## Contents

### Chapter 1 Introduction
- Additional documentation .......................................................... 12
- Position the AP ........................................................................ 12
- Safety instructions and warnings for an indoor access point......... 13

### Chapter 2 Hardware Overview
- Top panel with LEDs ................................................................. 17
- Back panel with ports, buttons, and a power connector .......... 19
- Position the antennas for best WiFi performance .................. 20
- Access point label ................................................................... 20

### Chapter 3 Installation and Initial Log-in
- What WiFi setup do you want? .................................................... 22
- About AP mode and router mode ............................................. 22
- Setup with an Ethernet wall outlet ........................................... 23
- Connect the AP to a routing device and log in for the first time .... 24
- Connect the AP to a modem and log in for the first time ........... 28
- How the operation mode affects how you can reach the local browser UI ................................................................. 32
- Find the IP address of the AP when you cannot use routerlogin.net ............................................................................ 32
- Log in to the AP after you complete the initial log-in process .... 34
- Change the language ................................................................. 35
- Connect a WiFi or wired device to the AP’s network after installation ........................................................................... 35
  - Join a WiFi network on the AP .............................................. 36
  - Use Wi-Fi Protected Setup to join the Wireless 1 network .... 37
  - Connect to the AP through an Ethernet cable ..................... 37
- Routing features enabled in router mode .................................. 38
- Dismiss a browser security warning ......................................... 38

### Chapter 4 Manually Set Up Internet Settings [Router Mode]
- Use the Setup Wizard [router mode] ........................................ 41
- Manually set up the AP Internet connection [router mode] ...... 42
  - Specify a dynamic or fixed WAN IP address Internet connection without a login [router mode] .......................................................... 42
Chapter 5 Basic WiFi and Radio Features

Set up or change an open or secure WiFi network ........................................64
Configure WPA and WPA2 Enterprise WiFi security with a RADIUS server .................................................................68
Enable or disable a WiFi network ..................................................................70
Hide or broadcast the SSID for a WiFi network ........................................71
Manage client isolation for clients of the Wireless 2 or Wireless 3 network ........................................................................................................72
Manage access to LAN ports for clients of the Wireless 2 or Wireless 3 network ........................................................................................................73
Manage SSID isolation for all WiFi networks ................................................75
Enable or disable a WiFi radio ......................................................................76
Use WPS to connect to the WiFi network ................................................77
  Use WPS with the push button method in the local browser UI .................78
  Use WPS with the PIN method .................................................................79

Chapter 6 Security, Firewall, and Access Rules

Firewall WAN settings [router mode] ..........................................................82
  Manage port scan protection and denial of service protection [router mode] .................................................................82
Set up a default DMZ server [router mode] .................................................83
Manage IGMP proxying [router mode] .....................................................84
Manage NAT filtering [router mode] .........................................................84
Manage the SIP application-level gateway [router mode] ................................85
Network access control lists ........................................................................86
  Enable and manage network access control ...........................................86
Add, remove, or change a device on the allowed list...............88
Add, remove, or change a device on the blocked list.............90
Block specific Internet sites [router mode].................................92
Set up keyword and domain blocking [router mode].................92
Remove a keyword or domain from the blocked list [router mode]........................................................................93
Remove all keywords and domains from the blocked list [router mode]........................................................................94
Block specific applications and services from the Internet [router mode]........................................................................95
Add a service blocking rule for a predefined service or application [router mode].........................................................95
Add a service blocking rule for a custom service or application [router mode].................................................................96
Change a service blocking rule [router mode]..........................98
Remove a service blocking rule [router mode]..........................99
Assign a trusted device [router mode]......................................100
Schedule blocking [router mode]............................................100
Set up security event email notifications..............................102

Chapter 7 Optimize Performance

Enable QoS and automatically set the Internet bandwidth........105
Enable QoS and manually set the Internet bandwidth.............106
Enable or disable the automatic update of the Performance Optimization Database.........................................................107
Manage WiFi Multimedia (WMM) for a radio..........................108
Improve network connections with Universal Plug and Play [router mode]........................................................................110
Change the priority for a connected device [router mode]........111

Chapter 8 Network Settings

LAN IP address settings [router mode].................................114
Change the LAN IP address and subnet settings [router mode]........................................................................114
Manage the DHCP server address pool [router mode]..........115
Disable the DHCP server [router mode].................................116
Manage the Router Information Protocol settings [router mode]........................................................................117
Change the AP network device name.................................118
Reserved LAN IP addresses [router mode]...........................119
Reserve a LAN IP address [router mode]...............................119
Change a reserved LAN IP address [router mode]...............120
Remove a reserved LAN IP address entry [router mode]........121
Static routes...........................................................................122
Chapter 9 Maintain and Monitor

Update the firmware.................................................................133
  Let the AP check for new firmware and update the firmware.133
  Manually check for new firmware and update the firmware...135
Back up or restore the settings................................................137
  Back up the AP settings.........................................................137
  Restore the AP settings.......................................................138
Change the local device password.........................................139
Change the password recovery questions for the local device password.................................................................139
Recover the local device admin password......................................141
Factory default settings.........................................................142
  Use the Reset button to return to factory defaults...............143
  Use the local browser UI to return to factory defaults........143
Time and Network Time Protocol server......................................145
  Manually set the time zone and adjust the daylight saving time.................................................................145
  Change the Network Time Protocol server.........................146
Logs..................................................................................147
  Specify which activities the AP logs..................................147
  View, send, or clear the logs..............................................148
Status and statistics................................................................149
  Display information about the Internet port, AP, and WiFi settings [router mode].................................................................149
  Display information about the LAN port, AP, and WiFi settings [access point mode].................................................................152
Check the Internet connection status...........................................155
Display the Internet port statistics............................................156
Display the devices currently on the AP network and change device information..................................................158
Traffic meter [router mode]......................................................160
  Start the traffic meter without traffic restrictions [router mode].161
  Restrict Internet traffic by volume [router mode]...............162
  Restrict Internet traffic by connection time [router mode]....163
  View the Internet traffic volume and statistics [router mode].164
Unblock the traffic meter after the traffic limit is reached [router mode]..................................................................................................................165
Change the system mode to access point mode or to router mode..................................................................................................................166
Disable LED blinking or turn off LEDs..................................................................................................................................................168

Chapter 10 Dynamic DNS [Router Mode]

About Dynamic DNS [router mode]..........................................................................................................................171
Set up a new Dynamic DNS account [router mode]..............................................................................................................171
Use an existing Dynamic DNS account [router mode]..........................................................................................................172
Change the Dynamic DNS account settings [router mode]..........................................................................................173

Chapter 11 VPN Client [Router Mode]

About setting up the AP as a VPN client [router mode]..............176
Enable the VPN client in the AP and connect to a VPN server [router mode]..................................................................................................................176
Disconnect the AP from the VPN server [router mode].............178

Chapter 12 VPN Server and Service with OpenVPN [Router Mode]

Enable and configure OpenVPN and VPN client access on the AP [router mode]..................................................................................................................181
OpenVPN client utility and VPN configuration files [router mode]..................................................................................................................182
    Install OpenVPN on a Windows-based computer [router mode]..................................................................................................................183
    Install OpenVPN on a Mac [router mode].................................................................................................................................184
    Install OpenVPN on an iOS device [router mode].........................................................................................................................185
    Install OpenVPN on an Android device [router mode]..................................................................................................................186
About setting up an OpenVPN connection [router mode].............187
About VPN access to your network or Internet service at your office or home [router mode]..................................................................................................................188
Use a VPN tunnel to remotely access your Internet service [router mode]..................................................................................188

Chapter 13 Advanced WiFi and Radio Features

Change the region of operation..........................................................................................................................191
Manage 802.11ax and enable or disable OFDMA for a radio...192
Enable or disable smart connect for the AP.................................193
Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio.195
Change the channel for a radio.....................................................196
Change the WiFi throughput mode for a radio............................197
Change the transmission output power for a radio.....................199
Add a WiFi schedule for a radio..................................................200
Enable or disable MU-MIMO..........................................................202
Enable or disable explicit beamforming........................................203
Enable or disable PMF.................................................................205
Set up the AP as a WiFi Bridge to another device.......................206
Change the CTS/RTS threshold and preamble mode for a radio.209

Chapter 14 Port Forwarding and Port Triggering [Router Mode]

Port forwarding to a local server for services and applications [router mode].................................212
Forward incoming traffic for a default service or application [router mode]........................................212
Add a port forwarding rule for a custom service or application [router mode]........................................213
Change a port forwarding rule [router mode]............................215
Remove a port forwarding rule [router mode]..........................216
How the AP implements a port forwarding rule [router mode]..............................................................217
Application example: Make a local web server public [router mode]......................................................217

Port triggering for services and applications [router mode]......218
Add a port triggering rule [router mode]................................218
Change a port triggering rule [router mode]...........................220
Remove a port triggering rule [router mode]..........................221
Specify the time-out for port triggering [router mode]..........221
Disable port triggering [router mode]......................................222
Application example: Port triggering for Internet Relay Chat [router mode].............................................223

Chapter 15 Diagnostics and Troubleshooting

Reboot the AP from the local browser UI.................................226
Quick tips for troubleshooting................................................227
Restart your AP network if in router mode............................227
Restart your AP when in access point mode..........................227
Check the Ethernet cable connections.................................227
Check the WiFi settings of your computer or mobile device..227
Check the DHCP network settings of your computer or mobile device..................................................228
Standard LED behavior when the AP is powered on.............229
Troubleshoot with the LEDs....................................................229
Power LED is off......................................................................229
Power LED does not turn green.............................................229
Internet LED is solid amber or off [router mode]...............230
Internet LED is solid amber or off [access point mode].......231
WiFi LED is Off..........................................................231
The LAN LED is off while a device is connected.................231
You cannot log in to the AP....................................................232
You cannot log in to the AP [router mode]..............................232
You cannot log in to the AP [access point mode]...................233
You cannot access the Internet [router mode].............................235
Check the Internet WAN IP address [router mode]................235
Check or manually start the PPPoE connection [router mode].237
Troubleshoot Internet browsing.....................................................238
Troubleshoot the WiFi connectivity..............................................238
Changes are not saved.................................................................240
Troubleshoot your network using the ping utility of your computer
or mobile device...............................................................................240
Test the LAN path from a Windows-based computer to the
AP...................................................................................................240
Test the path from a Windows-based computer to a remote
device [router mode]...................................................................241

Appendix A Factory Default Settings and Technical Specifications

Factory default settings...............................................................244
Technical specifications...............................................................246

Appendix B Wall-Mounting

Wall-mount the AP...........................................................................249
1

Introduction

The WiFi 6 AX1800 Dual Band Wireless Access Point Model WAX204, in this manual referred to as the AP, supports 802.11ax high performance WiFi connectivity and dual-band concurrent operation at 2.4 GHz and 5 GHz with a combined throughput of 1.8 Gbps (600 Mbps at 2.4 GHz and 1200 Mbps at 5 GHz). The AP is designed to function standalone in a small office network or home network.

You can use the AP in its default router mode with its router features enabled, directly connected to the Internet, for example through a modem. You can also use the AP in access point (AP) mode, connected to a device that provides routing functions in your network. In AP mode, the routing features of the AP are not required so they are masked out in the AP’s local browser interface (UI).

The chapter contains the following sections:

- Additional documentation
- Position the AP
- Safety instructions and warnings for an indoor access point

Note: For more information about the topics that are covered in this manual, visit the support website at netgear.com/support/.

Note: Firmware updates with new features and bug fixes are made available from time to time at netgear.com/support/download/. You can check for and download new firmware manually. If the features or behavior of your product does not match what is described in this manual, you might need to update the firmware.
Additional documentation

The following documents are available at netgear.com/support/download/:

- Installation guide
- Data sheet

Position the AP

Consider how you want to position the AP. Place it where you want to add WiFi, positioned so the WiFi range of the AP provides an optimal coverage area for your WiFi devices.

The WiFi range or coverage area can vary significantly depending on the physical placement of your AP. For example, the thickness and number of walls that the WiFi signal passes through can limit the range.

Additionally, other WiFi access points in and around your office or home might affect your AP’s signal. WiFi access points can be routers, repeaters, WiFi range extenders, and any other devices that emit WiFi signals.

Tips for positioning your AP:

- Place your AP so that you can connect it with an Ethernet cable to your router, modem, or Ethernet outlet and within reach of an AC power outlet.
- Place the AP near the center of the area where your computers and other devices operate, and within a line of sight to your WiFi devices.
- Place the AP in an elevated location, minimizing the number of walls and ceilings between the AP and your WiFi client devices.
- Place the AP away from electrical devices like these:
  - Ceiling fans
  - Home security systems
  - Microwaves
  - Computers
  - Base of a cordless phone
  - 2.4 GHz and 5.8 GHz cordless phones
Place the AP away from large metal surfaces, large glass surfaces, insulated walls, and items such as these:
- Solid metal door
- Aluminum studs
- Fish tanks
- Mirrors
- Brick
- Concrete

If other access points are nearby, consider using different radio frequency channels to reduce interference (see Change the channel for a radio on page 196).

Safety instructions and warnings for an indoor access point

Use the following safety guidelines to ensure your own personal safety and to help protect your system from potential damage.

To reduce the risk of bodily injury, electrical shock, fire, and damage to the equipment, observe the following precautions:

- This product is designed for indoor use only in a temperature-controlled and humidity-controlled environment. Note the following:
  - For more information about the environment in which this product must operate, see the environmental specifications in the appendix or the data sheet.
  - If you want to connect the product over an Ethernet cable to a device located outdoors, the outdoor device must be properly grounded and surge protected, and you must install an Ethernet surge protector inline between the indoor product and the outdoor device. Failure to do so can damage the product.
  - Before connecting the product to outdoor cables or wired outdoor devices, see https://kb.netgear.com/000057103 for additional safety and warranty information.

Failure to follow these guidelines can result in damage to your NETGEAR product, which might not be covered by NETGEAR's warranty, to the extent permissible by applicable law.

- Do not service the product except as explained in your product documentation. Some devices should never be opened.
• If any of the following conditions occur, unplug the product from its power source, and then replace the part or contact your trained service provider:
  - Depending on your product, the power adapter, power adapter cable, power adapter plug, or PoE Ethernet cable is damaged.
  - An object fell into the product.
  - The product was exposed to water.
  - The product was dropped or damaged.
  - The product does not operate correctly when you follow the operating instructions.

• Keep the product away from radiators and heat sources. Also, do not block cooling vents.

• Do not spill food or liquids on your product components, and never operate the product in a wet environment. If the product gets wet, see the appropriate section in your troubleshooting guide, or contact your trained service provider.

• Do not push any objects into the openings of your product. Doing so can cause fire or electric shock by shorting out interior components.

• Use the product only with approved equipment.

• If applicable to your product, allow the product to cool before removing covers or touching internal components.

• Be sure that devices that are attached over Ethernet cables are electrically rated to operate with the power available in your location.

• Depending on your product, use only the supplied power adapter or an Ethernet cable that provides PoE.
  
  If your product uses a power adapter:
  
  - If you were not provided with a power adapter, contact your local NETGEAR reseller.
  - The power adapter must be rated for the product and for the voltage and current marked on the product electrical ratings label.

• To help prevent electric shock, plug any system and peripheral power cables into properly grounded power outlets.

• If applicable to your product, the peripheral power cables are equipped with three-prong plugs to help ensure proper grounding. Do not use adapter plugs or remove the grounding prong from a cable. If you must use an extension cable, use a three-wire cable with properly grounded plugs.
• Observe extension cable and power strip ratings. Make sure that the total ampere rating of all products plugged into the extension cable or power strip does not exceed 80 percent of the ampere ratings limit for the extension cable or power strip.

• To help protect your system from sudden, transient increases and decreases in electrical power, use a surge suppressor, line conditioner, or uninterruptible power supply (UPS).

• Position system cables, power adapter cables, and PoE Ethernet cables carefully. Route cables so that they cannot be stepped on or tripped over. Be sure that nothing rests on any cables.

• Do not modify power adapters, power adapter cables, or plugs. Consult a licensed electrician or your power company for site modifications.

• Always follow your local and national wiring rules.
Hardware Overview

The WiFi 6 AX1800 Dual Band Wireless Access Point Model WAX204 is an indoor, standalone AP. The Gigabit Internet (WAN) port lets you connect the AP to a modem, gateway, router, or Ethernet outlet for Internet connectivity. Use the four Gigabit LAN ports to connect network devices through an Ethernet cable directly to the AP.

The chapter contains the following sections:

- Top panel with LEDs
- Back panel with ports, buttons, and a power connector
- Position the antennas for best WiFi performance
- Access point label

**Note:** Note: In this chapter, we refer to the access point as the AP.
Top panel with LEDs

The five status LEDs are located on the top panel of the AP. From left to right, the top panel contains the Power LED, Internet LED, WiFi LED, LAN LED, and WPS LED.

Figure 1. Top panel with LEDs
Table 1. LED descriptions

<tr>
<td><img src="image" alt="Green LED icon" /> <strong>Blinking green.</strong> The WPS button was pressed. For two minutes, the AP attempts to find the WiFi device (that is, the client) that can join the AP Wireless 1 network. For more information, see Use Wi-Fi Protected Setup to join the Wireless 1 network on page 37.</td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Off icon" /> <strong>Off.</strong> WPS is disabled.</td>
<td></td>
</tr>
</tbody>
</table>
The back panel of the AP provides ports, buttons, and a DC power connector.

Viewed from left to right, the back panel contains the following components:

- **WPS button**: Press the WPS button to join the AP’s WiFi network without typing the WiFi password. For more information, see Use Wi-Fi Protected Setup to join the Wireless 1 network on page 37.

- **Internet port**: One Internet (WAN) port (yellow) to connect the AP to a modem, a router, or an Ethernet wall outlet that provides Internet service:
  - **Connect to a modem**: Connect the WAN port directly to a broadband, cable, or DSL device that is a modem. The modem must provide an Internet connection to the AP. For more information about this setup, in which the AP must function in its default router mode, see Connect the AP to a modem and log in for the first time on page 28.
  - **Connect to a router**: Connect the WAN port directly to a broadband, cable, or DSL device that is a router (for example, the device also provides WiFi), to another router in your network, or to a switch or hub that is connected to the router. For
more information about this setup, in which the AP must function in AP mode, see Connect the AP to a routing device and log in for the first time on page 24.

- **Connect to an Ethernet wall outlet with Internet service**: Connect the WAN port directly to your Ethernet wall outlet. If you want to set up a WiFi 6 hotspot on an existing network, see Connect the AP to a routing device and log in for the first time on page 24. If you want to set up a private WiFi 6 network, see Connect the AP to a modem and log in for the first time on page 28.

- **LAN ports 1 through 4**: Four Gigabit Ethernet RJ-45 LAN ports numbered LAN 1 through LAN 4 to connect the AP to Ethernet devices such as a computer and a switch.

- **Reset button**: Press the Reset button to reset the AP to factory default settings. For more information, see Use the Reset button to return to factory defaults on page 143.

- **DC power connector**: Connect the power adapter that came in the product package to the DC power connector.

Position the antennas for best WiFi performance

You can swivel the three AP antennas in any direction. For best WiFi performance, we recommend that you experiment with various antenna positions. For example, you could position the center antenna vertically and aim the other two antennas outward at 45-degree angles.

Access point label

The AP label on the bottom panel of the AP shows the default login information, default WiFi network name (SSID), default WiFi passphrase, serial number and MAC address of the AP, and other information.
3

Installation and Initial Log-in

This chapter describes how you can install and access the AP in your network and log in to the local browser user interface (UI).

Depending on how you want to set up the AP in your environment, you can change the operation mode to AP mode or keep the AP in its default router mode. The AP setup options and their associated operation modes are also described in this chapter.

The chapter contains the following sections:

- What WiFi setup do you want?
- About AP mode and router mode
- Setup with an Ethernet wall outlet
- Connect the AP to a routing device and log in for the first time
- Connect the AP to a modem and log in for the first time
- How the operation mode affects how you can reach the local browser UI
- Find the IP address of the AP when you cannot use routerlogin.net
- Log in to the AP after you complete the initial log-in process
- Change the language
- Connect a WiFi or wired device to the AP’s network after installation
- Routing features enabled in router mode
- Dismiss a browser security warning

Note: In this chapter, we refer to the access point as the AP.
What WiFi setup do you want?

Use the following table to determine the type of WiFi setup that you want and the section that you must follow for your setup.

Table 2. What WiFi setup do you want?

<table>
<thead>
<tr>
<th>What you have</th>
<th>What you want</th>
<th>Operation mode</th>
<th>Follow section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadband, cable, or DSL device with WiFi (router)</td>
<td>Add WiFi 6 to your home or office</td>
<td>AP mode</td>
<td>Connect the AP to a routing device and log in for the first time on page 24</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>Set up a private WiFi 6 network.</td>
<td>Router mode</td>
<td>Connect the AP to a modem and log in for the first time on page 28</td>
</tr>
</tbody>
</table>

**Note:** By default, the operation mode is router mode. If you want to use AP mode, you can change the operation mode when you log in for the first time, as described in Connect the AP to a routing device and log in for the first time on page 24.

For more information about AP mode and router mode, see About AP mode and router mode on page 22.

About AP mode and router mode

The WAX204 is designed primarily to function as an access point, but can operate as a lightweight SOHO router with support for a PPPoE, PPTP, L2TP, or IPv6 Internet connection. The WAX204 supports multiple LAN and security features, including the capability to function as a VPN server or VPN client. Or, you can use the WAX204 as a lightweight router behind another router to create an independent network segment.

Your network and the WiFi setup that you want determine the operation mode that you must use for the AP. By default, the operation mode is router mode for easier initial login.
Depending on your setup (What WiFi setup do you want? on page 22), you can either change the operation mode to AP mode during the initial login procedure or keep the operation mode as router mode.

These are the differences between the operation modes:

- **AP mode**: The AP functions as a WiFi 6 access point and can support LAN clients through its LAN ports. The AP receives its IP address settings from a routing device in your network. The AP passes on the IP address settings from the routing device to its clients so that Internet access is provided.

  If you want to use AP mode, during the initial log-in process, change the operation mode from router mode to AP mode, as described in Connect the AP to a routing device and log in for the first time on page 24. If you already completed the initial log-in process, see Change the system mode to access point mode or to router mode on page 166.

  **Note**: In AP mode, the AP does not require routing features, so they are masked out in the local browser UI. For example, routing features such as NAT filtering and the DHCP server are disabled so that they do not interfere with the routing device in your network. For more information about the features that are enabled in router mode but not required in AP mode, see Routing features enabled in router mode on page 38.

- **Router mode**: The AP functions as both a router and WiFi 6 access point, and can support LAN clients through its LAN ports. Because the AP is connected to your modem, the AP receives its IP address settings from your Internet service provider (ISP). The AP delivers IP address settings to its clients so that Internet access is provided.

  If you want to use router mode, follow the initial log-in process as described in Connect the AP to a modem and log in for the first time on page 28.

**Setup with an Ethernet wall outlet**

If you have an Ethernet wall outlet that provides an Internet connection, you can connect the WAN port to the wall outlet and follow one of these procedures:

- **Set up a WiFi 6 hotspot on an existing network**: Follow the procedure that is described in Connect the AP to a routing device and log in for the first time on page 24 because the AP must operate in AP mode.

- **Set up a private WiFi 6 network**: Follow the procedure that is described in Connect the AP to a modem and log in for the first time on page 28 because the AP must operate in router mode.
Connect the AP to a routing device and log in for the first time

Use this procedure for the setups that are described in the following table:

Table 3. WiFi setups behind a routing device with the AP functioning in AP mode

<table>
<thead>
<tr>
<th>What you have</th>
<th>What you want</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadband, cable, or DSL device with WiFi (router)</td>
<td>Add WiFi 6 to your home or office</td>
</tr>
<tr>
<td>Gateway or regular router in your network</td>
<td>Add WiFi 6 to your home or office</td>
</tr>
<tr>
<td>Ethernet wall outlet with Internet service</td>
<td>Set up a WiFi 6 hotspot on an existing network.</td>
</tr>
</tbody>
</table>

You can also connect the AP to a switch or hub that is connected to one of the devices described in the previous table.

It is not common, but if your network includes an independent DHCP server, connect the AP to a switch or hub that is connected to the DHCP server.

Figure 4. Connect the AP to a broadband, cable, or DSL router

Figure 5. Connect the AP to an existing router in your network
To connect the AP directly to an existing router in your network and log in to the local browser UI for the first time:

1. Connect an Ethernet cable to the yellow Internet port on the AP.
2. Connect the other end of the cable to a LAN port on your network router.
   Your network router must support a DHCP server so that it assigns an IP address to the AP and its clients and provides Internet access.
3. Power on the AP.
   The Power LED lights solid red for about five seconds and then turns solid amber.
4. Wait about two minutes for the startup process to complete.
   The startup process is complete when the following happens:
   - The Power LED turns solid green.
   - The WiFi LED lights solid green.
5. Log in to the AP by using one of the following methods:
   - **Connect over WiFi.** On a WiFi-enabled computer or mobile device, find and connect to the AP’s WiFi network (SSID).
     The default SSID and WiFi password (network key) are printed on the AP label.
   - **Connect over Ethernet directly to the AP.** Using an Ethernet cable, connect the LAN port on your computer directly to any of LANs port on the AP.
Note the following:

- If the Setup Wizard does not start and your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.
- If the Setup Wizard still does not start, see You cannot log in to the AP [router mode] on page 232.

7. Follow the prompts.
   Note the following:
   - **Internet connection**: If the AP does not connect to the Internet, check the connection between the AP and your routing device.
   - **New admin password**: During the Setup Wizard process, you must set a new admin password (the local device password) and specify answers to two security questions (you can choose the questions).
   - **New WiFi network name (SSID) and WiFi password**: During the Setup Wizard process, you can set a new WiFi network name (SSID) and WiFi password for the Wireless 1 network. This SSID and WiFi password replace the default SSID and WiFi password that are printed on the AP label.
   - **Firmware update**: During the Setup Wizard process, you can update the firmware (if new firmware is available).

   At the end of the Setup Wizard process, the AP restarts. Do not close the browser page. Your WiFi-enabled computer or mobile device might be disconnected.

8. If your WiFi connection was terminated, reconnect to the AP.
   If you set a new WiFi network name (SSID) and WiFi password during the Setup Wizard process, use your new SSID and WiFi password to reconnect.

9. Log in to the local browser UI again by entering your new local device password. This is the password that you specified during the Setup Wizard process.
   The BASIC Home page displays.
   You now must change the operation mode to AP mode.

10. Select **ADVANCED > Advanced Setup > Router / AP / Bridge Mode**.
    The Router / AP / Bridge Mode page displays.

11. Select the **AP Mode** radio button.
    We recommend that you leave the **Get dynamically from existing access point/router** button selected to let the AP get an IP address dynamically from the routing device in your network.
12. Click the **Apply** button, and in the pop-up window that displays, click the **OK** button. Your settings are saved and the AP is reconfigured in AP mode, and is assigned a new IP address by your routing device. In AP mode, the routing functions of the AP are masked out in the local browser UI.

If you are connected over WiFi, your connection might be terminated.

13. If you were connected over WiFi and your connection was terminated, reconnect to the AP.

14. Close and then reopen your browser, and enter `http://www.routerlogin.net` in the address field.

The login window displays again.

If the login window does not display and your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

If you experience connectivity problems, see You cannot log in to the AP [access point mode] on page 233.

15. Enter your local device password.

The BASIC Home page displays.

16. Find the new IP address of the AP in the local browser UI by doing the following:
   a. Select **ADVANCED > ADVANCED Home**.

   The ADVANCED Home page of the AP displays. The Router Port pane shows the LAN IP address that is now assigned to the AP.
   
   b. Save the LAN IP address of the AP for later use.

   You must use this IP address if you plan to connect to the same network as the AP but not directly to the AP network. For example, use this IP address if you connect over the LAN to the AP.

   If you are directly connected to the AP over a WiFi connection or Ethernet connection to one of the LAN ports, you still can use `http://www.routerlogin.net`.

17. If you are using the AP in a country other than the U.S. or Canada (where the region is set and you cannot change it), set the country or region where you are using the AP by doing the following:
   a. Select **Advanced > Advanced Setup > Wireless Settings**.
   
   b. From the **Region** menu, select the country or region where you are using the AP.

**Note:** Make sure that the country is set to the location where the device is operating. You are responsible for complying with the local, regional, and national regulations for channels, power levels, and frequency ranges.
c. Click the **Apply** button. 
   Your settings are saved and the AP is configured for the new country or region. 
   Do not close the browser page. If you are connected over WiFi, your connection 
   might be terminated.

d. If you want to continue to configure the AP, reconnect to the AP (if you were 
   connected over WiFi and your connection was terminated) and log back in to 
   the local browser UI by entering your local device password. 
   The BASIC Home page displays. 
   The Home page displays various panes that let you see the status of your AP at 
   a glance. You can now configure and monitor the AP.

---

**Connect the AP to a modem and log in for the first time**

Use this procedure for the setups that are described in the following table:

---

Table 4. WiFi setups behind a modem with the AP functioning in router mode

<table>
<thead>
<tr>
<th>What you have</th>
<th>What you want</th>
</tr>
</thead>
<tbody>
<tr>
<td>Broadband, cable, or DSL device without WiFi (modem only)</td>
<td>Add WiFi 6 and a wired network to your home or office.</td>
</tr>
<tr>
<td>Ethernet wall outlet with Internet service</td>
<td>Set up a private WiFi 6 network.</td>
</tr>
</tbody>
</table>

---

![Figure 7. Connect the AP to your modem](image-url)
When you set up the AP and connect it to your modem, the following applies, depending on the type of WAN connection your modem uses:

- **Dynamic DHCP**: If the type of WAN connection is dynamic DHCP, the AP automatically receives an IP address from your Internet service provider (ISP) and you do not need to provide any IP address information. This type of WAN connection is the most common.

- **PPPoE, L2TP, or PPTP, or static IP address**: If the type of WAN connection is PPPoE, L2TP, or PPTP, or your Internet connection requires a static IP address, you must follow the prompts during the setup process and provide the required information for the Internet connection.

**Tip**: If you are not sure which type of WAN connection your Internet service uses, contact your ISP before you start the following procedure.

**To connect the AP to a modem and log in to the local browser UI for the first time:**

1. Unplug your modem’s power, leaving the modem connected to the wall jack for your Internet service.
2. If the modem uses a battery backup, remove the battery.
3. Connect the Ethernet cable to the yellow Internet port on the AP.
4. Connect the other end of the cable to a LAN port on your modem.
5. If the modem uses a battery backup, put the battery back in.
6. Plug in and turn on the modem.
7. Power on the AP.
   The Power LED lights solid red for about five seconds and then turns solid amber.
8. Wait about two minutes for the startup process to complete.
The startup process is complete when the following happens:

- The Power LED turns solid green.
- The WiFi LED lights solid green.

9. Log in to the AP by using one of the following methods:

- **Connect over WiFi.** On a WiFi-enabled computer or mobile device, find and connect to the AP’s WiFi network (SSID). The default SSID and WiFi password (network key) are printed on the AP label.
- **Connect over Ethernet directly to the AP.** Using an Ethernet cable, connect the LAN port on your computer directly to any of LANs port on the AP.

10. Launch a web browser and enter **http://www.routerlogin.net** in the address field. The Setup Wizard starts.

Note the following:

- If the Setup Wizard does not start and your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.
- If the Setup Wizard still does not start, see **You cannot log in to the AP [router mode]** on page 232.

