number that you want to use in the field.
The default port number for TUN mode is 12973. The TUN port number is used in the .ovpn file of the OpenVPN configuration software package for Mac and non-Windows clients.

7. To change the TAP mode settings, do the following:
   - To change the TAP mode service type, select the UDP or TCP radio button. The default protocol for TAP mode is UDP.
   - To change the TAP mode service port, type the port number that you want to use in the field. The default port number for TAP mode is 12974. The TAP port number is used in the .ovpn file of the OpenVPN configuration software package for Windows clients.

8. Click the Apply button.
   Your changes are saved. VPN is enabled in the router, but you must install and set up OpenVPN software on your device before you can use a VPN connection.

Install OpenVPN software on a VPN client

You must install OpenVPN software on each Windows-based computer, Mac computer, iOS device, and Android device that you plan to use for VPN connections to your router. Each computer or device is called a VPN client.

The software consists of the application software and the configuration files:

- Download and install the application software from the link that is provided in each client-specific section.
- Download and install the configuration files from the router as described in each client-specific section. The configuration files provide the correct router configuration information for the client utility. You must download the configuration files after you enable and configure OpenVPN service in the router (see Enable OpenVPN service in the router on page 154).

Note: If you later change the OpenVPN configuration in the router (for example, you change the TUN or TAP port number), you must download and install the .ovpn configuration file again on each client, depending on its operating system. If you change the TUN port number in the router, the .ovpn configuration file for Mac and non-Windows clients changes. If you change the TAP port number in the router, the .ovpn configuration file for Windows clients changes.
Install OpenVPN software on a Windows-based computer

You must install both the OpenVPN client utility and OpenVPN configuration files on each Windows-based computer where you want to use a VPN connection to your router.

To download and install the OpenVPN client utility and OpenVPN configuration files on a Windows-based computer:

1. To download the OpenVPN client utility on your Windows-based computer, visit openvpn.net/community-downloads/.
2. Select the Windows package with the installer files.
   In most situations, you can download the Windows 32-bit or Windows 64-bit installer files, depending on your Windows operating system.
3. Download and install the OpenVPN client utility on your computer.
   You need to have administrative privileges.
4. Launch a web browser from the computer, which must be connected to the router network.
5. Enter http://www.routerlogin.net.
   A login window opens.
6. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
7. Select ADVANCED > Advanced Setup > VPN Service.
   The VPN Service page displays.
8. Make sure that the Enable VPN Service check box is selected.
   For more information about the VPN configuration for the router, see Enable OpenVPN service in the router on page 154.
9. Click the For Windows button to download the router’s OpenVPN configuration files to your Windows-based computer.
10. Unzip the OpenVPN configuration files and copy them to the folder in which you installed the OpenVPN client utility.
11. Modify the VPN interface name to **NETGEAR-VPN**:
   a. If your computer is running Windows 10, select **Control Panel > Network and Sharing Center > Change adapter settings**.
      If your computer is running another Windows version, find the page that lets you change the adapter settings.
   b. In the local area connection list, find the local area connection with the device name **TAP-Windows Adapter**.
   c. Select the local area connection and change its name (not its device name) to **NETGEAR-VPN**.
      If you do not change the VPN interface name, the VPN tunnel connection will fail.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your Windows-based computer, visit https://openvpn.net/community-resources/how-to/#quick.

**Install OpenVPN software on a Mac computer**

You must install both the Tunnelblick OpenVPN client utility and OpenVPN configuration files on each Mac computer where you want to use a VPN connection to your router.

**To download and install the Tunnelblick OpenVPN client utility and OpenVPN configuration files on a Mac computer:**

1. To download the Tunnelblick OpenVPN client utility on your Mac computer, visit https://tunnelblick.net/downloads.html.
2. Download and install the Tunnelblick OpenVPN client utility on your Mac computer. You need to have administrative privileges.
3. Launch a web browser from the Mac computer, which must be connected to the router network.
5. Enter the router user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
6. Select **ADVANCED > Advanced Setup > VPN Service**. The VPN Service page displays.
7. Make sure that the **Enable VPN Service** check box is selected. 
   For more information about the VPN configuration for the router, see **Enable OpenVPN service in the router** on page 154.

