Orbi Pro Ceiling Satellite
Model SRC60
Support
Thank you for purchasing this NETGEAR product. You can visit https://www.netgear.com/support/ to register your product, get help, access the latest downloads and user manuals, and join our community. We recommend that you use only official NETGEAR support resources.

Compliance and Conformity
For regulatory compliance information including the EU Declaration of Conformity, visit https://www.netgear.com/about/regulatory/.

See the regulatory compliance document before connecting the power supply.

Do not use this device outdoors. If you connect cables or devices that are outdoors to this device, see http://kb.netgear.com/000057103 for safety and warranty information.

Overview

This manual covers how to set up your Orbi Pro Ceiling Satellite model SRC60 and configure its settings from the Orbi Pro router web interface.

For information about how to configure your Orbi Pro router, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx.

This chapter contains the following sections:

• Supported Orbi Pro routers and satellites
• Package contents
• Hardware overview
• Mount the satellite on a drop ceiling or wall
• Sync your satellite with your Orbi Pro router
• Set up your Orbi network with the NETGEAR Insight mobile app

Note: The Orbi Pro Ceiling Satellite (SRC60) requires an Orbi Pro Router (SRR60), which is sold separately. The Orbi Pro Ceiling Satellite does not support and does not pair with an Orbi Home WiFi System router.

Note: For more information about the topics that are covered in this manual, visit the support website at netgear.com/support/.
Supported Orbi Pro routers and satellites

The Orbi Pro Router (SRR60), Orbi Pro Satellites, and the Orbi Outdoor Satellite support the Orbi Pro Ceiling Satellite. You must own an Orbi Pro router to add the Orbi Pro Ceiling Satellite to your WiFi network. The Orbi Tri-Band Mesh WiFi Router (RBR20) and the Orbi Tri-Band Cable Modem Router (CBR40) do not support the Orbi Pro Ceiling Satellite.

Package contents

Your package contains the items that are shown in the following figure.

1. Orbi Pro Ceiling Satellite (Model SRC60).
2. Power adapter (varies by region).

**Note:** If you use a Power over Ethernet plus (PoE+) connection to a PoE+ switch, the satellite does not require a power adapter.
3. Metal bracket with T-bar and lock screw and four short screws. The metal bracket with T-bar and lock screw are for ceiling mounting. The four short screws are used to attach the plastic mount to the metal bracket.

4. Plastic mount. The mount can be used for either ceiling mounting or wall mounting.

5. Two tall screws and anchors. The screws and anchors are used to attach the plastic mount to a wall.

Hardware overview

The following figure shows the top panel (facing away from the ceiling or wall) and the next figure shows both the bottom panel (facing the ceiling or wall) and back panel with the connections and buttons.

![Figure 2. Top panel (facing away from the ceiling or wall)](image-url)
Figure 3. Bottom panel (facing the ceiling or wall) and back panel

1. **Power LED.** For more information, see Power LED on page 9.

2. **LED bar.** For more information, see LED Bar on page 9.

3. **DC power connector.** You do not need to connect a DC power adapter if you use a PoE+ connection. Otherwise, connect the 12V, 2.5A power adapter that is in the package.

4. **LAN 1 PoE+ port** 1/8 This port supports both an Ethernet backhaul connection and an optional PoE+ connection to a device that can provide 802.3at (PoE+) power.

5. **LAN 2 port.** 2 This port can function as a second Ethernet backhaul connection in an 802.3ad link aggregation group (LAG) configuration or a static link aggregation configuration. For more information, see About link aggregation on page 28.
6. **Reset button.** For more information, see *Reset the satellite to factory defaults* on page 28.

7. **Sync button.** For more information, see *Sync your satellite using the Sync button* on page 14.

**Power LED**

The Power LED is located to the left of the LED bar on the top panel. The following table describes the behavior for the Power LED bar.