11. Follow the prompts.

Note the following:

- **WAN and Internet connection:** If the WAN connection is PPPoE, L2TP, or PPTP, or your Internet connection requires a static IP address provide the required information when you are prompted to do so during the Setup Wizard process. If the AP does not connect to the Internet, see one of the following sections:
  - **Check the Internet WAN IP address [router mode]** on page 235
  - **Check or manually start the PPPoE connection [router mode]** on page 237
  - **Troubleshoot Internet browsing** on page 238
- **New admin password:** During the Setup Wizard process, you must specify a new admin password (the local device password) and specify answers to two security questions (you can choose the questions).
- **New WiFi network name (SSID) and WiFi password:** During the Setup Wizard process, you can set a new WiFi network name (SSID) and WiFi password for the Wireless 1 network. This SSID and WiFi password replace the default SSID and WiFi password that are printed on the AP label.
• **Firmware update:** During the Setup Wizard process, you can update the firmware (if new firmware is available).

At the end of the Setup Wizard process, the AP restarts. Do not close the browser page. Your WiFi-enabled computer or mobile device might be disconnected.

12. If your WiFi connection was terminated, reconnect to the AP.
   If you set a new WiFi network name (SSID) and WiFi password during the Setup Wizard process, use your new SSID and WiFi password to reconnect.

13. Log in again to the local browser UI by entering your new local device password. This is the password that you specified during the Setup Wizard process.
   The BASIC Home page displays.
   The Home page displays various panes that let you see the status of your AP at a glance. You can now configure and monitor the AP.

14. If you are using the AP in a country other than the U.S. or Canada (where the region is set and you cannot change it), set the country or region where you are using the AP by doing the following:
    a. Select **Advanced > Advanced Setup > Wireless Settings**.
    b. From the **Region** menu, select the country or region where you are using the AP.
       
       **Note:** Make sure that the country is set to the location where the device is operating. You are responsible for complying with the local, regional, and national regulations for channels, power levels, and frequency ranges.

    c. Click the **Apply** button.
       Your settings are saved and the AP is configured for the new country or region. If you are connected over WiFi, your connection might be terminated.

    d. If you want to continue to configure the AP, reconnect to the AP (if you were connected over WiFi and your connection was terminated) and log back in to the local browser UI by entering your local device password.
How the operation mode affects how you can reach the local browser UI

The operation mode affects how you can reach the AP local browser UI:

- **Router mode**: Enter http://www.routerlogin.net in the address field of your browser.
  In router mode, you always connect directly to the AP.

- **AP mode**: The method to reach the local browser UI depends on how you connect to the AP:
  - **Directly connected**: Enter http://www.routerlogin.net in the address field of your browser.
    One exception exists: If you assigned a static IP address to the AP, you must use that IP address to reach the local browser UI.
  - **Connected over your network**: In the address field of your browser, enter the IP address that your existing router or DHCP server assigned to the AP. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

Find the IP address of the AP when you cannot use routerlogin.net

Under the following circumstances, when the AP is operating in AP mode, you cannot use http://www.routerlogin.net (or http://www.routerlogin.com) to log in to the AP:

- Your computer or mobile device is not directly connected to the AP network even it is on the same network as the AP.
- Your computer or mobile device is directly connected to the AP, but the AP is using a static IP address.

**Note**: If the AP can reach its DNS server only over the Internet (for example, the IP address of the DNS server is 8.8.8.8), you cannot use http://www.routerlogin.net. However, if the DNS server is the IP address of the router to which the AP connects but the router’s Internet connection is down, you can use http://www.routerlogin.net because the AP can still reach the router.
• Your network includes another NETGEAR device that is also accessible by using http://www.routerlogin.net. In such a situation, if you use http://www.routerlogin.net, you might log in to the AP or you might log in to the other NETGEAR device, depending on your network situation.

In these situations, use the IP address that was assigned to the AP by your router during the setup process (see Connect the AP to a routing device and log in for the first time on page 24) to log in to the local browser UI of the AP.

If you do not know the IP address that was assigned to the AP, use one of the following options to find the IP address of the AP:

• Only if the AP is connected to the Internet, do one of the following:

  - **Option 1. Temporarily connect directly and log in**: Temporarily connect a computer directly either through an Ethernet cable or over WiFi or a mobile device over WiFi to the AP and do the following:
    1. Launch a web browser and enter http://www.routerlogin.net in the address field.
       A login window displays.
       If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.
    2. Enter the AP local device password.
       The local device password is the one that you specified. The local device password is case-sensitive.
       The BASIC Home page displays.
    3. Select **ADVANCED**.
       The ADVANCED Home page displays
    4. In the LAN Port pane, click the **CONNECTION STATUS** button.
       The IP Address field displays the IP address that is assigned to the AP.

  - **Option 2. Temporarily connect directly and ping the AP**: Temporarily connect a computer or mobile device directly through an Ethernet cable or over WiFi to the AP and send a ping to www.routerlogin.net.
    How to send a ping depends on your computer or mobile device.
    On your computer or mobile device, the field with the ping results displays the IP address that is assigned to the AP.

• Regardless of whether the AP is connected to the Internet, do one of the following:

  - **Option 1. Access your modem or existing router**: Access the DHCP server information of your modem or existing router to see the devices that are
connected to it, including the AP. The IP address that is assigned to the AP is listed.

- **Option 2. Use an IP scanner**: Use an IP scanner application (they are available free of charge on the Internet) in the network of your existing router. The IP scanner results include the IP address that is assigned to the AP.

If you made a direct connection to the AP, you can now terminate that connection. Connect your computer or mobile device to the same network as the AP, and use the discovered IP address to log in to the AP.

**Log in to the AP after you complete the initial log-in process**

After you complete the initial log-in process, the AP is ready for use and you can change the settings and monitor the traffic.

**To log in to the AP’s local browser UI after you complete the initial log-in process:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see *Dismiss a browser security warning* on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

The Home page displays various panes that let you see the status of your AP at a glance. You can now configure and monitor the AP.
Change the language

By default, the language of the local browser UI is set as Auto. You can change the language.

**To change the language:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. In the upper right corner, select a language from the menu.
   
   The page refreshes with the language that you selected.

Connect a WiFi or wired device to the AP’s network after installation

After you install the AP in your network (see Connect the AP to a routing device and log in for the first time on page 24 or Connect the AP to a modem and log in for the first time on page 28), you can connect devices to a WiFi network on the AP or to the AP’s LAN through Ethernet cables.
If the device that you are trying to connect is set up to use a static IP address, change the settings of your device so that it uses Dynamic Host Configuration Protocol (DHCP) and can receive an IP address through or from the AP.

**Note:** Connecting to the AP’s network is not the same as connecting to the local browser UI to view or manage the AP’s settings. For information about logging in to the AP’s local browser UI, see Log in to the AP after you complete the initial log-in process on page 34.

### Join a WiFi network on the AP

You can manually add a WiFi device such as a WiFi-enabled computer, tablet, or smartphone to a WiFi network of the AP.

On the WiFi device that you want to connect to the AP, use the software application that manages your WiFi connections.

**Note:** By default, the AP’s Wireless 1 network is enabled but the Wireless 2 and Wireless 3 networks are disabled.

**To connect a device to a WiFi network on the AP:**

1. Make sure that the AP is receiving power (its Power LED is solid green) and is connected to the Internet (its Internet LED is solid green), and that the WiFi radios are on (the WiFi LED is solid green).

2. On the WiFi device, open the software application that manages your WiFi connections.
   
   This application scans for all WiFi networks in your area.

3. Look for one of the AP’s networks and select it.
   
   For the Wireless 1 network, if you set a new SSID during the initial log-in process, use that SSID. If you did not set a new SSID, use the default SSID that is printed on the AP label.

4. Enter the WiFi password for WiFi access.
   
   For the Wireless 1 network, if you set a new WiFi password (network key) during the initial log-in process, use that WiFi password. If you did not set a new WiFi password, use the default WiFi password that is printed on the AP label.

5. Click the **Connect** button.
   
   The device connects to the WiFi network of the AP.
Use Wi-Fi Protected Setup to join the Wireless 1 network

You can use Wi-Fi Protected Setup (WPS) to add a WiFi device such as a WiFi-enabled computer, tablet, or smartphone to the Wireless 1 network of the AP.

WPS is a standard for easily adding computers and other devices to a home network while maintaining security. To use WPS (Push 'N' Connect), make sure that all WiFi devices to be connected to the network are Wi-Fi certified and support WPS. During the connection process, the client device gets the security settings from the AP so that every device in the network supports the same security settings.

**To use WPS to connect a device to the Wireless 1 network of the AP:**

1. Make sure that the AP is receiving power (its Power LED is solid green) and is connected to the Internet (its Internet LED is solid green), and that the WiFi radios are on (the WiFi LED is solid green).
2. Check the WPS instructions for your computer or WiFi device.
3. Press the **WPS** button on the AP for three seconds.
   
   For more information, see Back panel with ports, buttons, and a power connector on page 19.
   
   For two minutes, the AP attempts to find the WiFi device (that is, the client) that you want to join the AP's Wireless 1 network, and the WPS LED on the top panel of the AP blinks slowly.
4. Within two minutes, press the **WPS** button on your WiFi device, or follow the WPS instructions that came with the device.
   
   The WPS process automatically sets up the device with the WiFi passphrase and connects the device to the Wireless 1 network of the AP.

Connect to the AP through an Ethernet cable

You can connect a computer or other LAN device to the AP using an Ethernet cable and join the AP’s local area network (LAN).

**To connect a computer or LAN device to the AP with an Ethernet cable:**

1. Make sure that the AP is receiving power and is connected to the Internet (both its Power LED and Internet LED are solid green).
2. Connect an Ethernet cable to an Ethernet port on the computer or LAN device.
3. Connect the other end of the Ethernet cable to one of the LAN ports on the AP.
   
   You can use any of the LAN ports on the AP.

   **Note:** You can also connect the computer to a switch or hub that is connected to one of the LAN ports on the AP.
The AP LAN LED for the port to which you attached the device lights solid green. Your computer or LAN device connects to the local area network (LAN).

Routing features enabled in router mode

The AP can function in router mode (its default operation mode) or in AP mode.

When the AP is in router mode, the following routing features are enabled in the local browser UI:

- Internet settings, including an IP address issued through dynamic DHCP (the default setting), a manually specified static IP address, an IP address issued through PPPoE, L2TP, or PPTP, and various ways to implement an IPv6 address.
- WAN settings, including routing services such as NAT.
- LAN settings, including a DHCP server.
- QoS settings.
- Internet security settings, including the option to block sites and services, and the option to set up port forwarding and port triggering rules.
- VPN service and VPN client.
- Internet traffic meter.
- Bridge port and VLAN tag groups.
- Changing the priority for an attached device.

**Note:** In AP mode, these features are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these features are masked out in the local browser UI.

Dismiss a browser security warning

When you enter [http://www.routerlogin.net](http://www.routerlogin.net) or [http://www.routerlogin.com](http://www.routerlogin.com) in the address field of your browser, a security warning can display. This is normal. You can just dismiss the security warning.

To dismiss a browser security warning:

- **Google Chrome**: Click the ADVANCED link. Then, click the *Proceed to x.x.x.x (unsafe)* link, in which x.x.x.x represents the domain name or IP address of the device.
- **Apple Safari**: Click the Show Details button. Then, click the *visit this website* link. If a warning pop-up window displays, click the *Visit Website* button. If another
pop-up window displays to let you confirm changes to your certificate trust settings, enter your Mac user name and password and click the **Update Setting** button.

- **Mozilla Firefox**: Click the **ADVANCED** button. Then, click the **Add Exception** button. In the pop-up window that displays, click the **Confirm Security Exception** button.

- **Microsoft Edge**: Select **Details > Go on to the webpage**.

- **Microsoft Internet Explorer**: Click the **Continue to this website (not recommended)** link.
Manually Set Up Internet Settings [Router Mode]

This chapter describes how you can manually set up the Internet connection for your AP in router mode (the default operation mode). For information about changing the LAN settings if the AP is in router mode, see LAN IP address settings [router mode] on page 114.

Note: In AP mode, the Internet settings that are described in this chapter are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these Internet settings are masked out in the local browser UI.

Usually, the quickest way to set up the Internet connection is to allow the Setup Wizard to detect the Internet connection when you go through the initial log-in process. After initial setup, you can use the Setup Wizard at any time. If you prefer to specify the Internet setup yourself, you can enter the WAN IP address settings instead of using the Setup Wizard. You can also enter the IPv6 address settings.

This chapter contains the following sections:

- Use the Setup Wizard [router mode]
- Manually set up the AP Internet connection [router mode]
- IPv6 Internet connections and IPv6 addresses [router mode]

Note: In this chapter, we refer to the access point as the AP.
Use the Setup Wizard [router mode]

In most situations, you do not need to use the Setup Wizard in the local browser UI. In some situations, you might want to use the Setup Wizard to redetect your Internet settings.

After the initial setup and login procedure (see Connect the AP to a modem and log in for the first time on page 28), if AP is in router mode, you can use the Setup Wizard to redetect your Internet settings. Using the Setup Wizard in the local browser UI is much easier than resetting your AP to factory default settings and going through the initial login procedure.

**Note:** The Setup Wizard is not required if the AP is operating in AP mode and is therefore masked out in the local browser UI.

The Setup Wizard detects your Internet setting through the AP’s network connection to your modem, gateway, or Ethernet outlet with Internet connection. The Setup Wizard detects the WAN IP address assigned by your Internet service provider (ISP), and automatically adjusts the settings for your AP to access the Internet.

**To use the Setup Wizard:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Setup Wizard**.
   The Setup Wizard page displays.

5. Select the **Yes** radio button.

6. Click the **Next** button.
   The Setup Wizard searches your Internet connection for servers and protocols to determine your Internet configuration. When the AP connects to the Internet, you are prompted to change the local device password (also referred to as the admin password).
Manually set up the AP Internet connection [router mode]

If the AP is in router mode, you can view or change the AP’s Internet connection settings.

**Note:** The information in the following sections is not required if the AP is operating in AP mode. In AP mode, the Internet settings can be provided by the routing device to which the AP connects. Therefore, in AP mode, these Internet settings are masked out in the local browser UI.

Specify a dynamic or fixed WAN IP address Internet connection without a login [router mode]

Usually, the quickest way to set up a dynamic or fixed Internet connection is to allow the Setup Wizard to detect the Internet connection when you go through the initial log-in process as described in Connect the AP to a modem and log in for the first time on page 28 or, after initial setup, in Use the Setup Wizard [router mode] on page 41.

After you install the AP and it is in router mode, you can manually specify the dynamic or fixed Internet connection or change it. (These dynamic and fixed IP settings are not required if the AP is operating in AP mode.)

For this procedure, use the settings that your Internet service provider (ISP) gave you. If you are not sure, contact your ISP.

**To specify or view the settings for a WAN Internet connection that uses a dynamic or fixed IP address and that does not require a login:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **BASIC > Internet**.
The Internet Setup page displays.

5. Select the **No** radio button.
This is the default setting.

6. If your Internet connection requires an account name (sometimes referred to as a host name), enter it in the **Account Name** field.
The account name is the same as the device name, which, by default, is WAX204.

7. If your Internet connection requires a domain name, enter it in the **Domain Name (if Required)** field.
For the other sections on this page, the default settings usually work, but you can change them.

8. Select an Internet IP Address radio button:
   - **Get Dynamically**. Your ISP uses DHCP to automatically assign an IP address and related settings to the AP.
   - **Use Static IP Address**. Enter the static IP address, IP subnet mask, and gateway IP address that your ISP assigned to the AP. The gateway is the ISP router to which the AP connects.

9. Select a Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP**. Your ISP uses DHCP to assign DNS servers to the AP.
   - **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

10. Select a Router MAC Address radio button:
    A MAC address is a unique 12-digit hexadecimal number that identifies each network device. A device’s MAC address always stays the same. It does not change the way an IP address can.
    - **Use Default Address**. Use the default AP MAC address that displays on the Dashboard page and is on the AP label.
    - **Use Computer MAC Address**. The AP captures and uses the MAC address of the computer that you are now using to change the settings. Sometimes an ISP allows the MAC address of a particular computer only.
    - **Use This MAC Address**. Enter a MAC address that must be used. Sometimes an ISP allows the MAC address of a particular computer only.

11. If your ISP gave you a vendor class identifier (VCI) string, enter it in the **Vendor Class Identifier String (option 60)** field.
If your ISP did not give you a VCI string, leave this field blank.

12. If your ISP gave you a client identifier (client ID) string, enter it in the **Client Identifier String (option 61)** field.
   If your ISP did not give you a client ID string, leave this field blank.

13. If your Internet configuration requires a specific VLAN ID, click the **VLAN/Bridge Settings** link.
   For more information, see **Bridge port and VLAN tag groups [router mode]** on page 126.

14. Click the **Apply** button.
   Your settings are saved.

15. Click the **Test** button to test your Internet connection.
   If the NETGEAR website does not display within one minute, see one of the following sections:
   
   - **You cannot access the Internet [router mode]** on page 235
   - **Troubleshoot Internet browsing** on page 238

Specify a PPPoE Internet connection that uses a login [router mode]

Usually, the quickest way to set up a PPPoE Internet connection is to allow the Setup Wizard to detect the Internet connection when you go through the initial log-in process as described in **Connect the AP to a modem and log in for the first time** on page 28 or, after initial setup, in **Use the Setup Wizard [router mode]** on page 41.

After you install the AP and it is in router mode, you can manually specify the PPPoE Internet connection or change it. (These PPPoE settings are not required if the AP is operating in AP mode.)

For this procedure, use the settings that your Internet service provider (ISP) gave you. If you are not sure, contact your ISP.

**To specify or view the settings for an ISP Internet connection that uses PPPoE and that requires a login:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select BASIC > Internet.
   The Internet Setup page displays.

5. Select the Yes radio button.
   The settings on the page change.

6. From the Internet Service Provider menu, select PPPoE as the encapsulation method.

7. In the Login field, enter the login name that your ISP gave you.
   This login name is often an email address.

8. In the Password field, enter the password that you use to log in to your Internet service.

9. If your ISP requires a service name, type it in the Service Name (if Required) field.

10. From the Connection Mode menu, select Always On, Dial on Demand, or Manually Connect.

11. If you select Dial on Demand from the Connection Mode menu, in the Idle Timeout field, enter the number of minutes until the Internet login times out. This is how long the AP keeps the Internet connection active when no one on the network is using the Internet connection. A value of 0 (zero) means never log out. The default is 5 minutes.

12. Select an Internet IP Address radio button:
   - Get Dynamically. Your ISP uses DHCP to automatically assign an IP address and related settings to the AP.
   - Use Static IP Address. Enter the static IP address, IP subnet mask, and gateway IP address that your ISP assigned to the AP. The gateway is the ISP router to which the AP connects.

13. Select a Domain Name Server (DNS) Address radio button:
   - Get Automatically from ISP. Your ISP uses DHCP to assign DNS servers to the AP.
• **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

14. Select a Router MAC Address radio button:
A MAC address is a unique 12-digit hexadecimal number that identifies each network device. A device’s MAC address always stays the same. It does not change the way an IP address can.

• **Use Default Address.** Use the default AP MAC address that displays on the Dashboard page and is on the AP label.

• **Use Computer MAC Address.** The AP captures and uses the MAC address of the computer that you are now using to change the settings. Sometimes an ISP allows the MAC address of a particular computer only.

• **Use This MAC Address.** Enter a MAC address that must be used. Sometimes an ISP allows the MAC address of a particular computer only.

15. If your Internet configuration requires a specific VLAN ID, click the **VLAN/Bridge Settings** link.
For more information, see Bridge port and VLAN tag groups [router mode] on page 126.

16. Click the **Apply** button.
Your settings are saved.

17. Click the **Test** button to test your Internet connection.
If the NETGEAR website does not display within one minute, see one of the following sections:

• You cannot access the Internet [router mode] on page 235

• Troubleshoot Internet browsing on page 238

Specify a PPTP or L2TP Internet connection that uses a login [router mode]

Usually, the quickest way to set up a PPTP or L2TP Internet connection is to allow the Setup Wizard to detect the Internet connection when you go through the initial log-in process as described in Connect the AP to a modem and log in for the first time on page 28 or, after initial setup, in Use the Setup Wizard [router mode] on page 41.

After you install the AP and it is in router mode, you can manually specify the PPTP or L2TP Internet connection or change them. (These PPTP and L2TP settings are not required if the AP is operating in AP mode.)
For this procedure, use the settings that your Internet service provider (ISP) gave you. If you are not sure, contact your ISP.

To specify or view the settings for an ISP Internet connection that uses PPTP or L2TP and that requires a login:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **BASIC > Internet**.
   The Internet Setup page displays.
5. Select the **Yes** radio button.
   The settings on the page change.
6. From the **Internet Service Provider** menu, select **PPTP** or **L2TP** as the encapsulation method.
7. In the **Login** field, enter the login name that your ISP gave you.
   This login name is often an email address.
8. In the **Password** field, enter the password that you use to log in to your Internet service.
9. If your ISP requires a service name, type it in the **Service Name** field.
10. From the **Connection Mode** menu, select **Always On**, **Dial on Demand**, or **Manually Connect**.
11. If you select **Dial on Demand** from the **Connection Mode** menu, in the **Idle Timeout** field, enter the number of minutes until the Internet login times out.
    This is how long the router keeps the Internet connection active when no one on the network is using the Internet connection. A value of 0 (zero) means never log out. The default is 5 minutes.
12. If your ISP gave you fixed IP addresses and a connection ID or name, enter them in the **My IP Address**, **Subnet Mask**, **Server Address**, **Gateway IP Address**, and **Connection ID/Name** fields.
If your ISP did not give you an IP addresses, a connection ID, or name, leave these fields blank. The connection ID or name applies to a PPTP service only.

13. Select a Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign DNS servers to the AP.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

14. Select a Router MAC Address radio button:
   - **Use Default Address.** Use the default AP MAC address that displays on the Dashboard page and is on the AP label.
   - **Use Computer MAC Address.** The AP captures and uses the MAC address of the computer that you are now using to change the settings. Sometimes an ISP allows the MAC address of a particular computer only.
   - **Use This MAC Address.** Enter a MAC address that must be used. Sometimes an ISP allows the MAC address of a particular computer only.

15. Click the **Apply** button.
   Your settings are saved.

16. Click the **Test** button to test your Internet connection.
   If the NETGEAR website does not display within one minute, see one of the following sections:
   - **You cannot access the Internet [router mode]** on page 235
   - **Troubleshoot Internet browsing** on page 238
IPv6 Internet connections and IPv6 addresses [router mode]

The AP supports multiple types of IPv6 Internet connections. Which connection type you must use depends on your IPv6 ISP. Follow the directions that your IPv6 ISP gave you.

- If your ISP did not provide details, use the 6to4 tunnel connection type (see Set up an IPv6 6to4 tunnel Internet connection [router mode] on page 53).
- If you are not sure what type of IPv6 connection the AP uses, use the Auto Detect connection type, which lets the AP detect the IPv6 type that is in use (see Use Auto Detect for an IPv6 Internet connection [router mode] on page 50).
- If your Internet connection does not use pass-through, a fixed IP address, DHCP, 6rd, or PPPoE but is IPv6, use the Auto Config connection type, which lets the AP autoconfigure its IPv6 connection (see Use Auto Config for an IPv6 Internet connection [router mode] on page 51).

The AP supports the following IPv6 connection types:

- **Auto Detect.** For more information, see Use Auto Detect for an IPv6 Internet connection [router mode] on page 50.
- **Auto Config.** For more information, see Use Auto Config for an IPv6 Internet connection [router mode] on page 51.
- **6to4 tunnel.** For more information, see Set up an IPv6 6to4 tunnel Internet connection [router mode] on page 53.
- **Pass-through.** For more information, see Set up an IPv6 passthrough Internet connection [router mode] on page 56.
- **Fixed.** For more information, see Set up an IPv6 fixed Internet connection [router mode] on page 57.
- **DHCP.** For more information, see Set up an IPv6 DHCP Internet connection [router mode] on page 59.
- **6rd.** For more information, see Set up an IPv6 6rd Internet connection [router mode] on page 54.
- **PPPoE.** For more information, see Set up an IPv6 PPPoE Internet connection [router mode] on page 60.

When you enable IPv6 and select any connection type other than IPv6 pass-through, the AP starts the stateful packet inspection (SPI) firewall function on the WAN interface. This process is referred to as IPv6 filtering. The AP creates connection records and checks every inbound IPv6 packet. If the inbound packet is not destined for the AP itself...
and the AP does not expect to receive such a packet, or the packet is not in the connection record, the AP blocks this packet. This function works either in secured more or in open mode. In secured mode, the AP inspects both TCP and UDP packets. In open mode, the AP inspects UDP packets only.

IPv6 addresses are denoted by eight groups of hexadecimal quartets that are separated by colons. You can reduce any four-digit group of zeros within an IPv6 address to a single zero or omit it. The following errors invalidate an IPv6 address:

- More than eight groups of hexadecimal quartets
- More than four hexadecimal characters in a quartet
- More than two colons in a row

Use Auto Detect for an IPv6 Internet connection [router mode]

To set up an IPv6 Internet connection through autodetection:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter \texttt{http://www.routerlogin.net} in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
   The IPv6 page displays.
5. From the Internet Connection Type menu, select Auto Detect.
   The page adjusts. The AP automatically detects the information in the following fields:
   - \textbf{Connection Type}. This field indicates the connection type that is detected.
   - \textbf{Router’s IPv6 Address on WAN}. This field shows the IPv6 address that is acquired for the AP’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
- **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This is the default setting.
     
     This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

7. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

8. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

9. Click the **Apply** button.

   Your settings are saved.

**Manually Set Up Internet Settings [Router Mode]**

**To set up an IPv6 Internet connection through autoconfiguration:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**.
   The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **Auto Config**.
   The page adjusts. The AP automatically detects the information in the following fields:
   - **Router’s IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the AP’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
   - **Router’s IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. (Optional) In the **DHCP User Class (if Required)** field, enter a host name. Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.

7. (Optional) In the **DHCP Domain Name (if Required)** field, enter a domain name. You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP’s mail server is mail.xxx.yyy.zzz, type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.

8. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers.
     Your ISP automatically assigns these addresses.
   - **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IPv6 address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

9. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server**. This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config**. This is the default setting.
     This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).
10. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

11. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

12. Click the **Apply** button.
    Your settings are saved.

Set up an IPv6 6to4 tunnel Internet connection [router mode]

The remote relay router is the router to which your router creates a 6to4 tunnel. Make sure that the IPv4 Internet connection is working before you apply the 6to4 tunnel settings for the IPv6 connection.

**To set up an IPv6 Internet connection by using a 6to4 tunnel:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > IPv6.**
   The IPv6 page displays.
5. From the **Internet Connection Type** menu, select **6to4 Tunnel.**
   The page adjusts. The AP automatically detects the information in the Router’s IPv6 Address on LAN field. This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also
indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select a Remote 6to4 Relay Router radio button:
   - **Auto.** Your AP uses any remote relay router that is available on the Internet. This is the default setting.
   - **Static IP Address.** Enter the static IPv4 address of the remote relay router. Your IPv6 ISP usually provides this address.

7. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns these addresses.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

8. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

9. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

10. Select an IPv6 Filtering radio button:
    - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
    - **Open.** In open mode, the router inspects UDP packets only.

11. Click the **Apply** button.
    Your settings are saved.

Set up an IPv6 6rd Internet connection [router mode]

The 6rd protocol makes it possible to deploy IPv6 to sites using a service provider’s IPv4 network. 6rd (also referred to as IPv6 rapid deployment) uses the service provider’s own IPv6 address prefix. This limits the operational domain of 6rd to the service provider’s
network and is under direct control of the service provider. The IPv6 service provided is equivalent to native IPv6. The 6rd mechanism relies on an algorithmic mapping between the IPv6 and IPv4 addresses that are assigned for use within the service provider's network. This mapping allows for automatic determination of IPv4 tunnel endpoints from IPv6 prefixes, allowing stateless operation of 6rd.

With a 6rd tunnel configuration, the AP follows the RFC5969 standard, supporting two ways to establish a 6rd tunnel IPv6 WAN connection:

- **Auto Detect mode.** In IPv6 Auto Detect mode, when the AP receives option 212 from the DHCPv4 option, autodetect selects the IPv6 as 6rd tunnel setting (see Use Auto Detect for an IPv6 Internet connection [router mode] on page 50). The AP uses the 6rd option information to establish the 6rd connection.

- **Manual mode.** Select 6rd Tunnel. If the AP receives option 212, the fields are automatically completed. Otherwise, you must enter the 6rd settings.

**To set up an IPv6 6rd Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6.**
   
   The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **6rd Tunnel.**
   
   The page adjusts. The AP automatically detects the information in the following sections:
   
   - **6rd (IPv6 Rapid Development) Configuration.** The AP detects the service provider's IPv4 network and attempts to establish an IPv6 6rd tunnel connection. If the IPv4 network returns 6rd parameters to the AP, the page adjusts to display the correct settings in this section.

   **Note:** If the AP does not automatically receive the 6rd parameters, you might need to enter them manually.
• **Router’s IPv6 Address on LAN.** This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns these addresses.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

7. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to devices on your LAN than the Auto Config method, but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This method lets the AP assign IPv6 addresses to the devices on your the LAN. This is the default setting.

   This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

8. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

9. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

10. Click the **Apply** button. Your settings are saved.

**Set up an IPv6 passthrough Internet connection [router mode]**

In pass-through mode, the router works as a Layer 2 Ethernet switch with two ports (LAN and WAN Ethernet ports) for IPv6 packets. The AP does not process any IPv6 header packets.
To set up a pass-through IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
   The IPv6 page displays.
5. From the Internet Connection Type menu, select Pass Through.
   The page adjusts, but no additional fields display.
6. Click the Apply button.
   Your settings are saved.

Set up an IPv6 fixed Internet connection [router mode]

To set up a fixed IPv6 Internet connection:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
   The IPv6 page displays.
5. From the Internet Connection Type menu, select Fixed. The page adjusts.

6. In the WAN Setup section, specify the fixed IPv6 addresses for the WAN connection:
   - IPv6 Address/Prefix Length. The IPv6 address and prefix length of the AP’s Internet (WAN) port.
   - Default IPv6 Gateway. The IPv6 address of the default IPv6 gateway for the AP’s Internet (WAN) port.
   - Primary DNS Server. The primary DNS server that resolves IPv6 domain name records for the AP.
   - Secondary DNS Server. The secondary DNS server that resolves IPv6 domain name records for the AP.

   **Note:** If you do not specify the DNS servers, the AP uses the DNS servers that are configured for the IPv4 Internet connection on the WAN Setup page. (See Manually set up the AP Internet connection [router mode] on page 42.)

7. In the LAN Setup section, select an IP Address Assignment radio button:
   - Use DHCP Server. This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - Auto Config. This is the default setting.

   This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

8. In the LAN Setup section, in the IPv6 Address/Prefix Length fields, specify the static IPv6 address and prefix length of the AP’s LAN interface.

9. Select an IPv6 Filtering radio button:
   - Secured. In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - Open. In open mode, the router inspects UDP packets only.

10. Click the Apply button. Your settings are saved.
Set up an IPv6 DHCP Internet connection [router mode]

To set up an IPv6 Internet connection with a DHCP server:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

   The IPv6 page displays.

5. From the Internet Connection Type menu, select DHCP.
   The page adjusts. The AP automatically detects the information in the following fields:

   - Router’s IPv6 Address on WAN. This field shows the IPv6 address that is acquired for the AP’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
   - Router’s IPv6 Address on LAN. This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. (Optional) In the User Class (if Required) field, enter a host name.
   Most people can leave this field blank, but if your ISP gave you a specific host name, enter it here.

7. (Optional) In the Domain Name (if Required) field, enter a domain name.
   You can type the domain name of your IPv6 ISP. Do not enter the domain name for the IPv4 ISP here. For example, if your ISP’s mail server is mail.xxx.yyy.zzz, type xxx.yyy.zzz as the domain name. If your ISP provided a domain name, type it in this field. For example, Earthlink Cable might require a host name of home, and Comcast sometimes supplies a domain name.
8. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP.** Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns these addresses.
   - **Use These DNS Servers.** If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.

9. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCPv6 client function.
   - **Auto Config.** This is the default setting.
     This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

10. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

11. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

12. Click the **Apply** button.
    Your settings are saved.

**Set up an IPv6 PPPoE Internet connection [router mode]**

**To set up a PPPoE IPv6 Internet connection:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > IPv6**. The IPv6 page displays.

5. From the **Internet Connection Type** menu, select **PPPoE**. The page adjusts. The AP automatically detects the information in the following fields:
   - **Router’s IPv6 Address on WAN**. This field shows the IPv6 address that is acquired for the AP’s WAN (or Internet) interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.
   - **Router’s IPv6 Address on LAN**. This field shows the IPv6 address that is acquired for the AP’s LAN interface. The number after the slash (/) is the length of the prefix, which is also indicated by the underline (_) under the IPv6 address. If no address is acquired, the field displays Not Available.

6. If already you set up your IPv4 ISP connection for PPPoE and want to use the same login information for IPv6, select the **Use the same Login information as IPv4 PPPoE check box** and go to **Step 8**.

7. To manually configure the PPPoE settings for IPv6, specify the following settings:
   - **Login**. Enter the login name that your ISP gave you.
   - **Password**. Enter the password for the ISP connection.
   - **Service Name (if Required)**. Enter a service name. If your ISP did not provide a service name, leave this field blank.

   **Note:** The default setting of the **Connection Mode** menu is **Always On** to provide a steady IPv6 connection. The AP never terminates the connection. If the connection is terminated, for example, when the modem is turned off, the AP attempts to reestablish the connection immediately after the PPPoE connection becomes available again.

8. Select an IPv6 Domain Name Server (DNS) Address radio button:
   - **Get Automatically from ISP**. Your ISP uses DHCP to assign your DNS servers. Your ISP automatically assigns these addresses.
   - **Use These DNS Servers**. If you know that your ISP requires specific servers, select this option. Enter the IP address of your ISP’s primary DNS server. If a secondary DNS server address is available, enter it also.
9. In the LAN Setup section, select an IP Address Assignment radio button:
   - **Use DHCP Server.** This method passes more information to LAN devices but some IPv6 systems might not support the DHCv6 client function.
   - **Auto Config.** This is the default setting.

   This setting specifies how the AP assigns IPv6 addresses to the devices on your home network (the LAN).

10. (Optional) In the LAN Setup section, select the **Use This Interface ID** check box and specify the interface ID to be used for the IPv6 address of the AP’s LAN interface. If you do not specify an ID here, the AP generates one automatically from its MAC address.

11. Select an IPv6 Filtering radio button:
   - **Secured.** In secured mode, which is the default mode, the router inspects both TCP and UDP packets.
   - **Open.** In open mode, the router inspects UDP packets only.

12. Click the **Apply** button.

   Your settings are saved.
Basic WiFi and Radio Features

This chapter describes how you can manage the basic WiFi and radio settings of the AP. For information about the advanced WiFi and radio settings, see Advanced WiFi and Radio Features on page 190.

Tip: If you want to change the WiFi network settings, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

The chapter includes the following sections:

- Set up or change an open or secure WiFi network
- Configure WPA and WPA2 Enterprise WiFi security with a RADIUS server
- Enable or disable a WiFi network
- Hide or broadcast the SSID for a WiFi network
- Manage client isolation for clients of the Wireless 2 or Wireless 3 network
- Manage access to LAN ports for clients of the Wireless 2 or Wireless 3 network
- Manage SSID isolation for all WiFi networks
- Enable or disable a WiFi radio
- Use WPS to connect to the WiFi network

Note: In this chapter, we refer to the access point as the AP.
Set up or change an open or secure WiFi network

The AP provides three WiFi networks (Wireless 1, Wireless 2, and Wireless 3). By default, the Wireless 1 network is enabled and the other two WiFi networks are disabled. The default security is WPA2-Personal [AES].

Table 5. WiFi networks

<table>
<thead>
<tr>
<th>WiFi network</th>
<th>Default status</th>
<th>Default SSID</th>
<th>Default WiFi password</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wireless 1</td>
<td>Enabled</td>
<td>NETGEARXXXXXX</td>
<td>Unique, see label.</td>
</tr>
<tr>
<td>Wireless 2</td>
<td>Disabled</td>
<td>NETGEARXXXXXX-2</td>
<td>sharedsecret</td>
</tr>
<tr>
<td>Wireless 3</td>
<td>Disabled</td>
<td>NETGEARXXXXXX-3</td>
<td>sharedsecret</td>
</tr>
</tbody>
</table>

In the previous table, XXXXXXX represents the last six digits of the MAC address of the AP. The default SSID and WiFi password (network key) for the Wireless 1 network are printed on the AP label. If you changed the default SSID or WiFi password for the Wireless 1 network, use the ones that you specified.

**Note:** For security, we recommend that you do change the names of the default SSIDs and the default WiFi passwords.

For each WiFi network, the AP simultaneously supports the 2.4 GHz band for 802.11b/g/n/ax devices and the 5 GHz band for 802.11a/n/ac/ax devices. For the 2.4 GHz band, the default WiFi throughput mode is 600 Mbps. For the 5 GHz band, it is 1200 Mbps. You can change (lower) the WiFi throughput mode (see Change the WiFi throughput mode for a radio on page 197).

You can view or change the WiFi settings and WiFi security for the Wireless 1 network, and you can enable and set up the Wireless 2 and Wireless 3 networks.

**To set up or change an open or secure WiFi network:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **BASIC > Wireless**.
   The Wireless Network page displays.
   For information about SSID isolation, see Manage SSID isolation for all WiFi networks on page 75.

5. Select the WiFi network (**Wireless 1**, **Wireless 2**, or **Wireless 3**).

6. To enable the selected WiFi network and set up or change the settings, configure the options that are described in the following table.
   (For information about the WiFi security options, see **Step 7**.)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wireless Network</td>
<td>Select the <strong>Enable</strong> radio button to enable the WiFi network or the <strong>Disable</strong> radio button to disable the WiFi network. By default, the Wireless 1 network is enabled and the other two WiFi networks are disabled.</td>
</tr>
</tbody>
</table>
| Name (SSID)        | The SSID (service set identifier) is the WiFi network name. If you do not change the SSID, the default SSID displays, in which XXXXXX represents the last six digits of the MAC address of the AP:  
                         **Wireless 1**: NETGEARXXXXXX  
                         **Wireless 2**: NETGEARXXXXXX-2  
                         **Wireless 3**: NETGEARXXXXXX-3  
                         The default SSID (for the Wireless 1 network) is also printed on the AP label (see **Access point label** on page 20).  
                         If you change the SSID, enter a 32-character (maximum), case-sensitive name in this field. |
| Band               | Select a radio button for a single band (**2.4 GHz** or **5 GHz**) or keep the default selection, which is the **Both** radio button, to enable the WiFi network to broadcast on both radio bands. |
By default, the AP broadcasts its SSID so that WiFi clients can detect the WiFi name (SSID) in their scanned network lists. To turn off the SSID broadcast, clear the **Enable SSID Broadcast** check box. Turning off the SSID broadcast provides additional WiFi security, but users must know the SSID to be able to join the WiFi network.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable SSID Broadcast</td>
<td>By default, the AP broadcasts its SSID so that WiFi clients can detect the WiFi name (SSID) in their scanned network lists. To turn off the SSID broadcast, clear the <strong>Enable SSID Broadcast</strong> check box. Turning off the SSID broadcast provides additional WiFi security, but users must know the SSID to be able to join the WiFi network.</td>
</tr>
<tr>
<td>Client isolation</td>
<td>You cannot configure this setting for the Wireless 1 network. By default, client isolation is enabled for the WiFi network, and the <strong>Enable</strong> radio button is selected. To allow communication between WiFi clients that are associated with the same SSID or different SSIDs on the AP, select the <strong>Disable</strong> radio button.</td>
</tr>
<tr>
<td>Allow access to wired ports</td>
<td>You cannot configure this setting for the Wireless 1 network. By default, WiFi clients cannot reach devices that are connected to the wired ports (LAN ports) of the AP, and the <strong>Enable</strong> radio button is selected. To allow communication between WiFi clients and devices that are connected to the wired ports, select the <strong>Disable</strong> radio button.</td>
</tr>
</tbody>
</table>

7. To set up or change the AP WiFi security for selected WiFi network, select and configure one of the options that are described in the following table.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>An open WiFi network does not provide any security. Any WiFi device can join the network. We recommend that you do not use an open WiFi network but configure WiFi security. However, an open network might be appropriate for a WiFi hotspot. <strong>Note:</strong> If you change the Wireless 1 network to an open network, WPS is disabled and the WPS LED turns off.</td>
</tr>
<tr>
<td>WPA2 Personal [AES]</td>
<td>This option, which is the same as WPA2-PSK, is the default setting and uses AES encryption. This type of security enables only WiFi devices that support WPA2 to join the WiFi network. WPA2 provides a secure connection but some legacy WiFi devices do not detect WPA2 and support only WPA. If your network includes such older devices, select <strong>WPA-Personal [TKIP] + WPA2-Personal [AES]</strong> authentication. In the <strong>Password (Network Key)</strong> field, enter a phrase of 8 to 63 characters or 64 hexadecimal digits. To join the WiFi network, a user must enter this password. To view the password in clear text, click the <strong>eye</strong> icon.</td>
</tr>
</tbody>
</table>
### WiFi 6 AX1800 Dual Band Wireless Access Point WAX204

(Continued)

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WPA-Personal</td>
<td>This option, which is the same as WPA2-PSK/WPA-PSK, enables WiFi devices that support either WPA2 or WPA to join the WiFi network. This option uses AES and TKIP encryption.</td>
</tr>
<tr>
<td>[TKIP] + WPA2-Personal [AES]</td>
<td>WPA-PSK (which uses TKIP) is less secure than WPA2-PSK (which uses AES) and limits the speed of WiFi devices to 54 Mbps. In the <strong>Password (Network Key)</strong> field, enter a phrase of 8 to 63 characters or 64 hexadecimal digits. To join the WiFi network, a user must enter this password. To view the password in clear text, click the <strong>eye</strong> icon.</td>
</tr>
<tr>
<td>WPA/WPA2 Enterprise</td>
<td>This enterprise-level security uses RADIUS for centralized Authentication, Authorization, and Accounting (AAA) management. For more information, see [Configure WPA and WPA2 Enterprise WiFi security with a RADIUS server](User Manual#Configure WPA and WPA2 Enterprise WiFi security with a RADIUS server) on page 68).</td>
</tr>
<tr>
<td>WPA3-Personal</td>
<td>This option, which is the same as WPA3, is the most secure personal authentication option. WPA3 uses SAE encryption and enables only WiFi devices that support WPA3 to join the WiFi network. WPA3 provides a secure connection but some legacy WiFi devices do not detect WPA3 and support only WPA2. If your network also includes WPA2 devices, select <strong>WPA2 Personal [AES]</strong> authentication. In the <strong>Password (Network Key)</strong> field, enter a phrase of 8 to 127 characters or 128 hexadecimal digits. To join the WiFi network, a user must enter this password. To view the password in clear text, click the <strong>eye</strong> icon.</td>
</tr>
</tbody>
</table>

8. Click the **Apply** button. 
   Your settings are saved. 
   If you connected over WiFi to the network and you changed the SSID, you are disconnected from the network. 

9. Make sure that you can reconnect over WiFi to the network with its new settings. 
   If you cannot connect over WiFi, check the following: 
   - If your computer or device is connected to another WiFi network in your area, disconnect it from that WiFi network and connect it to the WiFi network that the AP provides. Some WiFi devices automatically connect to the first open network without WiFi security that they discover. 
   - If your computer or device is trying to connect to your network with its old settings (before you changed the settings), update the WiFi network selection in your WiFi-enabled computer or mobile device to match the current settings for your network.
• Does your computer or device display as an attached device? (See Display the devices currently on the AP network and change device information on page 158.) If it does, it is connected to the network.
• Are you using the correct network name (SSID) and password?

Configure WPA and WPA2 Enterprise WiFi security with a RADIUS server

Remote Authentication Dial In User Service (RADIUS) is an enterprise-level method for centralized Authentication, Authorization, and Accounting (AAA) management. To enable the AP to provide WPA and WPA2 enterprise WiFi security, the WiFi network must be able to reach a RADIUS server.

To configure WPA and WPA2 enterprise security:
1. Connect your computer or mobile device to the AP in one of the following ways
   • Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   • Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select BASIC > Wireless.
   The Wireless Network page displays.

5. Select the WiFi network (Wireless 1, Wireless 2, or Wireless 3).

6. In the Security Options section, select the WPA/WPA2 Enterprise radio button.
The WPA and WPA2 Enterprise settings display.

7. From the **WPA Mode** menu, select the enterprise mode:
   - **WPA2 [AES]**. WPA2 provides a secure connection but some older WiFi devices do not detect WPA2 and support only WPA. If your WiFi network includes such older devices, select **WPA [TKIP] + WPA2 [AES]** security.
   - **WPA [TKIP] + WPA2 [AES]**. This type of security enables WiFi devices that support either WPA or WPA2 to join the WiFi network. This is the default mode.

8. In the **RADIUS Server IP Address** field, enter the IPv4 address of the RADIUS server to which the WiFi network can connect.

9. In the **RADIUS Server Port** field, enter the number of the port on the AP that is used to access the RADIUS server for authentication.
   The default port number is 1812.

10. In the **RADIUS Sever Shared Secret** field, enter the RADIUS password that is used between the AP and the RADIUS server during authentication of a WiFi client. To view the RADIUS password in clear text, click the **eye** icon.

11. Click the **Apply** button.
    Your settings are saved.

12. Make sure that you can reconnect over WiFi to the network with its new security settings.
    If you cannot connect over WiFi, check the following:
    - If your computer or device is connected to another WiFi network in your area, disconnect it from that WiFi network and connect it to the WiFi network that the AP provides. Some WiFi devices automatically connect to the first open network without WiFi security that they discover.
    - If your computer or device is trying to connect to your network with its old settings (before you changed the settings), update the WiFi network selection in your WiFi-enabled computer or mobile device to match the current settings for your network.
    - Does your computer or device display as an attached device? (See Display the devices currently on the AP network and change device information on page 158.) If it does, it is connected to the network.
    - Are you using the correct network name (SSID) and password?
Enable or disable a WiFi network

You can temporarily disable a WiFi network (that is, an SSID) and you can reenable the WiFi network.

**Note:** For information about setting up a WiFi schedule that temporarily turns off a radio band (and, therefore, all WiFi networks that are active on that band), see Add a WiFi schedule for a radio on page 200. For information about turning off the radios entirely (and, therefore, all WiFi networks), see Enable or disable a WiFi radio on page 76.

**To disable or enable a WiFi network:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **BASIC > Wireless**.

   The Wireless Network page displays.

5. Select the WiFi network (**Wireless 1**, **Wireless 2**, or **Wireless 3**).

6. Select one of following VAP radio buttons:
   - **Enable**. Enables the WiFi network.
     By default, the Wireless 2 and Wireless 3 networks are disabled, but you can enable them.
• **Disable.** Disables the WiFi network. By default, the Wireless 1 network is enabled, but you can disable it.

7. Click the **Apply** button.
   Your settings are saved.

## Hide or broadcast the SSID for a WiFi network

By default, a WiFi network (SSID) broadcasts its network name (also referred to as the SSID) so that WiFi clients can detect the SSID in their scanned network lists. For additional security, you can turn off the SSID broadcast and hide the SSID so that users must know the SSID to be able to join the WiFi network.

**To hide or broadcast the network name for a WiFi network:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **BASIC > Wireless.**
   The Wireless Network page displays.

5. Select the WiFi network (**Wireless 1, Wireless 2, or Wireless 3**).
6. Select or clear the **Enable SSID Broadcast** check box.
   When you select the check box, the WiFi network broadcasts the SSID.
   When you clear the check box, the WiFi network hides the SSID.

7. Click the **Apply** button.
   Your settings are saved.

### Manage client isolation for clients of the Wireless 2 or Wireless 3 network

If client isolation is disabled for a WiFi network (SSID) on the AP, WiFi clients that are associated with that WiFi network can communicate with each other. This is the default setting for the Wireless 1 network and you cannot change the setting for the Wireless 1 network.

As an added security measure for the Wireless 2 and Wireless 3 networks, you can enable client isolation for all WiFi clients on the same WiFi network, preventing communication between WiFi clients that are associated with that WiFi network. Those WiFi clients can still communicate with each other over the Internet. This is the default setting for the Wireless 2 and Wireless 3 networks.

**To manage client isolation for the Wireless 2 or Wireless 3 network:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **BASIC > Wireless**.
   The Wireless Network page displays.

5. Select the WiFi network (**Wireless 2** or **Wireless 3**).

6. Select a Client Isolation radio button:
   - **Enable**. All WiFi clients are isolated. That is, WiFi clients that are connected to the same WiFi network are prevented from communicating with each other. (Communication over the Internet remains possible.)
   - **Disable**. WiFi clients that are connected to the same WiFi network are allowed to communicate with each other.

7. Click the **Apply** button.
   Your settings are saved.

**Manage access to LAN ports for clients of the Wireless 2 or Wireless 3 network**

You can manage whether WiFi clients can directly access devices that are connected to LAN ports of the AP. For example, if you connect a printer to LAN port 3 and a server to LAN port 4, WiFi clients might be able to access the printer and the server.

Access to LAN ports depends on the WiFi network that the clients are connected to and whether you enabled such access:

- **Wireless 1**. By default, WiFi clients that are connected to the Wireless 1 network can access devices that are connected to the LAN ports of the AP. For the Wireless 1 network, you cannot disable this type of access.

- **Wireless 2 or Wireless 3**. For the Wireless 2 and Wireless 3 networks independently, you can configure whether WiFi clients can access devices that are connected to the LAN ports. By default, such access is disabled. (If devices that are connected to the LAN ports are set up for communication over the Internet, WiFi clients of the Wireless 2 or Wireless 3 network might still be able to reach these devices.)
To specify whether WiFi clients of the Wireless 2 or Wireless 3 network can access devices that are connected to the LAN ports:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select BASIC > Wireless.
   The Wireless Network page displays.

5. Select the Wireless 2 or Wireless 3 button.
   The settings for the Wireless 2 or Wireless 3 network display.

6. Scroll down to Allow access to wired ports and select a radio button:
   - Enable. WiFi clients that are connected to the selected network can access devices that are connected to the LAN ports.
   - Disable. WiFi clients that are connected to the selected network cannot access devices that are connected to the LAN ports. (If devices that are connected to the LAN ports are set up for communication over the Internet, WiFi clients might still be able to reach these devices.)

7. Click the Apply button.
   Your settings are saved.
Manage SSID isolation for all WiFi networks

By default, as an added security measure, SSID isolation is enabled for all WiFi networks (SSIDs) on the AP, preventing communication between WiFi clients that are associated with different WiFi networks on the AP. Those WiFi clients can still communicate with each other over the Internet.

You can disable SSID isolation so that clients that are associated with different WiFi networks on the AP can communicate with each other.

**To manage SSID isolation for all WiFi networks:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see [Dismiss a browser security warning](#) on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **BASIC > Wireless**.

   The Wireless Network page displays.

5. Select an SSID Isolation radio button:
   - **Enable.** All SSIDs are isolated. That is, WiFi clients that are connected to different SSIDs are prevented from communicating with each other. This is the default setting. (Communication over the Internet remains possible.)
   - **Disable.** WiFi clients that are connected to different SSIDs can communicate with each other.
6. Click the **Apply** button.
   Your settings are saved.

### Enable or disable a WiFi radio

The AP has internal WiFi radios that broadcast signals in the 2.4 GHz and 5 GHz bands. By default, they are on so that you can connect over WiFi to the AP. When both WiFi radios are off, you can still use an Ethernet cable for a LAN connection to the AP. If you turn both WiFi radios off, WPS is also disabled.

You can also turn a WiFi radio on and off based on a schedule. (See Add a WiFi schedule for a radio on page 200.)

**IMPORTANT:** If the smart connect feature is enabled (which it is by default), you can only enable or disable both radios simultaneously. That means that you cannot enable or disable each radio individually.

### To enable or disable a WiFi radio:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Do one of the following:
   - **2.4 GHz radio.** To change the settings for the 2.4 GHz radio, scroll down to the Advanced Wireless Settings (2.4 GHz/b/g/n/ax) section.
   - **5 GHz radio.** To change the settings for the 5 GHz radio, scroll down to the Advanced Wireless Settings (5 GHz 802.11a/n/ac/ax) section.

   **Note:** If the smart connect feature is enabled (which it is by default), the page presents a single option in the Advanced Wireless Settings (2.4 GHz/b/g/n/ax & 5 GHz 802.11a/n/ac/ax) section. In that situation, enabling or disabling applies to both radios simultaneously. If the smart connect feature is disabled, you can enable or disable each radio individually.

6. Turn off or turn on the radio:
   - **Turn off the radio.** Clear the Enable Wireless Router Radio check box.
   - **Turn on the radio.** Select the Enable Wireless Router Radio check box.

7. Click the **Apply** button.
   Your settings are saved.
   If you turn off both radios, the WiFi LED turns off.

**Use WPS to connect to the WiFi network**

WPS (Wi-Fi Protected Setup) lets you connect a computer or mobile device to the AP’s Wireless 1 network without entering the WiFi network passphrase or key. Instead, you use a **WPS** button or enter a PIN to connect.

If you use the push button method, the computer or device that you are trying to connect must provide either a physical button or a software button. If you use the PIN method, you must know the PIN of the computer or device that you are trying to connect.

WPS supports WPA and WPA2 WiFi security. If your WiFi network is open (no WiFi security is set, which is not the default setting), connecting with WPS automatically sets WPA + WPA2 WiFi security on the WiFi network and generates a random passphrase. You can view this passphrase (see Set up or change an open or secure WiFi network on page 64).
Use WPS with the push button method in the local browser UI

For you to use the push button method to connect a WiFi device to the AP’s Wireless 1 network, the WiFi device that you are trying to connect must provide either a physical button or a software button. You can use the physical button and software button to let a WiFi device join the Wireless 1 network only.

You can use WPS with the push button method either by pressing the physical WPS button the back panel of the AP (see Use Wi-Fi Protected Setup to join the Wireless 1 network on page 37) or by using the button in the AP’s local browser UI, as described in the following procedure.

To join the AP’s Wireless 1 network using WPS with the push button method in the local browser UI:

1. Check the WPS instructions for the WiFi device that you want to connect to the Wireless 1 network.

2. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

3. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

4. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

5. Select ADVANCED > WPS Wizard.

   The Add WPS Client page displays and shows a description of the WPS method.

6. Click the Next button.

   By default, the Push Button (recommended) radio button is selected.
7. Click the button (that is, the green icon) onscreen.

8. Within two minutes, press the **WPS** button on the WiFi device, or follow the WPS instructions that came with the device.
   The WPS process automatically sets up the device with the WiFi passphrase and connects the device to the Wireless 1 network of the AP.

9. To verify that the WiFi device is connected to the AP’s Wireless 1 network, select **BASIC > Attached Devices**.
   The WiFi device displays on the page.

**Use WPS with the PIN method**

To use the PIN method to connect a WiFi device to the AP’s Wireless 1 network, you must know the PIN of the WiFi device that you are trying to connect.

**To join the AP’s Wireless 1 network using WPS with the PIN method:**

1. Get the PIN of the WiFi device that you want to connect to the Wireless 1 network.

2. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

3. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.

4. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

5. Select **ADVANCED > WPS Wizard**.
   The Add WPS Client page displays and shows a description of the WPS method.

6. Click the **Next** button.
The Add WPS Client page adjusts.
The Push Button (recommended) radio button is selected by default.

7. Select the PIN Number radio button.
8. In the Enter Client’s PIN field, enter the PIN number of the WiFi device.
9. Click the Next button.
   For four minutes, the AP attempts to find the WiFi device (that is, the client) that you want to join the AP’s Wireless 1 network.
   During this time, the WPS LED on the top panel of the AP blinks.

10. Within four minutes, go to the WiFi device and use its WPS software to join the network without entering a password.
    The WPS process automatically sets up the device with the WiFi passphrase and connects the device to the Wireless 1 network of the AP.

11. To verify that the WiFi device is connected to the AP’s Wireless 1 network, select BASIC > Attached Devices.
    The WiFi device displays on the page.
6

Security, Firewall, and Access Rules

The AP comes with a built-in firewall that helps to protect your network from unwanted intrusions from the Internet and lets you control access to the Internet.

This chapter includes the following sections:

- Firewall WAN settings [router mode]
- Network access control lists
- Block specific Internet sites [router mode]
- Block specific applications and services from the Internet [router mode]
- Assign a trusted device [router mode]
- Schedule blocking [router mode]
- Set up security event email notifications

**Note:** In this chapter, we refer to the access point as the AP.
Firewall WAN settings [router mode]

If the AP is in router mode, the basic firewall settings let you manage port scan protection and denial of service (DoS) protection, specify whether the AP can respond to a ping from the Internet (WAN) port, set up a DMZ server, and manage IGMP proxying, NAT filtering, and the application-level gateway (ALG) for the Session Initiation Protocol (SIP).

For information about the MTU size, which is another basic firewall setting, see Change the MTU size [router mode] on page 129.

Note: The information in this section and subsections does not apply if the AP is in access point mode.

Manage port scan protection and denial of service protection [router mode]

Port scan protection and denial of service (DoS) protection can protect your LAN against attacks such as Syn flood, Smurf Attack, Ping of Death, and many others. By default, DoS protection is enabled and a port scan is rejected.

You can also enable the AP to respond to a ping to its Internet (WAN) port. This feature allows your AP to be discovered. Enable this feature only as a diagnostic tool or if a specific reason exists.

To change the default WAN security settings:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Setup > WAN Setup.
   The WAN Setup page displays.
5. To enable a port scan and disable DoS protection, select the Disable Port Scan and DoS Protection check box.
6. To enable the AP to respond to a ping on its Internet (WAN) port, select the **Respond to Ping on Internet Port** check box.

7. Click the **Apply** button.

   Your settings are saved.

---

**Set up a default DMZ server [router mode]**

A default DMZ server is helpful when you are using some Internet services and videoconferencing applications that are incompatible with Network Address Translation (NAT). The AP is programmed to recognize some of these applications and to work correctly with them, but other applications might not function well. In some cases, one local computer can run the application correctly if the IP address for that computer is entered as the default DMZ server.

**WARNING:** DMZ servers pose a security risk. A computer designated as the default DMZ server loses much of the protection of the firewall and is exposed to exploits from the Internet. If compromised, the DMZ server computer can be used to attack other computers on your network.

The AP usually detects and discards incoming traffic from the Internet that is not a response to one of your local computers or a service or application for which you set up a port forwarding or port triggering rule (see Port Forwarding and Port Triggering [Router Mode] on page 211). Instead of discarding this traffic, you can direct the AP to forward the traffic to one computer on your network. This computer is called the default DMZ server.

**To set up a default DMZ server:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Setup > WAN Setup**.

   The WAN Setup page displays.
5. Select the **Default DMZ Server** check box.
6. Enter the LAN IP address of the computer that must function as the DMZ server.
7. Click the **Apply** button.
   Your settings are saved.

Manage IGMP proxying [router mode]

IGMP proxying allows a computer or mobile device on the AP network to receive multicast traffic from the Internet. If you do not need this feature, leave it disabled, which is the default setting.

**To enable IGMP proxying:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
   The WAN Setup page displays.
5. Clear the **Disable IGMP Proxying** check box.
   By default, this check box is selected and IGMP proxying is disabled.
6. Click the **Apply** button.
   Your settings are saved.

Manage NAT filtering [router mode]

Network Address Translation (NAT) determines how the AP processes inbound traffic. Secured NAT protects computers on the LAN from attacks from the Internet but might prevent some Internet services, point-to-point applications, or multimedia applications...
from working. Open NAT provides a much less secured firewall but allows almost all Internet applications to work. Secured NAT is the default setting.

**To change the default NAT filtering settings:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Setup > WAN Setup.**
   The WAN Setup page displays.

5. Select a NAT Filtering radio button:
   - **Secured.** Provides a secured firewall to protect the computers on the LAN from attacks from the Internet but might prevent some Internet services, point-to-point applications, or multimedia applications from functioning. By default, the Secured radio button is selected.
   - **Open.** Provides a much less secured firewall but allows almost all Internet applications to function.

6. Click the **Apply** button.
   Your settings are saved.

**Manage the SIP application-level gateway [router mode]**

The application-level gateway (ALG) for the Session Initiation Protocol (SIP) is enabled by default for enhanced address and port translation. However, some types of VoIP and video traffic might not work well when the SIP ALG is enabled. For this reason, the AP provides the option to disable the SIP ALG.

**To change the default SIP ALG setting:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.
A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Setup > WAN Setup.
   The WAN Setup page displays.

5. To disable the SIP ALG, select the Disable SIP ALG check box.
   The SIP ALG is enabled by default.

6. Click the Apply button.
   Your settings are saved.

Network access control lists

You can use access control to block or allow device access to your network. An access control list (ACL) functions with the MAC addresses of wired and WiFi devices that can either access your entire network or are blocked from accessing your entire network.

The AP can detect the MAC addresses of devices that are connected to the network and list the MAC addresses of devices that were connected to the network.

Each network device owns a MAC address, which is a unique 12-character physical address, containing the hexadecimal characters 0–9, a–f, or A–F (uppercase or lowercase) only, and separated by colons (for example, 00:09:AB:CD:EF:01). Typically, the MAC address is on the label of a device. If you cannot see the label, you can display the MAC address using the network configuration utilities of the computer. You might also find the MAC addresses of devices that are connected to the AP on the Access Control page of the local browser UI (see Enable and manage network access control on page 86).

Enable and manage network access control

When you enable access control, you must select whether new devices are allowed to access the AP network or are blocked from accessing the network. By default, currently connected devices are allowed to access the network, but you can also block these
devices from accessing the network. You can also view information about connected devices.

To set up network access control and view information about connected devices:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

   The Access Control page displays.

5. Select the Turn on Access Control check box.
   You must select this check box before you can specify an access rule and use the Allow all new devices to connect and Block all new devices from connecting buttons. When the Turn on Access Control check box is cleared, all devices are allowed to connect, even if a device is in the list of blocked devices.

6. Click the Apply button.
   Your settings are saved.

7. Select an access rule for new devices that are not currently connected:
   - Allow all new devices to connect. With this setting, if you add a new device, it can access your network. You do not need to enter its MAC address on this page. We recommend that you leave this radio button selected.
• **Block all new devices from connecting.** With this setting, if you add a new device, before it can access your network, you must enter its MAC address in the allowed list. For more information, see [Network access control lists](#) on page 86.

The access rule does not affect previously blocked or allowed devices. It applies only to devices joining your network in the future after you apply these settings.

8. To manage access for currently connected devices, do the following:

• **Allow your current device.** If you blocked all new devices, you can allow the device that you are currently using to continue to access the network. Select the check box next to your device in the table, and click the **Allow** button.

• **Allow or block a device.** To change the allow or block settings for a device that is currently connected, select the check box next to the device in the table, and click either the **Allow** button or the **Block** button.

• **Change the device name that is displayed.** To change the displayed name for a device that is currently connected, do the following:
  a. Select the check box next to the device in the table.
  b. Click the **Edit** button.
  The Edit Allowed Device or Edit Blocked Device page displays.
  c. In the **Device Name** field, change the name.
  d. Click the **Apply** button.
  The Access Control page displays again.

9. Click the **Apply** button.
Your settings are saved.

10. To refresh the information in the table with currently connected devices, click the **Refresh** button.
The table shows the status of the device (allowed or blocked from future sessions), device name, IP address, MAC address, and type of connection to the AP.