8. Click the **For Mac OS X** button to download the router’s OpenVPN configuration files to your Mac computer.

9. Unzip the OpenVPN configuration files and copy them to the folder in which you installed the Tunnelblick OpenVPN client utility.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your Mac computer, visit https://openvpn.net/vpn-server-resources/installation-guide-for-openvpn-connect-client-on-macos/.

**Install OpenVPN software on an iOS device**

You must install both the OpenVPN Connect app and OpenVPN configuration files on each iOS device where you want to use a VPN connection to your router.

**To download and install the OpenVPN Connect app and OpenVPN configuration files on an iOS device:**

1. On your iOS device, download and install the OpenVPN Connect app from the Apple app store.
2. Launch a web browser from a computer or your iOS device that is connected to the router network.
3. Enter **http://www.routerlogin.net**. 
   A login window opens.
4. Enter the router user name and password. 
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. 
   The BASIC Home page displays.
5. Select **ADVANCED > Advanced Setup > VPN Service**. 
   The VPN Service page displays.
6. Make sure that the **Enable VPN Service** check box is selected. 
   For more information about the VPN configuration for the router, see **Enable OpenVPN service in the router** on page 154.
7. Click the **For Smart Phone** button to download the router’s OpenVPN configuration files to your computer or iOS device.
If you download the configuration files to your computer, unzip the files, and send them to your iOS device.

8. On your iOS device, do the following:
   a. Open the .ovpn file.
   b. If the OpenVPN Connect app does not start automatically, a list of apps might display: Select the OpenVPN Connect app.
   c. Install the .ovpn file.

You can now open a VPN tunnel to the router.

For more information about installing and using OpenVPN on your iOS device, visit https://www.vpngate.net/en/howto_openvpn.aspx#ios.

Install OpenVPN software on an Android device

You must install both the OpenVPN Connect app and OpenVPN configuration files on each Android device where you want to use a VPN connection to your router.

To download and install the OpenVPN Connect app and OpenVPN configuration files on an Android device:

1. On your Android device, download and install the OpenVPN Connect app from the Google Play Store.

2. Launch a web browser from a computer or your Android device that is connected to the router network.

4. Enter the router user name and password. The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.

5. Select ADVANCED > Advanced Setup > VPN Service. The VPN Service page displays.

6. Make sure that the Enable VPN Service check box is selected. For more information about the VPN configuration for the router, see Enable OpenVPN service in the router on page 154.

7. Click the For Smart Phone button to download the router’s OpenVPN configuration files to your computer or Android device.
If you download the configuration files to your computer, unzip the files, and send them your Android device.

8. On your Android device, open the .ovpn file and import it into the OpenVPN Connect app.

You can now open a VPN tunnel to the router.

For more information about using OpenVPN on your Android device, visit https://www.vpngate.net/en/howto_openvpn.aspx#android.

Use VPN to access your Internet service at home

When you’re away from home and you access the Internet, you usually use a local Internet service provider. For example, at a coffee shop you might be given a code that lets you use the coffee shop’s Internet service account to surf the web.

Your router lets you use a VPN connection to access your own Internet service when you’re away from home. You might want to do this if you travel to a geographic location that doesn’t support all the Internet services that you use at home. For example, your Netflix account might work at home but not in a different country.

Allow VPN client Internet access in the router

By default, the router is set up to allow VPN connections only to your home network, but you can change the settings to allow Internet access. Accessing the Internet remotely through a VPN might be slower than accessing the Internet directly.

To allow VPN clients to use your home Internet service:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > VPN Service.
   The VPN Service page displays.
5. Make sure that the **Enable VPN Service** check box is selected.
    For more information about the VPN configuration for the router, see **Enable OpenVPN service in the router** on page 154.

6. Scroll down to the Clients will use this VPN connection to access section, and select the **All sites on the Internet & Home Network** radio button.
    When you access the Internet with the VPN connection, instead of using a local Internet service, you use the Internet service from your home network.