<table>
<thead>
<tr>
<th>Color</th>
<th>LED behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid green</td>
<td>Power is on. This is the normal Power LED behavior when the satellite is on.</td>
</tr>
<tr>
<td>Blinking amber</td>
<td>A firmware upgrade is in progress or the satellite is resetting to factory default settings.</td>
</tr>
<tr>
<td>Solid red</td>
<td>PoE power is not at the 802.3at (PoE+) level, which is required if you use a PoE connection. For more information, see <em>You use PoE power and the Power LED is solid red</em> on page 34.</td>
</tr>
<tr>
<td>Blinking red</td>
<td>The firmware is corrupted. For more information, see <em>The Power LED is blinking red</em> on page 34.</td>
</tr>
<tr>
<td>Off</td>
<td>Power is not supplied.</td>
</tr>
</tbody>
</table>

**LED Bar**

The LED bar is located to the right of the Power LED on the top panel. The following tables describe the behavior for the LED bar.

<table>
<thead>
<tr>
<th>Color</th>
<th>LED behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulsing white</td>
<td>The satellite is booting.</td>
</tr>
<tr>
<td>Pulsing white after you press the <strong>Sync</strong> button</td>
<td>The satellite is trying to sync with the Orbi Pro router. The LED might pulse white for about six minutes. After the LED pulses white, it lights blue, amber, or magenta. See the next table for more information.</td>
</tr>
<tr>
<td>Solid white</td>
<td>The satellite is ready to sync with the Orbi Pro router.</td>
</tr>
</tbody>
</table>

After you press the **Sync** button, the LED bar pulses white. Then, for about three minutes, the LED bar lights one of colors described in the following table. After three minutes, the LED bar turns off.
Table 3. Sync colors

<table>
<thead>
<tr>
<th>Color</th>
<th>LED Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>The Orbi Pro router and satellite synced, and the connection between the router and satellite is good.</td>
</tr>
<tr>
<td>Amber</td>
<td>The Orbi Pro router and satellite synced, and the connection between the router and satellite is fair. Consider moving the satellite closer to the router.</td>
</tr>
<tr>
<td>Magenta</td>
<td>The Orbi Pro router and satellite did not sync. Move the satellite closer to the router and try again.</td>
</tr>
<tr>
<td>Pulsing magenta</td>
<td>If the LED bar pulses magenta for about 30 seconds, the satellite’s Sync button is disabled. Log in to the router, enable the Sync button, and repeat the sync process. For more information, see Enable the Sync button on page 23.</td>
</tr>
</tbody>
</table>

Satellite label

The satellite label shows the WiFi network name (SSID), network key (password), the satellite’s serial number, and the satellite’s MAC address. The following figure is an example of the label.

![Satellite label example](image)

Figure 4. Satellite label

Mount the satellite on a drop ceiling or wall

You can mount the satellite on a drop ceiling or on a wall. The package contains the components for either mounting method.

Before mounting the satellite, first set up and test the satellite with your Orbi Pro router to verify WiFi network connectivity.
Note: If you are mounting the satellite on a hard ceiling, follow the instructions in Mount the satellite on a wall on page 13.

Mount the satellite on a drop ceiling

To mount the satellite on a drop ceiling:

1. Slide the T-bar partially into the metal bracket.
2. Attach the metal bracket to the ceiling bar.
3. Push the T-bar over the ceiling bar.
4. Use the lock screw to lock the metal bracket into place.
5. Use the four short screws to attach the plastic mount to the metal bracket.

6. Slide the satellite onto the plastic mount.

7. Use the retaining clip to lock the satellite into place.

8. Cable the satellite to your network.
Mount the satellite on a wall

To mount the satellite on a wall:

1. Place the plastic mount on the wall.
2. Mark the wall where the two mounting holes are.
3. If needed, drill holes.
4. Use the two wall anchors and tall screws to attach the plastic mount to the wall.

5. Slide the satellite onto the plastic mount.
6. Use the retaining clip to lock the satellite into place.

7. Cable the satellite to your network.

Sync your satellite with your Orbi Pro router

Use the Sync button on your Orbi Pro Ceiling Satellite to sync your satellite with your Orbi Pro router. You can also log in to your Orbi Pro router and use the router web interface to sync your satellite.