**Add, remove, or change a device on the allowed list**

If you set up an access list that blocks all new devices from accessing your network, you must set up an allowed list that defines which WiFi and wired devices are allowed to
access your entire network. You do so by adding the MAC addresses of these devices to the allowed list. You can also change or remove a device from the allowed list.

**To add, remove, or change a device on the allowed list:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.
   - If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   - The local device password is the one that you specified. The local device password is case-sensitive.
   - The BASIC Home page displays.

4. Select **ADVANCED > Security > Access Control**.
   - The Access Control page displays.

5. Click the **View list of allowed devices not currently connected to the network** link.
   - A table displays the detected device name, MAC address, and connection type of the devices that are not connected but allowed to access the network.

6. To manually add a device to the allowed list, do the following:
   a. Click the **Add** button.
      - The Add Allowed Device page displays.
   b. Enter the MAC address and device name for the device that you want to allow.
   c. Click the **Apply** button.
      - The device is added to the allowed list. The Access Control page displays again.
7. To remove a device from the allowed list, do the following:
   a. Select the check box for the device.
   b. Click the **Remove from the list** button.
      The device is removed from the allowed list.

8. To change the MAC address or name for a device on the allowed list, do the following:
   a. Select the check box for the device.
   b. Click the **Edit** button.
      The Edited Allowed Device page displays.
   c. Change the MAC address, device name, or both.
   d. Click the **Apply** button.
      The Access Control page displays again.

9. Click the **Apply** button.
   Your settings are saved.

Add, remove, or change a device on the blocked list

If you set up an access list that allows all new devices to access your network but you want to block some devices, you must set up a blocked list that defines which WiFi and wired devices are blocked from accessing your network. You do so by adding the MAC addresses of these devices to the blocked list. You can also change or remove a device from the blocked list.

**To add, remove, or change a device on the blocked list:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Access Control**.
   The Access Control page displays.

5. Click the **View list of blocked devices not currently connected to the network** link.
   A table displays the detected device name, MAC address, and connection type of the devices that are not connected and are blocked from accessing the network.

6. To manually add a device to the blocked list, do the following:
   a. Click the **Add** button.
      The Add Blocked Device page displays.
   b. Enter the MAC address and device name for the device that you want to block.
   c. Click the **Apply** button.
      The device is added to the blocked list. The Access Control page displays again.

7. To remove a device from the blocked list, do the following:
   a. Select the check box for the device.
   b. Click the **Remove from the list** button.
      The device is removed from the blocked list.

8. To change the MAC address or name for a device on the blocked list, do the following:
   a. Select the check box for the device.
   b. Click the **Edit** button.
      The Edited Blocked Device page displays.
   c. Change the MAC address, device name, or both.
   d. Click the **Apply** button.
      The Access Control page displays again.

9. Click the **Apply** button.
Your settings are saved.

Block specific Internet sites [router mode]

If the AP is in router mode, you can block keywords and domains (websites) to prevent certain types of HTTP traffic from accessing your network. Keyword and domain blocking does not work for HTTPS traffic.

By default, keyword blocking is disabled and no domains are blocked.

Note: The information in this section and subsections does not apply if the AP is in access point mode.

Set up keyword and domain blocking [router mode]

You can set up blocking of specific keywords and domains to occur continuously or according to a schedule.

To set up keyword and domain blocking:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field. A login window displays. If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password. The local device password is the one that you specified. The local device password is case-sensitive. The BASIC Home page displays.
5. Specify a keyword blocking option:
   - Per Schedule. Use keyword blocking according to a schedule that you set. For more information, see Schedule blocking [router mode] on page 100.
   - Always. Use keyword blocking continuously.
6. In the Type keyword or domain name here field, enter a keyword or domain.
Here are some sample entries:

- Specify the domain suffix (for example, .com) if you want to block only sites with a domain suffix such as .com. In such a situation, sites with domain suffixes such as .edu and .gov are still allowed.
- Enter a period (.) to block all Internet browsing access.

7. Click the **Add Keyword** button.
   The keyword or domain is added to the **Block sites containing these keywords or domain names** field (which is also referred to as the blocked list).

8. To add more keywords or domains, repeat the previous two steps.
   The keyword list supports up to 32 entries.

9. Click the **Apply** button.
   Your settings are saved.

**Remove a keyword or domain from the blocked list [router mode]**

If you no longer need a keyword or domain on the blocked list, you can remove the keyword or domain.

**To remove a keyword or domain from the blocked list:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Sites**.
   The Block Sites page displays.
5. In the **Block sites containing these keywords or domain names** field, select the keyword or domain.

6. Click the **Delete Keyword** button.
   The keyword or domain is removed from the blocked list.

7. Click the **Apply** button.
   Your settings are saved.

**Remove all keywords and domains from the blocked list [router mode]**

You can simultaneously remove all keywords and domains from the blocked list.

**To remove all keywords and domains from the blocked list:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Sites**.
   The Block Sites page displays.

5. Click the **Clear List** button.
   All keywords and domains are removed from the blocked list.

6. Click the **Apply** button.
   Your settings are saved.
Block specific applications and services from the Internet [router mode]

If the AP is in router mode, you can add service blocking rules to prevent access from your LAN to specific services and applications on the Internet. In addition, you can specify if a blocking rule applies to one user, a range of users, or all users on your LAN. The AP lists many default services and applications that you can use in blocking rules. You can also add a service blocking rule for a custom service or application.

**Note:** The information in this section and subsections does not apply if the AP is in access point mode.

Add a service blocking rule for a predefined service or application [router mode]

If the AP is in router mode, it lists many predefined services and applications that you can use in outbound rules.

You can add a service blocking rule to prevent access to a specific predefined service or application on the Internet.

**To add a service blocking rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Services**.
   The Block Services page displays.
5. In the Services Blocking section, specify how the AP applies outbound rules:
   - **Per Schedule.** Use service blocking according to a schedule that you set. For more information, see Schedule blocking [router mode] on page 100.
• **Always.** Use service blocking continuously.

6. Click the **Add** button.
   The Block Services Setup page displays.

7. From the **Service Type** menu, select the service or application to be covered by this rule.
   The **Protocol**, **Starting Port**, and **Ending Port** fields are automatically populated when you select the service or application.

   **Note:** If the service or application does not display in the list, you can add it by selecting **User Defined** from the **Service Type** menu (see Add a service blocking rule for a custom service or application [router mode] on page 96).

8. Specify which devices on your LAN are affected by the rule, based on their IP addresses:
   - **Only This IP Address.** Enter the required IP address in the fields to apply the rule to a single device on your LAN.
   - **IP Address Range.** Enter the required start and end IP addresses in the fields to apply the rule to a range of devices.
   - **All IP Addresses.** All computers and devices on your LAN are covered by this rule.
     By default, the All IP Addresses radio button is selected.

9. Click the **Add** button.
   The new rule is added to the Service Table on the Block Services page.

### Add a service blocking rule for a custom service or application [router mode]

If the AP is in router mode, it lists many predefined services and applications that you can use in outbound rules.

If a service or application is not predefined, you can add a service blocking rule for a custom service or application.
To add service blocking rule for a custom service or application:

1. Find out which protocol and port number or range of numbers the service or application uses.
   You can usually find this information by contacting the publisher of the service or application or through online user or news groups.

2. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

3. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

4. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

5. Select **ADVANCED > Security > Block Services**.
   The Block Services page displays.

6. The first time that you add an outbound firewall rule, in the Services Blocking section, specify how the AP applies outbound rules:
   - **Per Schedule.** Use keyword blocking according to a schedule that you set.
     For more information, see Schedule blocking [router mode] on page 100.
   - **Always.** Use keyword blocking continuously.

7. Click the **Add** button.
   The Blocking Services Setup page displays.

8. From the **Service Type** menu, select **User Defined**.

9. Specify a new service blocking rule by selecting a protocol, defining the ports, and defining a name:
   - **Protocol.** From the menu, select the protocol (TCP or UDP) that is associated with the service or application. If you are unsure, select TCP/UDP.
   - **Starting Port.** In the field, enter the start port in the range from 1 to 65535 for the service or application.
   - **Ending Port.** In the field, enter the end port in the range from 1 to 65535 for the service or application.
• **Service Type/User Defined.** In the field, enter the name of the custom service or application.

10. Specify which devices on your LAN are affected by the rule, based on their IP addresses:

• **Only This IP Address.** Enter the required address in the fields to apply the rule to a single device on your LAN.

• **IP Address Range.** Enter the required addresses in the start and end fields to apply the rule to a range of devices.

• **All IP Addresses.** All computers and devices on your LAN are covered by this rule.

By default, the **All IP Addresses** radio button is selected.

11. Click the **Add** button.

The new rule is added to the Service Table on the Block Services page.

**Change a service blocking rule [router mode]**

If the AP is in router mode, you can change an existing service blocking rule.

**To change a service blocking rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.

The local device password is the one that you specified. The local device password is case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Services.**

The Block Services page displays.

5. In the Service Table, select the radio button for the rule.

6. Click the **Edit** button.

The Block Services Setup page displays.

7. Change the settings.
For more information about the settings, see Add a service blocking rule for a custom service or application [router mode] on page 96.

8. Click the **Apply** button.
   
   Your settings are saved. The modified rule displays in the Service Table on the Block Services page.

Remove a service blocking rule [router mode]

If the AP is in router mode, you can remove a service blocking rule that you no longer need.

**To remove a service blocking rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Security > Block Services**.
   
   The Block Services page displays.

5. In the Service Table, select the radio button for the rule.

6. Click the **Delete** button.
   
   The rule is removed from the Service Table. Custom rules are deleted.
Assign a trusted device [router mode]

If the AP is in router mode, you can exempt one trusted device from blocking and logging.

The device that you exempt must be assigned a fixed (static) IP address.

**To assign a trusted device:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Security > Block Sites**.
   The Block Sites page displays.
5. Scroll down and select the **Allow trusted IP address to visit blocked sites** check box.
6. In the **Trusted IP Address** field, enter the IP address of the trusted device.
   The first three octets of the IP address (by default, 192.168.1) are automatically populated and depend on the IP address that is assigned to the DHCP server of the AP. For more information, see Manage the DHCP server address pool [router mode] on page 115.
7. Click the **Apply** button.
   Your settings are saved.

Schedule blocking [router mode]

If the AP is in router mode, you can set up a schedule that you can apply to keyword and domain blocking, Internet service and application blocking, or both.
The schedule can specify the days and times that these features are active. After you set up the schedule, if you want it to become active, you must apply it to keyword and domain blocking (see Set up keyword and domain blocking [router mode] on page 92), Internet service and application blocking (see Block specific applications and services from the Internet [router mode] on page 95), or both. Without a schedule, you can only enable or disable these features. By default, no schedule is set.

To set up a schedule:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
   The Schedule page displays.
5. Set up the schedule for blocking:
   - **Days to Block.** Select the check box for each day that you want to block access or specify that blocking occurs on every day by selecting the Every Day check box.
     By default, the Every Day check box is selected.
   - **Time of Day to Block.** Select a start and end time for blocking in 24-hour format or select the All Day check box for 24-hour blocking.
     By default, the All Day check box is selected.
6. Click the Apply button.
   Your settings are saved.
Set up security event email notifications

If the AP is in router mode, the AP can email you its logs of router activity. The log records activity and security events such as attempts to access blocked sites or services.

To set up email notifications:

1. Connect your computer or mobile device to the AP in one of the following ways
   • Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   • Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Security > E-mail.
   The E-mail page displays.

5. Select the Turn E-mail Notification On check box.

6. In the Primary E-mail Address field, type the email address to which logs and alerts are to be sent.
   This email address is also used for the From address. If this field is blank, log and alert messages are not sent.

7. In the Your Outgoing Mail Server field, enter the name of your ISP outgoing (SMTP) mail server (such as mail.myISP.com).
   You might be able to find this information in the configuration window of your email program. If you leave this field blank, log and alert messages are not sent.
8. In the **Outgoing Mail Server Port Number** field, enter the port number that the mail server uses.
   If you do not know the port number, leave the default port number, which is 25.

9. To send email alerts over a secure connection, select the **Secure connection (use SSL)** check box.

10. If your outgoing email server requires authentication, select the **My Mail Server requires authentication** check box, and do the following:
    a. In the **User Name** field, type the user name for the outgoing email server.
    b. In the **Password** field, type the password for the outgoing email server.

11. To send alerts when someone attempts to visit a blocked site, select the **Send Alerts Immediately** check box.
    Email alerts are sent immediately when someone attempts to visit a blocked site.

12. To send logs based on a schedule, from the **Send logs according to this schedule** menu, select the schedule type and specify the associated settings if applicable:
    - **When log is full.** The AP sends log messages when the log is full.
    - **Hourly.** The AP sends log messages hourly.
    - **Daily.** The AP sends log messages daily at the time that you specify. From the **Time** menu, select the time, and select the **AM** or **PM** radio button.
    - **Weekly.** The AP sends log messages weekly at the day and time that you specify. From the **Day** menu, select the day of the week. From the **Time** menu, select the time, and select the **AM** or **PM** radio button.

    The default selection from the menu is None.

13. Click the **Apply** button.
    Your settings are saved.
    Logs are sent automatically according to the schedule that you set. If the log fills before the specified time, it is sent. After the log is sent, it is cleared from the AP memory. If the AP cannot email the log and the log buffer fills, the AP overwrites the log.
Optimize Performance

This chapter describes how you can optimize the AP’s performance and manage the traffic flows through the AP.

The chapter contains the following sections:

- Enable QoS and automatically set the Internet bandwidth
- Enable QoS and manually set the Internet bandwidth
- Enable or disable the automatic update of the Performance Optimization Database
- Manage WiFi Multimedia (WMM) for a radio
- Improve network connections with Universal Plug and Play [router mode]
- Change the priority for a connected device [router mode]

**Note:** In this chapter, we refer to the access point as the AP.
Enable QoS and automatically set the Internet bandwidth

You can enable QoS and let the AP automatically set its Internet download and upload bandwidth based on an automated speedtest. Although can you manually set the download and upload speed (see Enable QoS and manually set the Internet bandwidth on page 106), we recommend that use the automatic method that is described in the following procedure.

**To enable QoS and set the Internet download and upload bandwidth based on a speedtest:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **BASIC > Quality of Service**.
   
   The QoS Setup page displays. By default, Quality of Service (QoS) is enabled, and the **Enable QoS** check box is selected.

5. Click the **Take A Speedtest** button.
   
   The speed test checks the AP download and uplink bandwidth, sets the detected bandwidths, and displays the results on the page.

6. Click the **Apply** button.
   
   Your settings are saved.
For information about bandwidth utilization by device and application, see Display the devices currently on the AP network and change device information on page 158.

Enable QoS and manually set the Internet bandwidth

If you enable QoS, we recommend that you use the automatic method to set the Internet download and upload speed for the AP (see Enable QoS and automatically set the Internet bandwidth on page 105). However, you can also manually set the Internet bandwidth.

Note the following about manual configuration:

- Do not set the bandwidth higher than the actual bandwidth because it causes dynamic QoS to become ineffective.
- If you set the bandwidth lower than the actual bandwidth, the AP underutilizes the available bandwidth.

To enable QoS and manually set the Internet download and upload bandwidth:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **BASIC > Quality of Service**.
   The QoS Setup page displays. By default, Quality of Service (QoS) is enabled, and the **Enable QoS** check box is selected. By default, the **Let Speedtest detect my Internet bandwidth** radio button is selected.

5. To find out what bandwidths your Internet connection supports, click the **Take A Speedtest** button.
   The speed test checks the AP download and uplink bandwidth, sets the detected bandwidths, and displays the results on the page.

6. Select the **I want to define my Internet bandwidth** radio button.
   A pop-up windows displays.

7. Click the **OK** button.
   The fields for manual configuration display.

8. In the **Download Speed (Mbps)** field, enter the Internet download speed in Mbps. You can use decimal numbers.

9. In the **Upload Speed (Mbps)** field, enter the Internet upload speed in Mbps. You can use decimal numbers.

10. Click the **Apply** button.
    A pop-up windows displays.

11. Click the **OK** button.
    Your settings are saved.
    For information about bandwidth utilization by device and application, see **Display the devices currently on the AP network and change device information** on page 158.

---

**Enable or disable the automatic update of the Performance Optimization Database**

The AP uses a Performance Optimization Database that includes the most popular applications and services for the implementation of dynamic QoS. By default, the AP automatically updates this database. You can turn off this feature and manually update the database.
To enable or disable the automatic update of the Performance Optimization Database:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select BASIC > Quality of Service.

   The QoS Setup page displays.

   In the Performance Optimization Database section, the version and release of the database are displayed.

5. Select or clear the Automatically update performance optimization database check box.

6. Click the Apply button.

   Your settings are saved.

7. To immediately let the AP update the Performance Optimization Database if an update is available, click the Update Now button.

Manage WiFi Multimedia (WMM) for a radio

WiFi Multimedia (WMM) is a subset of the 802.11e standard. Time-dependent information such as video or audio is given higher priority than normal traffic. For WMM to function correctly, WiFi clients must also support WMM. By enabling WMM, you allow WMM to
control upstream traffic flowing from WiFi devices to the access point and downstream traffic flowing from the access point to WiFi devices. WMM defines the following four queues in decreasing order of priority:

- **Voice.** The highest priority queue with minimum delay, which makes it very suitable for applications such as VoIP and streaming media.
- **Video.** The second highest priority queue with low delay. Video applications are routed to this queue.
- **Best effort.** The medium priority queue with medium delay. Most standard IP applications use this queue.
- **Background.** The low priority queue with high throughput. Applications such as FTP that are not time-sensitive but require high throughput can use this queue.

By default, WMM is enabled for both radios, but you can disable WMM for one or both radios.

**To disable WMM for one or both radios:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Setup > QoS Setup.**
   
   The QoS Setup page displays.

5. Select the **WMM** tab.
   
   The Quality of Service page displays.
6. Clear the **Enable WMM (Wi-Fi multimedia) settings** check box for the radio to disable WMM, or clear both check boxes for both radios.

7. Click the **Apply** button.
   
   Your settings are saved. The radio or radios restart and WiFi clients might need to reconnect.

---

### Improve network connections with Universal Plug and Play [router mode]

Universal Plug and Play (UPnP) helps devices such as Internet appliances and computers access the network and connect to other devices as needed. UPnP devices can automatically discover the services from other registered UPnP devices on the network.

If the AP is in router mode and you use applications such as multiplayer gaming, peer-to-peer connections, or real-time communications such as instant messaging or remote assistance, keep UPnP enabled, which it is by default in router mode.

**To manage Universal Plug and Play:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see *Dismiss a browser security warning* on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > UPnP**.

   The UPnP page displays.
5. Select the **Turn UPnP On** check box.
   By default, this check box is selected. You can disable or enable UPnP for automatic configuration. If the **Turn UPnP On** check box is cleared, a device cannot automatically control the resources of the AP. For example, a device cannot control port forwarding on the AP.

6. Enter the advertisement period in minutes.
   The advertisement period specifies how often the AP broadcasts its UPnP information. This value can range from 1 to 1440 minutes. The default period is 30 minutes. Shorter durations ensure that control points detect current device status at the expense of more network traffic. Longer durations can compromise the freshness of the device status but can significantly reduce network traffic.

7. Enter the advertisement time to live in hops.
   The time to live for the advertisement is measured in hops (steps) for each UPnP packet sent. Hops are the steps a packet takes between routers. The number of hops can range from 1 to 255. The default value for the advertisement time to live is 4 hops, which should be fine for most home networks. If you notice that some devices are not being updated or reached correctly, it might be necessary to increase this value.

8. Click the **Apply** button.
   If the AP is in router mode, the UPnP Portmap Table displays the IP address of each UPnP device that is accessing the AP and which ports (internal and external) that device opened. The UPnP Portmap Table also displays what type of port is open and whether that port is still active for each IP address.

9. If the AP is in router mode, to refresh the information in the UPnP Portmap table, click the **Refresh** button.

### Change the priority for a connected device [router mode]

If the AP is in router mode and you enabled QoS (Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page 106), the AP automatically assigns a priority to any device that connects to it. By default, an attached device receives a medium priority. However, the device with which you connect to the local browser UI of the AP receives a high priority. You can change
the priority for an attached device so that it receives a different treatment in the AP network.

To change the priority for an attached device:
1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select BASIC > Attached Devices.
   The Attached Devices page displays.

5. Select the radio button for the device for which you want to change the priority.

6. Click the Edit button.
   The Edit Device page displays.

7. Select one of the following Device Priority buttons: Highest, High, Medium, or Low.
   **Note:** For information about changing display settings for the device, see Display the devices currently on the AP network and change device information on page 158.

8. Click the Apply button.
   Your settings are saved.
Network Settings

This chapter describes how you can manage various network settings of the AP. The chapter includes the following sections:

- LAN IP address settings [router mode]
- Change the AP network device name
- Reserved LAN IP addresses [router mode]
- Static routes
- Bridge port and VLAN tag groups [router mode]
- Change the MTU size [router mode]

**Note:** In this chapter, we refer to the access point as the AP.
LAN IP address settings [router mode]

If the AP is in router mode, the LAN subnet defines the LAN IP address settings for the AP, including the IP address at which you can access the AP over the local browser UI, the DHCP IP address settings, and the Router Information Protocol (RIP) settings.

**Note:** The information in this section and subsections does not apply if the AP is in access point mode.

Change the LAN IP address and subnet settings [router mode]

If the AP is in router mode, it is preconfigured to use private IP addresses on the LAN side and to function as a DHCP server. The AP’s LAN IP configuration is as follows:

- **LAN IP address.** 192.168.1.1 (if the AP is in router mode, this is the same as www.routerlogin.net)
- **Subnet mask.** 255.255.255.0

These addresses are part of the designated private address range for use in private networks and are suitable for most applications. The IP address and subnet mask identify which addresses are local to a specific device and which must be reached through a gateway or router. If you need a specific IP subnet that one or more devices on the network use, or if competing subnets use the same IP scheme, you can change the LAN IP address settings.

**Note:** If you change the default LAN IP address settings, the IP address range for the default DHCP server also changes (see Manage the DHCP server address pool [router mode] on page 115).

**To change the LAN IP address and subnet settings:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field. A login window displays.
   - If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   - The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.

5. In the **IP Address** fields, enter the new LAN IP address.
   The LAN IP address at which you can access the local browser UI of the AP also changes.

6. In the **IP Subnet Mask** fields, enter the new LAN subnet mask.
   The LAN IP subnet mask at which you can access the local browser UI of the AP also changes.

7. Click the **Apply** button.
   Your settings are saved.
   If you changed the LAN IP address settings of the default LAN subnet, you are disconnected from the local browser UI.
   To reconnect, close your browser, relaunch it, and log in to the AP at its new LAN IP address.

**Manage the DHCP server address pool [router mode]**

If the AP is in router mode, it functions as a Dynamic Host Configuration Protocol (DHCP) server. The AP assigns IP, DNS server, and default gateway addresses to all computers and mobile devices that are connected to its LAN subnet.

These addresses are part of the same IP address subnet as the AP’s LAN IP address. By default, the DHCP address pool for the LAN subnet is 192.168.1.2 through 192.168.1.254.

The AP delivers the following parameters to any LAN device that requests DHCP:

- An IP address from the range that you define
- Subnet mask
- Gateway IP address
- DNS server IP address

**To change the DHCP pool of IP addresses that the AP assigns:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Setup > LAN Setup.
   The LAN Setup page displays.

5. Make sure that the Use Router as DHCP Server check box is selected.
   This check box is selected by default.

6. Specify the range of IP addresses that the router assigns for the LAN subnet:
   - In the Starting IP Address field, enter the lowest number in the range.
     This IP address must be in the same LAN subnet.
   - In the Ending IP Address field, enter the number at the end of the range of IP addresses.
     This IP address must be in the same LAN subnet.

7. To change the DHCP lease time, from the DHCP Lease Time menu, select a period from 1 hour to 24 hours.
   By default, the period is 24 hours. When the lease time expires, the DHCP server releases the IP address, and a DHCP client must reconnect to get a new (or the same) IP address from the DHCP server.

8. Click the Apply button.
   Your settings are saved.

Disable the DHCP server [router mode]

If the AP is in router mode, you can use another device on your network as the DHCP server or specify the network settings of all your computers.

**Note:** If you disable the DHCP server and do not specify another DHCP server or no other DHCP server is available on your network, you must set your computer IP addresses manually so that they can access the AP.
To disable the DHCP server:
1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Setup > LAN Setup.
   The LAN Setup page displays.
5. Clear the Use Router as DHCP Server check box.
6. Click the Apply button.
   Your settings are saved.

Manage the Router Information Protocol settings [router mode]

If the AP is in router mode, Router Information Protocol (RIP) lets the AP exchange routing information with other routers. By default, RIP is enabled in both directions (in and out) without a particular RIP version.

To manage the RIP settings:
1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**. The LAN Setup page displays.

5. From the **RIP Direction** menu, select the RIP direction:
   - **Both**. The AP broadcasts its routing table periodically and incorporates information that it receives. This is the default setting.
   - **Out Only**. The AP broadcasts its routing table periodically but does not incorporate the RIP information that it receives.
   - **In Only**. The AP incorporates the RIP information that it receives but does not broadcast its routing table.

6. From the **RIP Version** menu, select the RIP version:
   - **Disabled**. The RIP version is disabled. This is the default setting.
   - **RIP-1**. This format is universally supported. It is adequate for most networks, unless you are using an unusual network setup.
   - **RIP-2B**. This format carries more information than RIP-1, sends the routing data in RIP-2 format, and uses subnet broadcasting.
   - **RIP-2M**. This format carries more information than RIP-1, sends the routing data in RIP-2 format, and uses multicasting.

7. Click the **Apply** button. Your settings are saved.

### Change the AP network device name

The default network device name of the AP is the model number (WAX204). This device name displays in, for example, a file manager when you browse your network.

**To change the AP network device name:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Setup > Device Name**.
   The Device Name page displays.

5. Type a new name in the **Device Name** field.
   You can type up to 15 alphanumeric characters.

6. Click the **Apply** button.
   Your settings are saved.

Reserved LAN IP addresses [router mode]

If the AP is in router mode, you can specify a reserved IP address for a device on the LAN subnet. Each time such a device accesses the AP’s DHCP server, the device receives the same IP address.

**Note:** The information in this section and subsections does not apply if the AP is in access point mode.

Reserve a LAN IP address [router mode]

You can assign a reserved IP address for a device such as a computer or server that requires permanent IP settings.

**To reserve an IP address:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.

5. Below the Address Reservation table, click the **Add** button.
   The Address Reservation page displays.

6. Either select the radio button for an attached device that displays in the table or specify the reserved IP address settings in the following fields:
   - **IP Address**. Enter the IP address to assign to the computer or device.
     Enter an IP address in the AP's LAN subnet, such as 192.168.1.x.
   - **MAC Address**. Enter the MAC address of the computer or device.
   - **Device Name**. Enter the name of the computer or device.

7. Click the **Add** button.
   The reserved address is entered into the Address Reservation table on the LAN Setup page.
   The reserved address is not assigned until the next time the computer or device contacts the AP's DHCP server. Reboot the computer or device, or access its IP configuration and force a DHCP release and renew.

### Change a reserved LAN IP address [router mode]

If the AP is in router mode, you can change an existing reserved LAN IP address.

**To change a reserved LAN IP address:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.

5. In the Address Reservation table, select the radio button for the reserved address.

6. Click the **Edit** button.
   The Address Reservation page displays.

7. Change the settings.

8. Click the **Apply** button.
   Your settings are saved.

---

**Remove a reserved LAN IP address entry [router mode]**

If the AP is in router mode, you can remove a reserved LAN IP address entry that you no longer need.

**To remove a reserved LAN IP address entry:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Setup > LAN Setup**.
   The LAN Setup page displays.

5. In the Address Reservation table, select the radio button for the reserved address.

6. Click the **Delete** button.
   The IP address entry is removed.
Static routes

The AP supports IPv4 static routes. Static routes can provide detailed routing information to your AP. Typically, you do not need to add static routes. You must configure static routes only for unusual cases such as when you use multiple routers or multiple IP subnets on your network.

As an example of when a static route is needed, consider the following case:

- Your primary Internet access is through an ADSL modem to an ISP.
- You use an ISDN router on your home network for connecting to the company where you are employed. This router’s address on your LAN is 192.168.1.158.
- Your company’s network address is 203.0.113.0.

When you first configured your AP, two implicit static routes were created. A default route was created with your ISP as the gateway and a second static route was created to your local network for all 192.168.1.x addresses. With this configuration, if you attempt to access a device on the 203.0.113.0 network, your AP forwards your request to the ISP. The ISP forwards your request to the company where you are employed, and the request is likely to be denied by the company’s firewall.

In this case, you must define a static route, instructing your router that 203.0.113.0 is accessed through the ISDN router at 192.168.1.158. Here is an example:

- Through the destination IP address and IP subnet mask, specify that this static route applies to all 203.0.113.x addresses.
- Through the gateway IP address, specify that all traffic for these addresses is forwarded to the ISDN router at 192.168.1.158.
- A metric value of 2 works fine because the ISDN router is on the LAN.
Add an IPv4 static route

You can add an IPv4 static route to a destination IP address and specify the subnet mask, gateway IP address, and metric.

**To add an IPv4 static route:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Static Routes**.
   The Static Routes page displays.

5. Click the **Add** button.
   The Static Routed page adjusts.

6. In the **Route Name** field, enter a name for the route.
   The name is for identification purposes.

7. To make the route private, select the **Private** check box.
   A private static route is not reported in RIP.

8. To prevent the route from becoming active after you click the **Apply** button, clear the **Active** check box.
   In some situations, you might want to set up a static route but keep it disabled until a later time. By default, the **Active** check box is selected and a route becomes active after you click the **Apply** button.
9. Enter the route IP address and metric settings in the following fields:
   - **Destination IP Address.** Enter the IP address for the final destination of the route.
   - **IP Subnet Mask.** Enter the IP subnet mask for the final destination of the route.
     If the destination is a single host, enter **255.255.255.255**.
   - **Gateway IP Address.** Enter the IP address of the gateway.
     The IP address of the gateway must be on the AP LAN subnet.
   - **Metric.** Enter a number from 2 through 15.
     This value represents the number of routers between your network and the destination. Usually, a setting of 2 or 3 works, but if this is a direct connection, set it to 2.

10. Click the **Apply** button.
    Your settings are saved. The static route is added to the table on the Static Routes page.

### Change an IPv4 static route

You can change an IPv4 static route.

**To change an IPv4 static route:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP's WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Static Routes.**
   The Static Routes page displays.

5. In the Static Routes table, select the radio button for the route.

6. Click the **Edit** button.
   The Static Routes page adjusts.

7. Change the settings for the route.
   For more information about the settings, see Add an IPv4 static route on page 123.

8. Click the **Apply** button.
   The route settings are updated in the table on the Static Routes page.

---

**Add an IPv4 static route**

You can remove an existing IPv4 static route that you no longer need.

**To remove an IPv4 static route:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Static Routes.**
   The Static Routes page displays.
5. In the Static Routes table, select the radio button for the route.
6. Click the **Delete** button.
   The route is removed from the table on the Static Routes page.

**Bridge port and VLAN tag groups [router mode]**

If the AP is in router mode, some devices, such as an Internet Protocol television (IPTV), cannot function behind the AP’s Network Address Translation (NAT) service or firewall. Based on what your Internet service provider (ISP) requires, for the device to connect to the ISP’s network directly, you can enable a bridge either between the device and the AP’s Internet (WAN) port or between the device and a VLAN tag group.

Also, some ISPs might require the AP to send VLAN packets for the Internet connection. This requirement is common for ISP fiber connections.