7. Click the **Apply** button.
    Your settings are saved.

**Block VPN client Internet access in the router**

By default, the router is set up to allow VPN connections only to your home network, not to the Internet service for your home network. If you changed this setting to allow Internet access, you can change it back.

**To allow VPN clients to access only your home network and block them from using the Internet service for your home network:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VPN Service**.
   The VNP page displays.
5. Make sure that the **Enable VPN Service** check box is selected.
   For more information about the VPN configuration for the router, see **Enable OpenVPN service in the router** on page 154.
6. Scroll down to the Clients will use this VPN connection to access section, and select the **Home Network only** radio button.
   This is the default setting. The VPN connection is only to your home network, not to the Internet service for your home network.
7. Click the **Apply** button.
   Your settings are saved.

**Use VPN to remotely access a USB storage device attached to the router**

If you attach a USB storage device to a USB port on your router, after you make a VPN connection from a remote VPN client device to your home router, you can access the USB storage device. Because the router supports ReadySHARE, the USB storage device might display as a ReadySHARE network device on your home router’s local LAN.

**Note:** On the remote VPN client, your home router might display as the remote router.
Manage port forwarding and port triggering

You can use port forwarding and port triggering to set up rules for Internet traffic. You need networking knowledge to set up these features.

This chapter contains the following sections:
- Manage port forwarding to a local server
- Port triggering
Manage port forwarding to a local server

If your home network includes a server, you can allow certain types of incoming traffic to reach the server. For example, you might want to make a local web server, FTP server, or game server visible and available to the Internet.

The router can forward incoming traffic with specific protocols to computers on your local network. You can specify the servers for applications and you can also specify a default DMZ server to which the router forwards all other incoming protocols.

Set up port forwarding to a local server

To forward specific incoming protocols:

1. Decide which type of service, application, or game you want to provide.
2. Find the local IP address of the computer on your network that will provide the service.
   The server computer must always use the same IP address.
3. Assign the server computer a reserved IP address.
   See Manage reserved LAN IP addresses on page 93.
4. Launch a web browser from a computer or mobile device that is connected to the router network.
5. Enter http://www.routerlogin.net.
   A login window opens.
6. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
7. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
   The Port Forwarding / Port Triggering page displays.
8. Leave the Port Forwarding radio button selected as the service type.
9. From the Service Name menu, select the service name.
   If the service that you want to add is not in the menu, create a custom service. See Add a custom port forwarding service on page 165.
10. In the Server IP Address field, enter the IP address of the computer that will provide the service.
11. Click the Add button.
   The service displays in the menu.

Add a custom port forwarding service

The router lists default services and applications that you can use in port forwarding rules. If the service or application is not predefined, you can add a port forwarding rule with a custom service or application.

To add a custom service:
1. Find out which port number or range of numbers the application uses.
   You can usually find this information by contacting the publisher of the application or user groups or news groups.
2. Launch a web browser from a computer or mobile device that is connected to the router network.
3. Enter http://www.routerlogin.net
   A login window opens.
4. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
5. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
   The Port Forwarding / Port Triggering page displays.
6. Leave the Port Forwarding radio button selected as the service type.
7. Click the Add Custom Service button.
   The Ports - Custom Service page displays.
8. In the Service Name field, enter a descriptive name.
9. From the Protocol menu, select the protocol.
   If you are unsure, select TCP/UDP.
10. In the External port range field enter the port range.
11. Specify the internal ports by one of these methods:
   • Leave the Use the same port range for Internal port check box selected.
   • Type the port numbers in the Internal Starting Port field and the Internal Ending Port field.
You can enter a port range and fixed ports in one rule, for example, external (30–50, 78, 100–102), internal (40–60, 99, 200–202). With this rule, external ports 30–50 are forwarded to internal ports 40–60.

12. In the Internal IP address field, type the IP address or select the radio button for an attached device listed in the table.

13. Click the Apply button.
   The service is now in the list on the Port Forwarding/Port Triggering page.

Edit a port forwarding service

To edit a port forwarding entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.