Sync your satellite using the Sync button

After your satellite syncs with your Orbi Pro router, the satellite’s Sync button is disabled for security reasons. If you press the Sync button and the satellite’s LED bar pulses magenta, this LED behavior indicates that the Sync button is disabled. To enable the Sync button, log in to the router and go to the Attached Devices page. For more information, see Enable the Sync button on page 23.
To sync your satellite using the Sync button on both the Orbi Pro router and the satellite:

1. For the sync process, place your Orbi Pro satellite in an area near your Orbi Pro router.
   For example, place your satellite in the same room as your router, but not too close to the router. We suggest that you keep a distance of 20–25 feet (about 6–7 meters) between the satellite and the router.

2. Connect your satellite to a power source.
   Either connect the power adapter to the satellite and to a power source, or connect PoE+ LAN port 1 on the satellite to an Ethernet cable and to a Power over Ethernet Plus (PoE+) switch that can provide 802.3at (PoE+) power.
   The Power LED on the top panel of the satellite lights solid green.

   **Note:** If the Power LED does not light, check the power source or the PoE+ switch. If the Power LED lights red, the power is not at the required 802.3at (PoE+) level. Make sure that you use an 802.3at (PoE+) switch and not an 802.af (PoE) switch.

3. Wait for the LED bar (next to the Power LED) to light solid white.
   The following is the LED behavior during booting:
   - **Pulsing white.** The satellite is booting.
   - **Solid white.** The satellite finished booting and is ready to sync with your router.

4. Press the **Sync** button on the back of your satellite, and within two minutes, press the **Sync** button on the back of your router.

5. Wait for the satellite to sync with the router.
   The LED bar on the satellite lights pulsing white while it attempts to sync with your router. It might take about six minutes for your satellite to sync.
   After the LED bar lights white, it lights one of the following colors for about three minutes and then turns off.
<table>
<thead>
<tr>
<th>Color</th>
<th>LED Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>The Orbi Pro router and satellite synced, and the connection between the router and satellite is good.</td>
</tr>
<tr>
<td>Amber</td>
<td>The Orbi Pro router and satellite synced, but the connection between the router and satellite is only fair. Consider moving the satellite closer to the router.</td>
</tr>
<tr>
<td>Magenta</td>
<td>The Orbi Pro router and satellite did not sync. Move the satellite closer to the router and try again.</td>
</tr>
</tbody>
</table>

**Note:** After your satellite syncs with your router, the satellite’s **Sync** button is disabled for security reasons. If you press the **Sync** button and the satellite’s LED bar pulses magenta, this LED behavior indicates that the **Sync** button is disabled. For information about enabling the **Sync** button, see Enable the **Sync** button on page 23.

Sync your satellite using the Orbi Pro router web interface

You can use the Orbi Pro router web interface (*not* the satellite web interface) to add a satellite to your Orbi network.

**To add a satellite to your Orbi network using the router web interface:**

1. For the sync process, place your Orbi Pro satellite in an area near your Orbi Pro router.
   
   For example, place your satellite in the same room as your router, but not too close to the router. We suggest that you keep a distance of 20–25 feet (about 6–7 meters) between the satellite and the router.

2. Launch a web browser from a computer or mobile device that is connected to your Orbi network.

3. Enter **orbilogin.com**.
   
   A login window opens.

4. Enter the router admin user name and password.
   
   The user name is **admin**. The default password is **password**. The user name and password are case-sensitive.

   The BASIC Home page displays.

5. Select **Add Orbi Satellite**.
   
   The Place Your Satellite page displays.

6. Connect your satellite to a power source.
Either connect the power adapter to the satellite and to a power source, or connect PoE+ LAN port 1 on the satellite to an Ethernet cable and to a Power over Ethernet Plus (PoE+) switch that can provide 802.3at (PoE+) power.

The Power LED on the top panel of the satellite lights solid green.

**Note:** If the Power LED does not light, check the power source or the PoE+ switch. If the Power LED lights red, the power is not at the required 802.3at (PoE+) level. Make sure that you use an 802.3at (PoE+) switch and not an 802.af (PoE) switch.

7. Click the NEXT button.
8. Wait about two minutes for the satellite’s LED bar to light solid white.
9. Wait for the satellite’s LED bar (next to the Power LED) to light solid white. The following is the LED behavior during booting:
   - **Pulsing white.** The satellite is booting.
   - **Solid white.** The satellite finished booting and is ready to sync with your router.