**Note:** If your ISP provides directions on how to set up a bridge port or VLAN tag group for IPTV, Internet service, or both, follow those directions.

**Note:** The information in this section and subsections does not apply if the AP is in access point mode.

**Set up a bridge for a port group [router mode]**

If the AP is in router mode and a device such as an IPTV is connected to a LAN port or WiFi network, your ISP might require you to set up a bridge for a port group for the AP’s Internet (WAN) port.

A bridge with a port group allows packets that are sent between a device such as an IPTV and the AP Internet (WAN) port to circumvent the AP’s NAT service, which otherwise could drop the packets.

**CAUTION:** Unless you are comfortable with advanced network configurations, be sure to follow the directions of your ISP. Incorrect configuration might cause the Internet connection of the AP to go down.

**To set up a bridge for a port group:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > VLAN / Bridge Settings**.
   The VLAN / Bridge Settings page displays.

5. Select the **Enable VLAN / Bridge group** check box.
   The page expands.

6. Select the **By bridge group** radio button.
   The page adjusts.

7. Select the check box for the LAN port (**Port 1**, **Port 2**, **Port 3**, or **Port 4**) or WiFi network (**Wireless1**, **Wireless2**, or **Wireless2**) to which the device that must circumvent the AP’s NAT service is connected.
   You must select at least one LAN port or one WiFi network. You can select more than one LAN port and WiFi network.

8. Click the **Apply** button.
   Your settings are saved. You might need to reconnect to the AP.

Set up a bridge for a VLAN tag group [router mode]

If the AP is in router mode and a device such as an IPTV is connected to a LAN port or WiFi network, your ISP might require you to set up a bridge for a VLAN tag group for the AP’s Internet (WAN) port.

If you are subscribed to an IPTV service, the ISP might require you to use VLAN tags on the AP to distinguish between the Internet traffic and the IPTV traffic. A bridge with a VLAN tag group allows packets that are sent between the IPTV device and the AP Internet (WAN) port to circumvent the AP’s NAT service, which otherwise could drop the packets.

The AP includes a default VLAN tag group with the name Internet, with VLAN ID 10, and with all LAN ports, WiFi networks, and the WAN port as members. If you enable the bridge for a VLAN tag group, this default VLAN tag group is also enabled. To allow one or more devices to send and receive traffic over a separate VLAN, you can add custom VLAN tag groups, and assign a VLAN ID, priority value, and one or more ports, wireless network, or both to each VLAN tag group.
CAUTION: Unless you are comfortable with advanced network configurations, be sure to follow the directions of your ISP. Incorrect configuration might cause the Internet connection of the AP to go down.

To set up a bridge for a VLAN tag group and enable the new VLAN tag group:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > VLAN / Bridge Settings.
   The VLAN / Bridge Settings page displays.
5. Select the Enable VLAN / Bridge group check box.
   The page expands.
6. Select the By VLAN tag group radio button.
   The page adjusts and the default VLAN tag group displays.
7. To add a custom VLAN tag group, do the following:
   a. Click the Add button.
      The Add VLAN Rule page displays.
   b. Specify the settings in the following fields:
      - ISP Profile. This menu applies only to certain ISPs. If this option does not apply, the menu is set to Others.
      - Name. Enter a name for the VLAN tag group.
         The name is for identification purposes.
      - VLAN ID. Enter an ID from 1 to 4094.
      - Priority. Enter a value from 0 to 7.
   c. Select the check box for the LAN port (Port 1, Port 2, Port 3, or Port 4) or WiFi network (Wireless1, Wireless2, or Wireless3) to which the device that must circumvent the AP’s NAT service is connected.
You must select at least one LAN port or one WiFi network. You can select more than one LAN port and WiFi network.

8. Click the **Apply** button.
   The new VLAN tag group is added. The VLAN / Bridge Settings page display again.

9. To enable the bridge using the new VLAN tag group, do the following:
   a. Select the **Enable VLAN / Bridge group** check box again.
      The page expands.
   b. Select the **By VLAN tag group** radio button.
      The page adjusts and the default VLAN tag group and new VLAN tag group display.
   c. Select the radio button for the new VLAN tag group.
   d. Click the **Apply** button.
      Your settings are saved. You might need to reconnect to the AP.

**Change the MTU size [router mode]**

If the AP is in router mode, you can change the maximum transmission unit (MTU).

The MTU is the largest data packet a network device transmits. When one network device communicates across the Internet with another, the data packets travel through many devices along the way. If a device in the data path uses a lower MTU setting than the other devices, the data packets must be split or “fragmented” to accommodate the device with the smallest MTU.

The best MTU setting for router equipment is often the default value. In some situations, changing the value fixes one problem but causes another. Leave the MTU of the AP unchanged unless one of these situations occurs:

- You experience problems connecting to your ISP or other Internet service, and the technical support of the ISP recommends changing the MTU setting. These web-based applications might require an MTU change:
  - A secure website that does not open, or displays only part of a web page
  - Yahoo email
  - MSN portal

- You use VPN and experience severe performance problems.
- You used a program to optimize MTU for performance reasons and now you are experiencing connectivity or performance problems.
**Note:** An incorrect MTU setting can cause Internet communication problems. For example, you might not be able to access certain websites, frames within websites, secure login pages, or FTP or POP servers.

**To change the MTU size:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Setup > WAN Setup**.
   The WAN Setup page displays.
5. In the **MTU Size** field, enter a value from 616 to 1500.
   The default size is 1500 bytes.
6. Click the **Apply** button.
   Your settings are saved.

If you suspect an MTU problem, a common solution is to change the MTU to 1400. If you are willing to experiment, you can gradually reduce the MTU from the maximum value of 1500 until the problem goes away. The following table describes common MTU sizes and applications.

<table>
<thead>
<tr>
<th>MTU</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>1500</td>
<td>The largest Ethernet packet size. This setting is typical for connections that do not use PPPoE or VPN and is the default value for NETGEAR routers, adapters, and switches.</td>
</tr>
<tr>
<td>1492</td>
<td>Used in PPPoE environments.</td>
</tr>
<tr>
<td>1472</td>
<td>Maximum size to use for pinging. (Larger packets are fragmented.)</td>
</tr>
<tr>
<td>MTU</td>
<td>Application</td>
</tr>
<tr>
<td>------</td>
<td>----------------------------------</td>
</tr>
<tr>
<td>1468</td>
<td>Used in some DHCP environments.</td>
</tr>
<tr>
<td>1436</td>
<td>Used in PPTP environments or with VPN.</td>
</tr>
</tbody>
</table>
This chapter describes how you can maintain the AP by changing the password for local login, by managing the firmware, configuration file, and logs, and by setting up the traffic meter. The chapter also describes how you can monitor the AP and its network traffic.

The chapter includes the following sections:

- Update the firmware
- Back up or restore the settings
- Change the local device password
- Change the password recovery questions for the local device password
- Recover the local device admin password
- Factory default settings
- Time and Network Time Protocol server
- Logs
- Status and statistics
- Traffic meter [router mode]
- Change the system mode to access point mode or to router mode
- Disable LED blinking or turn off LEDs

**Note:** In this chapter, we refer to the access point as the AP.
Update the firmware

From time to time, or as needed, NETGEAR makes new firmware (software) available. You can log in to the AP and let the AP check if new firmware is available, or you can manually upload a specific firmware version to your AP.

Depending on how you are connected to the AP, we recommend the following firmware update methods:

- **WiFi connection from a computer or mobile device**: If you are connected over WiFi to the AP, we recommend that you let the AP check the Internet to see if new firmware is available. See Let the AP check for new firmware and update the firmware on page 133. If you let the AP check for new firmware and new firmware is available, it is downloaded directly to the AP.
  
  **Note**: If you want to load a particular firmware version (but not necessarily the latest firmware version), you must manually update the firmware (see below). In that situation, we recommend that you use a wired connection to the AP.

- **Wired connection from a computer**: If you are connected over an Ethernet cable to a LAN port on the AP or over a LAN connection to the same network as the AP, we recommend that you manually update the firmware. See Manually check for new firmware and update the firmware on page 135. With the manual update mode, if new firmware is available, or you want to load a particular firmware version (but not necessarily the latest firmware version), you must download it to your computer and then upload it to your AP.

Let the AP check for new firmware and update the firmware

You can let the AP check the Internet to see if new firmware is available. If it is, you can update the firmware.

**To let the AP check for new firmware and update the firmware:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Administration > Firmware Update.
   The Firmware Update page displays.

5. Click the Check button.
   The AP finds new firmware information if any is available and displays a message asking if you want to download and install it.

6. Click the Yes button.
   The AP locates and downloads the firmware and begins the update.

   **WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the update. For example, do not close the browser, click a link, or load a new page. Do not turn off the AP. Wait until the AP finishes restarting and the Power LED turns solid green.

   A progress bar might show the progress of the firmware update process. The firmware update process takes several minutes. When the update is complete, your AP restarts. Read the new firmware release notes to find out if you must reconfigure the AP after updating.

   To verify that the AP runs the new firmware version, continue with the following steps:

7. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

8. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

9. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

The firmware version is stated in the Firmware Version field at the top right of the page.

Manually check for new firmware and update the firmware

**To download new firmware and update the AP:**

1. Visit netgear.com/support/download/ and locate the support page for the router.
2. If available, download the new firmware to your computer or mobile device.
3. Read the new firmware release notes to determine whether you must reconfigure the router after updating.
4. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)
5. Launch a web browser and enter http://www.routerlogin.net in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.
6. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

7. Select **ADVANCED > Administration > Firmware Update**.
   The Firmware Update page displays.

8. Locate and select the firmware file on your computer or mobile device:
   a. Click the *Browse* button.
   b. Navigate to and select the firmware file.
      The file ends in `.img`.

9. Click the *Upload* button.
   A warning pop-up window displays.

10. Click the *OK* button.

   **WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the upload. For example, do not close the browser, click a link, or load a new page. Do not turn off the AP. Wait until the AP finishes restarting and the Power LED turns solid green.

   A progress bar might show the progress of the firmware upload process. The firmware upload process takes several minutes. When the upload is complete, your AP restarts.

   To verify that the AP runs the new firmware version, continue with the following steps:

11. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

12. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see *Dismiss a browser security warning* on page 38.

13. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.
The firmware version is stated in the Firmware Version field at the top right of the page.

**Back up or restore the settings**

The configuration settings of the AP are stored within the AP in a configuration file. You can back up (save) this file to your computer or restore it.

**Back up the AP settings**

You can save a copy of the current configuration settings.

**To back up the AP’s configuration file:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > Backup Settings**.
   The Backup Settings page displays.

5. Click the **Back Up** button.

6. Choose a location to store the file on your computer.
   The backup file ends in `.cfg`.

7. Follow the directions of your browser to save the file.
Restore the AP settings

If you backed up the configuration file, you can restore the configuration settings from this file.

**To restore configuration settings that you backed up:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > Backup Settings**.
   
   The Backup Settings page displays.

5. Click the **Browse** button and navigate to and select the saved configuration file.
   
   The backup file ends in `.cfg`.

6. Click the **Restore** button.
   
   A warning pop-up window displays.

7. Click the **OK** button.
   
   The configuration is uploaded to the AP. When the restoration is complete, the AP reboots. This process takes about two minutes.
**WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the restoration. For example, do not close the browser, click a link, or load a new page. Do not turn off the AP. Wait until the AP finishes restarting and the Power LED turns solid green.

**Change the local device password**

During the initial log-in process, when you followed the prompts of the Setup Wizard, you specified the local device password (also referred to as the admin password). This is the password that you use to log in to the local browser UI of the AP with the user name admin. You can change this password again.

We recommend that your password meets the following conditions:

- Contains 8 to 32 characters
- Contains no more than two identical characters in a row

In addition, we recommend that your password meets at least three of the following four conditions:

- At least one uppercase character
- At least one lowercase character
- At least one number
- At least one special character, such as the following characters: `@ # $ % ^ & * ( ) !`

**To change the password for the user name admin for login to the local browser UI of the AP:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.

   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > Set Password**.
   The Set Password page displays.

5. Enter the current password.

6. Enter the new password twice.
   For information about password recovery, see Change the password recovery questions for the local device password on page 140.

7. Click the **Apply** button.
   Your settings are saved.

---

**Change the password recovery questions for the local device password**

During the initial log-in process, when you followed the prompts of the Setup Wizard, you set up password recovery for the local device password (also referred to as the admin password). This is the password that you use to log in locally to the AP with the user name admin. If you forget this password, you can recover it. The recovery process is supported in the Chrome, Safari, Firefox, and Internet Explorer browsers.

You can change the password recovery questions.

**To change the password recovery questions:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP's WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Administration > Set Password.
   The Set Password page displays.

5. Make sure that the Enable Password Reset check box is selected.
   This check box is selected by default.

6. Select two security questions and provide answers to them.

7. Click the Apply button.
   Your settings are saved.

Recover the local device admin password

When you use the Setup Wizard for the initial log-in process, you must both customize the local device password and set up password recovery. If three local login failures occur, you can try to recover the password. This recovery process is supported in the Internet Explorer, Firefox, Chrome, and Safari browsers.

To recover your local device password:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter your local device password.
   If you enter an incorrect password three times, you are prompted to enter the serial number of the AP.
   The serial number is on the AP label.

4. Enter the serial number of the AP.
5. Click the Continue button.
   A window displays prompts for the answers to your security questions.

6. Enter the saved answers to your security questions.
7. Click the Continue button.
   A window displays your recovered password.

8. Click the Login again button.
   A login window displays.

9. With your recovered password, log in to the AP.

Factory default settings

Under some circumstances (for example, if you lost track of the changes that you made to the AP settings or you move the AP to a different network), you might want to erase the configuration and reset the AP to factory default settings.

If the AP is in access point mode and you do not know the current IP address of the AP, first try to use an IP scanner application to detect the IP address. (IP scanner applications are available on the Internet free of charge.) If you still cannot find the current IP address of the AP, reset the AP to factory default settings.

**Note:** If the AP is in router mode, you can always access the AP by using http://www.routerlogin.net.

To reset the AP to factory default settings, you can use either the Reset button on the back of the AP or the Erase function in the local browser UI. However, if you cannot find
the IP address or lost the password to access the AP and cannot recover it, you must use the **Reset** button.

After you reset the AP to factory default settings, the AP is in router mode, the login URL is www.routerlogin.net, and the DHCP server is enabled. For a list of factory default settings, see **Factory default settings** on page 244.

### Use the Reset button to return to factory defaults

You can use the **Reset** button to return the AP to its factory default settings.

After you return the AP to factory default settings, you must go through the initial login process again (see Connect the AP to a routing device and log in for the first time on page 24 or Connect the AP to a modem and log in for the first time on page 28).

**CAUTION:** The following process erases all settings that you configured in the AP.

#### To reset the AP to factory default settings using the Reset button:

1. On the back of the AP, locate the recessed **Reset** button.  
   For more information, see Back panel with ports, buttons, and a power connector on page 19.
2. Insert a device such as a straightened paper clip into the opening.
3. Press the **Reset** button for 5 seconds or until the Power LED starts blinking amber. After you release the **Reset** button, the Power LED turns off. After about 30 seconds, the Power LED lights solid red for about five seconds and then lights solid amber. When the reset process is complete and the AP is ready, the Power LED lights solid green. The reset process takes about two minutes.

   **Note:** If you hold the **Reset** button for less than 5 seconds and then release it, the AP restarts rather than returns to its factory default settings.

   **WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, if you are connected to the AP's local browser UI, do not close the browser, click a link, or load a new page. Do not turn off the AP. Wait until the AP finishes restarting and the Power LED turns solid green.

### Use the local browser UI to return to factory defaults

You can use the local browser UI to return the AP to its factory default settings.

After you return the AP to factory default settings, you must go through the initial login process again (see Connect the AP to a routing device and log in for the first time on page 24 or Connect the AP to a modem and log in for the first time on page 28).
**CAUTION:** The following process erases all settings that you configured in the AP.

**To erase the settings:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Administration > Backup Settings**.
   
   The Backup Settings page displays.

5. Click the **Erase** button.
   
   A warning page displays.

6. Click the **Yes** button.
   
   The configuration is reset to factory default settings. When the reset is complete, the AP reboots. This process takes about two minutes.

**WARNING:** To avoid the risk of corrupting the firmware, do not interrupt the reset. For example, do not close the browser, click a link, or load a new page. Do not turn off the AP. Wait until the AP finishes restarting. If you can see the AP, the Power LED turns solid green when the AP finishes restarting.
Time and Network Time Protocol server

By default, the AP receives its time settings from a NETGEAR Network Time Protocol (NTP) server. You can change to another NTP server or set the time zone and daylight saving time manually.

Manually set the time zone and adjust the daylight saving time

The AP might detect the time zone automatically or you might need to adjust the time zone and daylight saving time settings. When the AP synchronizes its clock with a Network Time Protocol (NTP) server, the AP detects the correct date and time. If the AP does not detect the correct date and time, you might need to manually set the time zone and adjust the daylight saving time setting.

To manually set the time zone and adjust the daylight saving time setting:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select ADVANCED > Administration > NTP Settings.

   The NTP Settings page displays.

5. From the Time Zone menu, select the time zone for the area in which the AP operates.
6. If the AP is in an area that observes daylight saving time, select the **Automatically adjust for daylight saving times** check box.

7. Click the **Apply** button.
   
   Your settings are saved.

   When the AP connects over the Internet to an NTP server, the date and time that display on the page are adjusted according to your settings.

---

**Change the Network Time Protocol server**

By default, the AP uses the NETGEAR NTP server to synchronize the network time. You can change the Network Time Protocol (NTP) server to your preferred NTP server.

**To change the NTP server to your preferred NTP server:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Administration > NTP Settings**.

   The NTP Settings page displays. The page also displays the current date and time. By default, the **Use default NETGEAR NTP server** radio button is selected.

5. Select the **Set your preferred NTP server** radio button.

6. Enter the NTP server domain name or IP address in the **Primary NTP server** field.

7. Click the **Apply** button.
Your settings are saved.
When the AP connects over the Internet to the new NTP server, the date and time that display on the page might be adjusted.

Logs

The log is a detailed record of the websites that users on your network accessed or attempted to access and many other AP actions. You can manage which activities are logged.

Specify which activities the AP logs

You can specify which activities the AP logs. These activities display in the log.

To manage which activities are logged:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Administration > Logs.
   The Logs page displays.

5. Select the check boxes that correspond to the activities that you want to be logged.
By default, all check boxes are selected, and the following activities are logged:

- Attempted access to allowed sites
- Attempted access to blocked sites and services
- Connections to the local browser UI of the AP
- Router operations such as startup, getting the time, and so on
- Known DoS attacks and port scans
- Port forwarding and port triggering
- WiFi access
- Scheduled deactivation of the WiFi signal
- VPN service

6. Clear the check boxes that correspond to the activities that you do not want to be logged.
7. Click the **Apply** button.
   Your settings are saved.

View, send, or clear the logs

In addition to viewing the logs, you can send them by email, and clear them.

**To view, send, or clear the logs:**

1. Connect your computer or mobile device to the AP in one of the following ways

   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.

3. Enter the AP local device password.
The local device password is the one that you specified. The local device password is case-sensitive.

The BASIC Home page displays.

4. Select **ADVANCED > Administration > Logs**.
   The Logs page displays.

5. To send the logs by email, click the **Send Log** button.
   The AP sends the logs to the email address that you specified for email notifications (see [Set up security event email notifications on page 102](#)).

6. To refresh the log entries onscreen, click the **Refresh** button.
7. To clear the log entries, click the **Clear Log** button.

**Status and statistics**

You can view information about the AP and its ports and the status of the Internet connection and WiFi network. In addition, you can view traffic statistics for the various ports.

**Display information about the Internet port, AP, and WiFi settings [router mode]**

If the AP is in router mode, you can display information about the AP, the IP addresses, and the WiFi settings for each radio.

**To display information about the AP and the IP and WiFi settings if the AP is in router mode:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see [Find the IP address of the AP when you cannot use routerlogin.net on page 32](#).
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED**.
   The ADVANCED Home page displays.
   
   The color in the heading of each of the panes uses the following coding:

   - **Green circle.** The settings are fine and no problems exist. For a WiFi network, a green circle displays if the network is enabled and secured.
   - **Red circle.** Settings are disabled, a problem exists, or the connection is down. For a WiFi network, a red circle displays if the network is disabled.

   The following tables describe the fields in the panes on the Advanced Home page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Router Information</strong></td>
<td></td>
</tr>
<tr>
<td>Hardware Version</td>
<td>The AP hardware version, which is the model number WAX204.</td>
</tr>
<tr>
<td>Firmware Version</td>
<td>The AP firmware version. If you update the firmware, the version changes (see <a href="#">Update the firmware</a> on page 133).</td>
</tr>
<tr>
<td>GUI Language Version</td>
<td>The AP language version for the local browser UI.</td>
</tr>
<tr>
<td>Operation Mode</td>
<td>The operation mode is Router. For more information about the changing the operation mode, see <a href="#">Change the system mode to access point mode or to router mode</a> on page 166.</td>
</tr>
<tr>
<td>CPU Load</td>
<td>The usage load on the CPUs</td>
</tr>
<tr>
<td>Memory Usage (Used/Total)</td>
<td>The RAM memory that is being used and the available memory.</td>
</tr>
<tr>
<td>Flash Usage (Used/Total)</td>
<td>The flash memory that is being used and the available memory.</td>
</tr>
<tr>
<td>System Uptime</td>
<td>The time elapsed since the AP was last restarted.</td>
</tr>
<tr>
<td><strong>LAN Port (This is a subsection in the Router Information pane)</strong></td>
<td></td>
</tr>
<tr>
<td>MAC Address</td>
<td>The single MAC address that applies to all four AP LAN ports combined.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address that applies to all four AP LAN ports. For more information, see <a href="#">Change the LAN IP address and subnet settings [router mode]</a> on page 114.</td>
</tr>
<tr>
<td>DHCP Server</td>
<td>If the AP is in router mode, this field displays if the DHCP server of the AP is enabled (the default setting in router mode) or disabled (see <a href="#">Disable the DHCP server [router mode]</a> on page 116).</td>
</tr>
</tbody>
</table>
### Field | Description
--- | ---
IP Subnet Mask | The IP subnet mask that applies to all four AP LAN ports. For more information, see Change the LAN IP address and subnet settings [router mode] on page 114.
DHCP Lease Time | The DHCP lease time. For more information, see Manage the DHCP server address pool [router mode] on page 115.

### Internet Port
To change these settings, see Use the Setup Wizard [router mode] on page 41 or Manually set up the AP Internet connection [router mode] on page 42.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC Address</td>
<td>The MAC address that applies to the AP WAN (Internet) port.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The WAN IP address that the AP receives from your ISP (through your modem) or the WAN IP address that you manually configured.</td>
</tr>
<tr>
<td>Connection</td>
<td>The type of Internet connection that the AP uses, which can be DHCP (the default setting), Static IP, PPPoE, PPTP, or L2TP.</td>
</tr>
<tr>
<td>IP Subnet Mask</td>
<td>The IP subnet mask that the AP uses.</td>
</tr>
<tr>
<td>Domain Name Server</td>
<td>The IP address of the Domain Name System (DNS) server that the AP uses.</td>
</tr>
<tr>
<td>WAN Preference</td>
<td>This field always shows Internet Port (1 Gbps).</td>
</tr>
</tbody>
</table>

### Wireless Settings (2.4GHz) or Wireless Settings (5GHz )
To change these settings, see Basic WiFi and Radio Features on page 63 and Advanced WiFi and Radio Features on page 190.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name of the SSID (see Set up or change an open or secure WiFi network on page 64).</td>
</tr>
<tr>
<td>Region</td>
<td>The country and region in which the AP is being used (see Change the region of operation on page 191).</td>
</tr>
<tr>
<td>Channel</td>
<td>The channel that the radio uses (see Change the channel for a radio on page 196).</td>
</tr>
<tr>
<td>Mode</td>
<td>The WiFi throughput mode that the radio uses (see Change the WiFi throughput mode for a radio on page 197).</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>

<tbody>
<tr>
<td>Wireless AP</td>
<td>Displays if the WiFi network is enabled (see Set up or change an open or secure WiFi network on page 64 or Enable or disable a WiFi network on page 70).</td>
</tr>
<tr>
<td>Broadcast Name</td>
<td>Displays if the WiFi network broadcasts its SSID (see Hide or broadcast the SSID for a WiFi network on page 71).</td>
</tr>
<tr>
<td>Wi-Fi Protected Setup</td>
<td>This setting applies to the Wireless 1 network only. Displays if WPS is enabled. <strong>Note:</strong> If you either set up open security for the Wireless 1 network or disable the WiFi radios, WPS is disabled.</td>
</tr>
</tbody>
</table>

---

### Display information about the LAN port, AP, and WiFi settings [access point mode]

If the AP is in access point mode, you can display information about the LAN IP addresses, AP, and the WiFi settings for each radio.

**To display information about the AP and the IP and WiFi settings if the AP is in access point mode:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.
4. Select **ADVANCED**.
The ADVANCED Home page displays.

The color in the heading of each of the panes uses the following coding:

- **Green circle.** The settings are fine and no problems exist. For a WiFi network, a green circle displays if the network is enabled and secured.
- **Red circle.** Settings are disabled, a problem exists, or the connection is down. For a WiFi network, a red circle displays if the network is disabled.

The following tables describe the fields in the panes on the Advanced Home page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Router Information</strong></td>
<td></td>
</tr>
<tr>
<td>Hardware Version</td>
<td>The AP hardware version, which is the model number WAX204.</td>
</tr>
<tr>
<td>Firmware Version</td>
<td>The AP firmware version. If you update the firmware, the version changes (see Update the firmware on page 133).</td>
</tr>
<tr>
<td>GUI Language Version</td>
<td>The AP language version for the local browser UI.</td>
</tr>
<tr>
<td>Operation Mode</td>
<td>The operation mode is AP. For more information about the changing the operation mode, see Change the system mode to access point mode or to router mode on page 166.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LAN Port</strong></td>
<td></td>
</tr>
<tr>
<td>MAC Address</td>
<td>The MAC address that applies to the AP WAN (Internet) port.</td>
</tr>
<tr>
<td>DHCP</td>
<td>Displays if the DHCP client of the AP is enabled.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The LAN IP address that the AP receives from an existing router in your network or the static (fixed) IP address that you manually configured.</td>
</tr>
<tr>
<td>IP Subnet Mask</td>
<td>The IP subnet mask that the AP uses.</td>
</tr>
</tbody>
</table>
### Wireless Settings (2.4GHz) or Wireless Settings (5GHz)

To change these settings, see [Basic WiFi and Radio Features](#) on page 63 and [Advanced WiFi and Radio Features](#) on page 190.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gateway IP Address</td>
<td>The IP address of the gateway to which the AP connects to the Internet.</td>
</tr>
<tr>
<td>Domain Name Server</td>
<td>The IP address of the Domain Name System (DNS) server that the AP uses.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>The name of the SSID (see <a href="#">Set up or change an open or secure WiFi network</a> on page 64).</td>
</tr>
<tr>
<td><strong>Region</strong></td>
<td>The country and region in which the AP is being used (see <a href="#">Change the region of operation</a> on page 191).</td>
</tr>
<tr>
<td><strong>Channel</strong></td>
<td>The channel that the radio uses (see <a href="#">Change the channel for a radio</a> on page 196).</td>
</tr>
<tr>
<td><strong>Mode</strong></td>
<td>The WiFi throughput mode that the radio uses (see <a href="#">Change the WiFi throughput mode for a radio</a> on page 197).</td>
</tr>
<tr>
<td>Wireless AP</td>
<td>Displays if the WiFi network is enabled (see <a href="#">Set up or change an open or secure WiFi network</a> on page 64 or <a href="#">Enable or disable a WiFi network</a> on page 70).</td>
</tr>
<tr>
<td>Broadcast Name</td>
<td>Displays if the WiFi network broadcasts its SSID (see <a href="#">Hide or broadcast the SSID for a WiFi network</a> on page 71).</td>
</tr>
<tr>
<td><strong>Wi-Fi Protected Setup</strong></td>
<td>This setting applies to the Wireless 1 network only. Displays if WPS is enabled. <strong>Note:</strong> If you either set up open security for the Wireless 1 network or disable the WiFi radios, WPS is disabled.</td>
</tr>
</tbody>
</table>
Check the Internet connection status

To check the Internet connection status:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED.
   The ADVANCED Home page displays.

5. In the Internet Port pane (in router mode) or in the LAN Port pane (in access point mode), click the CONNECTION STATUS button.
   The Connection Status pop-up window displays.
   The information that displays depends on whether the AP is in router mode (the default system mode) or access point mode and on the type of Internet connection.
   When the AP receives an IP address dynamically (which is the most common type of connection), the following information displays:
   - IP Address. The IP address that is assigned to the AP.
     In access point mode, the IP address is a LAN IP address. In router mode, the IP address is a WAN IP address.
   - Subnet Mask. The subnet mask that is assigned to the AP.
   - Default Gateway. The IP address for the default gateway that the AP communicates with.
In access point mode, the IP address is a LAN IP address. In router mode, the IP address is a WAN IP address.

- **DHCP Server.** The IP address for the Dynamic Host Configuration Protocol server that provides the TCP/IP configuration to the AP. In access point mode, the IP address is a LAN IP address. In router mode, the IP address is a WAN IP address.

- **DNS Server.** The IP address of the Domain Name Service server that provides translation of network names to IP addresses. In access point mode, the IP address is a LAN IP address. In router mode, the IP address is a WAN IP address.

- **Lease Obtained.** The date and time when the DHCP IP address lease was obtained.

- **Lease Expires.** The date and time that the DHCP IP address lease expires.

6. When the AP receives an IP address dynamically, you can perform the following actions:

   - **Release.** Click the **Release** button to terminate the DHCP IP address, that is, terminate the Internet connection.
   
   - **Renew.** Click the **Renew** button to renew the DHCP IP address, that is, renew the Internet connection.

**Display the Internet port statistics**

**To display the Internet port statistics:**

1. Connect your computer or mobile device to the AP in one of the following ways

   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see **Dismiss a browser security warning** on page 38.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED**.
   The ADVANCED Home page displays.

5. In the Internet Port pane (in router mode) or in the LAN Port pane (in access point mode), click the **Show Statistics** button.
   A pop-up window displays, showing the following information:
   - **System Up Time**. The time elapsed since the AP was last restarted.
   - **Port**. The statistics for the WAN (Internet) port, LAN (Ethernet) ports, and WLANs. For each port, the window displays the following information:
     - **Status**. The link status of the port.
     - **TxPkts**. The number of packets transmitted on this port since reset or manual clear.
     - **RxPkts**. The number of packets received on this port since reset or manual clear.
     - **Collisions**. The number of collisions on this port since reset or manual clear.
     - **Tx B/s**. The current transmission (outbound) bandwidth used on the WAN and LAN ports.
     - **Rx B/s**. The current reception (inbound) bandwidth used on the WAN and LAN ports.
     - **Up Time**. The time elapsed since this port acquired the link.

6. To manage the polling, do one of the following:
   - To change the polling frequency, which is the interval at which the statistics are updated in this window, enter a time in seconds in the **Poll Interval** field and click the **Set Interval** button.
   - To stop the polling entirely, click the **Stop** button.
Display the devices currently on the AP network and change device information

You can display the active wired and WiFi devices in the AP network. If you do not recognize a WiFi device, it might be an intruder.

If the AP is in router mode, you can also display the VPN devices in the AP network.

**To display the attached wired, WiFi, and VPN devices or to change device information:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **BASIC > Attached Devices**.
   The Attached Devices page displays:
   
   - Wired devices are connected to the AP with Ethernet cables. WiFi devices are connected to the AP through the WiFi network, in either the 2.4 GHz band or the 5 GHz band. VPN devices are connected over a VPN tunnel to the AP.
   - If you enabled access control (see Enable and manage network access control on page 86), the page displays the access control status of the device in the network.
   - If you enabled QoS (see Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page...
106), the page displays the detected download and upload speeds for the AP and the automatically assigned priority.