2. Enter http://www.routerlogin.net.
   A login window opens.

3. Enter the router user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

4. Select Advanced > Advanced Setup > Port Forwarding/Port Triggering.
   The Port Forwarding / Port Triggering page displays.

5. Leave the Port Forwarding radio button selected as the service type.

6. In the table, select the radio button next to the service name.

7. Click the Edit Service button.
   The Ports - Custom Services page displays.

8. Change the settings as needed.

9. Click the Apply button.
   Your settings are saved.
Delete a port forwarding entry

To delete a port forwarding entry:

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**.
   The Port Forwarding / Port Triggering page displays.
5. Leave the **Port Forwarding** radio button selected.
6. In the table, select the radio button next to the service name.
7. Click the **Delete Service** button.
   The service is deleted.

Application example: Make a local web server public

If you host a web server on your local network, you can use port forwarding to allow web requests from anyone on the Internet to reach your web server.

To make a local web server public:

1. Assign your web server either a fixed IP address or a dynamic IP address using DHCP address reservation.
   In this example, your router always gives your web server an IP address of 192.168.1.33.
2. On the Port Forwarding/Port Triggering page, configure the router to forward the HTTP service to the local address of your web server at 192.168.1.33.
   HTTP (port 80) is the standard protocol for web servers.
3. (Optional) Register a host name with a Dynamic DNS service and specify that name on the Dynamic DNS page of the router.
   Dynamic DNS makes it much easier to access a server from the Internet because you can type the name in the Internet browser. Otherwise, you must know the IP address that the ISP assigned, which typically changes.
How the router implements the port forwarding rule

The following sequence shows the effects of a port forwarding rule:

1. When you type the URL www.example.com in your browser, the browser sends a web page request message with the following destination information:
   - **Destination address.** The IP address of www.example.com, which is the address of your router.
   - **Destination port number.** 80, which is the standard port number for a web server process.

2. Your router receives the message and finds your port forwarding rule for incoming port 80 traffic.

3. The router changes the destination in the message to IP address 192.168.1.33 and sends the message to that computer.

4. Your web server at IP address 192.168.1.33 receives the request and sends a reply message to your router.

5. Your router performs Network Address Translation (NAT) on the source IP address and sends the reply through the Internet to the computer or WiFi device that sent the web page request.

Port triggering

Port triggering is a dynamic extension of port forwarding that is useful in these cases:

- An application must use port forwarding to more than one local computer (but not simultaneously).
- An application must open incoming ports that are different from the outgoing port.

With port triggering, the router monitors traffic to the Internet from an outbound “trigger” port that you specify. For outbound traffic from that port, the router saves the IP address of the computer that sent the traffic. The router temporarily opens the incoming port or ports that you specify in your rule and forwards that incoming traffic to that destination.

Port forwarding creates a static mapping of a port number or range of ports to a single local computer. Port triggering can dynamically open ports to any computer when needed and close the ports when they are no longer needed.

**Note:** If you use applications such as multiplayer gaming, peer-to-peer connections, real-time communications such as instant messaging, or remote assistance, enable Universal Plug and Play (UPnP).
Add a port triggering service

**To add a port triggering service:**

1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter http://www.routerlogin.net.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Port Forwarding/Port Triggering.
   The Port Forwarding / Port Triggering page displays.
5. Select the Port Triggering radio button.
   The page adjusts.
6. Click the Add Service button.
   The Port Triggering - Services page displays.
7. In the Service Name field, type a descriptive service name.
8. From the Service User menu, select a user option:
   - Any (the default) allows any computer on the Internet to use this service.
   - Single address restricts the service to a particular computer.
9. From the Service Type menu, select TCP or UDP.
   This selection sets the service type for the outbound connection.
10. In the Triggering Port field, enter the number of the outbound traffic port that will open the inbound ports.
11. From the Connection Type menu, select TCP, UDP, or TCP/UDP.
    This selection sets the service type for the inbound connection. If you are not sure, select TCP/UDP.
12. In the Starting Port and Ending Port fields, enter the numbers of the inbound traffic ports.
13. Click the Apply button.
The service is now in the Port Triggering Portmap Table. You must enable port triggering before the router uses port triggering. See Enable port triggering on page 170.