10. Click the SYNC button in the router web interface.
11. Wait for the satellite to sync with the router.
   
   The LED bar on the satellite lights pulsing white while it attempts to sync with your router. It might take about six minutes for your satellite to sync.

   After the LED bar lights white, it lights one of the following colors for about three minutes and then turns off.

<table>
<thead>
<tr>
<th>Color</th>
<th>LED Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>The Orbi Pro router and satellite synced, and the connection between the router and satellite is good.</td>
</tr>
<tr>
<td>Amber</td>
<td>The Orbi Pro router and satellite synced, but the connection between the router and satellite is only fair. Consider moving the satellite closer to the router.</td>
</tr>
<tr>
<td>Magenta</td>
<td>The Orbi Pro router and satellite did not sync. Move the satellite closer to the router and try again.</td>
</tr>
</tbody>
</table>

**Note:** After your satellite syncs with your router, the satellite’s Sync button is disabled for security reasons. If you press the Sync button and the satellite’s LED bar pulses magenta, this LED behavior indicates that the Sync button is disabled. For information about enabling the Sync button, see Enable the Sync button on page 23.
Set up your Orbi network with the NETGEAR Insight mobile app

You can use the NETGEAR Insight mobile app version 5.5 or a newer version to set up your Orbi Pro network.

**Note:** The NETGEAR Orbi app does not support the Orbi Pro Ceiling Satellite.

To find the NETGEAR Insight app, search for NETGEAR Insight in the Apple App Store or Google Play Store. Then launch the NETGEAR Insight app on your mobile device and follow the prompts. For more information about the NETGEAR Insight app, visit https://www.netgear.com/insight/.
2

Manage Your Orbi Pro Ceiling Satellite

This chapter describes how to manage your Orbi Pro Ceiling Satellite’s settings from your Orbi Pro router web interface.

The chapter contains the following sections:

- Update the Orbi Pro Ceiling Satellite and Orbi Pro router firmware
- Enable the Sync button
- Turn the satellite LEDs on or off
- Change the satellite device name
- View satellite information in the router web interface
- View the satellite status in the satellite web interface
- Reset the satellite to factory defaults
- About link aggregation
Update the Orbi Pro Ceiling Satellite and Orbi Pro router firmware

You can use the router web interface to check if new firmware is available and update your Orbi Pro satellite and Orbi Pro router, or you can manually update the firmware for your Orbi Pro satellite and Orbi Pro router.

Check for firmware updates

To check for new firmware using the router web interface and update your router and satellite:

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.
2. Enter orbilogin.com.
   A login window opens.
3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.
   For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx.
   The BASIC Home page displays.
4. Select ADVANCED > Administration > Firmware Update.
   The Firmware Update page displays.
5. Click the Check button.
   The router checks to see if new firmware is available for the router and satellite.
6. If new firmware is available, click the Update All button.
   The router locates and downloads the firmware for the router and satellite and begins the update.

   Note: To avoid the risk of corrupting the firmware, do not interrupt the upgrade. For example, do not close the browser, click a link, or load a new page. Do not turn off the router or satellite.
When the upload is complete, your router and satellite restart. The update process typically takes about one minute. Read the new firmware release notes to find out if you must reconfigure the router after updating.

Manually update firmware

If the satellite is connected to your router, you can log in to the router to manually upload the firmware to your satellite.

**WARNING:** We recommend that you always update the firmware on your satellite first, and then update your router. Do not update the firmware on your router and satellite at the same time.

To manually update the firmware on your Orbi router and satellite, follow these high level steps:

1. Visit netgear.com/support and download the firmware for both your Orbi Pro router and satellite.
2. Update the firmware on your Orbi Pro satellite. For more information, see Manually update the satellite firmware on page 21.
3. Update the firmware on your Orbi Pro router. For more information, see Manually update the router firmware on page 22.

Manually update the satellite firmware

We recommend that you update your satellite’s firmware before you update the router’s firmware.

To manually update your satellite’s firmware using the router web interface:

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive. For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx. The BASIC Home page displays.
4. Select **ADVANCED > Administration > Firmware Update > Manual Update.**
The Firmware Update page displays.