The following tables describe the fields on the Attached Devices page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>If access control is enabled (see Enable and manage network access control on page 86), the access control status of the device in the network (Allowed or Blocked).</td>
</tr>
<tr>
<td>Priority</td>
<td>If QoS is enabled (see Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page 106), the priority that the AP assigned automatically to the device or that you changed manually (see Step 5 or see Change the priority for a connected device [router mode] on page 111).</td>
</tr>
<tr>
<td>Connection Type</td>
<td>For WiFi devices, the connection type information shows the radio and WiFi network (Wireless 1, Wireless 2, or Wireless 3) to which the device is connected. For LAN devices, the connection type is always Wired.</td>
</tr>
<tr>
<td>Device Name, including device model and device type icon</td>
<td>The device name, if detected. This field also displays the device model, if detected, and device type icon. This information is for display only. You can change the information that displays (see Step 5).</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IP address that is assigned to the device when it joined the AP network. This address can change when a device is disconnected and rejoins the network. Note: If you enable access control or QoS, the IP address is displayed in the Device Name field.</td>
</tr>
<tr>
<td>Internet Download Speed by Device</td>
<td>If QoS is enabled (see Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page 106), the download speed in Mbps that the device uses.</td>
</tr>
<tr>
<td>Internet Upload Speed by Device</td>
<td>If QoS is enabled (see Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page 106), the upload speed in Mbps that the device uses.</td>
</tr>
</tbody>
</table>

The following information displays only if the AP is in router mode and supports VPN clients devices.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>VPN Client Devices</strong></td>
<td></td>
</tr>
<tr>
<td>Device Name</td>
<td>The device name, if detected.</td>
</tr>
</tbody>
</table>
Field | Description
---|---
Remote IP Address | The IP address of the device at the other side of the VPN tunnel.
Local IP Address | The IP address that is assigned to the device when it joined the AP network. This address can change when a device is disconnected and rejoins the network.
Connection Time | The time that elapsed since the device connected to the AP.

5. To change the information that displays for a device or the QoS priority, do the following:
   a. Select the radio button for the device for which you want to change the information or priority.
   b. Click the Edit button.
      The Edit Device page displays.
   c. In the Device Model field, specify a model.
   d. In the Device Name field, specify a name.
   e. From the Device Type menu, select a type.
      The device type displays as a device icon on the Attached Devices page.
   f. If QoS is enabled (see Enable QoS and automatically set the Internet bandwidth on page 105 or Enable QoS and manually set the Internet bandwidth on page 106), select one of the following Device Priority buttons: Highest, High, Medium, or Low.
   g. Click the Apply button.
      Your settings are saved. The Attached Devices page displays again.

6. To refresh the information onscreen, click the Refresh button.
   The information onscreen is updated.

Traffic meter [router mode]

If the AP is in router mode, you can enable traffic metering to monitor the volume of Internet traffic that passes through the AP’s Internet (WAN) port. With the traffic meter utility, you can set limits for traffic volume, set a monthly limit, and get a live update of traffic usage.

Note: The information in this section and subsections does not apply if the AP is in access point mode.
Start the traffic meter without traffic restrictions [router mode]

If the AP is in router mode, you can monitor the traffic volume without setting a limit on the volume or connection time.

**To start or restart the traffic meter without configuring traffic volume or connection time restrictions:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
   The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
   By default, no traffic limit is specified and the traffic volume or connection time is not controlled.
6. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
7. To start the traffic counter immediately, click the **Restart Counter Now** button.
8. Click the **Apply** button.
   Your settings are saved.

The Internet Traffic Statistics section helps you to monitor the data traffic. For more information, see View the Internet traffic volume and statistics [router mode] on page 164.
Restrict Internet traffic by volume [router mode]

If the AP is in router mode, you can record and restrict the traffic by volume in MB. This is useful when your ISP measures your traffic volume.

To record and restrict the Internet traffic by volume:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field. A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password. The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
5. Select the Enable Traffic Meter check box.
6. Select the Traffic volume control by radio button.
7. From the corresponding menu, select an option:
   • Download only. The restriction is applied to incoming traffic only.
   • Both Directions. The restriction is applied to both incoming and outgoing traffic.
8. In the Monthly Limit field, enter how many MBytes (MB) per month are allowed.
9. If your ISP charges you for extra data volume when you make a new connection, enter the extra data volume in MB in the Round up data volume for each connection by field.
10. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.
11. In the Traffic Control section, enter a value in MB to specify when the AP issues a warning message before the monthly limit in MB is reached.
   This setting is optional. The AP issues a warning when the balance falls below the number of MB that you enter. By default, the value is 0 and no warning message is issued.
12. Select one or more of the following actions to occur when the limit is reached:

---

WiFi 6 AX1800 Dual Band Wireless Access Point WAX204
• Turn the Internet LED to blinking green or amber. This setting is optional. When the traffic limit is reached, the Internet LED alternates between green and amber.
• Disconnect and disable the Internet connection. This setting is optional. When the traffic limit is reached, the Internet connection is disconnected and disabled.

13. Click the **Apply** button.
Your settings are saved.

The Internet Traffic Statistics section helps you to monitor the data traffic. For more information, see View the Internet traffic volume and statistics [router mode] on page 164.

Restrict Internet traffic by connection time [router mode]

If the AP is in router mode, you can record and restrict the traffic by connection time. This is useful when your ISP measures your connection time.

**To record and restrict the Internet traffic by connection time:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
   The Traffic Meter page displays.
5. Select the **Enable Traffic Meter** check box.
6. Select the **Connection time control** radio button.
   The AP must be connected to the Internet for you to be able to select the **Connection time control** radio button.
7. In the **Monthly Limit** field, enter how many hours per month are allowed.
   The AP must be connected to the Internet for you to be able to enter information in the **Monthly Limit** field.
8. In the Traffic Counter section, set the traffic counter to begin at a specific time and date.

9. In the Traffic Control section, enter a period in minutes to specify when the AP issues a warning message before the monthly limit in hours is reached. This setting is optional. The AP issues a warning when the balance falls under the number of minutes that you enter. By default, the value is 0 and no warning message is issued.

10. Select one or more of the following actions to occur when the limit is reached:

   • Turn the Internet LED to blinking green or amber. This setting is optional. When the traffic limit is reached, the Internet LED alternates between green and amber.

   • Disconnect and disable the Internet connection. This setting is optional. When the traffic limit is reached, the Internet connection is disconnected and disabled.

11. Click the Apply button.

    Your settings are saved.

The Internet Traffic Statistics section helps you to monitor the data traffic. For more information, see View the Internet traffic volume and statistics [router mode] on page 164.

---

View the Internet traffic volume and statistics [router mode]

If the AP is in router mode and you enabled the traffic meter (see Start the traffic meter without traffic restrictions [router mode] on page 161), you can view the Internet traffic volume and statistics.

To view the Internet traffic volume and statistics shown by the traffic meter:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter http://www.routerlogin.net in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select ADVANCED > Advanced Setup > Traffic Meter.

   The Traffic Meter page displays.
5. Scroll down to the Internet Traffic Statistics section. The Internet Traffic Statistics section displays when the traffic counter was started and what the traffic balance is. The table displays information about the connection time and traffic volume in MB.

6. To refresh the information onscreen, click the **Refresh** button. The information is updated.

7. To display more information about the data traffic and to change the polling interval, click the **Traffic Status** button. The Traffic Status pop-up windows displays.

### Unblock the traffic meter after the traffic limit is reached [router mode]

If the AP is in router mode and you configured the traffic meter to disconnect and disable the Internet connection after the traffic limit is reached, you cannot access the Internet until you unblock the traffic meter.

**CAUTION:** If your ISP set a traffic limit, your ISP might charge you for the overage traffic.

**To unblock the traffic meter:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see *Dismiss a browser security warning* on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Traffic Meter**.
   The Traffic Meter page displays.

5. In the Traffic Control section, clear the **Disconnect and disable the Internet connection** check box.

6. Click the **Apply** button.
   Your settings are saved.

Change the system mode to access point mode or to router mode

By default, the AP functions in router mode, that is, the system mode is router mode. You can connect the AP to a router, switch, or hub in your network and change the system mode to access point mode.

The AP can function in either of the following system modes:

- **Router mode.** By default, the AP functions in router mode with its router functionality enabled. When the AP is in router mode, you must connect the WAN (Internet) port of the AP to a LAN port on your Internet modem. For more information, see **Connect the AP to a modem and log in for the first time** on page 28.

- **Access point mode.** The AP can function in access point mode with its router functionality disabled. If the AP is in access point mode, you must connect the WAN (Internet) port of the AP to a LAN port on a router, switch, or hub in your network. For more information, see **Connect the AP to a routing device and log in for the first time** on page 24.

For information about the features that are enabled in router mode and disabled in access point mode, see **Routing features enabled in router mode** on page 38.

To change the system mode to access point mode or back to router mode:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select ADVANCED > Advanced Setup > Router / AP / Bridge Mode.
   The Router / AP / Bridge Mode page displays.

5. Specify the system mode by doing one of the following:
   - **Router mode.** Select the **Router Mode** radio button to let the AP function in router mode.
     The page adjusts to provide information. To change the WiFi settings before you change the system mode, click the **Wireless Setup** button. For more information, see Set up or change an open or secure WiFi network on page 64.
   - **AP mode.** Select the **AP Mode** radio button to let the AP function in access point mode.
     The page adjusts to provide information and the following options:
     - To change the device name before you change the system mode, click the **Edit** button.
     - To change the WiFi settings before you change the system mode, click the **Wireless Setup** button. For more information, see Set up or change an open or secure WiFi network on page 64.
     - Although you can configure a fixed IP address, we recommend that you leave the **Get dynamically from existing access point/router** button selected to let the AP get an IP address dynamically from the existing router in your network.
     To configure a static IP address, click the **Use fixed IP Address (not recommend)** button, and in the fields that display below the **Learn more** button, change the IP address information.

**Note:** For information about bridge mode, see Set up the AP as a WiFi Bridge to another device on page 206.
6. Click the **Apply** button.
   Your settings are saved and the AP is reconfigured in the new system mode.

## Disable LED blinking or turn off LEDs

The LEDs on the top panel of the AP indicate activities and behavior. By default, the Internet LED, LAN LED, and WiFi LED blink when the AP detects data traffic. You can disable LED blinking for data traffic, or turn off all LEDs except the Power LED.

**To disable LED blinking or turn off the LEDs:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see [Dismiss a browser security warning](#) on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > LED Control Settings**.
   The LED Control Settings page displays.
   By default, the first radio button is selected, which allows standard LED behavior.
   For more information about LEDs, see [Top panel with LEDs](#) on page 17.

5. Do one of the following:
   - **Disable blinking.** To disable blinking, select the **Disable blinking on Internet LED, LAN LED, Wireless LED when data traffic is detected** radio button.
• **Turn off all LEDs.** To turn off all LEDs except the Power LED, select the **Turn off all LEDs except Power LED** radio button.

6. Click the **Apply** button.
   
   Your settings are saved.
If the AP is in router mode, with Dynamic DNS (DDNS), you can use the Internet and a domain name to access a storage device that is attached to the AP when you are not in your office or home. If you know the IP address of the AP (and the IP address did not change), you can also access the storage device by using the IP address. If you use OpenVPN software to set up VPN tunnels, the AP requires an account with a Dynamic DNS service.

**Note:** In AP mode, the DDNS settings that are described in this chapter are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these DDNS settings are masked out in the local browser.

This chapter contains the following sections:

- About Dynamic DNS [router mode]
- Set up a new Dynamic DNS account [router mode]
- Use an existing Dynamic DNS account [router mode]
- Change the Dynamic DNS account settings [router mode]

For information about using DDNS if you set up the AP as a VPN server with OpenView, see About setting up an OpenVPN connection [router mode] on page 187.

**Note:** In this chapter, we refer to the access point as the AP.
About Dynamic DNS [router mode]

Internet service providers (ISPs) assign IP addresses to identify each Internet account. Most ISPs use dynamically assigned IP addresses. This means that the IP address can change at any time. You can use the IP address to access your network remotely, but most people do not know what their IP address is or when this address changes.

To make it easier to connect to a storage device that is connected to your AP or to set up a VPN tunnel to the AP, you can get a free account with a Dynamic DNS (DDNS) service that lets you use a domain name to access your office or home network. To use this account, you must set up the AP to use DDNS. Then the AP notifies the DDNS service provider whenever its IP address changes. When you access your DDNS account, the service finds the current IP address of your home network and automatically connects you.

The AP must be in router mode. However (and this is very unusual), if your ISP assigns a private WAN IP address (such as 192.168.x.x or 10.x.x.x), the DDNS service does not work because private addresses are not routed on the Internet.

Set up a new Dynamic DNS account [router mode]

NETGEAR offers you the opportunity to set up and register for a free Dynamic DNS account.

To set up Dynamic DNS and register for a free NETGEAR account:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Dynamic DNS.
   The Dynamic DNS page displays.
5. Select the **Use a Dynamic DNS Service** check box.
6. From the **Service Provider** menu, select **NETGEAR**.
7. Select the **No** radio button.
8. In the **Host Name** field, enter the name that you want to use for your URL.
   
   The host name is also called the domain name. Your free URL includes the host name that you specify and ends with mynetgear.com. For example, enter `MyName.mynetgear.com`.
9. In the **Email** field, enter the email address that you want to use for your account.
10. In the **Password** field, enter the password that you want to use for your account.

   The password must contain between 6 and 32 characters.
11. Click the **Register** button.
12. Follow the onscreen instructions to register for your NETGEAR Dynamic DNS service.

**Use an existing Dynamic DNS account [router mode]**

If you already created a Dynamic DNS (DDNS) account with NETGEAR, No-IP, or Dyn, you can set up the AP to use your account.

**To set up DDNS if you already created an account:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.

   The Dynamic DNS page displays.
5. Select the **Use a Dynamic DNS Service** check box.
6. From the **Service Provider** menu, select your provider.

7. Select the **Yes** radio button.

8. In the **Host Name** field, enter the host name (sometimes called the domain name) for your account.

9. Depending on the type of account, specify your user name or email address:
   - For a No-IP or Dyn account, in the **User Name** field, enter the user name for your account.
   - For a NETGEAR account, in the **Email** field, enter the email address for your account.

10. In the **Password** field, enter the password for your DDNS account.

11. Click the **Apply** button.

12. To verify that your DDNS service is enabled in the AP, click the **Show Status** button.

   A pop-window displays the DDNS status.

---

**Change the Dynamic DNS account settings [router mode]**

You can change the settings for your Dynamic DNS (DDNS) account.

**To your DDNS account settings:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Dynamic DNS**.

   The Dynamic DNS page displays.
5. Change your DDNS account settings as necessary.
6. Click the **Apply** button.
   Your settings are saved.
If the AP is in router mode, you can use it as a VPN client (as opposed to a VPN server) to let devices on the AP’s network securely access an external network using virtual private networking (VPN). This chapter describes how to set up the AP as a VPN client and use VPN access.

For you to be able to use the AP as a VPN client, you must obtain a third-party license for VPN server access. The local browser UI includes a link to a third-party VPN service (PureVPN) so that you can obtain a license.

For information about using the router as a VPN server, see VPN Server and Service with OpenVPN [Router Mode] on page 180.

**Note:** In AP mode, the VPN client settings that are described in this chapter are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these VPN client settings are masked out in the local browser UI.

This chapter includes the following sections:

- **About setting up the AP as a VPN client [router mode]**
- **Enable the VPN client in the AP and connect to a VPN server [router mode]**
- **Disconnect the AP from the VPN server [router mode]**

**Note:** In this chapter, we refer to the access point as the AP.
About setting up the AP as a VPN client [router mode]

In addition to using a virtual private network (VPN) to securely access your own network over the Internet when you are not home (see VPN Server and Service with OpenVPN [Router Mode] on page 180), you can also set up the AP as a VPN client to let devices on the AP’s network securely access an external network, while protecting your own network identity and preventing a distributed denial-of-service (DDoS) attack. An external network can be a business network behind a firewall or an Internet service that might not be accessible from your geographical location without using a VPN server in another country.

Similar to using the AP as a VPN server, this type of VPN access is also called a client-to-gateway tunnel, but in this situation the AP functions as the client and an external gateway (that is not on the AP’s network) functions as the VPN server.

A VPN creates a secure, encrypted tunnel over the Internet between your AP and a VPN server. The VPN client on the AP redirects the Internet connection so that the AP first connects to a VPN server (which could be in another country) and then to the Internet. All devices that are connected to your AP are assigned new IP addresses from the VPN server, which hides the actual location of your AP and the devices that are connected to it. After the VPN connection is established, you use your web browser and any apps as you would normally do.

Note: The AP comes with a predefined commercial VPN service provider called PureVPN. To use the VPN client feature in the AP, you need a license from this provider. However, if you want to use a free VPN service on a device on your AP’s network, you can download the service’s VPN client on your device and establish a connection to the free VPN server. Such a connection serves only that individual device, not all devices on the AP’s network.

To use the VPN client feature, the AP must be in router mode and you must log in to the AP, enable the AP’s VPN client, and establish a connection to an external VPN server (see Enable the VPN client in the AP and connect to a VPN server [router mode] on page 176).

Enable the VPN client in the AP and connect to a VPN server [router mode]

The AP comes with a commercial VPN service provider (HideMyAss) predefined. To use the VPN client feature in the AP, you need a license from the HideMyAss server provider.
You must enable the VPN client in the router before you can select one of two predefined VPN services and establish a connection to the VPN server.

**To enable the VPN client in the router and connect to a VPN server:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **BASIC > VPN Client**.

   The VPN Client page displays.

5. Select the **Enable VPN Client** check box.

   The VPN settings on the page becomes available.

6. If you do not have a VPN license or a predefined VPN service, do the following:
   a. From the **VPN Server** menu, select a VPN provider.
   b. Click the **Buy a License** button.

      A provider web page opens that lets you choose a price plan and purchase a license.
   c. Follow the instructions on the web page.
   d. When you obtain a license, save your user name and password for the VPN service.

   For more information about VPN service, click the **Help Center** button.

7. From the **VPN Server** menu, select a VPN provider.

8. From the **VPN Protocol** menu, select **UDP** or **TCP**.

   UDP functions without error correction in transmission, so it is faster, but less reliable.

   TCP functions with error correction in transmission, so it is more reliable, but slower.

9. From the **Country** menu, select the country in which you want to use the VPN server.

10. From the **City** menu, select the city in which you want to use the VPN server, or leave the Any City selection, which is the default.

11. In the **Username** field, enter the user name for authentication with the VPN server.
12. In the **Password** field, enter the password for authentication with the VPN server.

13. Click the **Connect** button.
   Your settings are saved and the AP attempts to connect to the VPN server.

   When the AP is connected to the VPN server, the **Connect** button changes into the **Disconnect** button, allowing you to terminate the VPN connection.

   The Status field at the top of the page displays the status of the VPN connection, which you can be one of the following:

   - **Connecting**. The AP is attempting to connect to the VPN server.
   - **Connected**. The AP is connected to the VPN server.
   - **Disconnected**. The AP is connected to the VPN server.
   - **Error**. The connection to the VPN server failed.

   If you experience difficulty in establishing a VPN connection, click the **Show Logs** link and see if any log messages provide helpful information. For more information about the logs, see **Logs** on page 147.

---

**Disconnect the AP from the VPN server [router mode]**

**To disconnect the router from the VPN server and terminate the VPN connection:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see **Find the IP address of the AP when you cannot use routerlogin.net** on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **BASIC > VPN Client**.
   The VPN Client page displays.

5. Click the **Disconnect** button.
The VPN connection is terminated. When the AP is disconnected from the VPN server, the Disconnect button changes into the Connect button, allowing you to reestablish the VPN connection.
12

VPN Server and Service with OpenVPN [Router Mode]

If the AP is in router mode, you can use OpenVPN software to set up VPN connections and remotely access an office or site at which the AP is installed. In such a situation, the AP functions as a VPN server.

This chapter describes how to set up OpenVPN on the AP and on a computer or mobile device and how to initiate a VPN connection to the AP, using OpenVPN.

Note: In AP mode, the VPN server and service settings that are described in this chapter are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these VPN server and service settings are masked out in the local browser UI.

The chapter includes the following sections:

- Enable and configure OpenVPN and VPN client access on the AP [router mode]
- OpenVPN client utility and VPN configuration files [router mode]
- About setting up an OpenVPN connection [router mode]
- About VPN access to your network or Internet service at your office or home [router mode]
- Use a VPN tunnel to remotely access your Internet service [router mode]

Note: In this chapter, we refer to the access point as the AP.
Enable and configure OpenVPN and VPN client access on the AP [router mode]

If the AP is in router mode, you can configure OpenVPN and VPN client access on the AP.

You must enable OpenVPN and specify the OpenVPN service settings on the AP before remote clients can access the AP with a VPN connection using OpenVPN software.

**Note:** Make sure that remote clients install their VPN configuration files after you configure OpenVPN on the AP. If you make changes to the OpenVPN configuration on the AP, the VPN configuration files that the remote clients use might change, requiring the remote clients to download and install the new VPN configuration files.

**To enable and configure OpenVPN on the AP:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > VPN Service**.

   The VPN Service page displays.
5. Select the **Enable VPN Service** check box.

   We recommend that you use the default TUN mode and TAP mode settings. However, if you know that you need other settings, you can change the TUN mode and TAP mode settings by doing the following:
   
   - To change the TUN mode service type, select the **UDP** or **TCP** radio button
   - To change the TUN mode service port, type the port number that you want to use in the field.
     
     The default port number is 12973.
To change the TAP mode service type, select the **UDP** or **TCP** radio button.

To change the TAP mode service port, type the port number that you want to use in the field. The default port number is 12974.

6. Specify how VPN client connections can be used on the AP by selecting one of the following radio buttons:

- **Auto.** The AP automatically uses the VPN service only for necessary access, that is, the AP allows access to sites and services that would not be accessible without a VPN connection. This is the default selection. However, if some sites or services are not accessible to the VPN client, or if a user cannot access some sites on the Internet, select another radio button.

- **All sites on the Internet & Home Network.** The VPN client can access the Internet and all sites and services on the AP network, that is, behind the AP firewall. Accessing the Internet remotely through a VPN connection might be slower than accessing the Internet directly.

- **Home Network only.** The VPN client can access all sites and services on the AP network, that is, behind the AP firewall, but cannot access the Internet.

7. Click the **Apply** button.

Your settings are saved. OpenVPN service is enabled on the AP.

Users must install and set up OpenVPN software on their computer or mobile device before they can establish a VPN connection to the AP.

### OpenVPN client utility and VPN configuration files [router mode]

To establish a VPN connection to the AP using OpenVPN software, a remote client must install both OpenVPN client software and the AP VPN configuration files on on their computer or mobile device. A remote client can install this software on a Windows computer, Mac computer, iOS device, and Android device.
Install OpenVPN on a Windows-based computer [router mode]

To download and install the OpenVPN client utility and the AP’s VPN configuration files on a Windows-based computer:

   You might need administrative privileges to install the OpenVPN client utility.

2. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

3. Launch a web browser and enter http://www.routerlogin.net in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

4. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

5. Select ADVANCED > Advanced Setup > VPN Service.
   The VPN Service page displays.

6. Make sure that the Enable VPN Service check box is selected.
   For more information, see Enable and configure OpenVPN and VPN client access on the AP [router mode] on page 181.

7. In the OpenVPN configuration package download section, click the For Windows button, and download the AP’s VPN configuration files.

8. Unzip the configuration files and copy them to the folder in which the OpenVPN client utility is installed.
9. Modify the VPN interface name to NETGEAR-VPN by doing the following:
   a. In Windows, open Network Connection or Network and Sharing Center.
      The network connection information displays.
   b. In the local area connection list, find the local area connection with the device
      name TAP-Windows Adapter.
   c. Change the name of the associated local area connection to **NETGEAR-VPN**.
      Make sure that you change the name of the local area connection, *not* the device
      name (TAP-Windows Adapter).

   If you do not change the local area connection name, the VPN connection to the AP
   will fail.

   The computer is now ready to for you to set up a VPN connection to the AP.

   For more information about using OpenVPN on a Windows-based computer, visit
   openvpn.net/community-resources/how-to/#quick.

---

**Install OpenVPN on a Mac [router mode]**

**To download and install the OpenVPN client utility and the AP’s VPN configuration
files on a Mac:**

1. Visit tunnelblick.net, download the OpenVPN client utility for a Mac, and install it on
   the Mac.
   You might need administrative privileges to install the OpenVPN client utility.

2. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either
     operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP
     is operating in AP mode.)

3. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address
   that is assigned to the AP. For information about finding the IP address, see **Find the
   IP address of the AP when you cannot use routerlogin.net** on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information,
   see **Dismiss a browser security warning** on page 38.

4. Enter the AP local device password.
The local device password is the one that you specified. The local device password is case-sensitive.

The BASIC Home page displays.

5. Select **ADVANCED > Advanced Setup > VPN Service**.
   The VPN Service page displays.

6. Make sure that the **Enable VPN Service** check box is selected.
   For more information, see Enable and configure OpenVPN and VPN client access on the AP [router mode] on page 181.

7. In the OpenVPN configuration package download section, click the **For Mac OS X** button, and download the AP’s VPN configuration files.

8. Unzip the configuration files and copy them to the folder in which the OpenVPN client utility is installed.
   The Mac is now ready to for you to set up a VPN connection to the AP.
   For more information about using OpenVPN on a Mac, visit openvpn.net/vpn-server-resources/installation-guide-for-openvpn-connect-client-on-macos/.

Install OpenVPN on an iOS device [router mode]

**To download and install the OpenVPN client utility and the AP’s VPN configuration files on an iOS device:**

1. On your iOS device, visit the Apple app store and download and install the OpenVPN Connect app.

2. Launch a web browser from the iOS device or a computer, either of which must be connected to the AP network.

3. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

4. Enter the AP user name and local device password.
   The user name is **admin**. The local device password is the one that you specified.
   The user name and local device password are case-sensitive.
   The BASIC Home page displays.
5. Select **ADVANCED > Advanced Setup > VPN Service**.  
The VPN Service page displays.

6. Make sure that the **Enable VPN Service** check box is selected.  
For more information, see Enable and configure OpenVPN and VPN client access on the AP [router mode] on page 181.

7. In the OpenVPN configuration package download section, click the **For Smart Phone** button, and download the AP’s VPN configuration files to your iOS device or computer.  
If you download the configuration files to a computer, unzip the configuration files that you downloaded and send the files to your iOS device.  
The configuration files include the `.ovpn` file.

8. On your iOS device, open the `.ovpn` file, select the OpenVPN Connect app, and import the `.ovpn` file.  
Your iOS device is now ready to for you to set up a VPN connection to the AP.  
For more information about using OpenVPN on an iOS device, visit vpngate.net/en/howto_openvpn.aspx#ios.

### Install OpenVPN on an Android device [router mode]

**To download and install the OpenVPN client utility and the AP’s VPN configuration files on an Android device:**

1. On your Android device, visit the Google Play Store and download and install the OpenVPN Connect app.

2. Launch a web browser from the Android device or a computer, either of which must be connected to the AP network.

3. Launch a web browser and enter **http://www.routerlogin.net** in the address field.  
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.  
A login window displays.  
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

4. Enter the AP local device password.  
The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

5. Select **ADVANCED > Advanced Setup > VPN Service**.
   The VPN Service page displays.

6. Make sure that the **Enable VPN Service** check box is selected.
   For more information, see *Enable and configure OpenVPN and VPN client access on the AP [router mode]* on page 181.

7. In the OpenVPN configuration package download section, click the **For Smart Phone** button, and download the AP’s VPN configuration files to your Android device or computer.
   If you download the configuration files to a computer, unzip the configuration files that you downloaded and send the files to your Android device.
   The configuration files include the `.ovpn` file.

8. On your Android device, start the OpenVPN Connect app, and search for and import the `.ovpn` file.
   Your Android device is now ready to for you to set up a VPN connection to the AP.
   For more information about using OpenVPN on an Android device, visit *vpngate.net/en/howto_openvpn.aspx#android*.

### About setting up an OpenVPN connection [router mode]

The type of virtual private network (VPN) access in which remote users access a protected network is called a client-to-gateway tunnel. The computer is the client, and the AP is the gateway. To enable users to access the AP over a VPN connection, the AP must be in router mode, and you must enable and configure OpenVPN service on the AP. Remote users must install and run OpenVPN client software on their computer or mobile device.

OpenVPN requires a static IP address or DDNS service on the AP to enable a remote client such as a computer or mobile device to connect with the AP. (If the AP uses a static WAN IP address that never changes, OpenVPN can use that IP address to connect to the network over a VPN connection.)

If the AP does not use a static WAN IP address, you can use a DDNS service for the AP and register for an account with a host name (also referred to as a domain name). A remote client such as a computer or mobile device can use that host name to connect with the AP and access the network over a VPN connection. For more information, see *About Dynamic DNS [router mode]* on page 171.
About VPN access to your network or Internet service at your office or home [router mode]

When you are away from your office or home and you access the Internet, you usually use a local Internet service provider. For example, at a coffee shop you might be given a code that lets you use the coffee shop’s Internet service account to surf the web.

The AP lets you use a VPN connection to access your own Internet service when you are away from your office or home. You might want to do this if you travel to a geographic location that does not support all the Internet services that you use at your office or home. For example, your Netflix account might work at home but not in a different country.

For information about the types of VPN client connections that the AP supports, see Enable and configure OpenVPN and VPN client access on the AP [router mode] on page 181. In addition to access to your office or home network, you can either allow or block VPN client Internet access through your office or home network.

For the VPN tunnel to work, the LAN where your VPN client computer is connected must use a different LAN IP address scheme from that of the LAN of the AP at your office or home. If both networks use the same LAN IP address scheme, when the VPN tunnel is established, you cannot access the AP network at your office or home with the OpenVPN software.

The default LAN IP address scheme for the AP is 192.168.1.x. The most common IP schemes are 192.x.x.x, 172.x.x.x, and 10.x.x.x. If you experience a conflict while you are not at your office or home, consider asking someone else at your office or home to change the AP IP address scheme for your office or home network (see LAN IP address settings [router mode] on page 114).

Use a VPN tunnel to remotely access your Internet service [router mode]

Before you leave the location with your Internet service (for example, your office or home), make sure that you do the following:

- Set up VPN client access to your office or home network for the type of computer or mobile device that you intend to use as a VPN client and allow VPN client Internet access through your office or home network (see Enable and configure OpenVPN and VPN client access on the AP [router mode] on page 181).
Download and install OpenVPN client software on the computer or mobile device that you intend to use as a VPN client and download and install the AP’s VPN configuration files (see OpenVPN client utility and VPN configuration files [router mode] on page 182).

To remotely access your Internet service:

1. On your computer, launch the OpenVPN application.
2. Right-click the icon and select **Connect**.
   Depending on the operating system on your computer or mobile client, you might have to do something else to make a VPN connection.
3. Enter the OpenVPN password for VPN access.
   This is the password that you set up when you installed and configured OpenVPN client software on your computer or mobile device.
4. When the VPN connection is established, launch your web browser.
13

Advanced WiFi and Radio Features

This chapter describes how you can manage the advanced WiFi and radio features of the AP. For information about the basic WiFi and radio settings, see Basic WiFi and Radio Features on page 63.