Enable port triggering

To enable port triggering:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Enter **http://www.routerlogin.net**. A login window opens.
3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive. The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding/Port Triggering**. The Port Forwarding/Port Triggering page displays.
5. Select the **Port Triggering** radio button. The page adjusts.
6. Clear the **Disable Port Triggering** check box. If this check box is selected, the router does not use port triggering even if you specified port triggering settings.
7. In the **Port Triggering Timeout** field, enter a value up to 9999 minutes. This value controls how long the inbound ports stay open when the router detects no activity. This value is required because the router cannot detect when the application terminates.
8. Click the **Apply** button. Your settings are saved.

Application example: Port triggering for Internet relay chat

Some application servers, such as FTP and IRC servers, send replies to multiple port numbers. Using port triggering, you can tell the router to open more incoming ports when a particular outgoing port starts a session.
An example is Internet Relay Chat (IRC). Your computer connects to an IRC server at destination port 6667. The IRC server not only responds to your originating source port but also sends an “identify” message to your computer on port 113. Using port triggering, you can tell the router, “When you initiate a session with destination port 6667, you must also allow incoming traffic on port 113 to reach the originating computer.” The following sequence shows the effects of this port triggering rule:

1. You open an IRC client program to start a chat session on your computer.
2. Your IRC client composes a request message to an IRC server using a destination port number of 6667, the standard port number for an IRC server process. Your computer then sends this request message to your router.
3. Your router creates an entry in its internal session table describing this communication session between your computer and the IRC server. Your router stores the original information, performs Network Address Translation (NAT) on the source address and port, and sends this request message through the Internet to the IRC server.
4. Noting your port triggering rule and observing the destination port number of 6667, your router creates another session entry to send any incoming port 113 traffic to your computer.
5. The IRC server sends a return message to your router using the NAT-assigned source port (for example, port 33333) as the destination port and sends an “identify” message to your router with destination port 113.
6. When your router receives the incoming message to destination port 33333, it checks its session table to see if a session is active for port number 33333. Finding an active session, the router restores the original address information replaced by NAT and sends this reply message to your computer.
7. When your router receives the incoming message to destination port 113, it checks its session table and finds an active session for port 113 associated with your computer. The router replaces the message’s destination IP address with your computer’s IP address and forwards the message to your computer.
8. When you finish your chat session, your router eventually senses a period of inactivity in the communications. The router then removes the session information from its session table and incoming traffic is no longer accepted on port numbers 33333 or 113.
13

Troubleshooting

This chapter provides information to help you diagnose and solve problems you might experience with your router. If you do not find the solution here, check the NETGEAR support site at netgear.com/support for product and contact information.

The chapter contains the following sections:

- Quick tips
- Troubleshoot with the LEDs
- You cannot log in to the router
- You cannot access the Internet
- Troubleshoot Internet browsing
- Changes are not saved
- Troubleshoot WiFi connectivity
- Troubleshoot your network using the ping utility
Quick tips

This section describes tips for troubleshooting some common problems.

Sequence to restart your network

If you must restart your network, follow this sequence:
1. Turn off and unplug the modem.
2. Turn off the router.
3. Plug in the modem and turn it on. Wait two minutes.
4. Turn on the router and wait two minutes.

Check the power adapter and Ethernet cable connections

If the router does not start, make sure that the power adapter cable is securely plugged in. If the Internet connection or LAN connections do not function, make sure that the Ethernet cables are securely plugged in. The Internet LED on the router is lit if the Ethernet cable connecting the router and the modem is plugged in securely and the modem and router are turned on. If one or more powered-on computers are connected to the router by an Ethernet cable, the corresponding numbered router LAN port LEDs light.

Check the WiFi settings

Make sure that the WiFi settings on the WiFi-enabled computer or mobile device and the router match exactly. The WiFi network name (SSID) and WiFi security settings of the router and the computer or mobile device must match exactly. WiFi passwords are case sensitive.