5. Select the check box next to your satellite’s model name.

6. Click the **Update** button.

7. If the browser asks you for the admin password, enter the same user name (**admin**) and password that you entered for the router.
   The Firmware Update pop-up window of the satellite web interface opens.

8. Click the **BROWSE** button.

9. Locate and select the satellite firmware file that you downloaded.
   The firmware file name ends in `.img` or `.chk`.

10. Click the **UPLOAD** button.
    It takes a few minutes to complete the process.
    The firmware on your Orbi satellite is updated.

11. After the Orbi satellite finishes updating, select **Status**, and verify the firmware version on the Status page.
    If the menu does not display and you cannot select Status, click the three-bar menu icon at the left of the pop-up window.

**Manually update the router firmware** We recommend that you update the router’s firmware after you update your satellite’s firmware.

**To manually update your router’s firmware using the router web interface:**

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.

2. Enter **orbilogin.com**.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is **admin**. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.
   For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx.
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > Firmware Update > Manual Update**.
   The Firmware Update page displays.
5. Click the **Browse** button.

6. Locate and select the router firmware file you downloaded. The firmware file name ends in `.img`.

7. Click the **Upload** button. The firmware is updated.

---

### Enable the Sync button

After your satellite syncs with your router, the satellite’s **Sync** button is disabled for security reasons. If you press the **Sync** button and the satellite’s LED bar pulses magenta, this LED behavior indicates that the **Sync** button is disabled. To enable the **Sync** button, log in to the router and go to the Attached Devices page.

**To enable your satellite’s Sync button using the router web interface:**

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.

3. Enter the router admin user name and password. The user name is **admin**. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.

   For more information, see the user manual for your Orbi Pro router, which you can download by visiting [https://www.netgear.com/support/download/default.aspx](https://www.netgear.com/support/download/default.aspx).

   The BASIC Home page displays.

4. Select **Attached Devices**. The Attached Devices page displays.

5. Select your satellite. The Edit Device page displays.

6. In the Sync Button section, click the **Disabled** button.

7. Click the **APPLY** button. Your settings are saved.

   The **Sync** button is enabled. You can now use the **Sync** button to sync your satellite to your router.
Turn the satellite LEDs on or off

By default, the satellite Power LED and bar LED on the top panel are enabled (see Power LED on page 9 and LED Bar on page 9). You can turn off these LEDs completely, for example, to keep the room dark.

**To turn the satellite LEDs on or off using the router web interface:**

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.
2. Enter [orbilogin.com](http://orbilogin.com).
   A login window opens.
3. Enter the router admin user name and password.
   The user name is `admin`. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.
   For more information, see the user manual for your Orbi Pro router, which you can download by visiting [https://www.netgear.com/support/download/default.aspx](https://www.netgear.com/support/download/default.aspx).
   The BASIC Home page displays.
4. Select **Attached Devices**.
   The Attached Devices page displays.
5. Select the satellite.
   The Edit Device page displays.
6. Do one of the following:
   - **Turn LEDs on.** In the LED On/Off section, click the **OFF** button.
     The button changes to the **ON** button and the Power LED and LED bar turn on.
   - **Turn LED off.** In the LED On/Off section, click the **ON** button.
     The button changes to the **OFF** button and the Power LED and LED bar turn off.
7. Click the **APPLY** button.
   Your settings are saved.
Change the satellite device name

You can change the satellite’s device name. The default device name is Ceiling Orbi Pro-1. The device name is the name that displays in a file manager when you browse your network.

To change the satellite’s device name using the router web interface:

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.
   For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx.
   The BASIC Home page displays.
5. Select the satellite. The Edit Device page displays.
6. Enter a new name in the Device Name field. The default device name is Ceiling Orbi Pro-1.
7. Click the APPLY button. Your settings are saved.

View satellite information in the router web interface

You can view information about your satellite from the Attached Devices page in the router web interface.
To view information about your satellite using the router web interface:

1. Launch a web browser from a computer or mobile device that is connected to your Orbi network.

2. Enter orbilogin.com.
   A login window opens.

3. Enter the router admin user name and password.
   The user name is admin. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.

   For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx.

   The BASIC Home page displays.

4. Select Attached Devices.
   The Attached Devices page displays the following information in the Connected Satellites section:

   • **Device Name.** This section displays the satellite model, name, LED status, Sync button status, and IP address.
   