Tip: If you want to change the settings of the AP’s WiFi network, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

The chapter includes the following sections:

- Change the region of operation
- Manage 802.11ax and enable or disable OFDMA for a radio
- Enable or disable smart connect for the AP
- Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio
- Change the channel for a radio
- Change the WiFi throughput mode for a radio
- Change the transmission output power for a radio
- Add a WiFi schedule for a radio
- Enable or disable MU-MIMO
- Enable or disable explicit beamforming
- Enable or disable PMF
- Set up the AP as a WiFi Bridge to another device
- Change the CTS/RTS threshold and preamble mode for a radio

Note: In this chapter, we refer to the access point as the AP.
Change the region of operation

You can change the region of operation, which is region in which you operate the AP. For some countries such as North America, you cannot change the region because it is preset.

**Note:** Make sure the country is set to the location where the device is operating. You are responsible for complying within the local, regional, and national regulations set for channels, power levels, and frequency ranges.

**WARNING:** It might not be legal to operate the AP in a region other than the regions listed in the menu. If your country or region is not listed, check with your local government agency.

To change the region of operation:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
    The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. From the **Region** menu, select the region in which the AP must operate.
6. Click the **Apply** button.

   Your settings are saved. The AP restarts with the settings for the new region.

**Manage 802.11ax and enable or disable OFDMA for a radio**

If 802.11ax (11AX) WiFi is enabled (which it is by default), you can enable Orthogonal Frequency-Division Multiple-Access (OFDMA) for each radio band independently. By default, OFDMA is disabled on both radio bands, even when 11AX WiFi is enabled.

OFDMA allows data transmission signals to be split into smaller signals. The AP sends these small signals directly to individual devices in your network. Because multiple devices can be served in the same transmission window, the AP does not need to wait for WiFi access for every packet. This method of communication increases network speed and efficiency.

Note the following about OFDMA:

- Enable OFDMA if your network includes many Internet of things (IoT) devices.
- After you enable OFDMA, if you notice that some of your devices do not function as expected, disable OFDMA to see if the devices function fine.
- If your network includes many older devices, you might want to keep OFDMA disabled.

We recommend that you keep 11AX enabled.

**To manage 11AX for both radios and enable or disable OFDMA for an individual radio:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see *Find the IP address of the AP when you cannot use routerlogin.net* on page 32.

   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Select or clear the Enable 11AX check box.
   Selecting this check box enables 11AX for both radio bands and clearing this check box disables 11AX for both radio bands. If you disable 11AX, you cannot enable OFDMA for either radio band.

6. If 11AX is enabled, select or clear the Enable OFDMA in 2.4GHz check box.
   Selecting this check box enables OFDMA in the 2.4 GHz radio band and clearing this check box disables OFDMA in the 2.4 GHz radio band.

7. If 11AX is enabled, select or clear the Enable OFDMA in 5GHz check box.
   Selecting this check box enables OFDMA in the 5 GHz radio band and clearing this check box disables OFDMA in the 5 GHz radio band.

8. Click the Apply button.
   Your settings are saved. The radio or radios restart and WiFi clients might need to reconnect.

Enable or disable smart connect for the AP

Smart connect automatically selects the fastest WiFi band for a WiFi client device that is connected to the AP. This feature is enabled by default and applies on all WiFi networks on the AP.

When smart connect is enabled, the 2.4 GHz and 5 GHz bands for a WiFi network use the same WiFi network name (SSID) and network key (WiFi password). That means that when you connect to the AP using that WiFi network, you see only one SSID, which connects to both bands of the WiFi network.
**Note:** If smart connect is enabled and the SSID and passwords for the 2.4 GHz and 5 GHz bands do not match, the WiFi settings for 2.4 GHz band overwrite the WiFi settings for the 5 GHz band.

If the smart connect feature is enabled, in addition to the SSID and network key, the following WiFi settings apply to both radios simultaneously, which means that you cannot configure these settings for each radio individually:

- Enabling or disabling the WiFi radios
- Changing the CTS/RTS threshold and preamble mode for the radios
- Changing the transmission output power for the radios
- Adding a WiFi schedule for the radios

**To enable or disable smart connect:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP's WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see [Dismiss a browser security warning](#) on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Select or clear the **Enable smart connect** check box.

   Selecting this check box enables smart connect and clearing this check box disables smart connect.
By default, smart connect is enabled and the check box is selected.

6. Click the **Apply** button.
   Your settings are saved. The radios restart and WiFi clients might need to reconnect.

## Enable or disable 20/40 MHz coexistence for the 2.4 GHz radio

20/40 coexistence allows a 20 MHz and 40 MHz channel width to be supported simultaneously. By default, 20/40 MHz coexistence is enabled on the 2.4 GHz radio to prevent interference between WiFi networks in your environment at the expense of the WiFi speed. If no other WiFi networks are present in your environment, you can disable 20/40 MHz coexistence to increase the WiFi speed on the 2.4 GHz radio to the maximum supported speed for the WiFi mode.

20/40 MHz coexistence does not apply to the 5 GHz radio.

### To enable or disable 20/40 MHz coexistence for the 2.4 GHz radio:

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](page 32).
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see [Dismiss a browser security warning](page 38).

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Select or clear the **Enable 20/40 MHz co-existence 2.4 GHz** check box.
   Selecting this check box enables 20/40 MHz coexistence and clearing this check box enables 20/40 MHz coexistence.
   By default, 20/40 MHz coexistence is enabled and the check box is selected.

6. Click the **Apply** button.
   Your settings are saved. The 2.4 GHz radio restarts and WiFi clients might need to reconnect.

### Change the channel for a radio

The available WiFi channels and frequencies depend on the region or country and the radio. For the 2.4 GHz radio, the default is Auto, which means that the radio automatically selects the most suitable channel. For the 5 GHz radio, the default channel depends on the region. When you select a particular channel, the channel selection becomes static.

**Note:** You do not need to change the WiFi channel unless you experience interference (which is indicated by lost connections).

**Note:** If you use multiple WiFi access points in your network, or your AP is close to another one, reduce interference by selecting different channels for adjacent access points. We recommend a channel spacing of four channels between adjacent access points (for example, for 2.4 GHz radios, use channels 1 and 5, or 6 and 10).

**To change the channel for a radio:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. From the 2.4 GHz Channel or 5 GHz Channel menu, select a channel.
   For the 2.4 GHz radio, the default is Auto, which means that the radio automatically selects the most suitable channel. For the 5 GHz radio, the default channel depends on the region. When you select a particular channel, the channel selection becomes static.

6. Click the Apply button.
   Your settings are saved. The radio or radios restart and WiFi clients might need to reconnect.

Change the WiFi throughput mode for a radio

By default, all types of WiFi clients can access a WiFi network on the AP, that is, the WiFi throughput modes on the AP support 802.11ax, 802.11ac, 802.11a, 802.11n, 802.11g and 802.11b clients. You can change the WiFi throughput mode for a radio to better suit your WiFi environment. However, in doing so, you might limit the speed that some WiFi clients are capable of.

To change the WiFi throughput mode for a radio:

1. Connect your computer or mobile device to the AP in one of the following ways
   • Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   • Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. From the Mode menu for a radio, select the WiFi throughput mode:

   - **2.4 GHz mode.** Select one of the following WiFi throughput modes for the 2.4 GHz radio:
     - **Up to 54 Mbps (11g).** Legacy mode. This mode allows 802.1ax, 802.11n, 802.11g, 802.11b, devices to join the network but limits 802.11ax and 802.11n devices to functioning at up to 54 Mbps.
     - **Up to 286 Mbps (11ax, HT20, 1024-QAM).** Neighbor-friendly mode for reduced interference with neighboring WiFi networks. This mode allows 802.1ax, 802.11n, 802.11g, and 802.11b devices to join the network but limits 802.11ax and 802.11n devices to functioning at up to 286 Mbps. This mode supports a 20 MHz-wide channel and 1024 quadrature amplitude modulation (QAM).
     - **Up to 600 Mbps (11ax, HT40, 1024-QAM).** Performance mode. This mode allows 802.1ax, 802.11n, 802.11g, and 802.11b devices to join the network and allows 802.11ax devices to function at up to 600 Mbps. This mode is the default mode. This mode supports a 40 MHz-wide channel and 1024 QAM.

   - **5 GHz mode.** Select one of the following WiFi throughput modes for the 5 GHz radio:
     - **Up to 286 Mbps (11ax, HT20, 1024-QAM).** Legacy mode. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the network but limits 802.11ax, 802.11ac, and 802.11n devices to functioning at up to 286 Mbps.
This mode supports a 20 MHz-wide channel and 1024 QAM.

- **Up to 573 Mbps (11ax, HT40, 1024-QAM)**. Neighbor-friendly mode for reduced interference with neighboring WiFi networks. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the network but limits 802.11ax and 802.11ac devices to functioning at up to 573 Mbps. This mode supports a 40 MHz-wide channel and 1024 QAM.

- **Up to 1200 Mbps (80 MHz) (11ax, HT80, 1024-QAM)**. Performance mode. This mode allows 802.11ax, 802.11ac, 802.11n, and 802.11a devices to join the network and allows 802.11ax and 802.11ac devices to function at up to 1200 Mbps. This mode is the default mode. This mode supports a 80 MHz-wide channel and 1024 QAM.

6. Click the **Apply** button.

   Your settings are saved. The radio or radios restart and WiFi clients might need to reconnect.

### Change the transmission output power for a radio

By default, the transmission output power of the AP is set at the maximum. If two or more APs are operating in the same area and on the same channel, interference can occur. In such a situation, you might want to decrease the transmission output power for one or both radios. Make sure that you comply with the regulatory requirements for total radio frequency (RF) output power in your country.

**IMPORTANT:** If the smart connect feature is enabled (which it is by default), any change in the transmission output power applies to both radios. That means that you cannot change the transmission output power for each radio individually.

**To change the transmission output power for a radio:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field.
Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Do one of the following:
   - **2.4 GHz radio**. To change the settings for the 2.4 GHz radio, scroll down to the Advanced Wireless Settings (2.4 GHz/b/g/n/ax) section.
   - **5 GHz radio**. To change the settings for the 5 GHz radio, scroll down to the Advanced Wireless Settings (5 GHz 802.11a/n/ac/ax) section.

   **Note**: If the smart connect feature is enabled (which it is by default), the page presents a single option in the Advanced Wireless Settings (2.4 GHz/b/g/n/ax & 5 GHz 802.11a/n/ac/ax) section. In that situation, any change in the transmission output power applies to both radios simultaneously. If the smart connect feature is disabled, you can change the transmission output power for each radio individually.

6. From the **Transmit Power Control** menu, select **100%, 75%, 50%, or 25%**. The default setting is 100%.

7. Click the **Apply** button.
   Your settings are saved. The radio restarts and WiFi clients might need to reconnect.

## Add a WiFi schedule for a radio

You can use this feature to turn off the WiFi signal from a radio at times when you do not need a WiFi connection. For example, you might turn it off at night, for the weekend,
or for a holiday. You can add multiple schedules but only a single schedule can be active for each radio.

**Note:** You can add a WiFi schedule only if the AP is connected to the Internet and synchronizes its internal clock with a time server on the Internet. For more information about whether the AP synchronizes its clock, see Time and Network Time Protocol server on page 145.

**IMPORTANT:** If the smart connect feature is enabled (which it is by default), you can add a WiFi schedule that applies to both radios. That means that you cannot add a WiFi schedule for each radio individually.

**To add a WiFi schedule for a radio:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter **http://www.routerlogin.net** in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Do one of the following:
   
   - **2.4 GHz radio.** To change the settings for the 2.4 GHz radio, scroll down to the Advanced Wireless Settings (2.4 GHz/b/g/n/ax) section.
• **5 GHz radio.** To change the settings for the 5 GHz radio, scroll down to the Advanced Wireless Settings (5 GHz 802.11a/n/ac/ax) section.

**Note:** If the smart connect feature is enabled (which it is by default), the page presents a single option in the Advanced Wireless Settings (2.4 GHz/b/g/n/ax & 5 GHz 802.11a/n/ac/ax) section. In that situation, setting up or changing a WiFi schedule applies to both radios simultaneously. If the smart connect feature is disabled, you can set up or change a WiFi schedule for each radio individually.

6. Click the **Add a new period** button.
   The settings to turn off the WiFi signal display.

7. Use the menus, radio buttons, and check boxes to set up a period during which you want to turn off the WiFi signal for the selected radio and specify whether the schedule is recurrent.
   The start time and end time cannot be identical, even if they fall on different days. For example, if you start the schedule at 12:00 midnight, you cannot end it on another day at 12:00 midnight but you can end it at 11:30 p.m. or 12:30 a.m.

8. Click the **Apply** button.
   Your settings are saved, the Advanced Wireless Settings page displays again, and the new schedule shows in the table for the selected radio.

9. To enable a schedule immediately, do the following above the table,
   a. In the table, select the radio button for the schedule.
      If the table includes a single schedule only, the radio button for the schedule is already selected.
      The radio button for the schedule also lets you select the schedule if you want to change (edit) or delete it.
   b. Select the **Turn off wireless signal by schedule** check box.

10. Click the **Apply** button.
    Your settings are saved and the schedule becomes active. The WiFi signal is turned off according to the schedule that you added.

---

**Enable or disable MU-MIMO**

Multiuser multiple input, multiple output (MU-MIMO) improves performance when multiple MU-MIMO-capable WiFi clients transfer data at the same time. WiFi clients must support MU-MIMO. This feature is enabled by default, but you can disable it.
**Note:** When MU-MIMO is enabled, Tx beamforming is automatically enabled and you cannot disable it.

**To enable or disable MU-MIMO:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field. Instead, if you are connected to the same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see [Find the IP address of the AP when you cannot use routerlogin.net](#) on page 32.
   
   A login window displays.
   
   If your browser displays a security warning, dismiss the warning. For more information, see [Dismiss a browser security warning](#) on page 38.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.
   
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
   
   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Select or clear the **Enable MU-MIMO** check box.
   
   Selecting this check box enables MU-MIMO. By default, MU-MIMO is enabled.

6. Click the **Apply** button.
   
   Your settings are saved. The radios restart and WiFi clients might need to reconnect.

---

**Enable or disable explicit beamforming**

Explicit beamforming (which is the same as Tx beamforming) lets the AP actively track WiFi clients and direct power to the AP antenna closest to the client.
With this technique, the AP uses information about the WiFi communication link with clients to improve signal transmission to the clients. Explicit beamforming provides better reception, range, and throughput while minimizing interference.

Explicit beamforming functions whether or not the client supports beamforming.

**Note:** When MU-MIMO is enabled, explicit beamforming is automatically enabled and you cannot disable it.

**To enable or disable explicit beamforming when MU-MIMO is disabled:**
1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP's WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)
2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Wireless Settings**.
   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)
5. Select or clear the **Enable Tx Beamforming** check box.
   Selecting this check box enables explicit beamforming and clearing this check box disables explicit beamforming. (Tx beamforming is another term for explicit beamforming.)
   By default, MU-MIMO is enabled, and therefore explicit beamforming is also enabled. If MU-MIMO is disabled, explicit beamforming is automatically enabled, but you can disable it.
6. Click the **Apply** button.

Your settings are saved. The radios restart and WiFi clients might need to reconnect.

### Enable or disable PMF

Protected Management Frames (PMF), according to the 802.11w standard, is a security feature that protects unicast and multicast management frames from being intercepted and changed for malicious purposes. PMF, which is enabled by default, requires devices on the AP WiFi networks to support PMF. However, you can disable PMF, for example, if your network includes many legacy WiFi clients that do not support PMF.

**To enable or disable PMF:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter [http://www.routerlogin.net](http://www.routerlogin.net) in the address field.
   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

A login window displays.

If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.

   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Wireless Settings**.

   The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Select or clear the **Disable PMF** check box.

   Selecting this check box disables PMF and clearing this check box enables PMF. By default, PMF is enabled and the check box is cleared.
6. Click the **Apply** button.
Your settings are saved. The radios restart and WiFi clients might need to reconnect.

**Set up the AP as a WiFi Bridge to another device**

You can use the AP as a WiFi bridge and connect multiple devices with WiFi, for example, at the faster 802.11ax speed. The AP that functions as the bridge must connect over WiFi to another WAX204 AP, WiFi router, or access point (AP) that provides Internet access. In this way, the AP that functions as the bridge receives Internet access over a **WiFi bridge** from the device that is connected to the Internet.

![Figure 9. WiFi bridge between two APs](image)

You can also connect the AP in router mode to a device that functions as a modem and use the other WAX204 AP or a different AP or WiFi router as a WiFi bridge (assuming that the AP or WiFi router is also capable of functioning as a WiFi bridge).

Setting up a WiFi bridge with two WAX204 APs offers the following benefits:

- Take advantage of high WiFi speeds (802.11ax) for WiFi devices connected to either side of the WiFi bridge.
- Connect multiple devices such as a NAS, Smart TV, NeoTV, and Blu-ray player using a high-speed (802.11ax) WiFi link.
Note: The Internet (WAN) and LAN ports of the WAX204 AP support gigabit speed. That means that speeds up to 1 GB can be achieved between the AP and its connected devices. It does not necessarily mean that traffic to and from the Internet is also at gigabit speed, because the speed for Internet traffic depends on your Internet connection.

As an example of a WiFi bridge, you could install the first AP in the office in which your Internet connection (your modem) is located. Then set up the second AP as a WiFi bridge and place it in a different room or floor. If you use a home office, you could use another room such as one where your home entertainment center is located. Cable the AP that functions as a WiFi bridge to your Smart TV, NeoTV, or Blu-ray player, and use its 802.11ax WiFi connection to the first AP in the office.

The AP that is connected to the Internet does not require any special setup because the AP that functions as a WiFi bridge connects to an existing SSID as a WiFi client, just like any other WiFi clients.

To set up the AP as a WiFi bridge to a device that provides the Internet connection:

1. Make a note of the WiFi settings of the other AP, WiFi router, or AP that is connected to the modem. You must know the SSID, WiFi security mode, WiFi password, and operating frequency (either 2.4 GHz or 5 GHz).

2. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

3. Launch a web browser and enter http://www.routerlogin.net in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

4. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
5. Select ADVANCED > Advanced Setup > Router / AP / Bridge Mode.
   The Router / AP / Bridge Mode page displays.

6. Select the Bridge Mode radio button.
   The page adjusts.

7. Click the Setup bridge mode wireless settings button.
   The Wireless Settings pop-up window displays.

8. Enter the WiFi settings of the WAX204 AP, WiFi router, or AP that is connected to
   the modem (that is, the other device):
   a. From the Choose a Wireless Network menu, select the WiFi band that the other
      device is using.
   b. In the Name (SSID) field, type the WiFi network name (SSID) that the other device
      is using.
   c. In the Security Options section, select the radio button for the WiFi security that
      the other device is using.
   d. In the Password (Network Key) field, type the passphrase (WiFi password) that
      the other device is using for the SSID to which you want to connect the AP.

9. Click the Apply button.
   Your settings are saved. The pop-up window closes.

10. To change the device name of the AP, enter a new name in the Device Name field.
    By default, the device name is the AP model (WAX204). If you use two WAX204 APs
    and you want to distinguish the names, you could, for example, change the name
    to WiFi bridge or something similar.

11. To let the AP that functions as the WiFi bridge get an IP address and DNS addresses
    dynamically from the other WAX204 AP, WiFi router, or AP that is connected to the
    modem, leave the Get IP Address Dynamically and Get DNS Server Address
    Dynamically check boxes selected.
    We recommend that you leave the Get IP Address Dynamically and Get DNS
    Server Address Dynamically check boxes selected. However, if you are sure that
    you must use a static IP address, use an IP address from the LAN IP address pool of
the WAX204 AP, WiFi router, or AP that is connected to the modem. To specify a static IP address for the AP that functions as the WiFi bridge, do the following:

a. Clear the **Get IP Address Dynamically** check box.

b. Enter all static IP address information and, if applicable, static DNS address information.

12. Click the **Apply** button.

   Your settings are saved. The AP restarts with a new IP address.

13. To reconnect, close your browser, relaunch it, and log in to the AP by entering http://www.routerlogin.net.

**Change the CTS/RTS threshold and preamble mode for a radio**

For most WiFi networks, the CTS/RTS threshold and preamble mode work fine and we recommend that you do not change the settings. (In general, these settings are intended for WiFi testing.)

**CAUTION:** Do not change these settings unless directed by NETGEAR support or unless you are sure what the consequences are. Incorrect settings might disable the WiFi function of a radio unexpectedly.

**IMPORTANT:** If the smart connect feature is enabled (which it is by default), the CTS/RTS threshold and preamble mode apply to both radios. That means that you cannot change the CTS/RTS threshold and preamble mode for each radio individually.

**To change the CTS/RTS threshold and preamble mode for a radio:**

1. Connect your computer or mobile device to the AP in one of the following ways
   
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter http://www.routerlogin.net in the address field.

   Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

The Wireless Settings page displays. The lower part of the page is called the Advanced Wireless Settings page. (As you scroll down on the page, the page name changes.)

5. Do one of the following:

- **2.4 GHz radio.** To change the settings for the 2.4 GHz radio, scroll down to the Advanced Wireless Settings (2.4 GHz/b/g/n/ax) section.
- **5 GHz radio.** To change the settings for the 5 GHz radio, scroll down to the Advanced Wireless Settings (5 GHz 802.11a/n/ac/ax) section.

**Note:** If the smart connect feature is enabled (which it is by default), the page presents a single option only in the Advanced Wireless Settings (2.4 GHz/b/g/n/ax & 5 GHz 802.11a/n/ac/ax) section. In that situation, any change in the CTS/RTS threshold or preamble mode applies to both radios simultaneously. If the smart connect feature is disabled, you can change the CTS/RTS threshold and preamble mode for each radio individually.

6. In the **CTS/RTS threshold (1-2347)** field, enter a value from 1 to 2437.
The default value is 2347.

7. Form the **Preamble Mode** menu, select **Automatic, Long Preamble, or Short Preamble**.
The default setting is Automatic.

**CAUTION:** Incorrect settings might disable the WiFi function for the selected radio unexpectedly.

8. Click the **Apply** button.
Your settings are saved.
Port Forwarding and Port Triggering [Router Mode]

As an advanced function of the AP firewall, you can use port forwarding and port triggering to set up port traffic rules for Internet services and applications. These rules apply specifically to ports. You need networking knowledge to set up port traffic rules.

**Note:** In AP mode, the port forwarding and port triggering settings that are described in this chapter are not required because they can be provided by the routing device to which the AP connects. Therefore, in AP mode, these port forwarding and port triggering settings are masked out in the local browser.

This chapter includes the following sections:

- Port forwarding to a local server for services and applications [router mode]
- Port triggering for services and applications [router mode]

**Note:** In this chapter, we refer to the access point as the AP.
Port forwarding to a local server for services and applications [router mode]

If the AP is in router mode, and if a server is part of your network, you can allow certain types of incoming traffic to reach the server. For example, you might want to make a local web server, FTP server, or game server visible and available to the Internet.

The AP can forward incoming traffic with specific protocols to computers on your local network. You can specify the servers for applications and you can also specify a default DMZ server to which the AP forwards all other incoming protocols (see Set up a default DMZ server [router mode] on page 83).

Note: The information in this section and subsections does not apply if the AP is in access point mode.

Forward incoming traffic for a default service or application [router mode]

If the AP is in router mode, you can forward traffic for a default service or application to a computer on your network.

To forward incoming traffic for a default service or application:

1. Decide which type of service, application, or game you want to provide.
2. Find the local IP address of the computer on your network that will provide the service.
   The server computer must always receive the same IP address. To specify this setting, use the reserved IP address feature (see Reserved LAN IP addresses [router mode] on page 119).
3. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
4. Enter http://www.routerlogin.net in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
5. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
6. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**. The Port Forwarding / Port Triggering page displays.

7. Make sure that the **Port Forwarding** radio button is selected.

8. From the **Service Name** menu, select the service or application. If the service or application that you want to add is not in the list, create a port forwarding rule with a custom service or application (see Add a port forwarding rule for a custom service or application [router mode] on page 213).

9. In the **Server IP Address** field, enter the LAN IP address of the computer or server that must provide the service or that runs the application.

10. Click the **Add** button. Your settings are saved and the rule is added to the table.

11. To sort the table by internal IP addresses, click the **Arrange By Internal IP** button.

**Add a port forwarding rule for a custom service or application [router mode]**

If the AP is in router mode, it lists default services and applications that you can use in port forwarding rules. If the service or application is not predefined, you can add a port forwarding rule with a custom service or application.

**To add a port forwarding rule with a custom service or application:**

1. Find out which port number or range of numbers the service or application uses. You can usually find this information by contacting the publisher of the service or application or through user groups or news groups.

2. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

3. Enter **http://www.routerlogin.net** in the address field. A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

4. Enter the AP local device password. The local device password is the one that you specified. The local device password is case-sensitive. The BASIC Home page displays.

5. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
The Port Forwarding / Port Triggering page displays.

6. Make sure that the **Port Forwarding** radio button is selected.

7. Click the **Add Custom Service** button.
   The Ports - Custom Services page opens.

8. Set up a new port forwarding rule for a custom service or application by specifying the following settings:
   - **Service Name**. Enter the name of the custom service or application.
   - **Service Type**. Select the protocol (TCP or UDP) that is associated with the service or application. If you are unsure, select **TCP/UDP**.
   - **External port range**. If the service or application uses a single port, enter the port number in the **External port range** field. If the service or application uses a range or ranges of ports, specify the range in the **External port range** field. Specify one range by using a hyphen between the port numbers. Specify multiple ranges by separating the ranges with commas.
   - **Internal port range**. Specify the internal port or ports by one of these methods:
     - If the external and internal port or ports are identical, leave the **Use the same port range for Internal port** check box selected.
     - If the service or application uses a range or ranges of ports, clear the check box and specify the range in the **Internal port range** field. Specify one range by using a hyphen between the port numbers. Specify multiple ranges by separating the ranges with commas.
   - **Internal IP address**. Either enter an IP address in the **Internal IP address** field or select the radio button for a currently attached device that is listed in the table.

9. Click the **Apply** button.
   Your settings are saved. The rule is added to the table on the Port Forwarding / Port Triggering page.

10. To sort the table by internal IP addresses, click the **Arrange By Internal IP** button.
Change a port forwarding rule [router mode]

If the AP is in router mode, you can change an existing port forwarding rule.

To change a port forwarding rule:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select ADVANCED > Advanced Setup > Port Forwarding / Port Triggering.
   The Port Forwarding / Port Triggering page displays.
5. Make sure that the Port Forwarding radio button is selected.
6. In the table, select the radio button for the service or application name.
7. Click the Edit Service button.
   The Ports - Custom Services page displays.
8. Change the settings.
   For information about the settings, see Add a port forwarding rule for a custom service or application [router mode] on page 213.
9. Click the Apply button.
   Your settings are saved. The changed rule displays in the table on the Port Forwarding / Port Triggering page.
Remove a port forwarding rule [router mode]

If the AP is in router mode, you can remove a port forwarding rule that you no longer need.

To remove a port forwarding rule:

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field. A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password. The local device password is the one that you specified. The local device password is case-sensitive. The BASIC Home page displays.
4. Select `ADVANCED > Advanced Setup > Port Forwarding / Port Triggering`. The Port Forwarding / Port Triggering page displays.
5. Make sure that the Port Forwarding radio button is selected.
6. In the table, select the radio button for the service or application name.
7. Click the Delete Service button. The rule is removed from the table.
   A default rule remains available in the Service Name menu. A custom rule is removed. If you want to reinstate the custom rule, you must redefine it.
How the AP implements a port forwarding rule [router mode]

The following sequence shows the effects of a port forwarding rule:

1. When you enter the URL www.example.com in your browser, the browser sends a web page request message with the following destination information:
   - **Destination address.** The IP address of www.example.com, which is the address of your AP.
   - **Destination port number.** 80, which is the standard port number for a web server process.

2. The AP receives the message and finds your port forwarding rule for incoming port 80 traffic.

3. The AP changes the destination IP address in the message to, for example, 192.168.1.123 and sends the message to that computer.

4. Your web server at IP address 192.168.1.123 receives the request and sends a reply message to your AP.

5. Your AP performs Network Address Translation (NAT) on the source IP address and sends the reply through the Internet to the computer or mobile device that sent the web page request.

Application example: Make a local web server public [router mode]

If the AP is in router mode and you host a web server on your local network, you can use port forwarding to allow web requests from anyone on the Internet to reach your web server.

**To make a local web server public:**

1. Assign your web server either a fixed IP address or a dynamic IP address using DHCP address reservation.
   - In this example, your AP always assigns your web server an IP address of 192.168.1.33.

2. On the Port Forwarding / Port Triggering page, configure the AP to forward the HTTP service to the local address of your web server at **192.168.1.33**. HTTP (port 80) is the standard protocol for web servers.

3. (Optional) Register a host name with a Dynamic DNS service, and specify that name on the Dynamic DNS page of the AP.
Dynamic DNS makes it much easier to access a server from the Internet because you can enter the name in the web browser. Otherwise, you must know the IP address that the ISP assigned, which typically changes.

Port triggering for services and applications [router mode]

If the AP is in router mode, port triggering can function as a dynamic extension of port forwarding that is useful in these cases:

- An application must use port forwarding to more than one local computer (but not simultaneously).
- An application must open incoming ports that are different from the outgoing port.

With port triggering, the AP monitors traffic to the Internet from an outbound “trigger” port that you specify. For outbound traffic from that port, the AP saves the IP address of the computer that sent the traffic. The AP temporarily opens the incoming port or ports that you specify in your rule and forwards that incoming traffic to that destination.

Port forwarding creates a static mapping of a port number or range of ports to a single local computer. Port triggering can dynamically open ports to any computer when needed and close the ports when they are no longer needed.

**Note:** If you use applications such as multiplayer gaming, peer-to-peer connections, real-time communications such as instant messaging, or remote assistance, we recommend that you do not disable Universal Plug-N-Play (UPnP, see Improve network connections with Universal Plug and Play [router mode] on page 110).

**Note:** The information in this section and subsections does not apply if the AP is in access point mode.

Add a port triggering rule [router mode]

The AP does not provide default services and applications for port triggering rules. You must define a custom service or application for each port triggering rule. The AP must be in router mode.

**To add a port triggering rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter http://www.routerlogin.net in the address field.
A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
The local device password is the one that you specified. The local device password is case-sensitive.
The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
The Port Forwarding / Port Triggering page displays.

5. Select the **Port Triggering** radio button.
The port triggering settings display.

6. Click the **Add Service** button.
The Port Triggering - Services page displays.

7. Set up a new port triggering rule with a custom service or application by specifying the following settings:
   - **Service Name**: Enter the name of the custom service or application.
   - **Service User**: From the **Service User** menu, select **Any**, or select **Single address** and enter the IP address of one computer:
     - **Any**: This is the default setting and allows any computer on the Internet to use this service.
     - **Single address**: Restricts the service to a particular computer. Enter the IP address in the fields that become available with this selection from the menu.
   - **Service Type**: Select the protocol (**TCP** or **UDP**) that is associated with the service or application.
   - **Triggering Port**: Enter the number of the outbound traffic port that must open the inbound port or ports.

8. Set up the inbound connection by specifying the following settings:
   - **Service Type**: Select the protocol (**TCP** or **UDP**) that is associated with the inbound connection. If you are unsure, select **TCP/UDP**.
   - **Starting Port**: Enter the start port number for the inbound connection.
   - **Ending Port**: Enter the end port number for the inbound connection.
9. Click the **Apply** button.
   Your settings are saved and the rule is added to the Port Triggering Portmap Table on the Port Forwarding / Port Triggering page.

**Change a port triggering rule [router mode]**

If the AP is in router mode, you can change an existing port triggering rule.