If you set up an access control list, you must add the MAC address of each computer and mobile device to the router’s access control list.

Check the network settings

If your computer or mobile device cannot connect to the router, make sure that the network settings of the computer or mobile device are correct. Computers and mobile devices must use network IP addresses on the same network as the router. By default, almost all computers and mobile devices are set up to obtain an IP address automatically using DHCP.
Some Internet service providers require you to use the MAC address of the computer initially registered on the account, but this is an unusual situation. You can view the MAC address on the Attached Devices page of the router web interface.

**Troubleshoot with the LEDs**

By default, the router uses standard LED settings.

**Standard LED behavior when the router is powered on**

After you turn on power to the router, verify that the following sequence of events occurs:

1. When power is first applied, verify that the Power LED is lit.
2. After about two minutes, verify the following:
   - The Power LED is lit.
   - The Internet LED is lit.
   - The WiFi LED is lit (unless you turned off the WiFi radio).

You can use the LEDs on the front panel of the router for troubleshooting.

**Power LED is off or blinking**

This could occur for a number of reasons. Check the following:

- Make sure that the power adapter is securely connected to your router and securely connected to a working power outlet.
- Make sure that you are using the power adapter that NETGEAR supplied for this product.
- If the Power LED blinks slowly and continuously, the router firmware is corrupted. This can happen if a firmware update is interrupted, or if the router detects a problem with the firmware. If the error persists, it is likely that a hardware problem exists. For recovery instructions, or help with a hardware problem, contact Technical Support at netgear.com/support.

**LEDs never turn off**

When the router is turned on, the LEDs light for about 10 seconds and then turn off. If all the LEDs stay on, this indicates a fault within the router.
If all LEDs are still lit one minute after power-up, do the following:

- Cycle the power to see if the router recovers.
- Press and hold the **Reset** button to return the router to its factory settings.

If the error persists, a hardware problem might be the cause. Contact Technical Support at netgear.com/support.

**Internet or Ethernet LAN port LEDs are off**

If the Internet LED or Ethernet LAN port LEDs do not light when an Ethernet connection is made, check the following:

- Make sure that the Ethernet cable connections are secure at the router and at the modem or computer.
- Make sure that power is turned on to the connected modem or computer.
- Be sure that you are using the correct cable.

When you connect the router’s Internet port to a modem, use the cable that was supplied with the modem. This cable can be a standard straight-through Ethernet cable or an Ethernet crossover cable.

**WiFi LED is off**

If the WiFi LED stays off, check to see if someone pressed the **WiFi On/Off** button on the router. This button turns the WiFi radios in the router on and off. If someone disabled the WiFi radios by using the router web interface, the WiFi LED also stays off. The WiFi LED is lit when the WiFi radios are turned on.

**You cannot log in to the router**

If you are unable to log in to the router from a computer or mobile device on your local network, check the following:

- If you are using an Ethernet-connected computer, check the cable connection between the computer and the router.
- If you are using a WiFi-enabled computer or mobile device, check the WiFi connection between the computer or mobile device and the router.
- Make sure that you are using the correct login information. The user name is **admin**. The password is the one that you specified the first time that you logged in. (The default password is **password**.) The user name and password are case-sensitive. Make sure that Caps Lock is off when you enter this information.
• Try quitting the browser and launching it again.

• Make sure that Java, JavaScript, or ActiveX is enabled in your browser. If you are using Internet Explorer, click the Refresh button to be sure that the Java applet is loaded.

• Make sure that the IP address of your computer or mobile device is in the same subnet as the router. If you are using the recommended addressing scheme, the IP address of your computer or mobile device is in the range of 192.168.1.2 to 192.168.1.254.

• If the IP address of your computer or mobile device is shown as 169.254.x.x, the computer or mobile device could not reach the router’s DHCP server and the Windows or Mac operating system generated and assigned an IP address. Such an autogenerated IP address is in the range of 169.254.x.x. If your IP address is in this range, check the connection from the computer or mobile device to the router, and reboot your computer or mobile device.