   • **IP Address.** This section displays the satellite IP address. The router assigns the satellite an IP address when it joins the network.
   
   • **MAC Address.** This section displays the satellite MAC address. The unique MAC address for each satellite does not change.
   
   • **Connection Type.** This section displays whether the satellite is connected to the Orbi network through a wired Ethernet connection or 2G or 5G WiFi connection.
   
   • **Connected Orbi.** This section displays the Orbi Pro router or satellite to which the satellite is connected along with it’s MAC address.
   
   • **Backhaul Status.** This section displays the connection status between the satellite and the router or another satellite.

   **Note:** The connection between the satellite and the device that provides the Internet connection (even if it is not a direct connection to the Internet) is called the backhaul connection. The connection between the satellite and its WiFi clients is called the front haul connection.

5. To update this page, click the Refresh button.
View the satellite status in the satellite web interface

The satellite web interface lets you view satellite status information that you cannot view from the router web interface.

You can find the IP address of the satellite in the router web interface. You can then launch a new web browser window, enter the satellite IP address, and access the satellite web interface.

**To view your satellite’s IP address using the router web interface and then open the satellite web interface:**

1. Launch a web browser from a computer or mobile device that is connected to your Orbi Pro network.
3. Enter the router admin user name and password. The user name is admin. The password is the one that you specified the first time that you logged in to the router web interface. The user name and password are case-sensitive.
   For more information, see the user manual for your Orbi Pro router, which you can download by visiting https://www.netgear.com/support/download/default.aspx. The BASIC Home page displays.
5. In the Connected Satellites section, find your satellite’s IP address.
6. Launch a new web browser window and enter your satellite’s IP address in the address bar. A login window opens.
7. Enter the same admin user name and password that you entered for the router in Step 3. The satellite status displays. The page displays information about the satellite connections, hardware and firmware versions, and the WiFi networks in the 2.4 GHz and 5 GHz bands.
8. To view detailed information about devices that are connected to the satellite networks, select Connected Devices.
The Connected Devices page displays. For each device, the page displays the IP address, device name, MAC address, and connection type.

**Reset the satellite to factory defaults**

Under some circumstances (for example, you move the satellite to a different network), you might want to erase the configuration and reset the satellite to factory default settings.

After you reset the satellite to factory default settings, the WiFi network name (SSID) and network key (password) are as shown on the satellite label (Satellite label on page 10). For a more extensive list of factory default settings, see Factory settings on page 37.

**To reset the satellite to factory defaults:**

1. On the back panel of the satellite, locate the recessed Reset button. For more information, see Hardware overview on page 7.

2. Using a straightened paper clip, press and hold the Reset button for about 10 seconds.

3. Release the Reset button.
   
   The configuration is reset to factory default settings. When the reset is complete, the satellite reboots. This process takes about two minutes.

   **WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the reset. Do not turn off the satellite. Wait until the satellite finishes restarting and the Power LED turns solid green.

**About link aggregation**

For a link aggregation (LAG) connection, you must use a switch that supports link aggregation. You can make a link aggregation connection between the satellite and a switch that supports an 802.3ad link aggregation group (LAG) or static link aggregation. Such a LAG connection allows for a single 2 Gbps connection for increased throughput or a 1 Gbps redundancy connection.

By default, both PoE+ LAN 1 port and LAN 2 port are enabled on the satellite. The LAN 2 port is the LAG connection port, required for a LAG connection. Link aggregation is enabled by default on the satellite, so you do not have to configure it. However, you must configure link aggregation on the switch.
You can set up a link aggregation connection between the satellite and a switch by doing the following:

1. On the switch, configure either static link aggregation or Link Aggregation Control Protocol (LACP) on the two Ethernet ports that you intend to use for the LAG connection to the satellite.

   **CAUTION:** To prevent a network loop, configure the switch ports before connecting them to the satellite ports.

2. Connect the two Ethernet ports on the switch to the LAN 1 and LAN 2 ports on the satellite.
3

Troubleshooting

This chapter provides information to help you diagnose and solve problems you might experience with your Orbi Pro Ceiling Satellite. If you do not find the solution here, check the NETGEAR support site at netgear.com/support/ for product and contact information.