**To change a port triggering rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter **http://www.routerlogin.net** in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
   The Port Forwarding / Port Triggering page displays.
5. Select the **Port Triggering** radio button.
   The port triggering settings display.
6. In the Port Triggering Portmap Table, select the radio button for the service or application name.
7. Click the **Edit Service** button.
   The Port Triggering - Services page displays.
8. Change the settings.
   For information about the settings, see Add a port triggering rule [router mode] on page 218.
9. Click the **Apply** button.
   Your settings are saved. The changed rule displays in the Port Triggering Portmap Table on the Port Forwarding / Port Triggering page.
Remove a port triggering rule [router mode]

If the AP is in router mode, you can remove a port triggering rule that you no longer need.

**To remove a port triggering rule:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
   The Port Forwarding / Port Triggering page displays.
5. Select the **Port Triggering** radio button.
   The port triggering settings display.
6. In the Port Triggering Portmap Table, select the radio button for the service or application name.
7. Click the **Delete Service** button.
   The rule is removed from the Port Triggering Portmap Table. If you want to reinstate the rule, you must redefine it.

Specify the time-out for port triggering [router mode]

The time-out period for port triggering controls how long the inbound ports stay open when the AP detects no activity. (The AP must be in router mode.) A time-out period is required because the AP cannot detect when the service or application terminates.

**To specify the time-out for port triggering:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
   The Port Forwarding / Port Triggering page displays.

5. Select the **Port Triggering** radio button.
   The port triggering settings display.

6. In the **Port Triggering Time-out** field, enter a value up to 9999 minutes.
   The default setting is 20 minutes.

7. Click the **Apply** button.
   Your settings are saved.

### Disable port triggering [router mode]

If the AP is in router mode, port triggering is enabled by default. You can disable port triggering temporarily without removing any port triggering rules.

**To disable port triggering:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.

2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED > Advanced Setup > Port Forwarding / Port Triggering**.
   The Port Forwarding / Port Triggering page displays.

5. Select the **Port Triggering** radio button.
The port triggering settings display.

6. Select the **Disable Port Triggering** check box.
   If this check box is selected, the AP does not apply port triggering rules even if you specified them.

7. Click the **Apply** button.
   Your settings are saved.

**Application example: Port triggering for Internet Relay Chat [router mode]**

Some application servers, such as FTP and IRC servers, send replies to multiple port numbers. Using port triggering (if the AP is in router mode), you can tell the AP to open more incoming ports when a particular outgoing port starts a session.

An example is Internet Relay Chat (IRC). Your computer connects to an IRC server at destination port 6667. The IRC server not only responds to your originating source port but also sends an “identify” message to your computer on port 113. Using port triggering, you can tell the AP, “When you initiate a session with destination port 6667, you must also allow incoming traffic on port 113 to reach the originating computer.”

The following sequence shows the effects of this port triggering rule:

1. You open an IRC client program to start a chat session on your computer.
2. Your IRC client composes a request message to an IRC server using a destination port number of 6667, the standard port number for an IRC server process. Your computer then sends this request message to your AP.
3. Your AP creates an entry in its internal session table describing this communication session between your computer and the IRC server. Your AP stores the original information, performs Network Address Translation (NAT) on the source address and port, and sends this request message through the Internet to the IRC server.
4. Noting your port triggering rule and observing the destination port number of 6667, your AP creates another session entry to send any incoming port 113 traffic to your computer.
5. The IRC server sends a return message to your AP using the NAT-assigned source port (for example, port 33333) as the destination port and also sends an “identify” message to your AP with destination port 113.
6. When your AP receives the incoming message to destination port 33333, it checks its session table to see if a session is active for port number 33333. Finding an active session, the AP restores the original address information replaced by NAT and sends this reply message to your computer.
7. When your AP receives the incoming message to destination port 113, it checks its session table and finds an active session for port 113 associated with your computer. The AP replaces the message’s destination IP address with your computer’s IP address and forwards the message to your computer.

8. When you finish your chat session, your AP eventually senses a period of inactivity in the communications. The AP then removes the session information from its session table, and incoming traffic is no longer accepted on port numbers 33333 or 113.
This chapter provides information to help you diagnose and solve problems you might experience with the AP. If you do not find the solution here, visit the NETGEAR support site at netgear.com/support for more product and contact information.

The chapter contains the following sections:

- **Reboot the AP from the local browser UI**
- **Quick tips for troubleshooting**
- **Standard LED behavior when the AP is powered on**
- **Troubleshoot with the LEDs**
- **You cannot log in to the AP**
- **You cannot access the Internet [router mode]**
- **Troubleshoot Internet browsing**
- **Troubleshoot the WiFi connectivity**
- **Changes are not saved**
- **Troubleshoot your network using the ping utility of your computer or mobile device**

**Note:** In this chapter, we refer to the access point as the AP.
Reboot the AP from the local browser UI

You or NETGEAR technical support can reboot the AP from its local browser UI, either locally or remotely, for example, if the AP seems to be unstable or is not operating normally.

**To reboot the AP from the local browser UI:**

1. Connect your computer or mobile device to the AP in one of the following ways
   - Connect directly to the AP’s WiFi network or LAN. (Applies to the AP in either operation mode.)
   - Connect to the same network that the AP is connected to. (Applies only if the AP is operating in AP mode.)

2. Launch a web browser and enter `http://www.routerlogin.net` in the address field. Instead, if you are connected to same network as the AP, enter the LAN IP address that is assigned to the AP. For information about finding the IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Dismiss a browser security warning on page 38.

3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.

4. Select **ADVANCED**.
   The ADVANCED Home page displays.

5. In the Router Information pane, click the **REBOOT** button.
   A pop-up warning window displays.

6. Click the **Yes** button.
   The AP restarts.
Quick tips for troubleshooting

Many common problems can be resolved by following our tips for troubleshooting.

Restart your AP network if in router mode

If the AP is in router mode and you must restart your network, follow this sequence:

1. Turn off and unplug the modem.
2. Turn off the AP.
3. Plug in the modem and turn it on. Wait two minutes.
4. Turn on the AP and wait two minutes.

Restart your AP when in access point mode

If the AP is in access point mode and you must restart it, follow this sequence:

1. Turn off the AP.
2. Turn on the AP and wait two minutes.

Check the Ethernet cable connections

Make sure that the Ethernet cables are connected correctly and securely plugged in:

- If the AP is in router mode (the default system mode), make sure that you connect the yellow Internet port on the AP through an Ethernet cable to a LAN port on your modem.
- If the AP is in access point mode, make sure that you connect the yellow Internet port on the AP through an Ethernet cable to a LAN port on the existing router in your network or to a switch or hub that is located between the AP and the router.
- For any computer or device that you connect directly through an Ethernet cable to the AP, make sure that you connect the Ethernet cable from the computer or device to one of the four LANs port on the AP.

Check the WiFi settings of your computer or mobile device

If you connect over WiFi to the AP, make sure that the WiFi settings on your computer or mobile device and the AP match exactly. If you did not change the SSID, the AP’s default SSID is “NETGEARXXXXXX”, where XXXXXX represents the last six characters of the AP’s MAC address, as printed on the AP label. If you did not change the passphrase
(also referred to as network key or WiFi password), the unique default passphrase is also printed on the AP label. The default security is WPA2-Personal [AES].

**Note:** If you set up an access control list on the AP, you must add each computer or mobile device to the access control list (see Enable and manage network access control on page 86).

The AP provides three WiFi networks (Wireless 1, Wireless 2, and Wireless 3). By default, the Wireless 1 network is enabled and the other two WiFi networks are disabled. If the Wireless 2 and Wireless 3 networks are enabled and you did not change the default settings, you can access these networks as follows:

- **Wireless 2.** The default SSID is NETGEARXXXXXX-2, in which XXXXXX represents the last six characters of the AP’s MAC address, and the default password is sharedsecret.

- **Wireless 3.** The default SSID is NETGEARXXXXXX-3, in which XXXXXX represents the last six characters of the AP’s MAC address, and the default password is sharedsecret.

Check the DHCP network settings of your computer or mobile device

Make sure that the network settings of the computer or mobile device with which you want to connect to the AP are correct:

- **Router mode.** If the AP is in router mode (the default system mode), make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the AP. If you are using the default addressing scheme, your device’s address is in the range of 192.168.1.2 to 192.168.1.254.

- **Access point mode.** If the AP is in access point mode, the LAN subnet to which your computer or device connects depends on the type of connection to the AP:
  - **Directly connected.** If you are directly connected over WiFi or an Ethernet cable to the AP network, make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the AP. If you are using the default addressing scheme, your device’s address is in the range of 192.168.1.2 to 192.168.1.254.
  
  - **Connected to the same network but not directly connected.** If you are not directly connected to the AP, make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the existing network router to which the AP is connected.
Most computers and mobile devices function as DHCP clients. If your computer or mobile device does not, enable its DHCP client so that it can obtain an IP address automatically using DHCP.

**Standard LED behavior when the AP is powered on**

After you turn on power to the AP, verify that the following sequence of events occurs:

1. When power is first applied, verify that the Power LED is lit.
2. After about two minutes, verify the following:
   - The Power LED is solid green.
   - The Internet LED is solid or blinking green.
   - The WiFi LED is solid or blinking green.
   - If a powered-up LAN device is connected to one of the LAN ports of the AP, the LAN LED is solid or blinking green, or solid or blinking amber, depending on the speed of the connection.

You can use the LEDs on the top panel of the AP for troubleshooting (see Troubleshoot with the LEDs on page 229)

**Troubleshoot with the LEDs**

You can troubleshoot by checking the LEDs.

**Power LED is off**

This could occur for a number of reasons. Check the following:

- Make sure that the power adapter is securely connected to your AP and securely connected to a working power outlet.
- Make sure that you are using the power adapter that NETGEAR supplied for this product.

**Power LED does not turn green**

When you turn on the AP, the Power LED lights solid red for about five seconds and then turns solid amber. After about 90 seconds, the Power LED lights solid green.
When the AP is upgrading firmware, the Power LED blinks amber temporarily and finally lights solid green.

If the LED stays solid red or blinking amber five minutes after startup, or lights solid red or blinking amber at any other time (not including a firmware upgrade), this indicates a problem with the AP. In that situation, do the following:

- Restart the AP to see if it recovers. If the problem occurs again, try one more time.
- If the AP does not recover, try to upload firmware to the AP using a TFTP client. For more information, see https://kb.netgear.com/000059633.
- If the AP still does not recover, press and hold the Reset button on the back to return the AP to its factory default settings. For more information, see Use the Reset button to return to factory defaults on page 143. If the problem occurs again, try one more time.

If the error persists, a hardware problem might be the cause. Contact NETGEAR technical support at netgear.com/support/.

Internet LED is solid amber or off [router mode]

If the AP is in its default router mode and the Internet LEDs is solid amber, the AP attempted to get an Internet connection but failed. Check the following:

- If the type of WAN connection of the modem is PPPoE, L2TP, or PPTP, or the connection requires a static IP address, make sure that you configured the Internet settings correctly. For more information, see Specify a PPPoE Internet connection that uses a login [router mode] on page 44, Specify a PPTP or L2TP Internet connection that uses a login [router mode] on page 46, or Specify a dynamic or fixed WAN IP address Internet connection without a login [router mode] on page 42.
- Make sure that you completed the initial log-in process. For more information, see Connect the AP to a routing device and log in for the first time on page 24 or, if you are connected to the local browser UI, see Use the Setup Wizard [router mode] on page 41.
- Make sure that your Internet service provider (ISP) is not experiencing an Internet outage.

If the AP is in its default router mode and the Internet LEDs is off, check the following:

- Make sure that the Ethernet cable connection is secure at the yellow Internet port (not a LAN port) of the AP and at an Ethernet port on the modem.
- Make sure that power is turned on to the connected modem.
When you connect the AP’s Internet port to a modem, use the cable that was supplied with the modem. This cable can be a standard straight-through Ethernet cable or an Ethernet crossover cable.

**Internet LED is solid amber or off [access point mode]**

If the AP is in access point mode and the Internet LED is solid amber, the AP attempted to get an Internet connection but failed. Check the following:

- If the network router to which the AP is connected does not function as a DHCP server (this is very unusual), make sure that another DHCP server in the network is active. The AP functions as a DHCP client and must receive an IP address from a network router or a DHCP server.
- Make sure that your Internet service provider (ISP) is not experiencing an Internet outage.

If the AP is in access point mode and the Internet LEDs is off, check the following:

- Make sure that the Ethernet cable connection is secure at the yellow Internet port (not a LAN port) of the AP and at an Ethernet port on the existing network router (or switch or hub that is connected to the router), and that you completed the initial log-in process. For more information, see Connect the AP to a routing device and log in for the first time on page 24. In access point mode, do not connect the cable directly to a modem.
- Make sure that power is turned on to the connected network router and that the network router is connected to the Internet.

When you connect the AP’s Internet port to the network router, use a standard straight-through Ethernet cable or an Ethernet crossover cable.

**WiFi LED is Off**

If the WiFi LED remains off, check to see if both radios on the AP are disabled (see Enable or disable a WiFi radio on page 76). By default, both radios are enabled and the WiFi LED lights solid green or blinks green.

Also, check to see if a WiFi schedule turned off both radios (see Add a WiFi schedule for a radio on page 200).

**The LAN LED is off while a device is connected**

If the LAN LED remains off while a powered-on device is connected, check these items:

- Make sure that the Ethernet cable connectors are securely plugged in at the AP and the network device.
• Make sure that the connected network device is actually turned on.
• Make sure that you are using the correct Ethernet cable. Use a standard Category 5 Ethernet patch cable. If the network device incorporates Auto Uplink™ (MDI/MDIX) ports, you can use either a crossover cable or a normal patch cable.

You cannot log in to the AP

If you are unable to log in to the AP’s local browser UI from a computer or mobile device, troubleshooting depends on whether the AP is in the default router mode or access point mode.

You cannot log in to the AP [router mode]

If the AP is in router mode and you are unable to log in to its local browser UI from a computer or mobile device on the AP network, check the following:

• Make sure that the yellow Internet port on the AP is connected to the Internet through your modem. The Internet LED must light solid green or blinking green.
• Make sure that the computer or mobile device that you are using is connected to the AP.
• Check the Ethernet or WiFi connection between your computer or mobile device and the AP:
  - Connect over Ethernet directly to the AP. If you connect the LAN port on your computer directly to the AP, check the Ethernet cable between the computer and the LAN port on the AP. (Do not connect your computer to the yellow Internet port on the AP.)
  - Connect over WiFi. If you are using a WiFi-enabled computer or mobile device, check the WiFi connection between the computer or device and the AP. If you did not change the SSID, the AP’s default SSID is “NETGEARXXXXXX”, where XXXXXX represents the last six characters of the AP’s MAC address, as printed on the AP label. If you did not change the passphrase (also referred to as network key or WiFi password), the unique default passphrase is also printed on the AP label.
• Make sure that you are using the correct login information.
  Use the user name admin and your customized local device password, also referred to as the admin password. When you used the Setup Wizard for the initial log-in process on the AP, you customized the local device password. (By default, the local device password is password.) The user name and password are case-sensitive. Make sure that Caps Lock is off when you enter this information.
• Make sure that you log in using http://www.routerlogin.net (which, in router mode, is the same as 192.168.1.1).

• Make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the AP. If you are using the default addressing scheme, your device’s address is in the range of 192.168.1.2 to 192.168.1.254. Most computers and mobile devices function as DHCP clients. If your computer or mobile device does not, enable its DHCP client so that is can obtain an IP address automatically using DHCP.

Note: Some versions of Windows and Mac OS generate and assign an IP address if a device cannot reach a DHCP server. These autogenerated addresses are in the range of 169.254.x.x. If your IP address is in this range, check the connection from the device to the AP and reboot your device.

• Try quitting the browser and launching it again.
• Clear your browsing data.
• Make sure that Java, JavaScript, or ActiveX is enabled in your browser. If you are using Internet Explorer, click the Refresh button to be sure that the Java applet is loaded.

You cannot log in to the AP [access point mode]

If the AP is in access point mode and you are unable to log in to its local browser UI from a computer or mobile device, check the following:

• Make sure that the yellow Internet port on the AP is connected to the Internet through an existing router in your network (or through a switch or hub that is connected to the router). The Internet LED must light solid green or blinking green.

• Make sure that the computer or mobile device that you are using is connected to the AP or the same network as the AP.

• Check the Ethernet or WiFi connection between your computer or mobile device and the AP:
  - Connect over Ethernet directly to the AP. If you connect the LAN port on your computer directly to the AP, check the Ethernet cable between the computer and the LAN port on the AP. (Do not connect your computer to the yellow Internet port on the AP.)
  - Connect over WiFi. If you are using a WiFi-enabled computer or mobile device, check the WiFi connection between the computer or device and the AP. If you did not change the SSID, the AP’s default SSID is “NETGEARXXXXXX”, where XXXXXX represents the last six characters of the AP’s MAC address, as printed.
on the AP label. If you did not change the passphrase (also referred to as network key or WiFi password), the unique default passphrase is also printed on the AP label.

**Note:** Connect over Ethernet to the same network. After you completed the initial login-process, if you connect your computer to the same network as the AP, check the Ethernet cable between your computer and the LAN port on either the network router or the switch or hub.

- Make sure that you are using the correct login information. Use the user name `admin` and your customized local device password, also referred to as the admin password. When you used the Setup Wizard for the initial log-in process on the AP, you customized the local device password. (By default, the local device password is `password`.) The user name and password are case-sensitive. Make sure that Caps Lock is off when you enter this information.

- If the AP’s IP address was changed and you cannot log in using `http://www.routerlogin.net` but you do not know the current IP address, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

- Make sure that the IP address of your computer or mobile device is on the correct LAN subnet. Most computers and mobile devices function as DHCP clients. If your computer or mobile device does not, enable its DHCP client so that it can obtain an IP address automatically using DHCP. The LAN subnet to which your computer or device connects depends on the type of connection to the AP:
  
  - **Directly connected.** If you are directly connected over WiFi or an Ethernet cable to the AP network, make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the AP. If you are using the default addressing scheme, your device’s address is in the range of 192.168.1.2 to 192.168.1.254.

  - **Connected to the same network but not directly connected.** If you are not directly connected to the AP, make sure that the IP address of your computer or mobile device is on the same subnet as the LAN subnet of the existing network router to which the AP is connected.

  **Note:** Some versions of Windows and Mac OS generate and assign an IP address if a device cannot reach a DHCP server. These autogenerated addresses are in the range of 169.254.x.x. If your IP address is in this range, check the connection from the device to the AP and reboot your device.

- Try quitting the browser and launching it again.
- Clear your browsing data.
- Make sure that Java, JavaScript, or ActiveX is enabled in your browser. If you are using Internet Explorer, click the **Refresh** button to be sure that the Java applet is loaded.

### You cannot access the Internet [router mode]

If the AP is in router mode and you can log in to the AP’s local browser UI but cannot get an Internet connection, check if the AP can obtain an IP address from your Internet service provider (ISP).

### Check the Internet WAN IP address [router mode]

If the AP is in router mode, unless your ISP provides a fixed IP address, the AP requests an IP address from your ISP. You can determine whether the request was successful.

**To check the Internet WAN IP address:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   
   A login window displays.

   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.

3. Enter the AP local device password.
   
   The local device password is the one that you specified. The local device password is case-sensitive.

   The BASIC Home page displays.

4. Select **ADVANCED**.
   
   The ADVANCED Home page displays.

5. In the Internet Port pane, click the **CONNECTION STATUS** button.
   
   The Connection Status pop-up window displays.

   **Note:** The information that displays depends on the type of Internet connection. If the Internet connection is PPPoE, PPTP, or L2TP, other information might display than if the Internet connection is an IP address that the ISP assigns dynamically (the most common situation).
6. Check to see that a valid IP address is shown in the IP address field.
If 0.0.0.0 is shown, the AP did not obtain an IP address from your ISP.

If the AP cannot obtain an IP address from the ISP, you might need to force your modem
to recognize the AP by restarting your network. For more information, see Restart your
AP network if in router mode on page 227.

If the AP is still unable to obtain an IP address from the ISP, the problem might be one
of the following:

- Your ISP might require a login program. Ask your ISP whether they require PPP over
  Ethernet (PPPoE) or some other type of login.
- If your ISP requires a login, the login name and password might be set incorrectly.
- Your ISP might check for your computer’s host name. Assign the computer host
  name of your ISP account as the account name (see Manually
  set
  up
  the
  AP
  Internet
  connection
  [router
  mode]
  on page 42).

- If your ISP allows only one Ethernet MAC address to connect to Internet and checks
  for your registered computer’s MAC address, do one of the following:
  - Inform your ISP that you bought a new network device and ask them to use the
    AP’s MAC address.
  - Configure the AP to clone your registered computer’s MAC address.

If the AP obtained an IP address, but your computer or mobile device does not load
any web pages from the Internet, it might be for one or more of the following reasons:

- Your computer or mobile device might not recognize any DNS server addresses.
  A DNS server is a host on the Internet that translates Internet names (such as www
  addresses) to numeric IP addresses. Typically, your ISP provides the addresses of
  one or two DNS servers for your use. If you entered a DNS address during the AP’s
  configuration, reboot your computer or mobile device, and verify the DNS address.
  You can configure your computer or mobile device manually with DNS addresses,
  as explained in your operating system documentation.

- The AP might not be configured as the TCP/IP gateway on your computer or mobile
device.
  If your computer or mobile device obtains its information from the AP by DHCP,
  reboot the computer or mobile device and verify the gateway address.

- You might be running login software that is no longer needed.
  If your ISP provided a program to log you in to the Internet, you might no longer
  need to run that software after installing your AP.
Check or manually start the PPPoE connection [router mode]

If the AP is in router mode and your ISP uses a PPPoE connection, you can check or manually start the PPPoE connection.

**To check or manually start the PPPoE connection:**

1. Launch a web browser from a computer or mobile device that is connected to a WiFi network or LAN port on the AP.
2. Enter `http://www.routerlogin.net` in the address field.
   A login window displays.
   If your browser displays a security warning, dismiss the warning. For more information, see Find the IP address of the AP when you cannot use routerlogin.net on page 32.
3. Enter the AP local device password.
   The local device password is the one that you specified. The local device password is case-sensitive.
   The BASIC Home page displays.
4. Select **ADVANCED**.
   The ADVANCED Home page displays.
5. In the Internet Port pane, click the **CONNECTION STATUS** button.
   The Connection Status pop-up window displays.
6. Check the information to see if your PPPoE connection is up and working.
   If the AP is not connected, click the **Connect** button.
   The AP continues to attempt to connect indefinitely.
7. If you cannot connect after several minutes, the AP might be set up with an incorrect PPPoE login name, password, or service name, or your ISP might be experiencing a provisioning problem.

**Note:** Unless you connect manually, the AP does not authenticate using PPPoE until data is transmitted to the network.
Troubleshoot Internet browsing

If the AP can obtain an IP address but your computer or mobile device is unable to load any web pages from the Internet, check the following:

- If the AP is in router mode and you can log in to the AP’s local browser UI but you cannot get an Internet connection, check if the AP can obtain an IP address from your ISP (see You cannot access the Internet [router mode] on page 235).

- The traffic meter is enabled, and the limit was reached. By configuring the traffic meter not to block Internet access when the traffic limit is reached, you can resume Internet access (see Unblock the traffic meter after the traffic limit is reached [router mode] on page 165). If your ISP sets a usage limit, they might charge you for the overage.

- Your computer or mobile device might not recognize any DNS server addresses. A DNS server is a host on the Internet that translates Internet names (such as www addresses) to numeric IP addresses. Typically, your ISP provides the addresses of one or two DNS servers for your use. If you entered a DNS address during the AP’s configuration, restart your computer or mobile device. Alternatively, you can configure your computer or mobile device manually with a DNS address, as explained in the documentation for your computer or mobile device.

- If the AP is in router mode, the AP might not be configured as the default gateway on your computer or mobile device. Reboot the computer or mobile device and verify that the AP address is listed by your computer or mobile device as the default gateway address.

- You might be running login software that is no longer needed. If your ISP provided a program to log you in to the Internet, you might no longer need to run that software after installing the AP.

Troubleshoot the WiFi connectivity

If you are experiencing trouble connecting over WiFi to the AP, try to isolate the problem:

- Make sure that the WiFi settings in your WiFi device and AP match exactly. For a device that is connected over WiFi, the WiFi network name (SSID) and WiFi security settings of the AP and WiFi device must match exactly. If you did not change the SSID, the AP’s default SSID is “NETGEARXXXXXX”, where XXXXXX represents the last six characters of the AP’s MAC address, as printed on the AP label. If you did not change the passphrase (also referred to as network key or WiFi password), the unique default passphrase is also printed on the AP label.
**Note:** If you set up an access control list on the AP, you must add each computer or mobile device to the access control list (see Enable and manage network access control on page 86).

The AP provides three WiFi networks (Wireless 1, Wireless 2, and Wireless 3). By default, the Wireless 1 network is enabled and the other two WiFi networks are disabled. If the Wireless 2 and Wireless 3 networks are enabled and you did not change the default settings, you can access these networks as follows:

- **Wireless 2.** The default SSID is NETGEARXXXXXX-2, in which XXXXXX represents the last six characters of the AP’s MAC address, and the default password is sharedsecret.
- **Wireless 3.** The default SSID is NETGEARXXXXXX-3, in which XXXXXX represents the last six characters of the AP’s MAC address, and the default password is sharedsecret.

- Does the WiFi device that you are using find your WiFi network? If not, check the WiFi LED on the AP. If the WiFi LED is off, both WiFi radios are probably off too. For more information about the WiFi radios, see Enable or disable a WiFi radio on page 76.

- If you disabled the AP’s SSID broadcast, your WiFi network is hidden and does not display in your WiFi client’s scanning list. (By default, SSID broadcast is enabled.) For more information, see Hide or broadcast the SSID for a WiFi network on page 71.

- Does your WiFi device support the security that you are using for your WiFi network? For information about changing the WiFi security, see Set up or change an open or secure WiFi network on page 64.

**Tip:** If you want to change the WiFi settings of the AP’s network, use a wired connection to avoid being disconnected when the new WiFi settings take effect.

If your WiFi device finds your network but the signal strength is weak, check these conditions:

- Is your AP too far from your WiFi device or too close? Place your WiFi device near the AP but at least 6 feet (1.8 meters) away and see whether the signal strength improves.
- Are objects between the AP and your WiFi device blocking the WiFi signal? For more information, see Position the AP on page 12.
Changes are not saved

If the AP does not save the changes that you make through the local browser UI, do the following:

- When entering configuration settings, always click the **Apply** button before moving to another page or tab, or your changes are lost.
- If the page in the local browser UI displays a **Refresh** button, click it. It is possible that the changes occurred, but the old settings might be in the web browser’s cache.

Troubleshoot your network using the ping utility of your computer or mobile device

Most network devices and routers contain a ping utility that sends an echo request packet to the designated device. The device then responds with an echo reply. You can troubleshoot a network using the ping utility in your computer or mobile device.

Test the LAN path from a Windows-based computer to the AP

You can ping the AP from a Windows-based computer to verify that the path to your AP is set up correctly. You can use a WiFi or wired connection to the AP, which can be in router mode or access point mode.

**To ping the AP from a Windows-based computer:**

1. From the Windows toolbar, click the **Start** button and select **Run**.
2. In the field provided, type `ping` followed by the IP address of the AP, as in this example:
   
   `ping www.routerlogin.net`

3. Click the **OK** button.
   
   You see a message like this one:
   
   Pinging `<IP address>` with 32 bytes of data
   
   If the path is working, you see this message:
   
   Reply from `<IP address>`: bytes=32 time=NN ms TTL=xxx
   
   If the path is not working, you see this message:
   
   Request timed out
If the path is not functioning correctly, check to see if the following is correct:

- **Correct LAN subnet?**
  Verify that the IP addresses and LAN subnet for the AP and your computer are correct. For more information, see Check the DHCP network settings of your computer or mobile device on page 228.

- **Correct physical connections?**
  If you are using a wired connection to the AP, make sure that the Ethernet port on your computer is connected to a LAN port on the AP. If the AP and computer are connected through a switch or hub, make sure that the link LEDs are lit for the switch ports that are connected to the AP and computer.

- **Correct software?**
  If you are using a wired connection to the AP, verify that the Ethernet card driver software and TCP/IP software are both installed and configured on your computer.

Test the path from a Windows-based computer to a remote device [router mode]

**If the AP is in router mode, to test the path from a Windows-based computer that is connected to the AP to a remote device:**

1. From the Windows toolbar, click the **Start** button and select **Run**.
2. In the Windows Run window, type `ping -n 10 <IP address>`
   in which `<IP address>` is the IP address of a remote device such as your ISP DNS server.
   
   If the path is functioning correctly, messages display that are similar to those shown in Test the LAN path from a Windows-based computer to the AP on page 240.

3. If you do not receive replies, check the following:
   - Check to see that IP address of the AP is listed as the default gateway for your computer. If DHCP assigns the IP configuration of your computers, this information is not visible in your computer Network Control Panel. Verify that the IP address of the AP is listed as the default gateway.
   - Check to see that the network address of your computer (the portion of the IP address specified by the subnet mask) is different from the network address of the remote device.
   - Check to see that your modem is connected and functioning.
• If your ISP assigned a host name to your registered computer, use that host name as the account name (see Manually set up the AP Internet connection [router mode] on page 42).

• Your ISP might be rejecting the Ethernet MAC addresses of all but one of your computers. Many broadband ISPs restrict access by allowing traffic only from the MAC address of your modem. Some ISPs additionally restrict access to the MAC address of a single computer connected to that modem. If your ISP does this, configure your router to “clone” or “spoof” the MAC address from the authorized computer.
Factory Default Settings and Technical Specifications

This appendix includes the following sections:

• Factory default settings
• Technical specifications

Note: In this appendix, we refer to the access point as the AP.
Factory default settings

You can reset the AP to the factory default settings, which are shown in the following table.

For more information about resetting the AP to its factory settings, see Factory default settings on page 142.

IEEE 802.11ac specification  
IEEE 802.11n 2.0 specification  
IEEE 802.11g  
IEEE 802.11b  
IEEE 802.11a |
| Radio bands                    | 2.4 GHz and 5 GHz, concurrent operation                                      |
| Maximum theoretical WiFi       | Up to 600 Mbps at 2.4 GHz  
Up to 1200 Mbps at 5 GHz  
Throughput can vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, and network overhead, affect the data throughput rate. |
| throughput                     | Maximum number of supported clients  
The AP can support a maximum of 64 WiFi clients:  
Maximum number of 2.4 GHz WiFi clients: 64  
Maximum number of 5 GHz WiFi clients: 64  
Even though each individual radio can support 64 clients, the total number of clients that the AP can support is 64. (For example, 44 clients on the 2.4 GHz radio and 20 clients on the 5 GHz radio.)  
In a WiFi network, the actual number of clients might be limited by the amount of WiFi traffic that is generated by each client. |
| Operating frequency range      | 2.4 GHz band

Wall-Mounting

This appendix includes the following sections:

- Wall-mount the AP

**Note:** In this appendix, we refer to the access point as the AP.
Wall-mount the AP

Wall-mounting holes are on the bottom of the AP. The distance between the holes is 4.125 in. (105 mm), center-to-center.

We recommend that you use M3 type screws, with a length of 0.75 inch (U.S.) or 20 mm (European).

**To wall-mount the AP:**

1. As an option, create a template:
   a. Place a piece of white paper on the bottom of the AP, covering the wall-mounting holes.
   b. Use a pencil to gently scratch around the mounting hole areas.
   c. Tape the paper onto the wall where you want to mount the AP.

2. Drill holes in the wall where you want to mount the AP.
   If you created a template, drill the mounting holes at the center of the template circles.
   The distance between the holes in the wall must be 4.125 in. (105 mm).

3. Insert wall anchors in the holes.

4. Insert screws into the wall anchors, leaving 3/16 in (0.5 cm) of each screw exposed.

5. Align the AP’s wall-mounting holes with the screws and mount the AP so that the antennas are at the top.

6. Slide down the AP into lock position.