• If your router’s IP address was changed and you do not know the current IP address, clear the router’s configuration to factory defaults. This sets the router’s IP address to 192.168.1.1.

Note: If the router is in access point mode or bridge mode and you do not know the IP address that is assigned to it, first try to use an IP scanner application to detect the IP address. (IP scanner applications are available online free of charge.) If you can detect the IP address, you don’t need to reset the router to factory default settings.

• If you are attempting to set up your NETGEAR router as a replacement for an ADSL gateway in your network, the router cannot perform many gateway services. For example, the router cannot convert ADSL or cable data into Ethernet networking information. NETGEAR does not support such a configuration.

You cannot access the Internet

If you can access your router but not the Internet, check to see if the router can obtain a WAN IP address from your Internet service provider (ISP). Unless your ISP provides a fixed IP address, your router requests an IP address from the ISP. You can determine whether the request was successful using the router web interface.

To check the WAN IP address:
1. Launch a web browser from a computer or mobile device that is connected to the router network.
2. Select an external site such as https://www.netgear.com/.
3. Enter **http://www.routerlogin.net**.
   A login window opens.

4. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in. The user name and password are case-sensitive.
   The BASIC Home page displays.

5. Click the **ADVANCED** tab.
   The ADVANCED Home page displays.

6. Check to see that an IP address is shown for the Internet port. If 0.0.0.0 is shown, your router did not obtain an IP address from your ISP.

If your router cannot obtain an IP address from the ISP, you might need to force your modem to recognize your new router by restarting your network. For more information, see **Sequence to restart your network** on page 173.

If your router is still unable to obtain an IP address from the ISP, the problem might be one of the following:

- Your Internet service provider (ISP) might require a login program. Ask your ISP whether they require PPP over Ethernet (PPPoE) or some other type of login.
- If your ISP requires a login, the login name and password might be set incorrectly.
- Your ISP might check for your computer’s host name. Assign the computer host name of your ISP account as the account name on the Internet Setup page.
- If your ISP allows only one Ethernet MAC address to connect to Internet and checks for your computer’s MAC address, do one of the following:
  - Inform your ISP that you bought a new network device and ask them to use the router’s MAC address.
  - Configure your router to clone your computer’s MAC address.

If your router obtained an IP address, but your computer does not load any web pages from the Internet, it might be for one or more of the following reasons:

- Your computer might not recognize any DNS server addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router’s configuration, reboot your computer, and verify the DNS address. You can configure your computer manually with DNS addresses, as explained in your operating system documentation.
- The router might not be configured as the TCP/IP gateway on your computer.
If your computer obtains its information from the router by DHCP, reboot the computer and verify the gateway address.

- You might be running login software that is no longer needed. If your ISP provided a program to log you in to the Internet, you no longer need to run that software after installing your router.

Troubleshoot Internet browsing

If your router can obtain an IP address but your computer is unable to load any web pages from the Internet, it might be for the following reasons:

- The traffic meter is enabled, and the limit was reached. By configuring the traffic meter not to block Internet access when the traffic limit is reached, you can resume Internet access. If your Internet service provider (ISP) sets a usage limit, they might charge you for the overage.

- Your computer might not recognize any DNS server addresses. A DNS server is a host on the Internet that translates Internet names (such as www addresses) to numeric IP addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the router’s configuration, restart your computer. Alternatively, you can configure your computer manually with a DNS address, as explained in the documentation for your computer.

- The router might not be configured as the default gateway on your computer. Restart the computer and verify that the router address (www.routerlogin.net) is listed by your computer as the default gateway address.

Changes are not saved

If the router does not save the changes that you make in the router web interface, do the following:

- When entering configuration settings, always click the Apply button before moving to another page or tab, or your changes are lost.