If you need help with your Orbi Pro router, see your Orbi Pro router’s manual user manual. You can view your router’s manual at https://www.netgear.com/support/download/default.aspx.

This chapter contains the following sections:

- You cannot log in to the Orbi Pro router to configure the satellite
- The router and satellite do not sync
- The Power LED is blinking red
- You use PoE power and the Power LED is solid red
- Network disruption occurs when you use link aggregation
You cannot log in to the Orbi Pro router to configure the satellite

If you cannot access www.orbilogin.com, follow these troubleshooting tips:

- Make sure that your Orbi devices are plugged into an active power source. Unless you turned off the LEDs, when your Orbi devices are powered on, the Power LED lights green.
- Make sure that your computer or mobile device is connected to the Orbi WiFi network or to the Orbi Pro router LAN port. The default WiFi login information is on the product label of your Orbi Pro router.
- It is possible that orbilogin.com is cached in your browser with another IP address. Do one of the following:
  - If you did not change your router’s IP address, use http://192.168.1.1, which is the default IP address that is associated with orbilogin.com.
  - Clear the cache of your browser.
  - Access orbilogin.com from a different browser such as Google Chrome or Mozilla Firefox.
- If you changed your router’s IP address, enter your new IP address instead of orbilogin.com or the default IP address.
- If you cannot connect to your Orbi network through a WiFi connection, connect an Ethernet cable to the Orbi Pro router LAN port.
- Make sure that your modem is connected to the Internet port on your Orbi Pro router.
- If you changed the admin password and you forgot what it is, see the Orbi Pro router user manual for more information.
- Use another WiFi device to connect to the Orbi Pro router.
The router and satellite do not sync

If you are experiencing difficulty syncing the Orbi Pro router and satellite, check the following:

1. Make sure that the **Sync** button is enabled. If the **Sync** button on the satellite is disabled, the button is unresponsive and the LED bar pulses magenta. For more information, see [Enable the Sync button](#) on page 23.

2. Make sure that your Orbi Pro router and the satellite run compatible firmware versions. The router and the satellite must run firmware version 2.3.0.0 or a newer firmware version. For information about updating the firmware, see [Update the Orbi Pro Ceiling Satellite and Orbi Pro router firmware](#) on page 20.

3. Make sure that the satellite is not too far from the Orbi Pro router. Depending on your environment, the satellite can cover a WiFi area of up to 2,000 square ft (185 square m). The Orbi Pro router must be within the WiFi cover area for a good or fair connection to the satellite.

If you still experience difficulty with syncing, we recommend that you move the satellite into the same room as the router during the sync process. After you successfully sync the router and the satellite, move the satellite to a different location.

**To sync your satellite using the Sync button on both the Orbi Pro router and the satellite:**

1. Place your Orbi Pro satellite in an area near your Orbi Pro router.
   For example, place your satellite in the same room as your router, but not too close to the router. We suggest that you keep a distance of 20–25 feet (about 6–7 meters) between the satellite and the router.

2. Connect your satellite to a power source.
   Either connect the power adapter to the satellite and to a power source, or connect PoE+ LAN port 1 on the satellite to an Ethernet cable and to a Power over Ethernet Plus (PoE+) switch that can provide 802.3at (PoE+) power.
   The Power LED on the top panel of the satellite lights solid green.

   **Note:** If the Power LED does not light, check the power source or the PoE+ switch. If the Power LED lights red, the power is not at the required 802.3at (PoE+) level. Make sure that you use an 802.3at (PoE+) switch and not an 802.af (PoE) switch.

3. Wait for the LED bar (next to the Power LED) to light solid white.
   The following is the LED behavior during booting:
   - **Pulsing white.** The satellite is booting.
- **Solid white.** The satellite finished booting and is ready to sync with your router.

4. Press the *Sync* button on the back of your satellite, and within two minutes, press the *Sync* button on the back of your router.

5. Wait for the satellite to sync with the router.
   The LED bar on the satellite lights pulsing white while it attempts to sync with your router. It might take about six minutes for your satellite to sync.

   After the LED bar lights white, it lights one of the following colors for about three minutes and then turns off.