- Click the Refresh or Reload button in the web browser. It is possible that the changes occurred, but the old settings might be in the web browser’s cache.
Troubleshoot WiFi connectivity

If you are experiencing trouble connecting over WiFi to the router, try to isolate the problem:

- Does the WiFi device or computer that you are using find your WiFi network? If not, check the WiFi LED on the router. If it is off, you can press the WiFi On/Off button on the router to turn the router WiFi radios back on. If you disabled the router’s SSID broadcast, then your WiFi network is hidden and does not display in your WiFi client’s scanning list. (By default, SSID broadcast is enabled.)

- Does your WiFi device support the security that you are using for your WiFi network (WPA, WPA2, or WPA3)?

- If you want to view the WiFi settings for the router, use an Ethernet cable to connect a computer to a LAN port on the router. Then log in to the router, and select BASIC > Wireless.

Note: Be sure to click the Apply button if you change settings.

If your WiFi device finds your network but the signal strength is weak, check these conditions:

- Is your router too far from your computer or too close? Place your computer near the router but at least 6 feet (1.8 meters) away and see whether the signal strength improves.

- Are objects between the router and your computer blocking the WiFi signal?

Troubleshoot your network using the ping utility

Most network devices and routers contain a ping utility that sends an echo request packet to the designated device. The device then responds with an echo reply. You can easily troubleshoot a network using the ping utility in your computer or workstation.

Test the LAN path to your router

You can ping the router from your computer to verify that the LAN path to your router is set up correctly.
To ping the router from a Windows-based computer:
1. From the Windows toolbar, click the Start button and select Run.
2. In the field provided, type ping followed by the IP address of the router, as in this example:
   ```
   ping www.routerlogin.net
   ```
3. Click the OK button.
   You see a message like this one:
   ```
Pinging <IP address > with 32 bytes of data
If the path is working, you see this message:
Reply from < IP address >: bytes=32 time=NN ms TTL=xxx
If the path is not working, you see this message:
Request timed out
   ```

If the path is not functioning correctly, one of the following problems might be occurring:

- Wrong physical connections
  For a wired connection, make sure that the numbered LAN port LED is lit for the port to which you are connected.
  Check to see that the appropriate LEDs are lit for your network devices. If your router and computer are connected to a separate Ethernet switch, make sure that the link LEDs are lit for the switch ports that are connected to your computer and router.

- Wrong network configuration
  Verify that the Ethernet card driver software and TCP/IP software are both installed and configured on your computer.
  Verify that the IP address for your router and your computer are correct and that the addresses are on the same subnet.

Test the path from a Windows-based computer to a remote device

To test the path from a Windows-based computer to a remote device:
1. From the Windows toolbar, click the Start button and select Run.
2. In the Windows Run window, type
   ```
   ping -n 10 <IP address>
   ```
   where <IP address> is the IP address of a remote device such as your ISP DNS server.
   If the path is functioning correctly, messages display that are similar to those shown in Test the LAN path to your router on page 179.
3. If you do not receive replies, check the following:

- Check to see that IP address of your router is listed as the default gateway for your computer. If DHCP assigns the IP configuration of your computers, this information is not visible in your computer Network Control Panel. Verify that the IP address of the router is listed as the default gateway.

- Check to see that the network address of your computer (the portion of the IP address specified by the subnet mask) is different from the network address of the remote device.

- Check to see that your cable or DSL modem is connected and functioning.

- If your ISP assigned a host name to your computer, enter that host name as the account name on the Internet Setup page.

- Your ISP might be rejecting the Ethernet MAC addresses of all but one of your computers.

Many broadband ISPs restrict access by allowing traffic only from the MAC address of your broadband modem. Some ISPs additionally restrict access to the MAC address of a single computer connected to that modem. If your ISP does this, configure your router to “clone” or “spoof” the MAC address from the authorized computer.
Supplemental Information

This chapter includes technical information about your router.
The chapter contains the following topics:

- Factory settings
- Technical specifications

For additional information, see the datasheet, which you can download by visiting netgear.com/support/product/raxe300.aspx.
Factory settings

You can return the router to its factory settings. Use the end of a paper clip or a similar object to press and hold the **Reset** button on the back of the router for at least seven seconds. The router resets and returns to the factory configuration settings shown in the following table.