<table>
<thead>
<tr>
<th>Color</th>
<th>LED Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>The Orbi Pro router and satellite synced, and the connection between the router and satellite is good.</td>
</tr>
<tr>
<td>Amber</td>
<td>The Orbi Pro router and satellite synced, but the connection between the router and satellite is only fair. Consider moving the satellite closer to the router.</td>
</tr>
<tr>
<td>Magenta</td>
<td>The Orbi Pro router and satellite did not sync. Move the satellite closer to the router and try again.</td>
</tr>
</tbody>
</table>

6. Do one of the following:
   - **The sync failed.** If the sync failed, try to sync again by repeating Step 4 and Step 5. If the sync keeps failing, try a different location or position.
   - **The sync is successful.** If the sync is successful, move the satellite to the location where you want to install it and continue with Step 7.

7. At the new location, connect your satellite to a power source.
   For more information, see Step 2.

8. At the new location, resync the satellite with the Orbi Pro router by repeating Step 4 and Step 5.
   If the LED bar lights blue or amber, the satellite synced successfully. If the LED bar lights blue, the connection is good. If the LED bar lights amber, consider moving the satellite closer to the router so that you can get a good connection instead of a fair connection.

9. If the LED bar pulses magenta or lights magenta, the satellite did not resync. Do one of the following:
   - **The LED bar pulses magenta.** If you press the *Sync* button and the satellite’s LED bar pulses magenta, this LED behavior indicates that the *Sync* button is
disabled. Enable the **Sync** button (see Enable the Sync button on page 23) and try to sync again.

- **The LED bar lights magenta.** If the LED bar on the satellite lights magenta, the Orbi Pro router and satellite did not sync. If they successfully synced when they were placed in the same room, do one of the following:
  
  - Move the satellite closer to the router and try again. Depending on your environment, the satellite can cover a WiFi area of up to 2,000 square ft (185 square m). The Orbi Pro router must be within the WiFi cover area for a good or fair connection to the satellite.
  
  - Place another Orbi Pro satellite between the Orbi Pro router and the Orbi Pro Ceiling Satellite and try to sync between the two satellites. With daisy chain networking, your satellites can connect to each other or to the router, depending on which connection is best.

The Power LED is blinking red

If the Power LED is blinking red, the firmware is corrupted.

Reset the satellite to factory defaults (see Reset the satellite to factory defaults on page 28) to see if that resolves the situation. If it does not, contact NETGEAR support. For more information, visit https://www.netgear.com/support/.

You use PoE power and the Power LED is solid red

If you use PoE power for the satellite and the Power LED is solid red, the PoE power is not at the 802.3at (PoE+) level, which is required if you use a PoE connection.

Follow these troubleshooting tips:

- Make sure that the Ethernet cables are plugged in correctly.
- Make sure that the PoE switch is an 802.3at (PoE+) switch and not an 802.3af (PoE) switch.
• The PoE power budget of the 802.3at (PoE+) switch might be oversubscribed. Disconnect some other PoE devices from the switch to see if the satellite Power LED turns solid green.

• Use a lower-numbered PoE port on the switch. For example, if the satellite is connected to PoE port 8, connect the satellite to PoE port 1. On some switches, supplied power is prioritized according to the port order, up to the total power budget of the device. For example, if your PoE switch provides eight PoE ports, port 1 could receive the highest PoE priority, while port 8 could be relegated to the lowest PoE priority.

Network disruption occurs when you use link aggregation

If network disruption occurs when you use link aggregation, check the following:

• Make sure that the switch that you are using can support link aggregation.

• Make sure that you configured link aggregation on the switch before you connected the cables between the ports on the switch and the satellite. If you did not, disconnect the cables between the switch and the satellite, configure link aggregation on the switch ports that you intend to use for the link aggregation connection, and then reconnect the cables between the ports.

• If the switch supports link aggregation and Spanning Tree Protocol (STP), make sure that the link aggregation configuration is correct and that STP did not shut down one of the LAG connections.

For more information, see About link aggregation on page 28.
A

Supplemental Information

This appendix covers the following topics:

• Factory settings
• Technical specifications
# Factory settings

The following table shows the factory default settings for the Orbi Pro Ceiling Satellite.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
